The Greystone property is located on the west side of Highway 29 and features the historic Greystone Cellars (c.1888) a masonry building designed in the Richardsonian Romanesque architectural style. The Greystone property is highly visible and situated at the northern gateway to the City. Exterior modifications proposed for the Greystone building are limited to the introduction of a 4,468 square foot storage cave, which will be accessed from the loading dock retaining wall and not readily visible from the primary elevations, and the introduction of three modular storage units at the building rear which would be accessed via the existing roadway. The modular units will range in size from ~~592 sf to 944 sf~~ 633 sf to 1,337 sf and measure approximately 9'8" in height. The units will be located at the rear of the west elevation and supported on new structures that span across the existing exterior breezeway in a similar manner as the support structures used for HVAC units. The units will sit below the existing roof eave and will be utilitarian in nature and feature painted metal siding and doors with a flat roof shielded by a small parapet.

*Cultural Resources, Impact Analysis, Criterion A, Page 25.*

a) (Historic Resources) Less than Significant: The proposed work at the Greystone Site is confined to the Greystone Cellars building, along the west elevation and below the north end of the building. Three modular units ranging in size from ~~592 sf to 944 sf~~ 633 sf to 1,337 sf are proposed on the west elevation (rear) of the building. The units will be accessed from an existing roadway, supported on new horizontal steel structure that spans the area and similar to existing modern mechanical equipment supports. Utilitarian in nature, the units are constructed of painted metal siding, doors, and flat roofs behind shallow parapets.

- ***The following changes to the language included on the last paragraph of page 39 and in Section 9(b) of the IS/MND, will be made, as shown below:***

...In addition, the project has requested a variance from the parking standards outlined in Municipal Code Section 7.124.30(A.3) and stipulated for "rooming, boarding, or lodging houses" (determined to be the closest applicable land use identified in the zoning code), which require two spaces for the "resident owner" and one space for each guest room ~~bed~~, for a total of ~~226~~ 175 parking spaces based on this requirement for the gross total of 173 rooms (224 dormitory beds) which would result at the Vineyard Lodge Housing Site. At present, the site features 85 parking spaces, but based on data provided by the applicant, only 31% of students have a demand for parking spaces. As described herein, the CIA provides a shuttle service to students for transport to and from the Vineyard Lodge to Greystone, as well as transport offsite. Staff, including cleaning and maintenance staff, are shared by both sites and as such, staff typically park at the Greystone site and are shuttled to the

**4. SUMMARY**

In the course of preparing the written responses, information was generated and is presented throughout this document. The City of St. Helena carefully reviewed the information developed through the responses-to-comments process and determined that the project does not meet any of the conditions under CEQA Section 15073.5, as outlined below.

**15073.5. RECIRCULATION OF A NEGATIVE DECLARATION PRIOR TO ADOPTION.**

- a) A lead agency is required to recirculate a negative declaration when the document must be substantially revised after public notice of its availability has previously been given pursuant to Section 15072, but prior to its adoption. Notice of recirculation shall comply with Sections 15072 and 15073.

- b) A “substantial revision” of the negative declaration shall mean:
- 1) A new, avoidable significant effect is identified and mitigation measures or project revisions must be added in order to reduce the effect to insignificance, or
  - 2) The lead agency determines that the proposed mitigation measures or project revisions will not reduce potential effects to less than significance and new measures or revisions must be required.
- c) Recirculation is not required under the following circumstances:
- 1) Mitigation measures are replaced with equal or more effective measures pursuant to Section 15074.1.
  - 2) New project revisions are added in response to written or verbal comments on the project's effects identified in the proposed negative declaration which are not new avoidable significant effects.
  - 3) Measures or conditions of project approval are added after circulation of the negative declaration which are not required by CEQA, which do not create new significant environmental effects and are not necessary to mitigate an avoidable significant effect.
  - 4) New information is added to the negative declaration which merely clarifies, amplifies, or makes insignificant modifications to the negative declaration.
- d) If during the negative declaration process there is substantial evidence in light of the whole record, before the lead agency that the project, as revised, may have a significant effect on the environment which cannot be mitigated or avoided, the lead agency shall prepare a draft EIR and certify a final EIR prior to approving the project. It shall circulate the draft EIR for consultation and review pursuant to Sections 15086 and 15087, and advise reviewers in writing that a proposed negative declaration had previously been circulated for the project.

Therefore, the recirculation of a revised IS/MND or the preparation of an Environmental Impact Report (EIR) is not required. Consistent with the CEQA Guidelines, the added information clarifies the information and analyses in the IS/MND.

The City of St. Helena will consider the proposed IS/MND, together with this Response to Comments document, prior to approving the project.

**CITY OF ST. HELENA PLANNING COMMISSION**

**RESOLUTION PC20xx-xx**

**RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF ST. HELENA  
ADOPTING A MITIGATED NEGATIVE DECLARATION AND MITIGATION  
MONITORING AND REPORTING PROGRAM FOR THE CULINARY INSITUTE OF  
AMERICA CAMPUS MASTER PLAN AND GRANTING APPROVAL OF DESIGN  
REVIEW AND A USE PERMIT FOR 2555 MAIN STREET AND GRANTING APPROVAL  
OF A DEMOLITION PERMIT, DESIGN REVIEW, USE PERMIT, AND VARIANCES FOR  
830 PRATT AVENUE IN THE CITY OF ST.HELENA, CALIFORNIA**

**PROPERTY OWNER:** CULINARY INSTITUTE OF AMERICA

**APN:** 009-010-024  
and 009-131-003

**Recitals**

1. **Whereas**, The Culinary Institute of America submitted an application for Design Review and Use Permit approval to expand student enrollment to 300 students, introduce storage cave, and three modular storage units at the Greystone Campus at 2555 Main Street (APN.009-131-003); and
2. **Whereas**, The Culinary Institute of America also submitted an application for a Demolition Permit, Design Review, Use Permit, and Variances to expand the student housing at the Vineyard Lodge Housing Site at 830 Pratt Avenue (APN. 009-010-024); and
3. **Whereas**, Pursuant to CEQA Guidelines Sections 15072 and 15073, a Draft Mitigated Negative Declaration and included Initial Study was circulated for public review and comment from December 9, 2016 until January 23, 2017; and
4. **Whereas**, the Initial Study/Mitigated Negative Declaration concluded that implementation of the Project could result in a number of potentially significant effects on the environment and identified mitigation measures that would reduce the significant effects to a less-than-significant level; and
5. **Whereas**, in connection with the approval of a project involving the preparation of an initial study/mitigated negative declaration that identifies one or more significant environmental effects, CEQA requires the decision-making body of the lead agency to incorporate feasible mitigation measures that would reduce those significant environmental effects to a less-than-significant level; and.
6. **Whereas**, whenever a lead agency approves a project requiring the implementation of measures to mitigate or avoid significant effects on the environment, CEQA also

*2555 Main Street/ 830 Pratt Avenue  
Demolition Permit, Variance, Design Review and Use Permit  
February 21, 2017*

requires a lead agency to adopt a Mitigation Monitoring and Reporting Program to ensure compliance with the mitigation measures during project implementation; and

7. **Whereas**, The Planning Commission of the City of St. Helena, State of California, considered the project, staff report, and all testimony, written and spoken, at a duly noticed public hearing on February 21, 2017.
8. **Whereas**, A public notice was published in the St. Helena Star and mailed to residents and occupants within 500 feet of the project site and in compliance with state and local law; and
9. **Now, therefore** let it be found that, the Planning Commission adopts the Mitigated Negative Declaration and Mitigation Monitoring and Reporting Program, and approves the requested Use permit and Design Review for 2555 Main Street and approves the Demolition Permit, Design Review, Use Permit, and Variances for 830 Pratt Avenue on the following basis:

#### **Resolution**

1. In making the findings in this Resolution, the Planning Commission relied upon and hereby incorporates by reference all of the documents referenced in this Resolution and the associated staff report, City files for this matter, correspondence, presentations and other materials.
2. **CEQA Findings**
  1. The Planning Commission has independently reviewed and analyzed the Initial Study/Mitigated Negative Declaration and other information in the record and has considered the information contained therein, prior to acting upon or approving the Project,
  2. The Initial Study/Mitigated Negative Declaration prepared for the Project has been completed in compliance with CEQA and consistent with state and local guidelines implementing CEQA,
  3. On the basis of the whole record, there is no substantial evidence that the Project as designed, conditioned, and mitigated, will have a significant effect on the environment.
  4. The Initial Study/Mitigated Negative Declaration represents the independent judgment and analysis of the City as lead agency for the Project.
3. **2555 Main Street Findings and Conditions of Approval**
  - A. **DESIGN REVIEW.** The Planning Commission finds that The Greystone Campus is historically significant as a good example of the late nineteenth century Richardsonian Romanesque architecture in California and provides a tangible link to the Napa Valley's historical viticultural operations of the last century. All project activities are either confined to the interior of buildings or less visible areas of the property such that any changes are not readily visible from main viewing areas. The exterior modifications proposed for the subject include the introduction of three new modular storage units at the rear of the property. The introduction of the proposed modular units would be reversible and their removal in the future would not affect

2555 Main Street/ 830 Pratt Avenue  
Demolition Permit, Variance, Design Review and Use Permit  
February 21, 2017

the historic integrity of the building. Given the very limited design changes and for the reasons described below, the project is found to be generally consistent with the design review requirements. As such, the Planning Commission determines the project is in compliance with the following Design Review criteria of Municipal Code Section 17.164.030:

1. Consistency and compatibility with applicable elements of the general plan;  
*As proposed the project will facilitate the continued use of the historic Greystone building and in doing so would preserve the historic resource as a valuable piece of St. Helena's heritage. As such, the project would be consistent with GP Policies, 2.6.30, 4.8.1, 4.8.2. Further, the Culinary Institutes' emphasis on food and wine education promotes the Valley's reputation of a world class destination for wine and the culinary arts. As such, the proposed project exhibits overall consistency with all applicable General Plan goals, policies, and objectives.*
2. Compatibility of design with the immediate environment of the site;  
*No exterior changes are proposed that would alter the design of the building or site.*
3. Relationship of the design to the site;  
*The design will greatly limit changes visible on the building exterior; for example, the proposed modular units will be located at the building's rear and not readily visible from public viewing areas. As such, the relationship of the design to the site is appropriate.*
4. Determination that the design is compatible in areas considered by the board as having a unified design or historical character;  
*All work will be performed in accordance with the Secretary of the Interior's Standards and will be consistent with the historic character of the subject site.*
5. Whether the design promotes harmonious transition in scale and character in areas between different designated land uses;  
*No substantial changes are proposed that would alter the existing scale or character.*
6. Compatibility with future construction both on and off the site;  
*No exterior changes are proposed that would alter compatibility with future construction on or off site.*
7. Whether the architectural design of structures and their materials and colors are appropriate to the function of the project;  
*The proposed modular units will be of simple design and materials which will ensure their functionality while also limiting changes to the visual environment.*
8. Whether the planning and siting of the various functions and buildings on the site create an internal sense of order and provide a desirable environment for occupants, visitors and the general community;

*The majority of changes are confined to the interior of the existing Greystone building and therefore would not alter the existing site configuration or overall functionality of the site. The proposed modular units and storage cave would be located conveniently with connectivity to the internal uses they serve. As such, proposed changes would be functional and would limit changes to the visual environment of the site.*

9. Whether the amount and arrangement of open space and landscaping are appropriate to the design and the function of the structures;

*No open space or landscaping is proposed as part of this project.*

10. Whether sufficient ancillary functions are provided to support the main functions of the project and whether they are compatible with the project's design concept;

*The project includes modular storage units and storage cave that will support the Culinary school use of the site. The ancillary components are either shielded from view, in the case of the modular units, or underground and not visible, in the case of the storage cave. Given the limited visibility of both components, they are expected to be compatible with the overall design of the Greystone property.*

11. Whether access to the property and circulation systems are safe and convenient for pedestrians, cyclists and vehicles;

*No changes to the circulation system are proposed.*

12. Whether natural features are appropriately preserved and integrated with the project;

*No changes to natural features are proposed.*

13. Whether the materials, textures, colors and details of construction are an appropriate expression of its design concept and function and whether they are compatible with the adjacent and neighboring structure and functions;

*Three modular units ranging in size from 633 sf to 1,337 sf are proposed on the west elevation (rear) of the building. The units will be accessed from an existing roadway, supported on new horizontal steel structure that spans the area and similar to existing modern mechanical equipment supports. Utilitarian in nature, the units are constructed of painted metal siding, doors, and flat roofs behind shallow parapets. The proposed modular units are located away from principal elevations, have been designed to fit below the historic eave of the building, and are minimal in size compared to the original structure. Proposed work will use materials to differentiate the additions from the historic exterior masonry. These characteristics reflect the project's compliance with the Secretary of the Interior Standards for Rehabilitation (SOISR). Given the above, the proposed new modular units are expected to be compatible with adjacent structures and functions.*

15. Whether the landscape design concept for the site, as shown by the relationship of plant masses, open space, scale, plant forms and foliage textures and colors create a desirable and functional environment and whether the landscape concept depicts an appropriate unity with the various buildings on the site;

*There is no new landscaping proposed.*

16. Whether plant material is suitable and adaptable to the site, capable of being properly maintained on the site, and is of a variety which is suitable to the climate of St. Helena;

*No landscaping is proposed.*

17. Whether sustainability and climate protection are promoted through the use of green building practices such as appropriate site/architectural design, use of green building materials, energy efficient systems and water efficient landscape materials.

*All outdated/inefficient fixtures and systems will be replaced with more efficient and environmentally friendly fixtures and as such, the project will further sustainability goals.*

- B. USE PERMIT. Pursuant to Municipal Code Section 17.168.050, the Planning Commission acknowledges that the Culinary Institute of America at Greystone endeavors to place a greater focus on occupational education. To achieve this, the applicant requests that the use permit authorize a total enrollment of 300 students, allow more flexibility in the operation of the retail store, and allow for a 58 seat student-run restaurant to replace the now closed, 190-seat Wine Spectator at Greystone Restaurant. It is determined that proposed changes do not substantially increase the intensity of the site or otherwise create an impact that would conflict with any of the requisite findings needed to approve a use permit. Accordingly, the Planning Commission makes the following Use Permit findings to support the motion to approve the use permit:

1. That the proposed use would not generate odors, fumes, dust, light, glare, radiation or refuse that would be injurious to surrounding uses or to the community.

*No significant changes in the operation of the facility will change and there is no expectation that the proposed project would generate odors, fumes, dust, light, glare, radiation or refuse beyond what is currently typical of the culinary school use. As such, operation of the Greystone Campus consistent with the proposed project would not be injurious to surrounding uses or the community.*

2. That the proposed use would not generate levels of noise that adversely affect the health, safety, or welfare of neighboring properties or uses.

*Levels of noise would be consistent with or less than existing noise levels given the reduction in events and size of the on-site restaurant.*

3. That the proposed use would not generate traffic noise in excess of the "normally acceptable" range identified in the General Plan.

*As detailed in the Traffic Impact Report, the proposed project will not cause a substantial increase in traffic trips that would cause the ambient noise level to*

*exceed the normally acceptable range. Given the limited traffic trips associated with the proposed project, the project would not cause traffic noise to noticeably increase beyond existing level or otherwise exceed normally acceptable ranges.*

4. That the proposed use would not make excessive demands on the provision of public services including water supply, sewer capacity, energy supply, communication facilities, police protection, and fire protection.

*The level of demand placed on public services will remain consistent with that which currently exists due to the introduction of more efficient fixtures and systems, adherence to the water neutrality policy, and the fact that the proposed use will continue to operate in a manner consistent with what currently exists, as a culinary school with an ancillary retail and restaurant component.*

5. That the proposed use would provide adequate ingress and egress to and from the proposed location.

*No changes to ingress/ egress are proposed.*

6. That allowing the proposed use would not conflict with the City's goal of maintaining the economic viability of a local serving economy.

*The proposed use is consistent with that which currently exists at the site and no changes are expected that would otherwise conflict with the City's goal of maintaining the economic viability of a local serving economy.*

7. That the proposed use would be compatible with surrounding land uses and would not conflict with the purpose established for the district within which it would be located.

*No significant change in use or operation is proposed and as such, the proposed use would continue to be compatible with surrounding land uses.*

8. That the proposed use would not be in conflict with the City's General Plan.

*As detailed above, the use would be consistent with all applicable General Plan policies.*

9. That the proposed use would not be injurious to public health, safety, or welfare.

*The proposed use is largely consistent with that which currently exists at the subject site and is not expected to be injurious to public health, safety, or welfare.*

10. That granting the use permit would not set a precedent for the approval of similar uses whose incremental effect would be detrimental to the City or would be in conflict with the General Plan.

*The findings related to this particular project are unique and applicable only to the CIA Campus Master Plan. There is no reason to expect that approval of this use permit would set a precedent for the approval of similar uses whose incremental effect would be detrimental to the City or would be in conflict with the General Plan.*

11. That, as demonstrated on a detailed plan submitted by the applicant, adequate off-street parking to accommodate the long term parking needs of employees and business owners and customers is available.

*No changes to parking are proposed. Students living off-site would continue to be required to utilize the shuttle for transportation between student housing and the Greystone Campus. As such, no demand that couldn't be accommodated by the existing level of parking is expected.*

12. That the capacity of surrounding streets is adequate to serve the automobile and delivery truck traffic generated by the proposed use.

*The surrounding roadways will continue to be able to accommodate automobile and truck traffic generated by the proposed project and is not expected to increase substantially beyond that which currently exists.*

- C. The Planning Commission approves the design review and use permit for the above-described project with the following conditions of approval. The project shall be in conformance with all city ordinances, rules, regulations and policies in effect at the time of issuance of a building permit. The conditions noted below are particularly pertinent to this permit and shall not be construed to permit violation of other laws and policies not so listed.

#### **Conditions of Approval**

1. Project approvals shall be vested within one (1) year from the date of final action. A building permit for the use allowed under this approval shall have been obtained within one (1) year from the effective date of this action or the approval shall expire, provided however that the approval may be extended for up to two (2) one-year periods pursuant to the St. Helena Municipal Code, Section 17.08.130, Extension of Permits and Approvals. Any request for an extension of this approval shall be justified in writing and received by the Planning Department at least thirty (30) days prior to expiration.

2. The approvals shall not become effective until fourteen (14) calendar days after approval, providing that the action is not appealed by the City Council or any other interested party within that 14-day period.
3. All required fees, including planning fees, development impact fees, residential in-lieu housing fees, building fees, toilet retrofit fees, and St. Helena Unified School District fees shall be paid prior to issuance of a building permit. Fees shall be those in effect at the time of the issuance of the building permit.
4. Upon approval of Resolution XX-XX, the Applicant shall provide the Planning Department with the Notice of Determination Fee required by Fish and Wildlife Code Section 711.4(d). The fee payment shall be made by check payable to the Napa County Clerk and in the amount required and published by the Napa County Clerk for such fee.
5. All Mitigation Measures enumerated in the Mitigated Negative Declaration and Mitigation Monitoring and Reporting Program are incorporated by reference and made conditions of approval.
6. Prior to issuance of any construction permits, these conditions of approval *and* the Mitigation and Monitoring and Reporting Program shall be included with the plan set. A copy of the approved plans shall be maintained on site when construction activities are underway.
7. Pursuant to St. Helena Municipal Code Section 17.08.110, this permit shall run with the land and shall be binding upon all parties having any right, title or interest in the real property or any part thereof, their heirs, successors and assigns, and shall inure to their benefit and benefit of the City of St. Helena.
8. The primary purpose of this review is for compliance with the General Plan and Zoning Ordinance. The property owners or their designee shall be responsible for meeting with the Building Official, Fire Inspector and or Public Works Department to review compliance with Building Codes, Fire Codes and specific Public Works Standards including fire protection systems and any applicable accessibility standards of Title 24.
9. Construction shall be in compliance with plans submitted and reviewed by the Planning Commission on February 21, 2017, except as modified herein.
10. Minor modifications to approved plans may be approved by the Planning Director insofar as they are in substantial conformance with this approval.
11. The site shall be kept clear at all times of garbage and debris. No outdoor storage is permitted.
12. A final lighting plan delineating building mounted lights shall be reviewed and approved by the Planning and Community Improvement Director prior to building permit issuance.
13. Trash bins shall not be visible from public right-of-way.
14. All plantings shall be maintained in good growing condition. Such maintenance shall include, where appropriate, pruning, mowing, weeding, and cleaning of debris and

2555 Main Street/ 830 Pratt Avenue  
Demolition Permit, Variance, Design Review and Use Permit  
February 21, 2017

trash, fertilizing and regular watering. Where necessary, plantings shall be replaced with other plant materials to insure continued compliance with applicable landscaping requirements, Irrigation systems shall be maintained in sound operating condition with heads periodically cleaned and replaced when missing to ensure efficient watering and to maintain good health and vitality of landscape materials.

15. No signage is approved by this permit. A separate sign permit in compliance with the Municipal Code shall be obtained prior to installation of signage.
16. Property owners shall recognize that there exists a right to farm properties within the district and in the vicinity of the district. There is a good faith expectation that no complaints will occur regarding legal, normal agricultural activities on properties in the district or in the vicinity of the district. Such activities may include day or night disbursement of chemicals, and creation of dust, noise, or fumes.
17. In any action or proceeding to attack, challenge, invalidate, set aside, void or annul the City's approval of applicant's Project, in whole or in part, applicant shall defend, at its own expense and without any cost to the City, and with counsel acceptable to the City, and shall fully and completely indemnify and hold the City, its agents, officers, and employees harmless from and against any and all claims, causes of action, damages, costs, attorney's fees and liability of any kind, so long as the City reasonably promptly notifies the applicant of any such claim, action, or proceedings and the City cooperates fully in the defense of the action or proceedings.

#### **Planning Department Conditions**

18. As applicable, the permittee shall comply with any and all previous conditions of approval for the CIA Greystone Campus except as they may be explicitly modified by this action. To the extent there is a conflict between previous conditions of approval enumerated in any previous resolutions relating to the subject site including, but not necessarily limited to: Resolution Nos. 93-105; 96-95; 97-162; 2001-60; 2003-42; 2004-112; 2006-07; 2006-130; or 2008-76 and these conditions of approval, these conditions shall control, superseding the prior approvals with respect to any such conflict.
19. The primary use shall be that of an advanced cooking school with ancillary uses limited to (1) 58 seat student run restaurant, (1) 35 seat bakery/café and, (1) 3,100 square foot retail store subject to the conditions herein.
20. The student population shall not exceed 300 students. Students shall be limited to those enrolled an Associate, Bachelor's, Master's and/or other Certificate Degree Program.
21. Only students actively enrolled at the CIA at Greystone campus shall be allowed to use school lodging accommodations. The student's length of stay shall be commensurate with the respective degree program.

22. As an ancillary component to the bakery and pastry education program and to help students satisfy educational requirements, a Bakery/Café with no more than 35 seats may be operated within the Greystone Cellars building.
23. A restaurant may be operated within the Flavor Discovery Center (FDC) as an accessory use to the school with seating limited to a total of 58 seats, including both indoor and outdoor dining. Any outdoor dining shall be consistent with the Zoning Regulations in effect at the time of operation.
24. A 3,100 sf campus store may be operated as an accessory use to the school within the main winery building. The store shall be limited to the hours of operation of 10:00 a.m. – 7:00 p.m. Items sold at the retail store shall be directly related to the food and beverage industry or to the incidental needs of the student residents, such as toiletries and stationery. Bottled wine sales may be permitted. The store may be advertised in educational, food service, trade and Napa county newspapers of record. Site signage shall comply with the St. Helena sign ordinance. Wine tasting may occur within the store as an accessory and subordinate activity relating to the sale of wine but shall occur only during the hours the retail store is open."
25. Valet parking shall be provided for all special and community events if they are held during hours that the restaurant is open and/or when designated on-site parking is not adequate. No parking shall be permitted along Highway 29/Main Street or Deer Park Road.
26. The CIA may offer tours and limited educational experiences to the General Public so long as such activities are incidental and secondary to the primary degree and/or Certificate educational programs offered at Greystone.
27. The Applicant shall provide a Transportation Plan that describes the operation of (1) the shuttle service (2) the rental car service (3) parking permits for individual vehicles and (4) the specifics of the on-demand bike program as they relate to the Greystone Campus and Vineyard Lodge Housing Site. The Plan shall be subject to review and approval by the Planning and Community Improvement Director. A copy of the approved Transportation Plan shall be provided and kept in the hard copy and digital project file.
28. Modular Units and the underground cave shall be used for storage of products and wares used for the purposes of culinary education.
29. Prior to issuance of building permit, the applicant shall execute a Joint Water Use Agreement with the Vineyard Lodge Housing Site. The Joint Agreement shall authorize a maximum water allocation of 23.1 acre feet/year to be utilized by the two sites. The Joint Agreement shall include enforcement provisions and penalties if the allowance is exceeded in a given year.

30. Any significant change(s) to the operation of the approved use, including a change in hours of operation, intensity, or type(s) of uses shall require amendment to this use permit.

### **Public Works Conditions**

31. Approval of this project shall be subject to the requirements of, and all improvements shall be designed and constructed in accordance with, the most current version at the time of improvement plan submittal, Caltrans Standards and Specifications, the City of St. Helena Municipal Code, the St. Helena Water and Sewer Standards, the St. Helena Street, Storm Drain and Sidewalk Standards, and all current federal, state and county codes governing such improvements.
32. For any improvements outside the existing building envelope, a grading and drainage plan showing topographic data, all easements, infrastructure onsite and directly adjoining, and an erosion control plan shall be submitted for review and approval by the City Engineer prior to the issuance of a building permit. If the project entails more than 50 cubic yards of soil disturbance, 10,000 square feet of disturbance area, a cut or fill of 3 feet or more, or alteration of any drainage pattern, a grading permit shall be required.
33. A detailed Soils Investigation/Geotechnical Report shall be prepared and submitted for review. The report shall address, at a minimum, potential for liquefaction, R-values, expansive soils, seismic risk, cave wall and ceiling stability, etc. The improvement plans shall incorporate all design and construction criteria recommended in the Geotechnical Report.
34. Remodels or new construction which requires fire sprinklers shall install an appropriately-sized water service with appropriate backflow and meter devices prior to Certificate of Occupancy. Fire system calculations shall be submitted with the Grading and Drainage Plan to verify fire service lateral and meter sizing. Deferred submittals are not accepted.
35. The applicant shall be required to submit to the requirements for annual inspections of food/beverage service establishments and businesses that handle hazardous wastes for illicit stormwater discharges as required by the State National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges. The annual stormwater illicit discharge inspections are performed and invoiced by Napa County Department of Environmental Management.
36. Trash areas, dumpsters and recycling containers shall be enclosed and roofed per State and County standards to prevent water run-on to the trash area and water runoff from the area, to contain litter and trash so that it is not dispersed by the wind or run-off during waste removal. In the event that wine or food is disposed in these areas, they shall drain to the sanitary sewer system. An area drain connected to the sanitary sewer shall be installed in the enclosure area and a structural control such as an oil/water separator or sand filter shall be included. No other area shall drain

into the trash enclosure. A sign shall be posted prohibiting the dumping of hazardous materials into the sanitary sewer.

37. The applicant shall incorporate water conservation practices into the proposed project per the Water Neutrality Calculations prepared by Summit Engineering, dated October 15, 2016. Any and all non-conforming appliances and plumbing fixtures shall be removed from the premises. The water conservation requirements shall be replicated in full on the architectural plans.
38. Erosion and sediment control plans shall conform to the latest State and City codes at a minimum.
39. Grading plans shall identify off-haul routes and soil disposal sites, subject to review and approval by Public Works. All grading and spoils generated by construction of the project facilities, including cave spoils, shall be removed and/or permanently placed prior to final occupancy.
40. The Applicant shall keep adjoining public streets free and clean of project dirt, mud, materials, and debris during the construction period, as is found necessary by the City Engineer.
41. Any new and modified existing water laterals, meters and backflow prevention devices shall be required and constructed in accordance with the requirements of the City of St. Helena's Water Standards.
42. The applicant shall repair all public improvements that are damaged by the construction process in accordance with the City Water/Sewer/Street/Storm Drain/Sidewalk Standards prior to Certificate of Occupancy.
43. Existing streets being cut by new utility services will require edge grinding and an A.C. overlay per City standards, extent to be determined by the Public Works Department.
44. The applicant shall be required to obtain an encroachment permit for improvements on public right-of-ways prior to receiving a grading or building permit authorizing site work or construction activities on the site.

#### **Building Department Conditions**

45. A building permit is required for all onsite demolition, construction and/or change of occupancy.
46. The applicant will be required to comply with the codes adopted at the time the applicant applies for a building permit. At this time the City of St. Helena utilizes the 2013 Title 24 codes.

47. When submitting plans for a building permit, the plans shall include all documentation listed on the building permit application checklist.
48. The applicant shall provide a construction waste management plan with the building permit application.
49. The plans for construction shall include a checklist for compliance with the California Green Buildings Standards Code, mandatory measures. Provide a reference on the checklist indicating where the mandatory measures can be found on the plans.
50. When submitting plans, the title page shall include all information referenced on the building permit application checklist Title Page requirements.
51. Building Permit application materials and plans shall include any documentation pertaining to special loads applicable to the design and the specified section of the code that addresses the condition; special inspections for any systems or components requiring special inspection; requirements for seismic resistance; and a complete list of deferred submittals at time of application. Any deferral of the required submittal items shall have prior approval of the Building Official however deferral of fire sprinkler design is not allowed.

#### **Fire Department Conditions**

58. Fire sprinklers and fire hydrants shall be installed as required by the Fire Department

#### **4. 830 Pratt Avenue Findings and Conditions of Approval**

- A. DEMOLITION. Pursuant to Municipal Code Section 17.164.050(E), the Planning Commission finds that the Vineyard Lodge 1 (c.1960) is not eligible for listing on the California Register of Historic Resources (CRHR) and because the building is not particularly cohesive with the surrounding agricultural and residential character makes the following findings for the approval of a Demolition Permit:

1. That, based on the public record and testimony presented at a public hearing, the building is determined not to be a significant architectural or historical building.

*The applicant is requesting a permit to demolish the former Marlinda Convalescent Home and what is today known as "Vineyard Lodge 1". The building was constructed c.1960. Following review of available records, consultants, Architectural Resources Group, determined that the subject building proposed for demolition does not meet the Criteria for listing on the California Register of Historic Resources (CRHR) given that it does not exhibit architectural significance, is not associated with any significant themes or persons and is not expected to yield any information important to expand our understanding of history or prehistory. Staff concurs with this determination.*

2555 Main Street/ 830 Pratt Avenue  
Demolition Permit, Variance, Design Review and Use Permit  
February 21, 2017

2. That the demolition does not eliminate elements that are required to maintain the essential character of the neighborhood.

*As a 1960s era convalescent home located in an otherwise agriculture and residential area, the building was not found to be particularly cohesive with the existing environment. Given this, it's demolition is not expected to adversely impact the essential character of the neighborhood. Accordingly, Staff finds that the demolition of the proposed building will not negatively impact a historic resource or existing visual environment.*

- B. DESIGN REVIEW. The Planning Commission determines the project's natural color palette, stepped design, retention of existing trees adjacent to the public right-of-way and the addition of new trees will be compatible with the surrounding character along Pratt Avenue and limit visual impacts such that it would be in compliance with the following Design Review criteria enumerated in Municipal Code Section 17.164.030, and as follows:

1. Consistency and compatibility with applicable elements of the general plan;

*As stated above, the subject project is consistent with General Plan policies 4.3.4, 2.6.2, 2.6.4, 2.6.5 and HE 1.5, 2.1, 2.2, and 2.6 in that the project would consist of infill on an already developed site, would occur in a logical and orderly manner proximate to urban services, and would be of a size and design that is consistent with existing site development. Further, the site would not encroach into or otherwise hinder agricultural activities in the vicinity of the subject site. As a previously developed site within approximately one mile of the Greystone Campus, the project location at 830 Pratt is well suited to accommodate student housing at a higher density and provide a creative solution to the need for affordable student housing. As such, the project is determined to exhibit overall consistency with the intent of the General Plan and Housing Element.*

2. Compatibility of design with the immediate environment of the site;

*The project site is situated at the northern border of St Helena's urban limits where medium density housing development is bordered by agricultural land uses immediately to the north and east. Adjacent development includes the Beringer Winery warehouse building and wastewater treatment facilities. Therefore, the visual character of the project area is comprised of both residential scale single-family residences (south and west) and agricultural uses including processing and storage (north, east, and west) building and facilities.*

*The subject site is currently developed with two dormitory buildings ranging from one to two stories in height. The one-story building will be demolished and the two story building is to be retained. The expansion of the Vineyard Lodge House is generally consistent with what is presently on the site and would not substantially alter the existing relationship of the site to its surroundings or otherwise make the site incompatible with the surroundings. The new construction would be clustered on the site and exhibit defined boundaries and*

*generous vegetative screening. As such, compatibility of the site with its surroundings is found to be maintained.*

3. Relationship of the design to the site;

*As stated above, the site configuration will include a series of four buildings (3 new) clustered around a central courtyard and traversed by a one-way access road. Those buildings with frontage on Pratt Avenue will feature a stepped design and a minimum setback of 20 feet from Pratt Avenue so as to limit visual prominence and provide continuity with other properties proximate to the site, which are developed with similar setbacks. Therefore, given the site constraints, the relationship of the design to the site appears to strike an appropriate balance between function and aesthetics.*

4. Determination that the design is compatible in areas considered by the board as having a unified design or historical character;

*The segments of Pratt Avenue proximate to the subject site do not exhibit a unified or historical character. The surrounding area features residential uses, industrial/agricultural production uses, and vineyards. The proposed design is generally consistent with Vineyard Lodge II and the existing character of the site and would not depart significantly from that existing character. The project is therefore not expected to impact an area having a unified or historical character.*

5. Whether the design promotes harmonious transition in scale and character in areas between different designated land uses;

*The subject buildings with frontage on Pratt Avenue will be stepped in height such that the buildings along Pratt will be two stories in front (with max height of 29'2") with taller (3-story) portions confined to the rear of the site (max height of 40'2"). Similarly, the buildings will feature a minimum 20' setback from the Pratt Avenue Property line (50' from Pratt Centerline) in an effort to reduce the perceived massing and scale and promote a harmonious transition in scale relative to residential buildings proximate to the site and in relation to the agricultural production facilities nearby. Further, this site serves as a transition from the adjacent agricultural production and warehouse use on the Beringer property to the single family and vineyard uses further down Pratt Avenue.*

6. Compatibility with future construction both on and off the site;

*The project design is contemporary in style, but with traditional detailing. The buildings feature a neutral color palette. The proposed design would not introduce an element that was so unique or exceptional as to make it incompatible with future development on and/or off site.*

7. Whether the architectural design of structures and their materials and colors are appropriate to the function of the project;

*The proposed buildings will be contemporary in style, but feature some craftsman-like details including wood columns and brackets. The building will be supported by an exposed, parge coated foundation. Exterior walls would be clad in a combination of painted clapboard siding and stained red cedar siding and*

*punctuated with clad windows. The buildings would feature articulated roof-lines with asphalt shingles. The proposed color palette includes neutral hues like brown, natural wood, and moss green. The proposed color and materials reflect traditional materials and colors that would help the buildings to more readily blend in with their surroundings. The architectural design, material, and colors are responsive to the needs of the site and appropriate to the function of the project and generally compatible with adjacent buildings and uses.*

8. Whether the planning and siting of the various functions and buildings on the site create an internal sense of order and provide a desirable environment for occupants, visitors and the general community;

*The proposed site configuration would feature three buildings clustered around a central courtyard. The site would be traversed by a one-way access road with parking clustered around the outer portions of the site, screened with significant amounts of vegetation. As such, the site configuration is expected to provide for a desirable environment that is both functional and aesthetically pleasing to residents and the general community.*

9. Whether the amount and arrangement of open space and landscaping are appropriate to the design and the function of the structures;

*The project proposes a generous level of landscaping and will retain a number of trees at the property frontage to promote screening. The level of landscaping will soften the look of the new buildings and appears to be appropriate for the use and to promote continuity with surrounding properties.*

10. Whether sufficient ancillary functions are provided to support the main functions of the project and whether they are compatible with the project's design concept;

*The project will include interior students commons and dining area as well as an outdoor courtyard and amenity area. In addition, the project will provide alternative forms of transportation to serve the student population and facilitate ease of travel between the subject site and Greystone Campus as well as other destinations. Given the on-site amenities and provision of alternative transportation, the project is expected to provide sufficient ancillary functions to support the functionality of the student dormitory use and which are of a design that is consistent with the overall aesthetic.*

11. Whether access to the property and circulation systems are safe and convenient for pedestrians, cyclists and vehicles;

*Primary automotive access will from Pratt Avenue and Vineyard Road, both of which were found to provide adequate circulation and access to the project site and have been conditioned to be improved to address project specific impacts. Onsite circulation and access is provided via one-way access road off of Vineyard Road and exiting at Pratt Avenue. This access road is expected to provide convenient vehicular site access. In addition, the project will be subject to Mitigation Measure Trans-2, which amongst other things, requires that the applicant introduce a Class II bike lane along westbound Pratt Avenue (northern side) extending from the project site to the intersection of SR 29 (Main Street)*

*and Pratt Avenue and restripe for a fog line along eastbound Pratt (southern side) extending from the project site to the intersection of SR 29 thereby promoting more safe and convenient connectivity for bicyclists. Accordingly, the project is expected to promote safe and convenient access for all types of transportation.*

12. Whether natural features are appropriately preserved and integrated with the project;

*As a previously developed site, the Vineyard Lodge Housing site does not contain any significant natural features with the exception of some Coast Live Oak Trees. To accommodate the proposed buildings, the project will remove two (2) Coast Live Oaks, which pursuant to Mitigation Measure BIO-1, shall be replaced in-kind and at a ratio of three (3) new 15 gallon trees for every one tree removed. A portion of replacement oaks may be accommodated on the Greystone Campus if site constraints are such that all replacement trees cannot be accommodated within the proposed site plan. As such, the project will integrate natural features to the extent possible and where that is not possible, will mitigate accordingly.*

13. Whether the materials, textures, colors and details of construction are an appropriate expression of its design concept and function and whether they are compatible with the adjacent and neighboring structure and functions;

*Please refer to response No. 7.*

14. In areas considered by the board as having a unified design character or historical character, whether the design is compatible with such character;

*Please refer to response No. 4*

15. Whether the landscape design concept for the site, as shown by the relationship of plant masses, open space, scale, plant forms and foliage textures and colors create a desirable and functional environment and whether the landscape concept depicts an appropriate unity with the various buildings on the site;

*The proposed landscape plan will feature a variety of trees, shrubs, and sod. The majority of existing Camphor trees at property frontage will be maintained. The landscape plan will feature 21 plant types which will be distributed throughout the site and promote continuity and unity throughout the site as well as soften the look of paved parking areas around the periphery of the site and provide shade.*

16. Whether plant material is suitable and adaptable to the site, capable of being properly maintained on the site, and is of a variety which is suitable to the climate of St. Helena;

*With the exception of the sod, all proposed plant materials are considered "low" water use plantings and are expected to be adaptable to the St. Helena climate. Further, all plantings on site are required to comply with the City of St Helena Municipal Water Efficient Landscape Ordinance, which regulates landscaping water use.*

17. Whether sustainability and climate protection are promoted through the use of green building practices such as appropriate site/architectural design, use of green building materials, energy efficient systems and water efficient landscape materials.

*As detailed herein, the project will use efficient fixtures and comply with Title 24 building standards. In addition, most landscaping will be comprised of low water use planting and will comply with the City of St Helena Municipal Water Efficient Landscape Ordinance. Further, the project will limit parking so as to avoid inducing vehicular travel demands and Green House Gas production by promoting use of alternative transportation and ride sharing. As such, the project will promote sustainable practices and climate protection.*

- C. SETBACK VARIANCE. Pursuant to Municipal Code Section 17.172.050, the Planning Commission makes the following variance findings to support the motion to approve a setback variance:

- (a) A hardship peculiar to the property, not created by any act of the owner, exists. In this context, personal, family or financial difficulties, loss of prospective profits, neighboring violations, are not hardships justifying a variance.

*The currently configured parcel was created in 1971 subject to dedication of a 20 foot strip of land along the northwesterly side of Pratt Avenue, creating a 60 foot right of way. As demonstrated in the applicant's setback variance request, neighboring properties were either (1) not required to dedicate land, or (2) were required to dedicate only a 10 foot strip of land. In addition, the property has a unique triangle shape with its widest and most developable portion immediately adjoining the property line subject to the special Pratt Avenue setback requirement. Literal enforcement of the 36 foot setback requirement from the property line—which encroaches 10-20 feet more into the property than does the property line at neighboring properties—would create a hardship peculiar to the property.*

- (b) The Variance is necessary for the preservation and enjoyment of substantial property rights of the applicant which are possessed by other properties in the same district and in the same vicinity; and that a Variance, if granted, would not constitute a special privilege of the recipient not enjoyed by his or her neighbors.

*Granting a variance would not constitute a special privilege for the property relative to neighboring properties. Six neighboring homes on the northwesterly side of Pratt Avenue are situated within the special 36 foot setback, none of which were required to dedicate a 20 foot strip of land like that of the subject property. The proposed development plan will exhibit a greater setback than what currently exists for the Vineyard Lodge 1 building (proposed for demolition). In light of the above, it is found that granting a setback variance is necessary for the preservation and enjoyment of the applicant's substantial property rights that*

*are possessed by nearby properties that are developed in similar proximity to the northwestern boundary of Pratt Avenue.*

- (c) The authorization of the Variance will not be of substantial detriment to adjacent properties, and will not materially impair the purpose and intent of this Chapter or the public interest, nor adversely affect the General Plan.

*Authorization of the Variance will not be of substantial detriment to adjacent properties, nor will it materially impair the public interest, as the new developed portion of the property will be located further from Pratt Avenue than the existing Vineyard Lodge I, proposed for demolition. In addition, large mature trees along a substantial portion of the site frontage and along its other borders will screen the views of the new dormitory development. Recognizing the unique nature of the property and granting a Variance does not impair the purpose and intent of the Code's Variance chapter.*

*The chapter's stated purpose is, in part, to allow for deviation from a strict application of the Code in the event that a property exhibits an unusual shape or other exceptional characteristic, and as a result would be subjected to practical difficulties or undue hardship in their development. Authorization of the Variance is consistent with St. Helena's longstanding efforts to manage growth by encouraging further development of already developed parcels, rather than removal of vineyards within City limits, and would not adversely affect the General Plan. The project's 123-bed expansion to serve a projected enrollment expansion of 100 students will allow students who currently compete for housing with members of the St. Helena workforce to move into student dormitories; freeing up that housing would benefit St. Helena families and employees.*

- (d) The condition or situation of the specific piece of property for which the Variance is sought is not so general or recurrent in nature as to make reasonably practicable the formulation of a general regulation for such condition or situation

*The property has a unique shape and was required to dedicate a larger strip of land relative to other nearby properties subject to the 36 foot special setback. Accordingly, the property's condition is not so general or recurrent in nature to make formulation of a general regulation addressing the issue reasonably practicable.*

- (e) The Variance and any buildings or structures permitted by the Variance will not be detrimental to the public health, safety and welfare of the community.

*Neither the Variance nor structures permitted by it will be detrimental to community public health, safety, and welfare. Granting the Variance will allow development of new student dormitories further removed from Pratt Avenue than the existing Vineyard Lodge I building. The applicant has designed the dormitory buildings to be partially screened by large, mature trees located along the site's*

*borders. Reducing parking spaces on the site and restricting supply of parking permits for student dormitory residents will remove vehicles from the City's streets, particularly St. Helena Highway. Student residents will have ample transportation alternatives: the frequent shuttle service between the property and the Greystone Campus, free access to on-site bicycles and the new bicycle lane provided by the Culinary Institute of America along Pratt Avenue, and the St. Helena shuttle and VINE transportation. The parking Variance further discourages private automobile trips by Culinary Institute of America students in and around St. Helena, and therefore confers a benefit to the community.*

D. PARKING VARIANCE. Pursuant to Municipal Code Section 17.172.050, the Planning Commission makes the following variance findings to support the motion to approve a parking variance:

- (a) A hardship peculiar to the property, not created by any act of the owner, exists. In this context, personal, family or financial difficulties, loss of prospective profits, neighboring violations, are not hardships justifying a variance.

*Imposition of the Code's parking requirement for a "rooming, boarding, or lodging house" or "hotel" in the student dormitory context would create a hardship peculiar to the property. Rooming, boarding, or lodging houses traditionally serve individuals unaffiliated with a college or university, who in a community such as St. Helena likely would require use of an automobile for daily activities. Similarly, hotels in St. Helena traditionally serve visitors exploring the region's amenities by private automobile. Requiring one parking space for each guestroom in those contexts is justifiable given the expected patterns of vehicle use, and the potential that failure to provide ample parking spaces could negatively affect neighboring properties. The Culinary Institute of America's students, on the other hand, are offered shuttle service for their daily trips to and from the Greystone Campus, do not require a car for the vast majority of their daily school-related activities, and are offered on-demand car rental for personal trips as well as access to free bicycles on site. Imposition of a one space per dormitory room requirement would create a hardship by dramatically changing the project as proposed and would require elimination of an open quad gathering area and potential reduction in number of student beds in favor of a hardscape parking lot.*

- (b) The Variance is necessary for the preservation and enjoyment of substantial property rights of the applicant which are possessed by other properties in the same district and in the same vicinity; and that a Variance, if granted, would not constitute a special privilege of the recipient not enjoyed by his or her neighbors.

*The Variance would not constitute a special privilege for the property relative to neighboring properties, none of which are developed with student dormitories that require limited on-site parking. Given the unique and limited travel patterns of student residents of the dormitory, with the Variance both the property and*

*neighboring properties will be subject to minimum parking requirements tailored to actual expected travel patterns and parking space demand, and neither the property nor neighboring properties will be required to provide unnecessary parking spaces reducing enjoyment of substantial property rights.*

- (c) The authorization of the Variance will not be of substantial detriment to adjacent properties, and will not materially impair the purpose and intent of this Chapter or the public interest, nor adversely affect the General Plan.

*Authorization of the Variance will not be of substantial detriment to adjacent properties, nor will it materially impair the public interest. The Culinary Institute of America will provide shuttle and on-demand car rental service, will impose a highly restrictive permit system both at the property and the Greystone Campus discouraging students without assigned parking from bringing cars to St. Helena, will provide free bicycles for use by students, and is amenable to restrictions on parking in the surrounding area to benefit nearby residents by discouraging student parking off the property. The Variance serves the public interest by effectively removing vehicles from City streets, particularly St. Helena Highway, encouraging environmentally-friendly and efficient transportation to and from the Greystone Campus. The parking Variance does not impair the purpose and intent of the Code's Variance chapter. The chapter's stated purpose is, in part, to allow variation from strict application of the Code where extraordinary situations or conditions mean that literal enforcement would involve practical difficulties or would cause undue hardship. Here, requiring unnecessary parking spaces would work against the public interest and cause undue hardship to the property and the school. Authorization of the Variance is consistent with City and regional policies encouraging use of alternate modes of travel, both to reduce harm to the environment and to take traffic off local roads, and would not adversely affect the General Plan. These policies and goals are consistent with the project's shuttle service and free bicycle program that reduce the need for parking and provides further support for the parking Variance.*

- (d) The condition or situation of the specific piece of property for which the Variance is sought is not so general or recurrent in nature as to make reasonably practicable the formulation of a general regulation for such condition or situation

*Formulation of a general regulation is not reasonably practicable given the lack of other student dormitories in the City, the targeted transportation options provided to the Culinary Institute of America's students, and consistency with parking reduction practices at other California campuses as discussed in the Crane Transportation Memo that justify the Variance.*

- (e) The Variance and any buildings or structures permitted by the Variance will not be detrimental to the public health, safety and welfare of the community.

*Neither the Variance nor structures permitted by it will be detrimental to community public health, safety, and welfare. Granting the Variance will allow development of new student dormitories further removed from Pratt Avenue than the existing Vineyard Lodge I building. The applicant has designed the dormitory buildings to be partially screened by large, mature trees located along the site's borders. Reducing parking spaces on the site and restricting supply of parking permits for student dormitory residents will remove vehicles from the City's streets, particularly St. Helena Highway. Student residents will have ample transportation alternatives: the frequent shuttle service between the property and the Greystone Campus, free access to on-site bicycles and the new bicycle lane provided by the Culinary Institute of America along Pratt Avenue, and the St. Helena shuttle and VINE transportation. The parking Variance further discourages private automobile trips by Culinary Institute of America students in and around St. Helena, and therefore confers a benefit to the community.*

- E. Pursuant to Municipal Code Section 17.124.030 (H), the Planning Commission further finds that the Vineyard Lodge Housing Site constitutes an "unlisted use" and determines that based on the particularities of the proposed project, including the dormitory-use, established shuttle program, and provision of on-demand rental cars and bicycles, the provision of 69 designated parking spaces is sufficient to serve the project site.
- F. USE PERMIT. Pursuant to Municipal Code Section 17.168.050, the Planning Commission finds that The Vineyard Lodge dormitories are appurtenant to the CIA at Greystone and provide affordable and convenient lodging for students enrolled in a culinary program. As conditioned, it is expected that the project would operate in an acceptable manner and therefore, the Planning Commission makes the following Use Permit findings to support the motion to approve the use permit:
1. That the proposed use would not generate odors, fumes, dust, light, glare, radiation or refuse that would be injurious to surrounding uses or to the community.

*The site operation is expected to be substantially similar to that currently existing. There is no expectation that the expansion of the student housing would generate odors, fumes, dust, light, glare, radiation or refuse that would be injurious to surrounding uses or to the community.*

2. That the proposed use would not generate levels of noise that adversely affect the health, safety, or welfare of neighboring properties or uses.

*At project operation, the on-site land use at the Vineyard Lodge Housing Site and associated noise environment will continue to be typical of a multi-unit development (dormitories) and subject to the City's noise exposure standards. The expansion of the Vineyard Lodge Housing site is not expected to introduce a substantial permanent increase in the ambient noise environment due to activities on-site or as a result of stationary or mobile sources. The noise*

*generating elements of the proposed project such as outdoor conversations, mechanical equipment, the operation of landscaping equipment, car engines and car doors would be similar to the existing noise environment present on-site and in the vicinity. The project is expected to introduce noise elements at levels that are generally consistent with the ambient noise conditions.*

3. That the proposed use would not generate traffic noise in excess of the "normally acceptable" range identified in the General Plan.

*As detailed in the Noise Impact Study (Appendix L of the IS/MND), the project is expected to add less than 8 trips to Pratt Avenue during the a.m. and p.m. peak hours. This would constitute a negligible increase in traffic noise of less than 0.5 dB which falls well below the threshold of a perceptible change of 3 dB. As such implementation of the proposed project will not substantially increase traffic noise in the area.*

4. That the proposed use would not make excessive demands on the provision of public services including water supply, sewer capacity, energy supply, communication facilities, police protection, and fire protection.

*The Project will not result in substantial adverse impacts associated with any public facilities or services. The project site is located adjacent to the urban limit line and is well served by existing public utilities and services. The project will not generate a substantial increase in demands that warrant the expansion or construction of new public facilities. The project site is also located proximate to the police and fire stations. Additional fire service and police calls may occur as a result of the project. However, the project will be subject to the payment of development impact fees, including the Public Safety Impact Fee which funds equipment and facilities' costs for Police and the Fire Departments that may go towards vehicles, capital equipment, and building improvements so as to maintain a high level of public safety. Accordingly, the project will not place excessive demands on any public services.*

5. That the proposed use would provide adequate ingress and egress to and from the proposed location.

*The project's internal circulation plan has been reviewed and meets all requirements of the St. Helena Public Works & Utilities and Fire Departments. Site circulation was determined to be adequate, including sufficient street widths to allow for fire truck turn around and sufficient access to residential buildings. Therefore, ingress and egress is considered adequate.*

6. That allowing the proposed use would not conflict with the City's goal of maintaining the economic viability of a local serving economy.

*The proposed student housing is appurtenant to the Culinary Institute of America Greystone Campus. The housing would not displace local serving uses nor impair the City's viability of maintaining a local serving economy.*

7. That the proposed use would be compatible with surrounding land uses and would not conflict with the purpose established for the district within which it would be located.

*The Vineyard Lodge site exhibits a land use and zoning designation of PQP: Public-Quasi-Public. The PQP zoning designation does not prescribe specific development standards, but rather stipulates that all projects within the PQP zoning district be subject to a conditional use permit and that development standards shall be established through the use permit review process. These regulations help guarantee that incompatible development and/or activities can be avoided by requiring such projects be held to a high level of scrutiny and are vetted through the public review process, CEQA review, and would be conditioned accordingly. Given that the proposed use serves an infill and expansion of an existing use there is no expectation that the proposed project would introduce an element that would conflict with the intent of the PQP zoning designation.*

8. That the proposed use would not be in conflict with the City's General Plan.  
*As detailed, herein the project would comply with applicable General Plan policies.*

9. That the proposed use would not be injurious to public health, safety, or welfare.  
*The proposed project consists of infill student housing that would operate in a manner substantially similar to the existing Vineyard Lodge Housing. As such, the project would not be injurious to health, safety, or welfare.*

10. That granting the use permit would not set a precedent for the approval of similar uses whose incremental effect would be detrimental to the City or would be in conflict with the General Plan.

*Use permits are considered on a case by case basis and based on the specific merits of a given project. Accordingly, the granting of this use permit would not influence future decisions or otherwise set a precedent.*

11. That, as demonstrated on a detailed plan submitted by the applicant, adequate off-street parking to accommodate the long term parking needs of employees and business owners and customers is available.

*The applicant proposes to provide a level of parking commensurate with the demand exhibited by the current residents of Vineyard Lodge Housing Site. At present, 31 percent of residents hold parking permits. It is reasonably expected that this level of demand would continue with implementation of the proposed*

*project which would translate to 69 designated spaces for the total proposed resident population of 224 students. .*

*There is no reason to believe that the student to vehicle ratio would substantially change under the proposed project, namely because (1) the CIA retains authority to issue or not issue parking permits, (2) the project will be subject to a condition of approval stipulating that it may not issue more than 69 parking permits, and (3) the site is uniquely operated in that it provides frequent reliable transportation to and from the Greystone Campus and to other locations, as needed, will provide three on-demand rental cars, and per mitigation measure LU-1, will be required to introduce a scalable bike share program that may be expanded as demand necessitates. As such, the project is expected to be able to accommodate long term parking needs for residents of the site.*

12. That the capacity of surrounding streets is adequate to serve the automobile and delivery truck traffic generated by the proposed use.

*As detailed in the Traffic Impact Report (Appendix Q of the IS/MND), the project's trip generation is minimal (approximately 4 trips during am and pm peak hours) and therefore the capacity of streets is presumed to be adequate.*

- G. The Planning Commission approves the demolition permit, design review, variances, and use permit for the above-described project with the following conditions of approval. The project shall be in conformance with all city ordinances, rules, regulations and policies in effect at the time of issuance of a building permit. The conditions noted below are particularly pertinent to this permit and shall not be construed to permit violation of other laws and policies not so listed.

#### **Conditions of Approval**

1. Project approvals shall be vested within one (1) year from the date of final action. A building permit for the use allowed under this approval shall have been obtained within one (1) year from the effective date of this action or the approval shall expire, provided however that the approval may be extended for up to two (2) one-year periods pursuant to the St. Helena Municipal Code, Section 17.08.130, Extension of Permits and Approvals. Any request for an extension of this approval shall be justified in writing and received by the Planning Department at least thirty (30) days prior to expiration.
2. The approvals shall not become effective until fourteen (14) calendar days after approval, providing that the action is not appealed by the City Council or any other interested party within that 14-day period.
3. All required fees, including planning fees, development impact fees, residential in-lieu housing fees, building fees, toilet retrofit fees, and St. Helena Unified School District fees shall be paid prior to issuance of a building permit. Fees shall be those in effect at the time of the issuance of the building permit.

2555 Main Street/ 830 Pratt Avenue  
Demolition Permit, Variance, Design Review and Use Permit  
February 21, 2017

4. Upon approval of Resolution XX-XX, the Applicant shall provide the Planning Department with the Notice of Determination Fee required by Fish and Wildlife Code Section 711.4(d). The fee payment shall be made by check payable to the Napa County Clerk and in the amount required and published by the Napa County Clerk for such fee.
5. All Mitigation Measures enumerated in the Mitigated Negative Declaration and Mitigation Monitoring and Reporting Program are incorporated by reference and made conditions of approval.
6. Prior to issuance of any construction permits, these conditions of approval and the Mitigation and Monitoring and Reporting Program shall be included with the plan set. A copy of the approved plans shall be maintained on site when construction activities are underway.
7. Minor modifications to approved plans may be approved by the Planning Director insofar as they are in substantial conformance with this approval.
8. Pursuant to St. Helena Municipal Code Section 17.08.110, this permit shall run with the land and shall be binding upon all parties having any right, title or interest in the real property or any part thereof, their heirs, successors and assigns, and shall inure to their benefit and benefit of the City of St. Helena.
9. The primary purpose of this review is for compliance with the General Plan and Zoning Ordinance. The property owners or their designee shall be responsible for meeting with the Building Official, Fire Inspector and or Public Works Department to review compliance with Building Codes, Fire Codes and specific Public Works Standards including fire protection systems and any applicable accessibility standards of Title 24.
10. Construction shall be in compliance with plans submitted and reviewed by the Planning Commission on February 21, 2017, except as modified herein.
11. The site shall be kept clear at all times of garbage and debris. No outdoor storage is permitted.
12. A final lighting plan delineating building mounted lights shall be reviewed and approved by the Planning and Community Improvement Director prior to building permit issuance.
13. Trash bins shall not be visible from public right-of-way. The trash enclosure(s) will be constructed of opaque materials and be of sufficient size to permit the storage, removal and replacement of standard commercial size trash bins. No collection, storage or stacking of garbage, trash and refuse is permitted outside the trash enclosure.
14. All plantings shall be maintained in good growing condition. Such maintenance shall include, where appropriate, pruning, mowing, weeding, and cleaning of debris and trash, fertilizing and regular watering. Where necessary, plantings shall be replaced with other plant materials to insure continued compliance with applicable landscaping requirements, Irrigation systems shall be maintained in sound operating condition with heads periodically cleaned and replaced when missing to

ensure efficient watering and to maintain good health and vitality of landscape materials.

15. No signage is approved by this permit. A separate sign permit in compliance with the Municipal Zoning Code shall be obtained prior to installation of signage.
16. Property owners shall recognize that there exists a right to farm properties within the district and in the vicinity of the district. There is a good faith expectation that no complaints will occur regarding legal, normal agricultural activities on properties in the district or in the vicinity of the district. Such activities may include day or night disbursement of chemicals, and creation of dust, noise, or fumes.
17. In any action or proceeding to attack, challenge, invalidate, set aside, void or annul the City's approval of applicant's Project, in whole or in part, applicant shall defend, at its own expense and without any cost to the City, and with counsel acceptable to the City, and shall fully and completely indemnify and hold the City, its agents, officers, and employees harmless from and against any and all claims, causes of action, damages, costs, attorney's fees and liability of any kind, so long as the City reasonably promptly notifies the applicant of any such claim, action, or proceedings and the City cooperates fully in the defense of the action or proceedings.

#### **Planning Department Conditions**

18. As applicable, the permittee shall comply with any and all previous conditions of approval for the Vineyard Lodge Housing Site except as they may be explicitly modified by this action. To the extent there is a conflict between previous conditions of approval enumerated in Resolution No. 2004-33 or 2008-75 and these conditions of approval, these conditions shall supersede the previous permit and associated conditions.
19. Rental and/or occupancy of Vineyard Lodge dormitories shall be limited only to students who are actively enrolled at the Culinary Institute of America at Greystone in an Associate, Bachelor's, Master's and/or other Certificate Degree Programs with the exception that an on-site manager(s) shall reside on site consistent with State Housing Law, Title 25. The student's length of stay shall be commensurate with the respective degree program.
20. The Applicant shall provide a detailed Transportation Plan that describes the operation of (1) the shuttle service (2) the rental car service (3) parking permits for individual vehicles and (4) the specifics of the on-demand bike program as they relate to the Greystone Campus and Vineyard Lodge Housing Site. The Plan shall be subject to review and approval by the Planning and Community Improvement Director. A copy of the approved shall be provided and kept in the hard copy and digital project file and made available to the public as requested.
21. Parking Permits issued to students who are actively enrolled at the Culinary Institute of America at Greystone for the Vineyard Lodge Housing Site shall not exceed 69 permits at any one time.

22. No off-street parking is allowed on the Southside of Pratt Avenue, east of the Railroad Tracks.
23. The applicant shall obtain all required approvals in writing for communal kitchen facilities from the Napa County Department of Environmental Management. A copy of the approval shall be provided to the City and added to the project file.
24. Prior to issuance of building permit, the applicant shall enter into a Joint Water Use Agreement with the City and applicable to 830 Pratt Avenue and 2555 Main Street. The Joint Agreement shall authorize a maximum water allocation of 23.1 acre feet/year to be utilized by the two sites. The Joint Agreement shall include enforcement provisions and penalties if the allowance is exceeded in a given year. Said agreement is subject to the approval of the St Helena City Council.
25. Any significant change(s) to the operation of the approved use, including a substantial change in the operational characteristics of the site, intensity, or type(s) of uses shall require amendment to this use permit.

#### **Public Works Department Conditions**

26. Approval of this project shall be subject to the requirements of, and all improvements shall be designed and constructed in accordance with, the most current version at the time of improvement plan submittal, Caltrans Standards and Specifications, the City of St. Helena Municipal Code, the St. Helena Water and Sewer Standards, the St. Helena Street, Storm Drain and Sidewalk Standards, and all current federal, state and county codes governing such improvements.
27. For any improvements outside the existing building envelope, a grading and drainage plan showing topographic data, all easements, infrastructure onsite and directly adjoining, and an erosion control plan shall be submitted for review and approval by the City Engineer prior to the issuance of a building permit. If the project entails more than 50 cubic yards of soil disturbance, 10,000 square feet of disturbance area, a cut or fill of 3 feet or more, or alteration of any drainage pattern, a grading permit shall be required.
28. Drainage needs to be routed to prevent inundation of neighboring properties. Grading and/or site improvement plans shall show how 2-year and 10-year storm flows shall be infiltrated on site and/or diverted at the property lines to prevent inundation of neighboring properties. The applicant shall submit a drainage and hydrology analysis for the project impact, including downstream erosion potential, to the City of St. Helena Public Works Department with the Improvement Plan submittal in accordance with City of St. Helena, Napa County and State of California codes in effect at the time of improvement plan submittal.
29. Erosion and sediment control plans shall conform to the latest State and City codes at a minimum

2555 Main Street/ 830 Pratt Avenue  
Demolition Permit, Variance, Design Review and Use Permit  
February 21, 2017

30. The applicant shall adhere to the latest Water Agreement with the City and shall incorporate water conservation practices into the proposed project per the Water Availability Analysis prepared by Summit Engineering, dated September 2, 2016. Any and all non-conforming appliances and plumbing fixtures shall be removed from the premises. The water conservation requirements shall be replicated in full on the architectural plans.
31. A detailed Post-Construction Stormwater Control Plan (SWCP) that identifies and sizes all permanent post-construction stormwater treatment BMPs shall be prepared and submitted for review approval. The Plan shall be prepared in accordance with the latest edition of the *Bay Area Stormwater Management Agencies Association (BASMAA) Post-Construction Manual* and the requirements of the State Water Resources Control Board Phase II Municipal Separate Storm Water System (MS4) General Permit (Order 2013-0001 DWQ).
32. A Post Construction Stormwater Operations and Maintenance Plan that provides a color-coded plan sheet showing all storm drain and water quality infrastructure that is to be maintained, along with detailed instructions and schedules for the ongoing maintenance and operation of all post-construction stormwater BMPs shall be submitted for review and approval by the City Engineer. Once approved, the property owner shall enter into an agreement with the City that provides the terms, conditions, and security associated with the ongoing requirements of the Post Construction Stormwater Best Management Practices.
33. Prior to Certificate of Occupancy, the Applicant shall enter into and record a Post-Construction Stormwater Operations and Maintenance Agreement with the City.
34. If the project includes 500 square feet or more of new landscaping and/or 2,500 square feet or more of rehabilitated landscape, the proposed landscaping shall comply with the State's Model Water Efficient Landscape Ordinance (MWELO).
35. A detailed Soils Investigation/Geotechnical Report shall be prepared and submitted for review. The report shall address, at a minimum, potential for liquefaction, R-values, expansive soils and seismic risk. The improvement plans shall incorporate all design and construction criteria recommended in the Geotechnical Report.
36. Unless otherwise explicitly permitted, all existing wells, septic tanks/systems and/or underground fuel storage tanks shall be abandoned under permit and inspection of Napa County Department of Environmental Services or other

designated agency. If there are none, the project engineer shall provide a letter describing the scope of the search done to make this determination.

37. Site plan shall show the location of any trees within the project area. Provide a tree protection plan for approval by the Public Works Director prior to approval of the building permit. The plan shall be coordinated with any civil grading/drainage/improvement plans.
38. The Applicant shall keep adjoining public streets free and clean of project dirt, mud, materials, and debris during the construction period, as is found necessary by the City Engineer.
39. The developer shall underground all on-site utility lines per St. Helena Municipal Code. The cost of undergrounding shall be the responsibility of applicant.
40. Due to the economic and engineering infeasibility of undergrounding regional serving overhead power lines, such existing lines may remain on overhead power poles.
41. Provide details of any and all proposed fencing, gates and/or walls on all plans submitted for building permit review.
42. Any new and modified existing water laterals, meters and backflow prevention devices shall be required and constructed in accordance with the current requirements of the City of St. Helena's Water Standards and the California Department of Health Standards. Existing meter boxes located within a driveway shall be retrofitted with a traffic-rated box. New laterals shall be located perpendicular to the water main and outside any driveway/drive aisle.
43. Remodels or new construction which requires fire sprinklers shall install an appropriately-sized water service with appropriate backflow and meter devices prior to Certificate of Occupancy. Fire system calculations shall be submitted with the Grading and Drainage Plan to verify fire service lateral and meter sizing. Deferred submittals are not accepted.
44. No construction shall commence until adequate access to fire water supply is available to building sites, and the Fire Chief shall ensure adequate access to fire water supply prior to issuance of building permits.
45. In order to confirm the theoretical assumptions in the provided sewer capacity study, the applicant is required to perform 7-day flow monitoring at the downstream sanitary sewer manholes (No. 6-5 and No. 6-18) to verify that the existing sewer pipe has adequate capacity to accommodate the proposed additional flows prior to building permit approval. Peak sewer flows will not be allowed to exceed 2/3 full pipe. If insufficient capacity is available at the site and

with the current infrastructure, a new sanitary sewer must be constructed with adequate capacity by the owner as a condition of the site development.

46. Construct frontage improvements in accordance with the *Frontage Improvement Plan* prepared by Summit Engineering, dated December 7, 2016. Said improvements shall include a full with grind and overlay of 0.10 feet and a cross section consisting of a minimum of 8' parallel parking, 5' bike lane, and 12' lanes (east and west).
47. Trash areas, dumpsters and recycling containers shall be enclosed and roofed per State and County standards to prevent water run-on to the trash area and water runoff from the area, to contain litter and trash so that it is not dispersed by the wind or run-off during waste removal. In the event that wine or food is disposed in these areas, the enclosed trash area shall drain to the sanitary sewer system. An area drain connected to the sanitary sewer shall be installed in the enclosure area and a structural control such as an oil/water separator or sand filter shall be included. No other area shall drain into the trash enclosure. A sign shall be posted prohibiting the dumping of hazardous materials into the sanitary sewer.
48. The applicant shall repair all public improvements that are damaged by the construction process in accordance with the City Water/Sewer/Street/Storm Drain/Sidewalk Standards prior to Certificate of Occupancy.
49. Existing streets being cut by new utility services will require edge grinding and an A.C. overlay per City standards, extent to be determined by the Public Works Department.
50. The applicant shall be required to obtain an encroachment permit for improvements on public right-of-ways prior to receiving a grading or building permit authorizing site work or construction activities on the site.

#### **Building Department Conditions**

51. A building permit is required for all onsite demolition, construction and/or change of occupancy.
52. The applicant will be required to comply with the codes adopted at the time the applicant applies for a building permit. At this time the City of St. Helena utilizes the 2013 Title 24 codes.
53. When submitting plans for a building permit, the plans shall include all documentation listed on the building permit application checklist.
54. The applicant shall provide a construction waste management plan with the building permit application.

2555 Main Street/ 830 Pratt Avenue  
Demolition Permit, Variance, Design Review and Use Permit  
February 21, 2017

55. The plans for construction shall include a checklist for compliance with the California Green Buildings Standards Code, mandatory measures. Provide a reference on the checklist indicating where the mandatory measures can be found on the plans.
56. When submitting plans, the title page shall include all information referenced on the building permit application checklist Title Page requirements.
57. Building Permit application materials and plans shall include any documentation pertaining to special loads applicable to the design and the specified section of the code that addresses the condition; special inspections for any systems or components requiring special inspection; requirements for seismic resistance; and a complete list of deferred submittals at time of application. Any deferral of the required submittal items shall have prior approval of the Building Official however deferral of fire sprinkler design is not allowed.

**Fire Department Conditions**

58. Fire sprinklers and fire hydrants shall be installed as required by the Fire Department.

I HEREBY CERTIFY that the foregoing demolition permit, design review, and use permit for 2555 Main Street, and the foregoing demolition permit, design review, variances, and use permit for 830 Pratt Avenue were duly and regularly approved by the Planning Commission of the City of St. Helena at a regular meeting of said Planning Commission held on February 21, 2017 by the following roll call vote:

**CITY OF ST. HELENA****RESOLUTION NO. 2004-33****APPROVING A USE PERMIT TO CONVERT THE MARLINDA SKILLED NURSING HOME TO A DORMITORY FOR STUDENTS ENROLLED AT THE CULINARY INSTITUTE OF AMERICA GREYSTONE CAMPUS.**

PROPERTY OWNER: Eugene and Marthann Demchuk APN: 009-<sup>010</sup>~~001~~-024

**Recitals**

1. The Culinary Institute of America (CIA) requested approval of a Use Permit to convert the Marlinda Skilled Nursing Facility to use as a dormitory for students enrolled at the CIA Greystone campus. The request was made pursuant to Section 17.140.020 D, which allows a non-conforming use to be changed to another nonconforming use of lesser intensity. The property is zoned A-20: Twenty Acre Agriculture and a skilled nursing facility is neither a permitted nor conditional use in the zoning district.

The Marlinda Skilled Nursing Facility is 15,862 square feet, including a storage/laundry building to the rear of the property. The main building has bedrooms, kitchen, offices, physical therapy rooms and a beauty salon. The facility is located on a 2.61 acre property and has City water and City sewer services.

Marlinda has been licensed for an occupancy of 70 residents in the past, but has been operating with a permit for 61 residents in recent years. The CIA proposes to use the facility for 40 students and one resident manager. The interior of the main structure will be remodeled to have 40 bedrooms, each with a private bath. There will be also be a lounge / dining area and kitchen. The exterior of the structure will not be modified except to repair existing conditions. The storage/laundry building will remain in that use. The students will attend courses at the CIA Greystone campus for periods of time ranging from three to five days. The school will operate a shuttle bus to take students between the dormitories and the Greystone building.

The CIA would also like to utilize the property for overflow parking from special events. The CIA has previously utilized Beringer Vineyards, Charles Krug, Markham Winery, Freemark Abbey, St. Clement, and Marlinda for overflow parking.

2. The Planning Commission of the City of St. Helena, State of California, held a noticed public hearing on February 17, 2004 and approved the use permit.

3. The Planning Commission action was appealed to the City Council by Joice Beatty. The appeal was filed within the 14 day appeal period.

4. The City Council of the City of St. Helena, State of California, held a noticed public hearing on March 23, 2004.

Resolution

The City Council of the City of St. Helena, State of California, approved the Use Permit on the following basis:

A. The City Council hereby finds that this project is exempt from the California Environmental Quality Act pursuant to Section 15301, Class 1 of the CEQA Guidelines pertaining to existing facilities. Class 1 consists of the operation, repair, maintenance, permitting, leasing, licensing, or minor alteration of existing public or private structures, facilities, mechanical equipment or topographical features involving negligible or no expansion of use beyond that existing at the time of the lead agency's determination.

B. The City Council makes the following Use Permit findings, Section 17.168.050, to support the motion to approve the Use Permit:

1. That the proposed use would not generate odors, fumes, dust, light, glare, radiation or refuse that would be injurious to surrounding uses or to the community.
2. That the proposed use would not generate levels of noise that adversely affect the health, safety, or welfare of neighboring properties or uses.
3. That the proposed use would not generate traffic noise in excess of the "normally acceptable" range identified in the General Plan.
4. That the proposed use would not make excessive demands on the provision of public services including water supply, sewer capacity, energy supply, communication facilities, police protection, and fire protection.
5. That the proposed use would provide adequate ingress and egress to and from the proposed location.
6. That allowing the proposed use would not conflict with the City's goal of maintaining the economic viability of a local serving economy.
7. That the proposed use would be compatible with surrounding land uses and would not conflict with the purpose established for the district within which it would be located.
8. That the proposed use would not be in conflict with the City's General Plan.
9. That the proposed use would not be injurious to public health, safety, or welfare.
10. That granting the use permit would not set a precedent for the approval of similar uses whose incremental effect would be detrimental to the City or would be in conflict with the General Plan.
11. That, as demonstrated on a detailed plan submitted by the applicant, adequate off-street parking to accommodate the long term parking needs of employees and business owners and customers is available.
12. That the capacity of surrounding streets is adequate to serve the automobile and delivery truck traffic generated by the proposed use.

C. The City Council makes the following additional findings, pursuant to Chapter 17.168. to allow the conversion of a non-conforming use to another non-conforming use of lesser intensity:

1. The proposed nonconforming use is of lesser intensity than the previous nonconforming use (e.g., fewer employees, reduced storage capacity, reduced demand on public facilities, reduced traffic impacts, less energy consumption or fewer hours of operation);

The City Council utilized the following information for the approval of this finding:

Marlinda operates with 45 full time employees over three shifts per day plus other part-time employees. The CIA dormitory use would have one resident manager plus part time housekeeping and gardening services.

Storage capacity would be reduced on site because interior rooms are being rearranged to be bedrooms.

Water and sewer use is projected to decrease with the dormitory use. The following chart shows the water use for Marlinda for the years 2001, 2002, and 2003.

| Year             | 2001              | 2002              | 2003              | 3 year average    |
|------------------|-------------------|-------------------|-------------------|-------------------|
| Avg. use per day | 6,657 gpd         | 6,545 gpd         | 5,597 gpd         | 6,266 gpd         |
| Avg. 2 month use | 399,432 gallons   | 392,700 gallons   | 335,852 gallons   | 375,994 gallons   |
| Yearly use       | 2,396,592 gallons | 2,357,696 gallons | 2,015,112 gallons | 2,256,466 gallons |

A water use agreement will limit the water use of the dormitory to 1,150,000 gallons of water per year. This is approximately 50% of the historical use.

The decrease in sewage generation should also be proportionately decreased with the conversion to dormitories. The Marlinda sewage system is unusual in that there are three on-site septic tanks, but no leach field. Instead, there are grinders in two of the tanks to break down the solids. These two tanks are then pumped into the larger third tank. The liquids from the third tank are pumped to the City's Crinella Street Pump station, which then pumps to a gravity flow sewer main.

There will be a substantial reduction in traffic trips due to the reduction in employees on-site.

The lighter occupancy load, fewer hours of occupancy, and fewer employees should result in less energy consumption.

The skilled nursing facility operates 24 hours per day, 365 days per week. The dormitory will primarily be occupied during weeknight evenings when classes are over for the day.

2. The proposed nonconforming use will not be detrimental to any existing or potential permitted use in the area in which the nonconforming use is located. These findings shall be in addition to those required for the approval of use permits contained in Chapter 17.168. If a nonconforming use is replaced by a use of lesser intensity, the occupancy thereafter may not revert to a use of greater intensity. In granting a use permit to allow a nonconforming use to be replaced with another nonconforming use of lesser intensity, the planning commission shall establish an amortization schedule for the nonconforming use, by setting a date after which the nonconforming use must be discontinued or replaced with a conforming use.

Existing and potential uses in the surrounding agricultural and residential districts will not be harmed by the change in non-conforming use.

The amortization period for the dormitory use shall coincide with the time period allowed by the Income Tax Code for amortization of the buildings and improvements. That time period allows a thirty-nine and one half year depreciation schedule.

D. The Use Permit for the above described use is granted subject to compliance with the following conditions. Permit shall be in conformance with all City ordinances, rules, regulations and policies in effect at the time of issuance of a building permit. The conditions noted below are particularly pertinent to this permit and shall not be construed to permit violation of other laws and policies not so listed.

1. The Use Permit shall be vested within one (1) year from the date of approval. A building permit for the use allowed under this Use Permit shall have been obtained within one (1) year from the effective date of the Use Permit or the Use Permit shall expire; provided however that the Use Permit may be extended for up to two (2) one-year periods pursuant to the St. Helena Municipal Code, Section 17.08.130, Extension of Permits and Approvals.
2. This permit is valid for this use only. New permits must be applied for upon any change in use. These permits will expire if the use is discontinued pursuant to then existing ordinances and regulations.
3. Any request for an extension of the Use Permit must be justified in writing and received by the Planning Department at least thirty (30) days prior to expiration.
4. All required fees, including planning fees, development fees, building fees toilet retrofit fees, and St. Helena Unified School District fees shall be paid prior to issuance of building permit. Fees shall be those in effect at the time of the issuance of the building permit. All required fees, including planning fees, development impact fees, building fees, toilet retrofit fees, and St. Helena Unified School District fees shall be paid prior to issuance of building permit. Pursuant to City Council Resolution 2003-65, the owner and applicant are informed of the following:

*In recognition of the need for additional affordable housing, and to mitigate the effects of this development on the supply and demand of affordable housing, the permittee shall be subject to a Housing Impact Fee, an inclusionary requirement, an in-lieu fee, and/or similar fair and appropriate mechanisms, to provide funds for or to develop additional affordable housing, should such mechanisms be established by the City.*

5. Compliance with all permit conditions shall occur in accordance with specific regulations but in all cases no later than prior to occupancy or initiation of use unless another time is set by law or by this approval. Occupancy or final inspection of a project may be withheld if all conditions, including payment of fees for services rendered by the City, are not met.
6. The applicant will defend and indemnify and hold the City, its agents, officers, and employees harmless of any claim, action or proceedings to attack, set aside, void or annul an approval so long as the City promptly notifies the applicant of any such claim, action, or proceedings and the City cooperates fully in the defense of the action or proceedings.

7. Provided they are in general compliance with the Use Permit, minor modification may be approved by the Planning Director.
8. This Use Permit shall run with the land and shall be binding upon all parties having any right, title or interest in the real property or any part thereof, their heirs, successors and assigns, and shall inure to their benefit and benefit of the City of St. Helena.
9. The primary purpose of this review is for compliance with the General Plan and Zoning Ordinance. The owner/applicant is responsible for meeting with the Building Official / Fire Inspector to review compliance with Building and Fire Codes, including fire protection systems and the accessibility standards of Title 24.
10. This permit allows the continuation of a legal non-conforming use. Pursuant to Municipal Code Section 17.140.020 D. 2., the Planning Commission establishes an amortization schedule of 39.5 years. Therefore, the use shall be discontinued or brought into legal conforming status prior to September, 2043.
11. The use of the Marlinda facility as a dormitory fulfills the 1993 use permit requirement for student accommodations and allows the enrollment of 104 students at the Greystone Campus.
12. Construction shall be consistent with plans marked Exhibits A, B and C, dated 02/03/04 and with the uses as described in this document.
13. The dormitory rooms shall only be rented to students and teachers of the Culinary Institute of America at Greystone. Rental of rooms are subject to payment of the Transient Occupancy Tax (TOT) pursuant to Municipal Code Chapter 3.28.
14. CIA shall operate a shuttle bus between the Greystone campus and the Pratt Avenue dormitories. The minimum service provided by the shuttle bus shall be on weekdays to coincide with class schedules.
15. In compliance with State Housing Law (Title 25), a manager is required to reside upon the premises.
16. The Marlinda parking lot shall only be utilized by staff and students of the Culinary Institute of America.
17. The property owner shall enter into a water use agreement with the City of St. Helena for municipal water use not to exceed 1,150,000 gallons of water per year. The water agreement shall also be structured to encourage other means of water conservation.
18. A Magnetic Flow Meter shall be installed on the pump at the wastewater system to measure the sewerage flows to the Crinella pump station for the purpose of determining the extent of stormwater infiltration.
19. Any future modifications to landscaping shall be submitted to the Planning Director for reviews. Landscape plans shall comply with Ordinance 92-20, Water Efficient Landscape

Standards and Procedures. Plans shall be designed and verified by a landscape professional and shall include drought tolerant landscaping and low water irrigation systems. Landscaping shall not block vision from exits or at street intersections. If the landscape area is 2,500 square feet or greater, a landscape water flow meter shall be installed for verification of the amount of water being used for landscaping.

20. Plant materials shall be purchased from a source that verifies they have been inspected for glassy winged sharpshooter to ensure that they will not contribute to the spread of Pierce's disease to the surrounding vineyards.
21. Plans and specifications for alteration of the existing automatic fire protection system shall be submitted to the Fire Department for review and approval prior to permit issuance.
22. Fire equipment shall be inspected annually by the Fire Department.
23. Exterior lighting shall be directed or shielded to prevent glare onto the public roadway or adjacent properties.
24. The applicant shall provide for the enclosed storage of trash and separated recyclable materials. The design of the trash storage and recycling area shall be reviewed and approved by the Planning Director.
25. A backflow prevention device shall be installed prior to occupancy unless waived by the Public Works Director.
26. No signs, awnings, or facade modifications shall be installed or constructed without approval of a Sign Permit or Design Review.
27. This property is located in an agricultural district. There exists a right-to-farm the adjoining property. There is a good faith expectation that no complaints will occur regarding legal, normal agricultural activities on the adjacent land. Such activities may include day or night disbursement of chemicals, and creation of dust, noise, or fumes.

**CITY OF ST. HELENA**

**RESOLUTION NO. 2008-75**

**APPROVING A USE PERMIT, DESIGN REVIEW, AND DEMOLITION PERMIT  
FOR THE CULINARY INSTITUTE OF AMERICA, 830 PRATT AVENUE.**

**PROPERTY OWNER:** Culinary Institute of America

**APN:** 009-101-024

**RECITALS**

1. Request of the Culinary Institute of America for a Use Permit, Demolition Permit and Design Review to construct a second dormitory building at the Vineyard Lodge site at 830 Pratt Avenue.

The project also includes a Rezoning of the parcel from A-20: Twenty Acre Agriculture to PQP: Public & Quasi-Public, as adopted with Ordinance 2008-8. Other project components at the CIA Greystone campus, 2555 Main Street, were approved with Resolutions No. 2008-76 and No. 2008-77.

3. The applicant's proposal is subject to review under the California Environmental Quality Act (CEQA). An Initial Study was prepared on the proposed project and an Environmental Checklist was utilized to focus the Initial Study on the environmental factors that may be impacted or further impacted by implementation of the proposed project. The document was posted for a review period of June 12, 2008 through July 15, 2008. A Mitigated Negative Declaration and Mitigation Monitoring and Reporting Plan were adopted with Resolution No. 2008-74.

4. The Planning Commission of the City of St. Helena, State of California, held noticed public hearings for this project on July 1, 2008 and July 15, 2008 for the purpose of reviewing the project. The Planning Commission recommended approval of the project to the City Council.

5. The City Council of the City of St. Helena, State of California, held a noticed public hearing for this project on August 26, 2008.

**FINDINGS**

NOW, THEREFORE, the City Council for the City of St. Helena resolves as follows:

- A. The City Council determined that the project is subject to CEQA and adopted a Mitigated Negative Declaration, including the recommended mitigation measures attached to the Initial Study and Mitigation Monitoring and Reporting Program (MMRP). The Mitigated Negative Declaration prepared for this project and circulated in compliance with the requirements of CEQA established that although the proposed project could have a significant effect on the environment, there would not be a significant effect in this case because revisions to the

project in the form of mitigation measures have been adopted. The City Council adopted the Mitigated Negative Declaration with the following findings:

1. This project does not have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory.
  2. This project does not have impacts that are individually limited, but cumulatively considerable.
  3. This project does not have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly.
- B. The City Council makes the following findings for approval of the Demolition Permit to demolish the abandoned laundry building pursuant to Section 17.164.050:
1. That, based on the public record and testimony presented at a public hearing, the building is determined not to be a significant architectural or historical building.
  2. That the demolition does not eliminate elements that are required to maintain the essential character of the neighborhood.
- C. The City Council makes the following findings for approval of a Use Permit, contained in Municipal Code Section 17.168.050 , to support the motion to approve a Use Permit to allow the proposed improvements on the subject parcel:
1. That the proposed use would not generate odors, fumes, light, glare, radiation or refuse that would be injurious to surrounding uses or to the community;
  2. That the proposed use would not generate levels of noise that adversely affect the health, safety or welfare of neighboring properties or uses;
  3. That the proposed use would not generate traffic noise in excess of the normally acceptable range identified in the General Plan;
  4. That the proposed use would not make excessive demands on the provision of public services including water supply, sewer capacity, energy supply, communication facilities, police protection and fire protection;
  5. That the proposed use would provide adequate ingress and egress to and from the proposed location;
  6. That allowing the proposed use would not conflict with the City's goal of maintaining the economic viability of a local-serving economy;
  7. That the proposed use would be compatible with surrounding land uses and would not conflict with the purpose established for the district within which it would be located;
  8. That the proposed use would not be in conflict with the City's General Plan;
  9. That the proposed use would not be injurious to public health, safety or welfare;
  10. That granting the Use Permit would not set a precedent for the approval of similar uses whose incremental effect would be detrimental to the city or would be in conflict with the General Plan;

11. That, as demonstrated on a detailed plan submitted by the applicant, adequate off-street parking to accommodate the long-term parking needs of employees and business owners and customers is available;
  12. That the capacity of surrounding streets is adequate to serve the automobile and delivery truck traffic generated by the proposed use.
- D. The City Council approves the Design Review for construction of the project subject to the applicable Design Criteria contained in Municipal Code section 17.164.030:
1. Consistency and compatibility with applicable elements of the St. Helena General Plan.
  2. Compatibility of design with the immediate environment of the site.
  3. Relationship of the design to the site.
  4. Determination that the design is compatible in areas considered by the Board as having a unified design or historical character.
  5. Whether the design promotes harmonious transition in scale and character in areas between different designated land use.
  6. Compatibility with future construction both on and off the site.
  7. Whether the architectural design of structures and their materials and colors are appropriate to the function of the project.
  8. Whether the planning and siting of the various functions and buildings on the site create an internal sense of order and provide a desirable environment for occupants, visitors and the general community.
  9. Whether the amount and arrangement of open space and landscaping are appropriate to the design and the function of the structures.
  10. Whether sufficient ancillary functions are provided to support the main functions of the project and whether they are compatible with the project's design concept.
  11. Whether access to the property and circulation systems are safe and convenient for pedestrians, cyclists and vehicles.
  12. Whether natural features are appropriately preserved and integrated with the project.
  13. Whether the materials, textures, colors and details of construction are an appropriate expression of its design concept and function and whether they are compatible with the adjacent and neighboring structure and functions.
  14. In areas considered by the Board as having a unified design character or historical character, whether the design is compatible with such character.
  15. Whether the landscape design concept for the site, as shown by the relationship of plant masses, open space, scale, plant forms and foliage textures and colors create a desirable and functional environment and whether the landscape concept depicts an appropriate unity with the various buildings on the site.
  16. Whether plant material is suitable and adaptable to the site, capable of being properly maintained on the site, and is of a variety which is suitable to the climate of St. Helena.

### RESOLUTION

- A. The City Council approves the project entitlements, as identified herein, subject to compliance with the following conditions. This project shall be in conformance with all City ordinances, rules, regulations and policies in effect at the time of issuance of the

approval. The conditions noted below are particularly pertinent to this action and shall not be construed to permit violation of other laws and policies not so listed.

1. This approval is contingent upon the approval of the Zoning Ordinance Map Amendment to change the Zoning designations from A-20: Agriculture to PQP: Public & Quasi-Public.
2. Compliance with all permit conditions shall occur in accordance with specific regulations but in all cases not later than prior to occupancy or initiation of use unless another time is set by law or by this approval. Occupancy or final inspection of a project may be withheld if all conditions, including payment of fees for services rendered by the City, are not met.
3. The applicant will defend and indemnify and hold the City, its agents, officers, and employees harmless of any claim, action or proceedings to attack, set aside, void or annul an approval so long as the City promptly notifies the applicant of any such claim, action, or proceedings and the City cooperates fully in the defense of the action or proceedings.
4. Provided they are in general compliance with the project as approved by the City Council, minor modifications may be approved by the Planning Director.
5. This permit shall run with the land and shall be binding upon all parties having any right, title or interest in the real property or any part thereof, their heirs, successors and assigns, and shall inure to their benefit and the benefit of the City of St. Helena.
6. The primary purpose of this review is for compliance with the General Plan and Zoning Ordinance. The owner/applicant is responsible for meeting with the Building Official / Fire Inspector to review compliance with Building and Fire Codes, including fire protection systems and the accessibility standards of Title 24.
7. All required fees, including planning fees, development impact fees, and building permit fees shall be paid prior to issuance of building permit unless such payment has been modified by adopted mitigation measures or conditions of approval. Fees shall be those in effect at the time of the issuance of the building permit.
8. This permit authorizes the construction of a new 12,282 sq. ft. dormitory at 830 Pratt Avenue. The new dormitory will house 60 students and 1 on-site manager. The project shall achieve LEED Silver certification at a minimum and shall be consistent with Exhibits A-E, dated 7/01/08, unless modified herein.
9. The Transient Occupancy Tax (TOT) shall only be paid for residents of the new dormitory if their stay is for a period of time of less than 30 days. Payment of TOT shall continue to be paid by residents of the existing dormitory regardless of the length of stay.
10. All uses of the property shall be in compliance with the PGP: Public & Quasi-Public zoning district regulations.

11. The applicant shall observe and comply with the no parking regulations that will be drafted, adopted and enforced by the City of St. Helena's police department for the south side of Pratt Avenue east of the rail road tracks.
12. The applicant shall be responsible for coordination and compliance with Napa County Department of Environmental Management regulations for the proposed dormitory kitchen facilities. A letter of approval for the kitchen facilities from the Napa County Department of Environmental Management will be required prior to issuance of building permits.
13. The applicant shall be responsible for compliance with all mitigations measures adopted as part of this project and listed in the Mitigated Negative Declaration and Mitigation Monitoring and Reporting Program (MMRP) adopted as part of the this permit.
14. Prior to issuance of building or demolition permits the applicant shall provide the Department of Toxic Substance Control (DTSC) with a Phase I report for review specific to the soil studies conducted at the Vineyard Lodge location.
15. No trees shall be removed from site without written approval by the St. Helena Planning Department.
16. No signs shall be installed or constructed without approval of a Sign Permit
17. Exterior lighting shall be directed or shielded to prevent glare onto the public roadway or adjacent properties.
18. The applicant shall provide for the enclosed storage of trash and separated recyclable materials. The design of the trash storage and recycling area shall be reviewed and approved by the Planning Director.
19. Fire equipment shall be inspected annually by the Fire Department.
20. Installation of a rapid entry Knox Box system, unless waived by the Fire Chief.
21. Construction activities and business operation shall be in compliance with all mitigation measures adopted in the Negative Declaration.
22. Prior to issuance of a demolition permit, the applicant shall provide the Building Department with an approval letter from the Bay Area Air Quality Management District authorizing the demolition.
23. To preserve air quality, the following practices shall be observed during construction:
  - Water all active construction areas at least twice daily.
  - Cover all trucks hauling soil, sand, and other loose materials.
  - Apply water three times daily to all unpaved access roads, parking area, and staging areas at the construction site.
  - Sweep adjacent public streets daily with water sweepers if visible soil material is carried onto streets.

24. Plant materials shall be purchased from a source that verifies they have been inspected for glassy winged sharpshooter to ensure that they will not contribute to the spread of Pierce's disease to the surrounding vineyards.
25. Landscape plans shall comply with Ordinance 92-20, Water Efficient Landscape Standards and Procedures. Plans shall be designed and verified by a landscape professional and shall include drought tolerant landscaping and low water irrigation systems. Landscaping shall not block vision from exits or at street intersections.
26. Mechanical equipment, including heating and air conditioning units shall be located away from property lines and shall be shielded or enclosed to minimize noise levels. Noise generated shall not exceed 60 dBA, Ldn.
27. The applicant and/or construction manager shall notify all contractors and subcontractors that no trespassing is allowed on adjoining properties.
28. To reduce disturbance of residents in the project vicinity, construction activities which generate noise that can be heard at the property line of any parcel of real property within the City limits shall be limited to 8:00 a.m. to 5:00 p.m. Monday through Saturday. Delivery of materials/equipment and cleaning and servicing of machines/equipment shall be limited to 7:00 a.m. to 6:00 p.m. Exceptions to these time restrictions may be granted by the Public Works Director for one of the following reasons: (1) inclement weather affecting work, (2) emergency work, or (3) other work, if work and equipment will not create noise that may be unreasonably offensive to neighbors as to constitute a nuisance. The City Engineer must be notified and give approval in advance of such work. No construction activities shall occur on Sundays or federal or local holidays that generate noise that can be heard at the property line of any parcel of real property within the City limits.
29. This property adjoins an agricultural district. There exists a right-to-farm the adjoining property. There is a good faith expectation that no complaints will occur regarding legal, normal agricultural activities on the adjacent land. Such activities may include day or night disbursement of chemicals, and creation of dust, noise, or fumes.

Approved at a Regular Meeting of the St. Helena City Council on August 26, 2008 by the following vote:

AYES: Councilmembers Schoch, Novak, Potter, Sklar, Mayor Britton

NOES: None

APPROVED:

  
Delford Britton  
Mayor

 PLANNING DEPARTMENT

JUN 28 2016

**PRATT AVENUE HOUSING PROJECT DESCRIPTION**

City of St. Helena

The CIA was fortunate to be able to acquire the former Marlinda facility to provide additional housing. This flat site, located extremely close to the Greystone educational facility, provided an opportunity to provide essential needed housing at an affordable cost with the added benefit of reducing pressure on the supply of affordable rental housing in the City of St. Helena. The property was zoned Public-Quasi Public in 2008 because it is an intrinsic element of the CIA's efforts to provide world-class education to students seeking professional employment in the hospitality industry.

With the expansion to 300 students, the Master Plan requires a net increase to amount of student housing at the Vineyard Lodge site. The Use Permit Amendments will authorize approval of:

- Demolition of the 15,050 sf existing Vineyard Lodge 1, an aged and inefficient residential facility. The CIA will construct three new lodges, ranging in size from 11,380 sf to 17,885 sf, for total new construction of 40,645 sf, or a net increase of 25,595 sf after the demolition of Vineyard Lodge 1.
- These three lodges will contain 164 new beds primarily in double rooms, with a few single units (a net gain of 123 beds with the elimination of 41 beds due to the demolition of Vineyard Lodge 1). Combined with the 60 beds in the existing Vineyard Lodge 2 ("VL 2") there will be a maximum occupancy of 224 residents on-site.
- With its PQP: Public & Quasi-Public zoning the property is properly zoned for the development of additional student housing in conjunction with the educational program at Greystone. Furthermore, under the PQP: Public & Quasi-Public zoning district, property setbacks and other design characteristics are not required to comply with adjacent zoning standards, but are determined through the Use Permit process. The CIA is mindful of the potential visual impacts of the project for neighbors and passerby. The CIA will retain the current large camphor trees located along Pratt Avenue that provide substantial existing screening of the current and proposed improvements, and additional landscape screening will be added as needed. While this property has agricultural properties surrounding the site, the largest neighbor, located on two sides is the Beringer winery which operates a large winery to the west, and has vineyard and sewage treatment ponds on the east. PQP zoning requires that these developments honor the "right to farm" on adjacent property and the Vineyard Lodge has never had an issue with the agricultural activities occurring alongside. In fact, Treasury Wine Estates, the owner of the adjacent property, has agreed to formalize an easement for shared use of the existing roadway partially owned by the CIA and Treasury.

The CIA has made numerous modifications to its plans for housing at the Vineyard Lodge. Even before a community meeting in April, the CIA revised its housing design to

eliminate rooms at either end of the proposed third floor units along Pratt Avenue so that the roof could be sloped downward to minimize the bulking of the buildings. In addition, the lodges were oriented to minimize the views of the larger sides of the buildings to passing motorists and pedestrians. Through screening and architecture, the CIA sought to minimize the visual impacts of the buildings along Pratt Avenue.

After the April community meeting facilitated by the Planning Department, the CIA reconsidered its site design to address the following issues that were raised by the staff and the public:

1. A concern about "massing" of the buildings by the inclusion of three story buildings along Pratt Avenue.

2. A request that the project be redesigned so that buildings would be set further back from Pratt Avenue to permit screening to be retained and added, and to minimize the visual impact of buildings along Pratt Avenue.

3. A desire for a reduction in the total capacity of the housing, and a request that the number of single rooms (which were predominant) be modified so that double rooms would be the primary room occupancy design, which would reduce the total square footage required for housing students.

4. Reassurance that noise factors on-site would not adversely impact neighboring properties.

5. A concern about potential adverse impacts on neighbors from student intrusions onto neighboring lands.

6. City staff voiced concerns regarding a lack of cohesion and connection with the existing VL 2 that will be retained.

The CIA has exhaustively analyzed possible revisions to the project that would address neighborhood concerns. After much thought and discussion, the submitted plans have been revised to address the design concerns noted above. The project's new design proposes the following improvements:

- The project's proposed buildings along Pratt Avenue have been pushed back an additional 15 feet to provide a 20' setback. Further, the project has modified the building design to eliminate any three story lodges along Pratt Avenue. Building B, located directly along Pratt Avenue, is entirely a two story building. Building A, an L-shaped building with a wing directed toward Pratt Avenue runs westward into the site as a two story building until it turns southward as a three story building on the interior of the site. Building A remains a two-story design for 151'6" from the innermost end of the current parking indent along Pratt Avenue, or 177'0 from the standard width of Pratt Avenue adjacent to all other properties along the entire length of Pratt Avenue other than the Vineyard Lodge property. Building C, which runs along the southernmost boundary line of the Vineyard Lodge site along the Napa Valley Wine Train tracks is three

stories in height, but the building is 90' from the current widened edge of Pratt Avenue, or 116' from the northern boundary of the travel-way of Pratt Avenue that currently exists along its entire north side.

- Through a redesign of the Lodge interiors, the CIA reduced student capacity by 12 beds, while also reducing total new construction from 42,610 sf to 40,645, a reduction of 1,965 sf, almost 10% of the total net new construction of 25,595 after the removal of Vineyard Lodge 1. The reduction in capacity was accomplished in substantial part due to the inclusion of substantially all double-rooms rather than the original focus on single room units.

- The CIA undertook a noise study to address concerns that site noise would adversely impact on neighboring properties.

- The CIA reviewed its records and determined that the perception that numerous complaints had been made regarding student intrusions onto neighboring properties was not supported by governmental records. The on-site director has the support of the CIA's security staff to ensure compliance with trespass and nuisance violations, and violators will be expelled.

- The CIA integrated VL 2 into the site design by providing for a central plaza, reducing the width of the road between VL 2 and Building A, eliminating parking in that central area and adding porches the VL 2 side of Building A so that the existing lodge no longer looked at the "back side" of Building A.

The CIA has continuously sought to provide as much housing for its students (who are employees at the CIA and throughout the St. Helena area) as possible, far in excess of that offered by any other businesses or educational facilities in St. Helena. Housing is of a serious concern to the residents and employees of St. Helena. The CIA has had to lease several houses in the City of St. Helena for its students. This housing plan has been developed to reduce the number of students who need to obtain housing off campus, thereby creating additional affordable rental housing options for other St. Helena residents.

The CIA currently has housing for 38 students in a Guest House constructed at the northern edge of the Greystone site and currently has 101 beds on the Vineyard Lodge site providing total housing capacity for 139 beds. While it proposes an increase of 100 students to its current 200 student capacity at Greystone, the new occupancy at Vineyard Lodge will be 224 beds, an increase in occupancy by 123 beds. Between existing housing at Greystone and Vineyard Lodge, and the new housing at Vineyard Lodge, the CIA will have housing for 262 of its total 300 students.

At the community meeting in April, suggestions were made that the CIA should develop some or all of this additional student housing at other sites, including the Greystone site. The CIA is fully aware of the market for housing and additional developable land in the City of St. Helena and no viable alternative site is available. Land surrounding the City is located within the County of Napa, and is not zoned for this kind of development. And, development of additional housing at Greystone is not viable. The current parking at Greystone will continue to be needed after the Master Plan because there will still be community and private events

requiring parking so the physical removal of needed parking will interfere with the safe and efficient operation of Greystone. The vast majority of the undeveloped land on-site is on steep slopes (and the land about the Historic Greystone Building is subject to a conservation easement that prohibits additional development). And, the cost to develop the Carpy House into an additional dorm would provide minimal additional beds at a prohibitively high cost. For financial, educational, and social programming reasons, students are best served by a compact campus where they obtain housing at an affordable cost.

The CIA's AOS educational program is a total two year program for students who continue their education by employment either on campus or at restaurants and other hospitality facilities in and around St. Helena. CIA students provide a substantial portion of the work force in local restaurants, and the CIA believes it is in the best interests of the citizens of St. Helena, and for its students, for the CIA to provide substantially all of its housing on-site at an affordable price rather than requiring its students to obtain housing in competition with other residents of St. Helena. The CIA believes its mission to provide adequate housing for essentially all of its students is a model workforce housing program that reduces housing demand in the local community. The CIA is eager to discuss with its neighbors, and the City, how to address this important housing need during a severe housing shortage within the City, and how to mitigate the visual impacts on its neighbors.

The CIA is mindful of the City of St. Helena's concerns regarding possible impacts on its infrastructure. The CIA believes that the project will mitigate all such concerns:

- Water Issues. Upon the full implementation of the Master Plan, the combined water demand from the Greystone site and the Pratt Avenue housing will be "water neutral." Under the current Water Agreement with the City, the Pratt Avenue site is allocated 4,750 gpd for its occupants. As noted in Summit Engineering's Water Availability Analysis, there is ample additional water available under the Greystone Water Agreement for the combined Water Agreements at these two sites to provide adequate water within the total current allotment from the City of St. Helena. Furthermore, the potential availability of domestic water from well water on the Greystone site, will ensure that the combined water demand from these two properties will be "water neutral" even after the full implementation of the Master Plan. The two Water Agreements have been inter-connected since the acquisition of the Vineyard Lodge property and transfers of water between the two Agreements has been allowed by the City in the past. As a result, the CIA proposes that they be combined into a single combined Water Agreement for both properties.
- Traffic Issues. Upon full implementation of the Mater Plan, the traffic impacts will be reduced along Main Street, and there will be a negligible change at the intersection of Pratt Avenue and Highway 29/128. As noted in the Crane Transportation Group's ("CTG") Traffic and Parking Study, the relocation of employees and programs to Copia, and the substantial reduction in the size and period of operation with the new restaurant will substantially reduce daily traffic to Greystone. In addition, students residing at Vineyard Lodge are not allowed to

park at Greystone, they must utilize the existing CIA shuttle service, or walk to the site. The CIA will acquire a larger bus (32 seats) as well as its two existing shuttles (22 & 14 seats respectively) to be utilized in its shuttle service, which will allow more students to be transported between Vineyard Lodge and Greystone with the same number of trips. At the same time, the number of larger conferences and events that create the greatest traffic and parking demand at Greystone are being relocated to Copia. As a result, the CTG study concluded that the expansion of the housing capacity at Vineyard Lodge by 123 beds only increases traffic by the negligible amount of 4 trips per day at the Pratt Avenue – Highway 29/128 intersection.

- Parking Issues. Upon implementation of the Master Plan, the parking capacity for students at Vineyard Lodge will be adequate. The CIA has substantial experience operating the housing at Vineyard Lodge as well as the housing on its Greystone site and its campus in Hyde Park, N.Y. The Vineyard Lodge site currently has excess parking capacity. Existing parking permits on-site total only 31% of the capacity of 101 person capacity of the existing dormitories. The accompanying Variance Application requests a reduction in the required parking capacity on-site because most students residing in on-campus housing do not bring their own vehicles when traveling to attend Greystone. Based on the current 31% parking permit need, the CIA has determined that only 31% of the total 224 students will require parking permits, for a total of 69 spaces. To address the needs of students who do not bring vehicles to the Vineyard Lodge dormitories the CIA will provide space for 3 shared rental cars to address students' sporadic needs for access to their own automobiles. Such need is substantially diminished because no Vineyard Lodge residents are allowed to park at Greystone; the shuttles provided by the CIA (including the larger 32 passenger capacity bus to be introduced to the shuttle schedule) provide convenient travel to Greystone; and the CIA uses its shuttles to pick up and deliver students from nearby airports and other public transit sites. The included Variance requests reduced parking requirements to reflect the reduced need for parking and student-owned vehicles.
- Effluent Issues. Summit Engineering's Wastewater Feasibility Study has concluded that there will not be a significant impact on St. Helena's wastewater disposal system due to the expansion of available storage capacity, pretreatment options, and flow regulation.

The CIA believes that it has the duty to improve the rental housing market in St. Helena, and to provide affordable housing for its students. The CIA also recognizes neighbor concerns regarding potential adverse impacts, and has made a substantial effort to address those concerns with an improved design.

PLANNING DEPARTMENT

JUL 12 2016

City of St. Helena

**VINEYARD LODGE 1 DEMOLITION**  
**PROJECT DESCRIPTION**

The CIA was fortunate to be able to acquire the former Marlinda facility to provide additional housing. This flat site, located extremely close to the Greystone educational facility, provided an opportunity to provide essential needed housing at an affordable cost with the added benefit of reducing pressure on the supply of affordable rental housing in the City of St. Helena. The property was zoned Public-Quasi Public in 2008 because it is an intrinsic element of the CIA's efforts to provide world-class education to students seeking professional employment in the hospitality industry.

With the expansion to 300 students, the Master Plan requires a net increase to amount of student housing at the Vineyard Lodge site. The Use Permit Amendments, dated June 22, 2016, included the following description of proposed demolition work:

- Demolition of the 15,050 sf existing Vineyard Lodge 1, an aged and inefficient residential facility. The CIA will construct three new lodges, ranging in size from 11,380 sf to 17,885 sf, for total new construction of 40,645 sf, or a net increase of 25,595 sf after the demolition of Vineyard Lodge 1.

The proposed demolition of Vineyard Lodge 1 meets the criteria set out for demolition of a structure in the St. Helena Municipal Code for the following:

- The existing building is not architecturally or historically significant.  
*Built at an unknown date, the original structure at the site was a residential building. Multiple additions over numerous years created and expanded the convalescent hospital facility and completely engulfed and incorporated the original residential structure within its walls.*
- The demolition does not eliminate elements that are required to maintain the essential character of the neighborhood.  
*The existing structure does not contain any character defining features.*

As stated in the Use Permit submittal, the CIA believes that it has the duty to improve the rental housing market in St. Helena, and to provide affordable housing for its students. Demolition of this existing building is necessary to achieve this goal.

**AMENDED AND RESTATED  
PROJECT STATEMENT FOR VARIANCE REQUEST**

The Culinary Institute of America ("CIA") hereby resubmits its request of two variances in conjunction with the expansion of housing at 830 Pratt Avenue ("Vineyard Lodge") in conjunction with its response to City comments.

1. Waiver of 36' Setback on the Northwestern Side of Pratt Avenue. Under Municipal Code Section 17.112.050, a special setback requirement of 36' applies from the railroad tracks to the Napa River on the northwesterly side of Pratt Avenue. The property is, however, zoned P:QP – Public Quasi-Public which provides that standard setbacks do not apply, but that the setback shall be established "through the Use Permit process". The CIA has doubts whether the 36' special setback applies to a property with this zoning designation which is intended to allow a waiver of setback and development standards that would ordinarily apply.

Section 17.112.050 does not specify how to measure the 36' setback –whether from the property line or the centerline of Pratt Avenue. All of these parcels on the Northwestern side of Pratt Avenue are located in the A-20 Zoning District (which was the base zoning for 830 Pratt Avenue prior to its rezoning to P-QP Zoning). Under Section 17.20.060, the 50' front yard setback shall be measured "from the centerline of the abutting streets". Many of the buildings located along this side of Pratt Avenue are located fairly close to Pratt Avenue, there is the possibility that the 36' setback was imposed not to increase the quantity of setback along Pratt Avenue, but to recognize many of these residences could not meet a 50' setback from the centerline of an expanded city ROW after dedications for Right of Way purposes. If so, the 36' setback would be measured from the centerline, rather than the property line.

Even if the ROW should be measured from the property line, a substantial number of the nearby residences that would be subject to this 36' setback do not comply with that requirement, even when the circumstances show that the CIA's property was subject to a uniquely severe ROW dedication not imposed on its neighbors.

The CIA has extensively investigated the extent of the City Right of Way ("ROW") along Pratt Avenue based on several parcel maps that were recorded where dedications for an expanded ROW were included as a condition of approval. Those Parcel Maps include 3 PM 12 recorded June 22, 1971 by which the currently configured 830 Pratt Avenue parcel was created. Under that Parcel Map, the road frontage along this parcel, and the adjacent vineyard parcel not owned by Treasury Wine Estates, was subject to the dedication of a 20' strip of land along the northwesterly side of Pratt Avenue, resulting in a 60' ROW. Based on this Parcel Map, we have determined that the yellow striped centerline of Pratt Avenue is located almost precisely in the middle of the preexisting 40' ROW, which makes that centerline 40' from the property line. As can be seen by the other enclosed Parcel Maps, no other properties along the northwesterly side of Pratt Avenue were required to dedicate a 20' strip for ROW purposes, all of those properties were required to merely dedicate a 10' strip, which resulted in those property lines being located only 30' from the centerline of the existing roadway. Moreover, once Pratt Avenue curves to the north to run parallel to the Napa River, those property owners appear to have made no dedication

for ROW purposes, so those property lines are located only 20' from the apparent centerline of Pratt Avenue (as is true for the closest residence to the CIA's property).

As a result, the CIA's property line intrudes 10', if not 20' further into its parcel than its neighboring parcels which theoretically are subject to the special 36' setback. Notwithstanding the other parcels along Pratt Avenue have a lesser functional setback from the centerline of Pratt Avenue than the CIA's parcel, six of those homes (almost one-half of the homes located along this side of Pratt Avenue) fail to meet the 36' setback requirement. Those homes, and the setback from the property line determined in Google Earth (photos attached), are as follows:

|                  |        |                                             |
|------------------|--------|---------------------------------------------|
| 196 Pratt Avenue | 25.04' | (no ROW dedication)                         |
| 200 Pratt Avenue | 31.85' | (no ROW dedication)                         |
| 345 Pratt Avenue | 17.25' | (10' ROW dedication)                        |
| 492 Pratt Avenue | 30.04' | (10' ROW dedication)                        |
| 640 Pratt Avenue | 20.04' | (10' ROW dedication)                        |
| 652 Pratt Avenue | 32.02' | (NO ROW dedication)(CIA's closest neighbor) |

If each of these parcels were also subject to the same 20' ROW dedication as was imposed on the CIA's parcels, these structures would be located from 5.04' to 20'04' from the property line, showing that the CIA's property at 830 Pratt Avenue would be substantially detrimentally treated compared to its immediate neighbors if the 36' setback requirement is rigidly imposed on this property. Moreover, the proposed project will increase the setback that currently exists for the existing building located closest to Pratt Avenue).

In conjunction with this project, the CIA will be demolishing the one story dormitory known as Vineyard Lodge 1 (the former Marlinda facility). Along Pratt Avenue the 20' dedication for ROW purposes allowed the installation of a parking "indent" that extends paving beyond the normal travel-way for Pratt Avenue. Adjacent to the indent is an existing sidewalk. Based on survey data, the CIA has determined that the Vineyard Lodge property line is located on the interior of that sidewalk. As a result, Vineyard Lodge 1 is currently located approximately seven (7) feet from the property line, substantially within the 36' setback. Nonetheless, in an effort to dramatically reduce the potential impacts on neighboring properties, the CIA has proposed to increase the setback so the enclosed plans provide for a 20' setback from the property line, which is approximately 36' from the travel-way for Pratt Avenue (effectively providing a 36' foot buffer along Pratt Avenue that may have been the intention of the 36' setback.

Moreover, the functional impact of the new improvements will be substantially less than results from the existing residences along Pratt Avenue that encroach into the 36' setback. Those six properties generally have no trees or other screening to obscure visual sight of the residence, including the two story home recently remodeled at 345 Pratt Avenue. In contrast, the CIA's buildings along Pratt, also two stories in height, will be partially screened from the outset by large, mature camphor trees that are located along a good portion of the site frontage. As a result, the variance is necessary for the preservation and enjoyment of substantial property rights which other properties in the same zoning district and in the same vicinity enjoy, particularly when mature screening dramatically blocks the view of a large portion of the new dormitories

closest to Pratt Avenue. Given the P-QP zoning applicable to the property which is appropriately zoned for the support of a private school, and the location of the new buildings approximately 12' – 13' further from Pratt Avenue than already exists on the property, the CIA does not believe that a substantial negative effect on other properties will arise by approval of this Variance.

## 2. Variance from Parking Standards.

Under Municipal Code Section 7.124.30 (A)(3) the St. Helena City parking code requires two spaces for the "resident owner" and one space for each guest room (apparently for each bed). for a total of 226 parking spaces for the 224 dormitory beds contained in the Vineyard Lodge by classifying this facility as a "rooming, boarding, or lodging house. This calculation results in a requirement of 154 spaces more than the 72 parking spaces calculated by providing for 0.31 parking spaces per bed as has been true in the operation of the 101 bed facility at this property. That parking ratio is satisfactory for this project because these students, for the most part, do not bring vehicles to campus as is true for most college campuses where dormitories and residence halls are provided. The students are urged not to bring vehicles because they have no need for vehicles to travel between their housing and the educational facilities at Greystone. Moreover, the CIA provides an "on demand" car rental service on-site that provides access to a vehicle when necessary. As a result, there is no need for additional parking on-site.

Based on the nature of a residence hall operation in an educational setting the CIA requests a variance from this parking requirement because this property is uniquely operated compared to a standard "lodging house". In the typical lodging house the facility offers no transportation and the occupants do not travel jointly to and from work or school. In the Vineyard Lodge property the residents all have to be enrolled in the CIA at Greystone, they have to take the shuttle to their full-time educational program, they have to travel to Napa from elsewhere from which it may be very inconvenient to drive, and they have to be issued a parking permit to be allowed to park on the premises. As indicated in the Crane Transportation Group Traffic and Parking Report, the situation is more analogous to the classification under Section 7.124.30 (A)(6): "Rest homes, convalescent hospitals, residential care and similar group care facilities" which require only one parking space per four beds (interestingly, this property was operated as a convalescent hospital for decades).

The P:QP zoning district applicable to this property can also be applicable to Churches, Chapels, Funeral Homes, Auditoriums, Stadiums and Similar Places of Assembly. But, contrary to the requirement of only one parking space per four seats at such facilities under subsection (B)(1), the application of the lodging house parking requirement means the CIA is obligated to provide one parking space per occupant, when there is no basis for assuming that four persons will occupy each vehicle traveling to Similar Places of Assembly. As a result, the CIA is not entitled to enjoy the same assumptions regarding this similar zoned property, particularly when the CIA has far more ability to control the travel and parking activities of its residents.

The approval of this variance will not adversely impact on the property's neighbors, particularly if the conditions applicable to the Variance restrict parking in the area that would adversely impact nearby residents. The CIA is agreeable to developing a parking management plan to ensure that condition is satisfied.

### MEMORANDUM

**TO:** Chuck Meibeyer, Esq., Coblenz, Patch, Duffy and Bass, LLP

**cc:** Naomi Miroglio, FAIA, Principal, Architectural Resources Group

**FROM:** Carolyn Cole, AICP, Principal

**DATE:** February 8, 2017

**RE:** Notes on Student Housing Parking Demand and Management

---

The Institute of Traffic Engineers (ITE) *Parking Generation, 4th Edition*, provides data and analysis for Land Use 550 University/College, addressing suburban and urban 4-year college sites. Data also exist for 2-year colleges, but these generally have little to no campus housing component.

the ITE data consists of 8 suburban sites and 5 urban sites; suburban and urban locations were calculated separately. The average parking supply ratio was found to be 0.4 spaces per total number of students, faculty and staff (school population) at the suburban sites, and 0.3 spaces per school population at the urban sites.

The CIA's planned 31% parking permit limitation for its Vineyard Lodge (Pratt Avenue) student housing is very close to the ITE parking supply ratio found for urban sites. However, the Vineyard Lodge site pertains only to CIA student housing, thus, may be considered to have little in common with the surveyed 4-year university sites, with their mix of classrooms, halls, offices, and student housing. For this reason, parking supply and parking management policies were examined for student housing on other campuses in California.

In a review of the online parking policies for on-campus housing, it is clear that each institution handles its parking through issuing highly restrictive permits for specified periods of time and specified parking areas. All campuses examined have an administrative division for parking management in order to manage their available student housing, and campus-wide parking supply. All encourage use of transportation alternatives to the private automobile. For example, UC Santa Barbara coordinates a vanpool and ridesharing program, discounted bus passes and an Emergency Ride Home program as part of its Transportation Alternatives Program (TAP). UC Santa Cruz maintains a parking prohibition for residential freshmen and sophomore students. First and second-year students (students with less than 90 units) that reside in on- or off-campus University housing facilities are not eligible to purchase a permit (except motorcycle permits) to

park on-campus. For students eligible to purchase permits, UC Santa Cruz issues lot-specific permits, however, its 2016-2017 TAPS bulletin (available on-line) lists eight parking lots that are sold out. The website also notes in a 2016-17 update, “due to unprecedented demand, the sale of undergraduate permits has been suspended for the 2016-17 year.” At the College of Notre Dame de Namur, in Belmont, California, first year undergraduate students are not permitted to bring cars or motorcycles to campus. At UC Davis, students living in the residence halls are not eligible to purchase campus parking permits. Residence hall students may not bring a car to campus and instead are expected to utilize public transportation and other transportation alternatives.

Parking supply was found to be an issue for all campuses examined, and strict policies are in place at all institutions to manage student housing parking demand.

The CIA’s Vineyard Lodge housing expansion project will require strict limits on the number of parking permits issued to student residents of the Vineyard Lodge housing; however, the CIA’s program of shuttle service to and from the Lodge and the Greystone facility, running every 15-minutes from 5:30 AM to the end of the student day, at 9:30 PM, is highly supportive of students not requiring personal vehicles to travel to and from campus.

*This Report is intended for presentation and use in its entirety, together with all of its supporting exhibits, schedules, and appendices. Crane Transportation Group will have no liability for any use of the Report other than in its entirety, such as providing an excerpt to a third party or quoting a portion of the Report. If you provide a portion of the Report to a third party, you agree to hold CTG harmless against any liability to such third parties based upon their use of or reliance upon a less than complete version of the Report.*

PLANTING NOTES:

1. ALL PLANTS AND LAWN TO BE IRRIGATED WITH AN AUTOMATED IRRIGATION SYSTEM.
2. ALL PROPOSED PLANT MATERIALS SHALL BE APPROVED BY THE LANDSCAPE ARCHITECT PRIOR TO INSTALLATION AND WILL BE REJECTED IF NOT IN CONFORMANCE WITH INDUSTRY STANDARDS. PLANTS SHALL BE PRUNED PRIOR TO INSPECTION.
3. THE PLANT COUNT SHALL GOVERN IF ANY DISCREPANCY IS FOUND BETWEEN THE PLANT COUNT AND THE PLANTING PLAN(S).
3. PLANTING AREAS SHALL BE CLEARED OF ALL WEEDS AND DEBRIS PRIOR TO SOIL PREPARATION. IN THE CASE OF PERNICIOUS PERENNIAL WEEDS, A SYSTEMATIC HERBICIDE SHALL BE APPLIED PRIOR TO CLEARING. IF PARTICULARLY DIFFICULT WEEDS SUCH AS WILD ONION ARE ENCOUNTERED, THE LANDSCAPE ARCHITECT AND OWNERS SHALL BE ADVISED PRIOR TO PROCEEDING.
4. ALL PLANTING OPERATIONS SHALL BE PERFORMED BY PERSONNEL FAMILIAR WITH THIS TYPE OF WORK AND UNDER THE SUPERVISION OF A QUALIFIED PLANTING FOREMAN.
5. THE LANDSCAPE CONTRACTOR SHALL SUPPLY AND CULTIVATE 2 INCHES OF NITROLIZED FIR BARK AND 1 INCH OF 3/16" MINUS LAVA STONE INTO THE TOP 6 INCHES OF ALL PLANTING AREAS. ROTOTILL IN LIFTS AS REQUIRED, OR HAND WORK NEAR ROOT SYSTEMS OF EXISTING TREES.
6. ALL PLANT MATERIAL SHALL BE DELIVERED TO THE JOBSITE FOR INSPECTION. PRIOR TO PLANTING, THE CONTRACTOR SHALL CONFIRM LOCATIONS OF ALL PLANTS WITH THE LANDSCAPE ARCHITECT. THE CONTRACTOR SHALL GIVE 3 DAYS NOTICE OF PLANT DELIVERY AND PLACEMENT.
7. ON COMPLETION OF PLANTING AND IRRIGATION INSTALLATION, ALL PLANTED AREAS SHALL RECEIVE A UNIFORM LAYER OF 2 INCHES OF FIR BARK WOOD MULCH. CONTRACTOR SHALL PROVIDE A SAMPLE OF MULCH PRIOR TO ORDERING.
8. THE LANDSCAPE CONTRACTOR SHALL MAKE NO CHANGES TO THE PLANT LAYOUT WITHOUT CONSENT OF THE LANDSCAPE ARCHITECT.
9. THE LANDSCAPE CONTRACTOR SHALL GUARANTEE ALL NEW PLANTINGS FOR A 6 MONTH PERIOD OR UNTIL THERE IS EVIDENCE OF POSITIVE GROWTH. THE GUARANTEE PERIOD SHALL BEGIN AFTER FINAL INSPECTION AND APPROVAL.
10. ANY PLANTS THAT DIE OR ARE DAMAGED SHALL BE REPLACED IMMEDIATELY.

HYDROZONES

IRRIGATION NOTES

- LAYOUT OF PIPING, VALVES AND HEADS IS DIAGRAMMATIC AND MAY BE FIELD ADJUSTED FOR OPTIMUM COVERAGE AND EASE OF INSTALLATION AND MAINTENANCE. LAYOUT OF THE MAIN LINE, LATERALS AND VALVES IS FOR VISUAL CLARITY AND SHOULD BE LOCATED IN PLANTING BEDS AT ALL TIMES. PARALLEL PIPES IN A COMMON TRENCH SHOULD HAVE 3" MIN. HORIZONTAL SEPARATION.
- THE CONTRACTOR SHALL VERIFY ALL EXISTING CONDITIONS AND COORDINATE SLEEVE LOCATIONS, WATER PRESSURE, CONTROLLER LOCATION, AND EXISTING UNDERGROUND UTILITIES AND STRUCTURES WITH FDC PRIOR TO ANY EXCAVATION. ALL DAMAGE CAUSED BY OR DURING THE PERFORMANCE OF THIS WORK SHALL BE REPAIRED AT NO ADDITIONAL COST TO THE OWNER.
- PROVIDE 18" OF COVER OVER MAIN LINES AND 12" OF COVER OVER LATERALS. ALL TRENCHING WITHIN OR NEAR THE DRIPLINES OF EXISTING TREES SHALL BE APPROVED BY THE ARBORIST PRIOR TO PROCEEDING.
- ALL BACKFILL MATERIAL SHALL BE CLEAN AND FREE OF ROCKS AND DEBRIS AND SHALL BE COMPACTED TO ORIGINAL SOIL DENSITY. SLEEVES SHALL EXTEND 12" BEYOND PAVING EDGES.
- THE CONTRACTOR SHALL MAINTAIN AN ACCURATE AS-BUILD DRAWING OF THE INSTALLED SYSTEM AND PROVIDE IT TO THE OWNER UPON COMPLETION OF THE WORK.

STATEMENT OF COMPLIANCE:

I HAVE COMPLIED WITH THE CRITERIA OF THE ORDINANCE AND APPLIED THEM FOR THE EFFICIENT USE OF WATER IN THE LANDSCAPE DESIGN PLAN.

| Project Phase No.                              | N/A                                                                                                                                                                                                          |
| Project Type and Description                   | Project Type: Regulated – This project consists of the demolition of the existing parking lot and dormitory building and the construction of four new dormitory lodges, access drive, and new parking areas. |
| Total Project Site Area                        | 2.61 acres                                                                                                                                                                                                   |
| Total New and Replaced Impervious Surface Area | 70,366 sqft (1.62acres)                                                                                                                                                                                      |
| Total Pre-Project Impervious Surface Area      | 59,723 sqft (1.37acres)                                                                                                                                                                                      |
| Total Post-Project Impervious Surface Area     | 77,959 sqft (1.79 acres)                                                                                                                                                                                     |

**II. SETTING****II.A. Project Location and Description**

The CIA Vineyard Lodge project site is approximately 2.61 acres and located at 830 Pratt Ave, St. Helena, CA. The project site is located approximately one mile northwest of the Town of St. Helena, 0.3 miles northeast of State Road 128, 0.2 miles west of York Creek, and has approximate coordinates of 38.513583° N & 122.475675° W. See the Vicinity Map.

**II.B. Existing Site Features and Conditions**

The project site currently consists of a parking lot and two dormitory buildings. The area surrounding the project boundary consists of vineyards and agricultural land. The project site is relatively flat with average slopes of the approximately 1% towards the eastern portion of the property. The elevation of the project site ranges from 243 to 250 feet above mean sea level (msl). Surface stormwater runoff from the site generally sheet flows towards the trapezoidal ditch located along the northeast property line and outlets via a valley gutter in a road side swale along Pratt Avenue. Drainage from the site eventually discharges to the Napa River.

Based on mapping from the National Resources Conservation Service (NRCS) Web Soil Survey, the project site soils are classified as Bale loam clay (104 and 105); both being in Hydrologic Soil Group "B". According to the NRCS, Hydrologic Soil Group "B" consists of soils having a moderate infiltration rate when thoroughly wet, consisting chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Project No. 2016040

June 21, 2016

**SUMMIT ENGINEERING, INC.**

Stormwater Control Plan

**II.C. Opportunities and Constraints for Stormwater Control**

Landscaped areas located throughout the project site can be utilized for bioretention facilities and self-retaining areas. The soil at the project site also allows for moderate infiltration.

Constraints for drainage at the site include the relative flat site with average slopes of approximately 1%.

**III. LOW IMPACT DEVELOPMENT DESIGN STRATEGIES****III.A. Optimization of Site Layout****III.A.1. Limitation of development envelope**

Project limitations such as the minimal slope at the site require many of the landscape areas to be self-retaining areas. LID Facilities (SCMs) are proposed to be adjacent to the proposed impervious areas not draining to self-treating areas. Landscaped areas shall be provided throughout the site to promote infiltration and treatment.

**III.A.2. Preservation of natural drainage features**

Constructed vegetated swales are currently at the site. The existing drainage pattern for the site shall be preserved where feasible.

**III.A.3. Setbacks from creeks, wetlands, and riparian habitats**

Development is not proposed to be performed within 20 feet or more of nearby creeks and riparian habitats.

**III.A.4. Minimization of imperviousness**

Impervious surfacing of the site shall be minimized with landscaped areas adjacent to proposed improvements.

**III.A.5. Use of drainage as a design element**

Grass-line interceptor swales adjacent to a portion of impervious area shall be utilized for both treatment and aesthetics and convey runoff to LID facilities.

**III.B. Use of Permeable Pavements**

Permeable pavements will not be used in this project as surfacing is limited to the asphalt concrete for the parking and access drive areas, and concrete for sidewalks.

**III.C. Dispersal of Runoff to Pervious Areas**

Runoff from Area 25 will sheetflow onto the adjacent vineyards and roadside drainage.

**III.D. Stormwater Control Measures**

This project will follow the "Design Guidance for Stormwater Treatment and Control for Projects in Marin, Sonoma, Napa, and Solano Counties (DGSTC)", prepared for the Bay Area Stormwater Management Agencies Association (BASMAA). Bio-retention LID Facilities are sized at a minimum of 4% of the equivalent tributary area, as specified in the Phase II Stormwater National Pollutant Discharge Elimination System (NPDES) Permit.

Bio-retention LID Facilities shall vary in size depending on the impervious areas for which they serve and shall be located adjacent to these areas. These facilities are designed in accordance with the Bioretention Facility Design Criteria beginning on Page 4-3 of the DGSTC, as well as Figures 4-1 and 4-2. Locations of LID facilities can be seen on the Drainage Map attached.

**CIA VINEYARD LODGE USE PERMIT**

Project No. 2016040

June 21, 2016

**SUMMIT ENGINEERING, INC.**

Stormwater Control Plan

Storm drains shall be utilized throughout the project to direct stormwater from impervious areas, to the bioretention facilities at locations specified in the Stormwater Control Plan. These new pipes shall be sized adequately to handle post project flow rates. Self-retaining areas are designed in accordance with the criteria in "Areas draining to self-retaining areas" on page 4-2 of the DGSTC: a maximum ratio of two parts impervious to one part pervious area.

Running parallel to the access drive, grass-lined interceptor swales shall be utilized to convey and treat runoff from access drive. All swales shall be designed to handle runoff from the 100-year storm event.

**IV. DOCUMENTATION OF DRAINAGE DESIGN****IV.A. Descriptions of Each Drainage Management Area****IV.A.1. Table of Drainage Management Areas**

Table 2. Drainage Management Areas

| DMA Region | Surface Type     | Area(acres) |
|------------|------------------|-------------|
| 1          | Asphalt/Rooftop  | 0.20        |
| 2          | Rooftop          | 0.11        |

Stormwater Control Plan

**IV.A.2. Drainage Management Area Descriptions**

**DMA 1**, totaling 8,531 square feet, is comprised of asphalt concrete surfacing. DMA 1 drains to Stormwater Control Measure LIDF 1.

**DMA 2**, totaling 4,743 square feet, is comprised of rooftop. DMA 2 drains to Stormwater Control Measure LIDF 1.

**DMA 3**, totaling 1,478 square feet, is comprised of concrete sidewalk. DMA 3 drains to Stormwater Control Measure LIDF 1.

**DMA 4**, totaling 4,014 square feet, is comprised of asphalt concrete parking. DMA 4 drains to Stormwater Control Measure LIDF 2.

**DMA 5**, totaling 3,780 square feet, is comprised of rooftop. DMA 5 drains to Stormwater Control Measure LIDF 2.

**DMA 6**, totaling 2,699 square feet, is comprised of rooftop and concrete sidewalk. DMA 6 drains to self-retaining area, DMA 7.

**DMA 7**, totaling 3,088 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 8**, totaling 2,698 square feet, is comprised of rooftop and concrete sidewalk. DMA 8 drains to Stormwater Control Measure LIDF 3.

**DMA 9**, totaling 2,715 square feet, is comprised of rooftop and concrete sidewalk. DMA 9 drains to Stormwater Control Measure LIDF 3.

**DMA 10**, totaling 657 square feet, is comprised of landscaping. DMA 10 drains to Stormwater Control Measure LIDF 3.

**DMA 11**, totaling 275 square feet, is comprised of concrete sidewalk. DMA 11 drains to Stormwater Control Measure LIDF 3.

**DMA 12**, totaling 2,296 square feet, is comprised of rooftop and concrete sidewalk. DMA 12 drains to self-retaining area, DMA 13.

**DMA 13**, totaling 1,186 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 14**, totaling 7,039 square feet, is comprised of asphalt and concrete. DMA 14 drains to Stormwater Control Measure LIDF 4.

**DMA 15**, totaling 1,283 square feet, is comprised of concrete sidewalk. DMA 15 drains to self-retaining area, DMA 16.

**DMA 16**, totaling 684 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 17**, totaling 2,455 square feet, is comprised of rooftop and concrete. DMA 17 drains to Stormwater Control Measure LIDF 5.

**DMA 18**, totaling 511 square feet, is comprised of concrete sidewalk. DMA 18 drains to self-retaining area, DMA 19.

**DMA 19**, totaling 262 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 20**, totaling 1,263 square feet, is comprised of concrete sidewalk. DMA 20 drains to self-retaining area, DMA 21.

Stormwater Control Plan

**DMA 21**, totaling 982 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 22**, totaling 1,175 square feet, is comprised of asphalt. DMA 22 drains to Stormwater Control Measure LIDF 6.

**DMA 23**, totaling 1,717 square feet, is comprised of asphalt. DMA 23 drains to Stormwater Control Measure LIDF 7.

**DMA 24**, totaling 14,815 square feet, is comprised of asphalt. DMA 24 drains to Stormwater Control Measure LIDF 8.

**DMA 25**, totaling 4,887 square feet, is comprised of asphalt. DMA 25 drains to surrounding vineyard area, maintaining the existing drainage pattern at this location.

**DMA 26**, totaling 2,678 square feet, is comprised of concrete sidewalk. DMA 26 drains to Stormwater Control Measure LIDF 9.

IV.B. Tabulation and Sizing Calculations

IV.B.1. Information Summary for Bioretention Facility Design

| Total Project Area: 2.61 acres          |                                                     |

Stormwater Control Plan

**V. SOURCE CONTROL MEASURES****V.A. Site activities and potential sources of pollutants**

- On-site Storm Drain Inlets
- Parking Areas
- Landscape Maintenance

**V.B. Summary of Maintenance Requirements for Each Stormwater Facility**

- Access drive shall be designed according to the latest version of the City of St. Helena Road and Street Standards.
- Parking areas shall be designed to minimize impervious surface areas and graded to direct runoff to nearby Treatment Control BMPs to treat and remove oil and petroleum hydrocarbons.
- Energy dissipaters constructed of rip rap shall be specified at the outlets of new and reconstructed storm drains and swales to minimize erosion.
- Grass lined swales shall be incorporated into the design to treat runoff and minimize erosion.
- Existing trees, shrubs and groundcover shall be preserved where feasible.
- Plant species tolerant of saturated soil conditions shall be specified in landscaped areas to be utilized for stormwater infiltration and treatment.
- Trash storage areas shall be paved and stormwater from adjacent areas shall not be directed to the storage area. Containers shall have lids.
- All roofs, gutters, and downspouts made of unprotected metals shall discharge to landscaped areas designed to infiltrate and detain stormwater runoff.

Table 14. Source Control Table

| Potential source of runoff pollutants        | Permanent source control BMPs                                                                                                                                                                           | Operational source control BMPs                                                                                                                                                                                                                                                                               |

Collect debris from pressure washing to prevent entry into the storm drain system. Collect washwater containing any cleaning agent or degreaser and discharge to the sanitary sewer not to a storm drain.</li> </ul> |

**V.C. Features, Materials, and Methods of Construction of Source Control BMPs**

All Source Control BMPs listed in the previous section will be implemented with corresponding and appropriate features, materials, and methods of construction.

**VI. STORMWATER FACILITY MAINTENANCE**

**VI.A. Ownership and Responsibility for Maintenance in Perpetuity**

The applicant accepts responsibility for interim operation and maintenance of stormwater treatment and flow-control facilities until such time as this responsibility is formally transferred to a subsequent owner. The owner then accepts full responsibility for the proper operation and maintenance of all stormwater facilities.

**VI.B. Summary of Maintenance Requirements for Each Stormwater Facility**

Any maintenance of all bio-retention facilities will be financed and implemented by the owner of the CIA Vineyard Lodge project. All facilities shall be inspected annually and documented. Any necessary repairs to facilities shall also be documented. Updated information, including contact information, must be provided to the municipality if property is sold and whenever designated individuals or contractors change.

## Culinary Institute of America 830 Pratt Avenue

### GHG Emissions Analysis

#### Executive Summary

This report evaluates greenhouse gas (GHG) emissions that would be generated by the construction and operation of three proposed dormitory structures around a central courtyard serving the Culinary Institute of America campus located east of State Highway 29 in Napa County at 830 Pratt Avenue. This project is located in the Bay Area Air Quality Management District (BAAQMD) and the project would be subject to the BAAQMD rules and regulations. This evaluation uses the approach and methodology established by the BAAQMD for assessing GHG emissions.

The projected emissions for this project have been established using the current CalEEmod program developed for this purpose by the California Air Resources Board. Table 1 provides the greenhouse gas emissions of the project during construction and operation. The total project construction emissions for all phases, including demolition of the existing lodge are estimated to be a total of 389 metric tons CO<sub>2</sub>e (MTCO<sub>2</sub>e). The total annual emissions after project completion is estimated to be a net value of 174 MTCO<sub>2</sub>e including the exclusion of operations emissions associated with the existing lodge to be removed. The emissions by year are provided below. The annual emissions from both construction and operations are below the threshold of significance for all years.

Table 1: Unmitigated GHG Emissions Summary

[www.gilleranenergy.com](http://www.gilleranenergy.com)

750A Davis Street | Santa Rosa CA 95401  
 p: 707.528.7318 | f: 707.528.7325  
 info@gilleranenergy.com

The Bay Area Air Quality Management District (BAAQMD) has recommended value of 1,100 annual metric tons CO<sub>2</sub>e as the threshold of significance for greenhouse gas emissions. This threshold is limited to operational GHG emissions. The BAAQMD recommends using this threshold or compliance with a qualified Climate Action Plan (CAP) for evaluation of projects. If the project is part of a qualified CAP, or emissions are less than the threshold of significance (1,100 metric tons CO<sub>2</sub>e/yr.) it can be considered to have a less than significant GHG impact.

The annual emissions of the Culinary Institute of America project, estimated to be a maximum of 174 MTCO<sub>2</sub>e in 2019, well below the 1,100 MTCO<sub>2</sub>e threshold of significance.

### **Introduction**

This report evaluates the greenhouse gas (GHG) emissions that would be generated by the construction and operation of a proposed 40,642 sf new construction, a net increase of 26,780 sf with the removal of the existing lodge (15,682 sf). The project will be constructed in two phases with all construction projected to be completed by January 1, 2019. This project would be located east of State Highway 29 at 830 Pratt Avenue on a developed site. The estimate includes transportation emissions by users and staff in addition to emissions associated with construction and building operation. This GHG evaluation uses the approach and methodology established by the Bay Area Air Quality Management District (BAAQMD) for assessing GHG emissions.

### **Project Description**

The Culinary Institute of America project at 830 Pratt Avenue is a Vineyard Lodge located on a 2.52 acre developed site. The projected start of construction is June 2016 with an operation date of June 2017. The first full year of operation is 2018.

Figure 1 provides the project regional location. Figure 2 provides a closer view of the project site at 830 Pratt Avenue, east of Highway 29

### **Project Construction**

This project is projected to be completed in two phases, one completed in 2017 and the second in 2018. The construction work schedule is 5 days per week.

### Greenhouse Gas Impact Discussion:

This report estimates the GHG emissions of the proposed project using the California Emission Estimator Model (CALEEMod). The model report summarizes the greenhouse gases that would be generated during construction and annual operation of the project and compares the results to the threshold of significance established by BAAQMD.

#### Greenhouse Gas Threshold of Significance

Greenhouse gases (GHGs) are generated both from natural geological and biological processes and through human activities including the combustion of fossil fuels and industrial and agricultural processes. GHGs include carbon dioxide (CO<sub>2</sub>), nitrous oxide (N<sub>2</sub>O), methane (CH<sub>4</sub>), chlorofluorocarbons, hydrofluorocarbons and perfluorocarbons. While GHGs are emitted locally they have global implications. GHGs trap heat in the atmosphere, which heats up the surface of the Earth. This concept is known as global warming and is contributing to climate change. Changing climatic conditions pose several potential adverse impacts including sea level rise, increased risk of wildfires, degraded ecological systems, deteriorated public health, and decreased water supplies.

To address GHG's at the State level, the California legislature passed the California Global Warming Solutions Act in 2006 (Assembly Bill 32), which requires that statewide GHG emissions be reduced to 1990 levels by 2020. Executive Order S-3-05 provides the California Environmental Protection Agency with the regulatory authority to coordinate the State's effort to achieve GHG reduction targets. S-3-05 goes beyond AB 32 and calls for an 80 percent reduction below 1990 levels by 2050. Senate Bill 375 has also been adopted, which seeks to curb GHGs by reducing urban sprawl and vehicle miles traveled.

The BAAQMD adopted revised CEQA Guidelines, which included thresholds of significance for greenhouse gas emissions. The Guidelines were subsequently updated in May 2011. Based on the BAAQMD Guidelines, a project is considered to have a less-than-significant impact due to GHG emissions if it:

1. Complies with an adopted Qualified GHG Reduction Strategy;
2. Emits less than 1,100 metric tons (MT) CO<sub>2</sub>e per year; or
3. Emits less than 4.6 MT CO<sub>2</sub>e per service population per year (residents and employees).

This report estimates the project GHG emissions and compares the result to the BAAQMD threshold of significance for GHG annual emissions.

### Greenhouse Gas Impact Discussion:

The proposed project will result in the generation and emission of GHGs during construction and operation. Construction will result in GHG emissions from heavy-duty construction equipment, worker trips, and material delivery and hauling including emissions associated with the demolition of the existing Vineyard Lodge 1. Construction GHG emissions are short term and will cease once construction

www.gilliranenergy.com

750A Davis Street | Santa Rosa CA 95401  
p: 707.528.7318 | f: 707.528.7325  
info@gilliranenergy.com

is complete. Although the BAAQMD has not established thresholds of significance for GHG emissions resulting from construction activities, BAAQMD encourages the incorporation of best management practices to reduce GHG emissions during construction.

Operation of the proposed project will result in GHG emissions from onsite lighting, heating, refrigeration and cooling of the proposed building and product, as well as the treatment and transport of water and wastewater. Additionally, GHGs from operation will result from vehicle trips associated with staff and residents transportation to and from the site. Operational GHG emissions are ongoing for the life of the project.

### CalEEMod modeling

There were two model adjustments impacting the results, each noted in the reports attached.

#### 1) Land Use CalEEMod input

- a. The project units are entered based on the number of rooms
- b. The project areas were entered based on values in the plans
- c. The project acreage was determined from the site plan.

| Land Use Type | Land Use Subtype    | Unit Amount      | Size Metric | Lot Acreage | Square Feet | Population |
|---------------|---------------------|------------------|-------------|-------------|-------------|------------|
| Residential   | Apartments Mid Rise | 39 Dwelling Unit |             | 1.25        | 17,885      | 70         |

#### 2) Operational = Mobile CalEEMod input

- a. WkDy Trip Rate (/size/day) input changed to 1 to reflect net reduction of trips upon project completion and internal shuttle per the traffic study referenced below<sup>1</sup>.
- b. Res H-W Trip Length input changed to 1 to reflect reduced trips with completion of the project per the traffic study referenced below.

| Land Use SubType    | Size Metric   | WkDy Trip Rate (/size/day) | Sat Trip Rate (/size/day) | Sun Trip Rate (/size/day) | Res H-W Trip Length (miles) | Rd H-W Trip Length (miles) |
|---------------------|---------------|----------------------------|---------------------------|---------------------------|-----------------------------|----------------------------|
| Apartments Mid Rise | Dwelling Unit | 1                          | 7.16                      | 6.07                      | 1                           |                            |

#### 3) Energy: The CalEEMod assumes compliance with 2013 CBC Title 24. This has been confirmed by the design team.

### Summary of Findings

#### GHG Emissions during Construction

The BAAQMD has not adopted GHG thresholds of significance for construction. The project's cumulative and annual construction emissions would both be less than the BAAQMD operational significance threshold of 1,100 metric tons per year. Therefore the proposed project GHG related construction emissions are less than significant.

The table below provides the emissions estimate for construction of the Culinary Institute of America project including the demolition of Vineyard Lodge 1.

| Construction Emissions (CalEEMod) |        |
|-----------------------------------|--------|
| Year 2017                         | 251.35 |
| Year 2018                         | 137.39 |

Table 2: Construction GHG Emissions (by year)

#### GHG Annual Operational Emissions

The project unmitigated annual operational emissions are provided in the table below.

| Culinary Institute of America Vineyard Lodge                              |                                           |                                      |                                      |                                      |              |                 |

Table 3: Operations Unmitigated Emissions<sup>2</sup>

This project will employ measures that will reduce operational emissions below code requirements. These features are identified in the project descriptions, plans and traffic study

- Transfer of function to the Napa Facility: "The 15-trip decrease in Master Plan-related trips during summer/fall Thursday AM peak traffic conditions on SR 29-128 would be primarily related to the reduction in Administrative staff and the SIG program at Greystone. The 21-trip

<sup>2</sup> BAAQMD has not established thresholds for construction period emissions

decrease in Master Plan-related trips during summer/fall Thursday PM peak traffic conditions on SR 29-128 would be primarily related to the relocation of the restaurant and staff, as well as Administrative staff and the SIG program.”<sup>3</sup>

- Student shuttle: The housing is occupied exclusively by students. Resident students are not allowed to park at Greystone; they must utilize the existing CIA shuttle service, bike or walk to and from the Lodge and the Greystone facility.

Other emissions reduction initiatives include:

- Increased Density
- Limit Parking Supply
- Increase Transit Frequency
- Implement Trip Reduction Program

The CalEEMod version 2013.2.2 emissions model was used to estimate CO<sub>2</sub>e emissions from construction and annual operation. The GHG construction emission estimates assumed construction would begin in 2016 and completed by 2017. The estimate is based on the first full year of operation of 2018. In summary, this construction and operation emissions for this project do not exceed the threshold of significance recommended by the Bay Area Air Quality Management District (BAAQMD).

The results are provided in the attachment on the following pages.

| <b>CO2 Intensity (lb/MWhr)</b> | 641.35                         | <b>CH4 Intensity (lb/MWhr)</b> | 0.029 | <b>N2O Intensity (lb/MWhr)</b>   | 0.006 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - The number of dwelling units based on 39 rooms totalling 67 beds. Lot acreage = 50% of total (2.5 acres)

Construction Phase -

Vehicle Trips - traffic study description of CIA internal transportation plan indicates 100% of transportation to class by bus, individual car to class is prohibited.

| <b>CO2 Intensity (lb/MW hr)</b> | 641.35                         | <b>CH4 Intensity (lb/MW hr)</b> | 0.029 | <b>N2O Intensity (lb/MW hr)</b>  | 0.006 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - The number of dwelling units based on 28 rooms totalling 52 beds. Lot acreage = 25% of total (2.5 acres)=.625 acres

Construction Phase -

Vehicle Trips - traffic study description of CIA internal transportation plan indicates 100% of transportation to class by bus, individual car to class is prohibited.

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - The number of dwelling units based on 28 rooms totalling 52 beds. Lot acreage = 25% of total (2.5 acres)=.625 acres

Construction Phase -

Vehicle Trips - traffic study description of CIA internal transportation plan indicates 100% of transportation to class by bus, individual car to class is prohibited.

|                                                                                                                                  |                                |                                                     |                              |           |
|                                                                                                                                  |                                |                                                     |                              |           |
|                                                                                                                                  |                                |                                                     |                              |           |
|                                                                                                                                  |                                |                                                     |                              |           |
| Discussion, and any mitigations required to make any impacts less than significant                                               |                                |                                                     |                              |           |

This Environmental Checklist Form has been provided to assist in the analysis of the environmental issues associated with the project. The following standard rules, generated from the CEQA Guidelines, apply when completing and reviewing the Environmental Checklist Form:

- 1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g. the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g. the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).*
- 2. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.*
- 3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.*
- 4. "Negative Declaration: Potentially Significant Unless Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from Section 17, "Earlier Analysis," may be cross-referenced).*
- 5. Earlier analysis may be used where an effect has been adequately analyzed in an earlier EIR or Negative Declaration. In this case, a brief discussion should identify the following:*
  - a. Earlier Analysis Used. Identify and state where they are available for review.*
  - b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.*
  - c. Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures, which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.*
- 6. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g. general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.*
- 7. Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.*
- 8. This checklist is only a suggested form, and lead agencies are free to use different formats. However, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.*
- 9. The analysis of each issue should identify: (a) the significance criteria or threshold used to evaluate each question; and (b) the mitigation measure identified, if any, to reduce the impact to a level of less-than-significant.*

## Culinary Institute of America Greystone Rehabilitation

### GHG Emissions Analysis

#### Executive Summary

This report evaluates greenhouse gas (GHG) emissions that would be generated by the Culinary Institute of America Greystone educational facility located at 2555 Main Street, St Helena, CA. This project is located in the Bay Area Air Quality Management District (BAAQMD) and the project would be subject to the BAAQMD rules and regulations. This evaluation uses the approach and methodology established by the BAAQMD for assessing GHG emissions.

The projected emissions for this project have been established using the current CalEEMod program developed for this purpose by the California Air Resources Board. Table 1 provides the greenhouse gas emissions of the project during construction and operation. The total project construction emissions 193.35 metric tons CO<sub>2</sub>e (MTCO<sub>2</sub>e). The total annual emissions after project completion is estimated to be a net increase of 114.93 MTCO<sub>2</sub>e. The emissions by year are provided below. The annual emissions from both construction and operations are below the threshold of significance for all years.

Table 1: Unmitigated GHG Emissions Summary

The Bay Area Air Quality Management District (BAAQMD) has recommended value of 1,100 annual metric tons CO<sub>2</sub>e as the threshold of significance for greenhouse gas emissions. This threshold is limited to operational GHG emissions. The BAAQMD recommends using this threshold or compliance with a qualified Climate Action Plan (CAP) for evaluation of projects. If the project is part of a qualified CAP, or

info@gilleranenergy.com

emissions are less than the threshold of significance (1,100 metric tons CO<sub>2</sub>e/yr.) it can be considered to have a less than significant GHG impact.

The increase in annual emissions of the Culinary Institute of America Greystone facility due to the Rehabilitation project is estimated to be a 114.93 MTCO<sub>2</sub>e in 2019, the first full year of operation. This value is well below the 1,100 MTCO<sub>2</sub>e threshold of significance.

### Introduction

This report evaluates the greenhouse gas (GHG) emissions that would be generated by the proposed 27,500 sqft rehabilitation of the Greystone facility. The interior renovation is anticipated to begin in January 2017 and continue for 14 months. The student capacity will increase from 200 students currently served to a maximum of 320 students. The analysis estimates the increase in operational emissions due to the expanded student capacity, and the emissions due to project construction. This GHG evaluation uses the approach and methodology established by the Bay Area Air Quality Management District (BAAQMD) for assessing GHG emissions.

### Project Description

The Culinary Institute of America Greystone rehabilitation project is located at 2555 Main Street in St. Helena, CA. The rehabilitation will affect roughly 27,500 sqft within the existing building. The projected start of construction is January 2017 with completion roughly 14 months later in March 2018. The first full year of operation is 2019.

Figure 1 provides the project regional location. Figure 2 provides a closer view of the project site at 2555 Main Street in St. Helena, CA.

### Project Construction

This project is projected to be completed in 14 months. The construction work schedule is 5 days per week.

### **Greenhouse Gas Impact Discussion:**

This report estimates the GHG emissions of the proposed project using the California Emission Estimator Model (CALEEMod). The model report summarizes the greenhouse gases that would be generated during construction and annual operation of the project and compares the results to the threshold of significance established by BAAQMD.

### **Greenhouse Gas Threshold of Significance**

Greenhouse gases (GHGs) are generated both from natural geological and biological processes and through human activities including the combustion of fossil fuels and industrial and agricultural processes. GHGs include carbon dioxide (CO<sub>2</sub>), nitrous oxide (N<sub>2</sub>O), methane (CH<sub>4</sub>), chlorofluorocarbons, hydrofluorocarbons and perfluorocarbons. While GHGs are emitted locally they have global implications. GHGs trap heat in the atmosphere, which heats up the surface of the Earth. This concept is known as global warming and is contributing to climate change. Changing climatic conditions pose several potential adverse impacts including sea level rise, increased risk of wildfires, degraded ecological systems, deteriorated public health, and decreased water supplies.

To address GHG's at the State level, the California legislature passed the California Global Warming Solutions Act in 2006 (Assembly Bill 32), which requires that statewide GHG emissions be reduced to 1990 levels by 2020. Executive Order S-3-05 provides the California Environmental Protection Agency with the regulatory authority to coordinate the State's effort to achieve GHG reduction targets. S-3-05 goes beyond AB 32 and calls for an 80 percent reduction below 1990 levels by 2050. Senate Bill 375 has also been adopted, which seeks to curb GHGs by reducing urban sprawl and vehicle miles traveled.

The BAAQMD adopted revised CEQA Guidelines, which included thresholds of significance for greenhouse gas emissions. The Guidelines were subsequently updated in May 2011. Based on the BAAQMD Guidelines, a project is considered to have a less-than-significant impact due to GHG emissions if it:

1. Complies with an adopted Qualified GHG Reduction Strategy;
2. Emits less than 1,100 metric tons (MT) CO<sub>2</sub>e per year; or
3. Emits less than 4.6 MT CO<sub>2</sub>e per service population per year (residents and employees).

This report estimates the project GHG emissions and compares the result to the BAAQMD threshold of significance for GHG annual emissions.

### **Greenhouse Gas Impact Discussion:**

The proposed project will result in the generation and emission of GHGs during construction and operation. Construction will result in GHG emissions from worker trips, and material delivery and hauling including emissions associated with the rehabilitation demolition. Construction GHG emissions are short term and will cease once construction is complete. Although the BAAQMD has not established

info@gilleranenergy.com

thresholds of significance for GHG emissions resulting from construction activities, BAAQMD encourages the incorporation of best management practices to reduce GHG emissions during construction.

Operation of the proposed project will result in GHG emissions from onsite lighting, heating, refrigeration and cooling of the proposed building and product, as well as the treatment and transport of water and wastewater. Additionally, GHGs from operation will result from vehicle trips associated with staff and residents transportation to and from the site. Operational GHG emissions are ongoing for the life of the project.

#### CalEEMod modeling

The results are based on the net increase of operations emissions calculated by modeling the existing 200 students and comparing the results to the emissions associated with the projected 320 student capacity after completion. The unit acre and project square feet were entered based on project area defined by use permit drawings<sup>1</sup>. The models and notations are provided in the attachments.

- 1) No Project Analysis (200 students) CalEEMod input
  - a. The project units are entered based on the number of students
  - b. The project acreage was determined based on building footprint
  - c. The project area was determined from the project use permit drawings.

| Land Use Type | Land Use Subtype     | Unit Amount | Size Metric | Lot Acreage | Square Feet | Population |
|---------------|----------------------|-------------|-------------|-------------|-------------|------------|
| Educational   | Junior College (2yr) | 200         | Student     | 0.82        | 27,500      | 0          |

- 2) Rehabilitation Project Analysis (320 students) CalEEMod input
  - a. The project units are entered based on the number of students
  - b. The project acreage was determined based on building footprint
  - c. The project area was determined from the project use permit drawings.

| Land Use Type | Land Use Subtype     | Unit Amount | Size Metric | Lot Acreage | Square Feet | Population |
|---------------|----------------------|-------------|-------------|-------------|-------------|------------|
| Educational   | Junior College (2yr) | 320         | Student     | 0.82        | 27,500      | 0          |

- 3) Energy: The CalEEMod assumes compliance with 2013 CBC Title 24. This has been confirmed by the design team.

### Summary of Findings

#### GHG Emissions during Construction

The BAAQMD has not adopted GHG thresholds of significance for construction. The project's cumulative and annual construction emissions would both be less than the BAAQMD operational significance threshold of 1,100 metric tons per year. Therefore the proposed project GHG related construction emissions are less than significant.

The table below provides the emissions estimate for rehabilitation of the Culinary Institute of America Greystone facility.

| Construction Emissions (CalEEMod) |        |
|-----------------------------------|--------|
| Year 2017                         | 166.34 |
| Year 2018                         | 27.01  |

Table 2: Construction GHG Emissions (by year)

### GHG Annual Operational Emissions

The project unmitigated annual operational emissions are provided in the table below.

| Culinary Institute of America Greystone Rehabilitation                    |                                              |                                                          |                                       |                                          |

Table 3: Operations Unmitigated Emissions<sup>2</sup>

This project will employ measures that will mitigate operational emissions below calculated values. These features identified in the project descriptions, plans and traffic study project documents are not quantified in this report as the unmitigated results are significantly below the threshold of significance.

- Elimination of the Wine Spectator Greystone Restaurant (WSGR)
- Reduced Farm to Table restaurant operation

<sup>2</sup> BAAQMD has not established thresholds for construction period emissions

- Elimination of existing three separate dish wash rooms
- Replacement with one dish room saving 1,200,000 gallons per year.
- Use onsite well to supply domestic water that will substantially replace city water required
- Relocation of staff and programs to Copia (Napa) facility.
- Reduction of restaurant size and period of operation reducing water and effluent

The CalEEMod version 2013.2.2 emissions model was used to estimate CO<sub>2</sub>e emissions from construction and annual operation. The GHG construction emission estimates assumed construction would begin in 2017 and completed by 2018. The estimate is based on the first full year of operation of 2019. In summary, this construction and operation emissions for this project do not exceed the threshold of significance recommended by the Bay Area Air Quality Management District (BAAQMD).

The results are provided in the attachment on the following pages.

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - First full year of operation

Land Use - Student population 320 max; project acreage (building footprint) = .82 acres; Rehabilitation area = 27,500 sqft. The project is an interior rehabilitation. Project has no site demolition,

Construction Phase - Interior rehabilitation, no site demolition, site prep, grading, trenching, paving, or architectural coating. Anticipated 14 month construction schedule. Construction will occur M - F, 8am-5pm.

| Discussion, and any mitigations required to make any impacts less than significant                                               |                                |                                                     |                              |           |

This Environmental Checklist Form has been provided to assist in the analysis of the environmental issues associated with the project. The following standard rules, generated from the CEQA Guidelines, apply when completing and reviewing the Environmental Checklist Form:

- 1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g. the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g. the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).*
- 2. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.*
- 3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.*
- 4. "Negative Declaration: Potentially Significant Unless Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from Section 17, "Earlier Analysis," may be cross-referenced).*
- 5. Earlier analysis may be used where an effect has been adequately analyzed in an earlier EIR or Negative Declaration. In this case, a brief discussion should identify the following:*
  - a. Earlier Analysis Used. Identify and state where they are available for review.*
  - b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.*
  - c. Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures, which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.*
- 6. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g. general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.*
- 7. Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.*
- 8. This checklist is only a suggested form, and lead agencies are free to use different formats. However, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.*
- 9. The analysis of each issue should identify: (a) the significance criteria or threshold used to evaluate each question; and (b) the mitigation measure identified, if any, to reduce the impact to a level of less-than-significant.*

## PURPOSE

This summary describes the drainage analysis associated with the proposed improvements at the Culinary Institute of America's Vineyard Lodge expansion project. The analysis includes the pre- and post-construction hydrology analysis to conclude that there shall not be any increase in the stormwater runoff for the 10-year storm. All the stormwater conveyances shall be sized to accommodate the runoff from the 100-year storm event.

## PRE/POST PROJECT HYDROLOGY ANALYSIS

A hydrology analysis was conducted for the pre and post construction project watersheds using the NRCS/TR-55 curve number method. The intent of this analysis is to demonstrate that there shall not be an increase stormwater runoff volume or flowrate resulting from the proposed improvements and the preconstruction runoff conditions shall be maintained. Refer to the Pre-/Post-Construction Hydrology Map, H1, in Appendix D for the pre-post-construction pervious and impervious surface areas. Composite CN values for the pre-/post-construction conditions are shown below and are based on hydrologic soil group B. Refer to Appendix B for the pre-/post-construction hydrographs. The parameters used in this analysis are located in Appendix A. For information on the pervious pavers and the associated curve number values, refer to Appendix C. Refer to Appendix D for Pre-/Post-Construction Hydrology map.

### PRE-CONSTRUCTION

|                               | CN        | Area (ac)     |
|-------------------------------|-----------|---------------|
| <b>Impervious</b>             |           |               |

## HYDRAULICS

### RAINFALL DATA/DESIGN PARAMETERS

Hydraulic Analysis for this project was performed using the Napa County Road and Street Standards with the Rational Method in order to appropriately size stormwater conveyances.

The location of the site and review of these standards provides the following mathematical models and constant values used in the hydraulic analysis. All supporting information for the parameters given in this section can be found in Appendix A.

### NAPA COUNTY ROAD AND STREET STANDARDS

The Napa County Road and Street Standards gives the following parameters for the project location. The minimum initial time of concentration was found using Hydraflow Hydrographs. The following Napa County Road and Street Standards parameters were used with the Rational Method for hydraulic calculations of the storm drain network. See Appendix B for pipe capacity report.

CIA-VINEYARD LODGE  
Project No. 2016096  
September 2, 2016

**SUMMIT ENGINEERING, INC.**  
Hydrology and Hydraulic Calculations  
BY: CIP CHK: MS

Mean Seasonal Precipitation : 33 in/yr

Minimum Initial Time of Concentration :  $T_c = 10$  min

#### 10-YEAR STORM EVENT

60 Minute Rainfall ( $P_{60}$ ) :  $P_{60} = 1.0$  in.

Rainfall Intensity : 2.41 in/hr

#### 100-YEAR STORM EVENT

60 Minute Rainfall ( $P_{60}$ ) :  $P_{60} = 1.45$  in.

Rainfall Intensity : 3.12 in/hr

### RATIONAL METHOD

The Rational Method was used to size the storm drain conveyances for the site. All swales and pipes are sized using the flow rate from the 100-year storm event. Runoff Coefficients were determined with reference to the Napa County Road and Streets Standards, see Appendix A for reference.

Impervious Area : 0.90

Pervious/Landscaped Areas : 0.40

Drainage areas for the constructed conditions were developed and are presented in the Hydrology Map in Appendix D. Flow rate calculations for each area were developed based on the Rational Method formula.

Rational Method Formula :  $Q = CiA$

$Q$  = Flowrate (cubic feet per second)

$A$  = Area (acres)

$C$  = Runoff Coefficient

$i$  = 100-year Rainfall Intensity

### FLOWRATE CALCULATIONS

100 YEAR STORM INTERVAL

Runoff:  $Q = CiA$

$Q = 0.78 * 3.12 \text{ in/hr} * 2.15 \text{ Ac} = 5.26 \text{ cfs}$

### STORM DRAIN SIZING

Storm drains are designed to convey the 100-year storm event flow rate calculated using the Rational Method. The pipe sizes were calculated using Manning's Equation as shown below. See Appendix A for flow calculations.

$$\text{Manning's Equation} : Q = \frac{1.49}{n} AR^{2/3} S^{1/2}$$

$$A = \pi \left( \frac{D}{2} \right)^2$$

Project No. 2016096  
September 2, 2016

**SUMMIT ENGINEERING, INC.**  
Hydrology and Hydraulic Calculations  
BY: CIP CHK: MS

---

$$R = \frac{A}{\pi D}$$

D = diameter of pipe (feet)

n = 0.012 (Manning's Roughness Coefficient)

S = 0.005 (Slope)

Pipe sizes were selected based on the sub-region flow rate for the 100-year flow being conveyed with the pipe at or less than 90% full. See Appendix B for pipe capacity report for the 18 inch storm drain outlet for the site.

## CONCLUSION

---

Based on this analysis, the post- curve number values, the flowrate, and the volume match the pre-project conditions. The properties off-site shall not be adversely affected, since there shall be no increase in runoff resulting from the 10-year storm event for the proposed improvements.

<sup>1</sup> Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).  
 Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.  
 Please refer to NOAA Atlas 14 document for more information.

## MAP LEGEND

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

**Warning:** Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service  
Web Soil Survey URL: <http://websoilsurvey.nrcs.usda.gov>  
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Napa County, California  
Survey Area Data: Version 8, Sep 23, 2015

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 14, 2011—Aug 15, 2011

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

## Rating Options

|--------------------------------------------------------------------------------|----|----|----|----|

Idle lands (CN's are determined using cover types  
similar to those in table 2-2c).

<sup>1</sup> Average runoff condition, and  $I_a = 0.2S$ .

<sup>2</sup> The average percent impervious area shown was used to develop the composite CN's. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition. CN's for other combinations of conditions may be computed using figure 2-3 or 2-4.

<sup>3</sup> CN's shown are equivalent to those of pasture. Composite CN's may be computed for other combinations of open space cover type.

<sup>4</sup> Composite CN's for natural desert landscaping should be computed using figures 2-3 or 2-4 based on the impervious area percentage (CN = 98) and the pervious area CN. The pervious area CN's are assumed equivalent to desert shrub in poor hydrologic condition.

<sup>5</sup> Composite CN's to use for the design of temporary measures during grading and construction should be computed using figure 2-3 or 2-4 based on the degree of development (impervious area percentage) and the CN's for the newly graded pervious areas.

## SF-RIMA™ PERMEABLE PAVING STONE SYSTEM

### INTRODUCTION

Storm-water management is a fundamental aspect of facility engineering, landscape architecture, and site development. Today it is tightly regulated by a variety of federal, state, and local requirements that seek to control amount of runoff discharged into waterways and the quality of the discharge. Depending on the specific locality these regulations may require on-site storm-water retention with controlled rate or quality of discharge limits (or both), mandatory cleaning of discharge (e.g. oil-water separators), limits on the percentage of an area that may be developed, or special fees or taxes on any covered or paved areas that are built.

However, conventional storm-water practices have not proven entirely satisfactory. Professor Ferguson of the University of Georgia noted in the preface to his revolutionary new text on storm-water control (Ferguson 1994) that

*Too many American cities are caught up in stormwater management practices that are self-defeating and destructive. Too many are clinging to conventions inherited from previous generations despite the growth of scientific knowledge and development of environmental values.*

Storm-water infiltration whereby storm-water management systems are specifically designed to return the storm-water back into the underlying soil rather than allowing it to escape as surface runoff is the most promising new concept for dealing with this issue. Storm-water infiltration reduces pollutant discharge, sedimentation of downstream channels, helps prevent downstream flooding, nourishes existing or develops new wetland areas, and recharges the existing ground-water system. This concept of storm-water management is far more economical and environmentally sustainable than more conventional methods of retention basins and storm sewers. It has been practiced effectively for over a half century in the U.S. with examples in the Southwest where it was used to recharge alluvial aquifers, in various urban watersheds (e.g., Fresno, Los Angeles, and Long Island) and other areas (e.g., Florida, Maryland, Minnesota, and Texas). It is now appropriate for this sound concept to be used more widely.

### THE CONCEPT OF A PERMEABLE PAVEMENT

Paved areas are essentially impermeable and are major contributors to storm-water control problems. Not only must all of the water falling on the paved area be collected and handled in some manner, it is a major contributor of pollutants and sediments that degrade natural waters. Ideally, if a pavement could be made permeable so that water simply reentered the soil, a significant portion of the storm-water problem would be solved. However, there are some technical difficulties with achieving this (which in many cases can be overcome), and

existing permeable pavement surfaces are less than ideal. They tend to be expensive and difficult to maintain, porous asphalt concrete often has stability problems under turning or braking loads and may be vulnerable to stripping (emulsification of the asphalt binder in water), porous or “no fines” portland cement concrete tend to be vulnerable to damage by freezing and thawing (Korhonen and Bayer 1989), and precast portland cement concrete lattice pavers or turf pavers are generally not suitable for sustained traffic.

## **SF-RIMA<sup>™</sup>, A NEW PRODUCT FOR PERMEABLE PAVEMENTS**

SF-Rima<sup>™</sup> is a high-quality portland cement concrete paving stone that can be assembled to provide a high quality pavement surface. The paving stone is 196 mm by 196 mm (7.7 in. by 7.7 in.) in plan and 80-mm (3.1-in.) thick. Protruding from each side are 12-mm (0.5 in.) deep and 30-mm (1.2-in.) wide placement spacers (Figure 1) that provide an open joint between the paving stone (Figure 2). These placement spacers ensure that the typical SF-Rima<sup>™</sup> surface will be composed of approximately 10 percent joint area that will be available for storm-water drainage. When these joints are filled with appropriately permeable granular material and the underlying layers are properly designed for drainage, storage, and percolation over time, substantial portions of the storm-water falling on a SF-Rima<sup>™</sup> surface can be diverted into the pavement surface where it can be allowed to infiltrate naturally back into the underlying soils. This volume of water no longer contributes to the runoff problem. With proper design and conservative selection of factors of safety, it is appropriate to anticipate the long-term infiltration rate of the SF-Rima<sup>™</sup> pavement surface will be 1.1 in./hr (80 l/sec x ha), and much higher rates will be common in the early life of the pavement. The key to making this concept work is proper hydraulic design, adequate structural design, and judicious choice of materials and site conditions.

## **OVERVIEW OF DESIGN REQUIREMENTS**

While SF-Rima<sup>™</sup> is new to the United States and Canada, it has been used successfully in Germany for over ten years. The recommendations presented here are heavily based on this German experience, testing, and literature modified to fit North American pavement design and construction practices. The recommendations are necessarily conservative in order to ensure successful introduction of this product to North America, and more extensive technical background and detail are maintained by SF Concrete Technology, Inc. of Mississauga, Canada for those requiring more detailed data. We shall briefly examine the fundamental issues that must be addressed in evaluating candidate sites for permeable pavements made with SF-Rima<sup>™</sup> paving stones and then will examine the more detailed requirements involved in the appropriate Hydraulic Design and Structural Design of the pavement.

Figure 1. Unfilled Joints in SF-Rima<sup>™</sup> Paving Stone Showing Spacers.

Figure 2. SF-Rima<sup>™</sup> in Storage Yard to Provide Permeable Pavement

## Site Selection

Not every site will be appropriate for a permeable pavement. First, one must consider if there are adjacent structures or facilities such as basements that would be adversely affected by infiltrating water. Ideally, the subgrade should have a permeability exceeding  $5.4 \times 10^{-3}$  cm/sec and clayey soils should be avoided. This will be discussed further later in *Hydraulic Design Considerations*. In addition, the ground-water table should be at least 3 ft below the pavement surface, but it is best if there is at least 6 ft separation. This allows adequate filtration and trapping of contaminants and ensures proper drainage of the pavement structure. Heavily polluted sites such as maintenance areas, refueling areas, or leach pads are poor candidates for any permeable pavement as they run considerable risk of contaminating underlying ground water. Deicing salts applied to pavements have already been identified as a serious potential pollutant from conventional pavements. Consequently, if soluble deicing salts will be used on the pavement, a permeable pavement would only exacerbate the existing pollution problem. If the proposed pavement has a steep grade, a permeable pavement can be a poor choice. Water entering the uphill portion of the pavement will tend to drain out onto the surface of the lower areas rather than percolate into the subgrade. It is best if the permeable pavement has a slope between 0 and 1 percent to maximize the surface water infiltration, and it should generally not have any slopes greater than 5 percent. Steeper slopes increase runoff and minimize water infiltration.

## Surface Infiltration

The joint filling material, the bedding layer under the paving stones and the underlying base and subbase courses in the pavement must be designed to allow water drainage in order for the water to penetrate the surface. This is the key to obtaining high infiltration rates - if the joints were simply filled with the local soil, the infiltration rate would be only 10 percent of the local soil infiltration. However, by appropriate selection of the joint filling material so that its permeability is much higher and design for appropriate permeability in the underlying materials, the inflow through the joints will be much higher than the native surrounding soils. For example, a natural lean clay (CL by the unified soil classification system) soil might have a permeability on the order of  $10^{-7}$  cm/sec and a silty sand (SM) might have a permeability on the order of  $10^{-5}$  cm/sec. Proper selection of clean small gravel for filling joints will provide permeability in excess of  $10^{-3}$  cm/sec, 100 times greater than our sandy soil and 10,000 times greater than the clay soil. In this manner, a relatively small total open area in the joints is capable of providing a potentially large infiltration into the pavement structure.

These initially high permeability values will not be maintained throughout the life of the pavement. As fine material, detritus, rubber, vegetative matter, etc. accumulate in the joints, permeability will drop drastically. Unfortunately, there is no way to ascertain at the design stage what level of clogging will occur during the life of the pavement. Such clogging is a natural phenomena and is observed in well filters, geotextile filter fabrics, etc. Attempts at maintaining permeable pavements through sweeping and cleaning have given mixed results (Ferguson 1994). Consequently, the potential for long-term reduction in permeability is probably best handled by careful detailing and use of a generous factor of safety in designing for long-term infiltration.

The pavement should be designed to minimize surface flows onto the pavement that may be carrying suspended sediment. If it is necessary to divert flows from other areas onto the permeable pavement, a stilling basin, silt fence, filter, or similar structure would be prudent to remove sediment before it flows onto the permeable pavement.

While initial infiltration of SF-Rima<sup>™</sup> with small gravel as joint filling may exceed 21.25 in./hr in laboratory tests (Drewes 1989), SF Concrete Technology Inc. recommends that the long-term design infiltration rate for SF-Rima<sup>™</sup> is best taken as 1.1 in./hr to allow for differences between laboratory and field conditions, the vagaries of construction in the real world, and the inevitable clogging with fines that will occur during the extended life of the pavement. This value corresponds to results for field infiltration tests on conventional concrete paving blocks with much narrower joints than SF-Rima<sup>™</sup> and with sand-filled joints rather than gravel-filled joints recommended for SF-Rima<sup>™</sup>. As such, it represents a conservative estimate of infiltration capacity very late in the pavement life (say 25 or 30 years) when very substantial clogging has occurred.

Table 1 provides the results of measurements of field infiltration rates for SF-Rima<sup>™</sup> for various conditions and joint filling material. Several important aspects of permeable pavement behavior are illustrated in these results. The selection of the joint filling material is critical. Small crushed gravel (“chippings”) outperforms sand as a filler by a substantial margin, and sand is a poor choice if long-term infiltration is needed. Permeability of the base course under the SF-Rima<sup>™</sup> paving stone will have a major impact on the performance of the system. Also, infiltration decreases with time.

The suggestion of a long-term design infiltration rate of 1.1 in./hr appears to be reasonable and conservative in light of current knowledge and test results. It coincides with the measured infiltration of 20 year old block pavements which should be much less permeable than SF-Rima<sup>™</sup> pavements with gravel-filled joints. This design value provides a factor of safety of 20 to laboratory measured infiltration rates, a factor of safety of approximately 8 to infiltration rates measured on new SF-Rima<sup>™</sup> paving stones, and a factor of safety of approximately 3 to infiltration rates measured on 4-year old SF-Rima<sup>™</sup> paving stones. As new data become available on older SF-Rima<sup>™</sup> installations it may become possible to increase this suggested design infiltration rate.

### System Design

The SF-Rima<sup>™</sup> paving stone surface, the joint filler, the bedding layer upon which the SF-Rima<sup>™</sup> paving stone is seated, and the underlying base and subbase courses must be designed as a functional unit (Figure 3). Water must penetrate the surface rapidly, flow unimpeded to the bottom of the pavement structure where it can be allowed to percolate into the subgrade over time. The layers must be designed so that the flowing water does not dislodge and pipe finer particles into underlying layers, and the pavement must be designed to withstand the structural loads applied by vehicular traffic. An example of the design process is shown in Appendix A.

| Table 1. Measured Field Infiltration Rates of SF-Rima™ (data from Borgwardt 1995) |              |       |                                          |                   |       |
|-----------------------------------------------------------------------------------|--------------|-------|------------------------------------------|-------------------|-------|
| Inst. No.                                                                         | Application  | Age   | Joint Filling                            | Infiltration Rate |       |
|                                                                                   |              |       |                                          | l/sec x ha        | in/hr |
| 1                                                                                 | Storage Area | New   | Chippings, 2/5 mm                        | 640               | 8.7   |
| 2                                                                                 | Parking Lot  | 2 yrs | Chippings, 2/5 mm                        | 140               | 2.0   |
| 3                                                                                 | Parking Lot  | 4 yrs | Chippings, 2/5 mm                        | 230               | 3.2   |
| 4                                                                                 | Parking Lot  | 4 yrs | Chippings, 2/5 mm with vegetation growth | 210               | 2.9   |
| 5                                                                                 | Parking Lot  | New   | Sand                                     | 120               | 1.7   |
| 6                                                                                 | Parking Lot  | 5 yrs | Sand                                     | 20                | 0.3   |

Notes: All testing done under the direction of Dr. Sönke Borgwardt, a scientific advisor for ecological planning in Hannover, Germany. Testing used a percolating infiltrometer that simulates rainfall onto a sealed 0.2 m<sup>2</sup> area on the pavement surface. Infiltration curves are developed that show an exponential drop in infiltration rate with time that approaches an asymptotic value when the joint materials are saturated. Infiltration rates reported in this table are at 15 minutes which in all tested materials was on the asymptotic portion of the curve as the joint materials were at or near saturation. This indicates the steady, long-term infiltration rate under prolonged rainfall. Chippings are crushed aggregate with all particles between 2 and 5. The sand was appreciably finer with particles between 0 and 2 mm. Test No. 4 was at the same location as No. 3 but was in an unused area where vegetation had begun growing in the joints. Test No. 4 had an asphalt base which had some believe had become plugged with fines and had an unexpectedly low permeability.

Figure 3. Cross Section of Permeable Pavement with SF-Rima™ Surface

### Design Storm and Regulatory Compliance

The specific storm for which facilities must be designed is generally set by regulatory requirements and typically is expressed as a storm of a specific period and recurrence level. For example, the one-hour, 10-year storm would provide the rainfall expected of a storm lasting one hour and occurring on the average once every ten years. Maps are prepared showing the rainfall intensities or total rainfall expected for different lengths of storm and different recurrence levels in standard government publications (e.g., Department of Commerce 1961, 1964) or handbooks on storm-water design (e.g., Ferguson 1998).

The SF-Rima<sup>™</sup> paving stone surface will probably infiltrate the bulk of most storms during its early life, but design should provide additional storm-water control capacity for runoff that develops from the largest storms and which will develop later in the pavement life as permeability drops toward the recommended 1.1 in./hr design rate. SF-Rima<sup>™</sup> is capable of significantly reducing runoff from paved surfaces, but a secondary control system will generally be needed (depending on location and specific design storm) to handle the reduced runoff from the pavement, and the SF-Rima<sup>™</sup> capacity and the secondary system need to be incorporated with other storm-water control facilities for the site. These additional systems should make maximum use of the new concepts encouraging environmentally sensitive storm-water control and infiltration concepts.

## HYDRAULIC DESIGN CONSIDERATIONS

### Permeability

The ability of water to flow through a soil or gravel material is usually assessed by the material's coefficient of permeability which is defined to be the rate of discharge of water at 20°C under conditions of laminar flow through a unit cross-section of soil under a unit hydraulic gradient and is expressed in units of length per time (e.g., cm/sec or in./hr). The value of the coefficient of permeability of soils and gravels is a function primarily of its particle size with the percentage of fine particles (particles passing the No. 200 sieve) having a particularly important impact, the distribution of particle sizes or grading of the soil, plasticity characteristics of the soil, and the soil's density. Probably no engineering material property shows as wide a variety of values as does soil permeability which may range from  $10^{-10}$  to  $10^2$  cm/sec (12 orders of magnitude).

Determining the coefficient of permeability of a material is difficult. Permeability can be measured in the laboratory using constant head or falling head tests, but laboratory samples seldom are representative of field conditions. There are also empirical equations such as Hazen's equation below that estimate permeability based on grain size characteristics:

$$k = C_1 (D_{10})^2$$

where  $k_1$  is coefficient of permeability in cm/sec,  $C_1$  is a constant equal to a value between 1.0 and 1.5, and  $D_{10}$  is the effective grain or particle size in mm at which 10 percent of the soil particles are finer and which is determined from the soil gradation curve. This equation is only very approximate; it is based on tests with sand; and it neglects the very large effect of density and void ratio on the coefficient of permeability. There are also a variety of different field permeability tests which require skill and experience to interpret accurately. Because permeability is such a difficult parameter to determine accurately, many small projects are designed with a hefty factor of safety and approximate estimates of permeability based on approximate correlations to soil types. Table 2 provides some general estimates of permeability for different soil types, but as with all such generic tables, the data should be used with caution. More comprehensive information on permeability is available from standard references on soil mechanics or on pavement drainage (e.g., Federal Highway Administration 1980 or Cedergran 1974).

### **Joint and Bedding Layer Materials**

Selecting a proper material for the joint filling material and the bedding layer under the SF-Rima<sup>TM</sup> paving stone is crucial to the success of the infiltration system. German practice calls for this material to have an average permeability of  $2 \times 10^{-3}$  cm/sec or better. In practice, this has been met by crushed fine gravel with particles between 2 and 5 mm (roughly No. 10 to 1/4 in. sieve) or alternatively a somewhat finer gradation between 1 and 3 mm (roughly No. 20 sieve to No. 6 sieve). Aggregate size No. 9 under ASTM D 448 (4.75 mm to 1.18 mm) roughly encompasses both of these standard German gradations. This crushed aggregate offers high interlock and stability, it has sufficient void space to allow rapid infiltration; it is sufficiently fine to allow filling of the joints between stones; and it also allows proper seating of the stone in the bedding layer. The bedding layer is a construction necessity to allow proper leveling of the stones. This layer should be kept to not more than 1 in. in thickness, and excessive thickness of the bedding layer can be detrimental to the structural performance of the pavement. As seen in Table 1 and 2, sands simply will not provide the desired permeability, and they are more prone to clogging than are the coarser gravels. Crusher screenings are unsuitable for these applications because of excess fines.

### **Base and Subbase Course Materials**

The base and subbase courses of the pavement are a major element of the water penetration and storage system of the pavement. They should drain all water that infiltrates into the bedding layer, and consequently, the base should have a permeability greater than the bedding layer. Permeability greater than  $10^{-2}$  cm/sec is recommended for the base course material.

Conventional dense-graded aggregates such as those in ASTM D 1241 or that are commonly used for pavement construction are totally unsuitable for use in a permeable pavement. As seen in Table 2, their permeabilities will normally be far too low because of the content of minus No. 200 material and the high densities to which they are compacted.

| Table 2. General Estimates for Permeability Values for Paving Materials                |                                                                                                                                                                                  |                        |
|----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| Material                                                                               | Qualifying Notes                                                                                                                                                                 | Permeability (cm/sec)  |
| Conventional Pavement Surfacing Materials                                              |                                                                                                                                                                                  |                        |
| Portland Cement Concrete                                                               | Leakage through poorly sealed joints and cracks will be much higher                                                                                                              | $< 10^{-8}$            |
| Asphaltic Concrete                                                                     | Highly dependent upon density. Increased leakage at construction joints between lanes, particularly if poorly done.                                                              | $10^{-3}$ to $10^{-8}$ |
| Typical Base and Subbase Courses, Fill Materials, and predominately Granular Subgrades |                                                                                                                                                                                  |                        |
| Dense-Graded Base Course                                                               | Well-graded, low plasticity, about 5 to 15 percent passing the No. 200 sieve, and very well compacted. Typically, GW-GM, GP-GM, or GM by the unified soil classification system. | $10^{-2}$ to $10^{-6}$ |
| Dense-Graded Base with Few or No Fines                                                 | Similar to the above but with 0 to 5 percent passing the No. 200 sieve and classifying as GW or GP by the unified soil classification system.                                    | $10^{-1}$ to $10^{-2}$ |
| Clayey Gravels                                                                         | Have significant plastic fines and classify as GW-GC, GP-GC, or GC by the unified soil classification system.                                                                    | $10^{-3}$ to $10^{-7}$ |
| Open-Graded Gravels                                                                    | Uniformly-graded with few or no small sand sizes. Designed to provide good drainage and classifying as GP. Typical example is No. 57 stone in ASTM D 448                         | $10^{-1}$ to $10^{-2}$ |
| Well-Graded Sand with Few or No Fines                                                  | Often sold as a concrete sand and classifying as SW or SP by the unified soil classification system.                                                                             | $10^{-2}$ to $10^{-4}$ |
| Silty Sands                                                                            | Typically classifying as SP-SM, SW-SM, or SM.                                                                                                                                    | $10^{-3}$ to $10^{-7}$ |
| Clayey Sands                                                                           | Typically classifying as SP-SC, SW-SC, or SC.                                                                                                                                    | $10^{-6}$ to $10^{-8}$ |
| Poorly-Graded Sands                                                                    | Typically classifying as SP. Examples would be beach or filter sands.                                                                                                            | $10^{-1}$ to $10^{-3}$ |
| Typical Fine-Grained Subgrade Materials                                                |                                                                                                                                                                                  |                        |
| Silts                                                                                  | Typically classifying as ML or MH.                                                                                                                                               | $10^{-4}$ to $10^{-9}$ |
| Lean Clays                                                                             | Typically classifying as CL or CL-ML.                                                                                                                                            | $< 10^{-6}$            |
| Highly Plastic Clays                                                                   | Typically classifying as CH.                                                                                                                                                     | $< 10^{-8}$            |

Generally, the base course will have to be a special material selected for its high drainage capacity. This will normally be an open-graded material such as a size No. 357 (2 in. to No. 4), No. 467 (1 ½ in. to No. 4), No. 57 (1 in. to No. 4), or No. 67 (¾ in. to No. 4) stone from ASTM D 448. This material should be crushed so that it has a high degree of stability as well as high drainage capacity. These open-graded materials are sometimes difficult to work with during construction as they are unstable under foot and vehicle traffic unless they are confined in the pavement structure. For that reason they are sometimes "choked" with a finer gravel which provides a more stable operating surface. The choking material is spread over the surface in a thin layer (~ ½ in.) and worked into the surface voids of the open-graded material by wetting and rolling with a vibratory roller (analogous to the old-fashioned Macadam pavement construction). The finer gravel helps fill in the surface voids, but because it contains no fines or fine sand particles, it still maintains a high permeability in the system. Alternatively, a gradation that has a wider spectrum of particle sizes but does not include fine sands and minus No. 200 material will provide superior stability, especially during construction activities and may still provide adequate permeability. Table 3 shows a very open-graded gradation, a choke stone gradation that may be used with it to improve surface stability of the open-graded stone, and a less permeable but still rapid-draining graded material that the U.S. Army Corps of Engineers currently recommends for use as possible drainage media in pavements. Small additions of asphalt cement and portland cement have been used to stabilize open-graded drainage layers, but extreme care must be used to ensure that only a minimal amount of binder is used to coat and secure the particles but still leave the void structure unfilled.

Conventional compaction tests are almost impossible to run on these open-graded granular materials and accurate measurement of the in-situ density is almost impossible in the field. Consequently, it is more common to specify a method of compaction rather than try to specify a certain percentage of a laboratory density as is customarily done. A minimum of six coverages with a 10-ton (static weight) vibratory roller has been used as a specification requirement for compaction of some drainage layers within pavements.

Depending on specific structural requirements, design storm, and subgrade permeability, it may be possible to use a less expensive and less open-graded material for a subbase below the base course. However, design calculations should establish the permeability needed to accomplish the project objectives.

| Table 3. Suggested Requirements for Granular Drainage Materials in Pavements<br>(U.S. Army Corps of Engineers 1992)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                               |                      |                                     |

| LA Abrasion, %                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | < 40                          | --                   | < 40                                |
| Notes: C <sub>u</sub> = D <sub>60</sub> /D <sub>10</sub> . The Corps of Engineers open-graded gradation deviates from ASTM<br>Size No. 57 stone at the ½ in. sieve where it allows 80 percent passing rather than 60 percent.<br>Choke stone is spread and vibrated into surface of open-graded material to improve surface<br>stability for construction activities if desired. Only sufficient material to fill and stabilize<br>surface voids is used. If choke stone is used it must also meet the following filter criteria: D <sub>15</sub><br>Open- Grade/D <sub>50</sub> Choke Stone < 5 and D <sub>50</sub> Open-Grade/D <sub>50</sub> Choke Stone > 2. |                               |                      |                                     |

The base and subbase also serve as storage basins to hold the water while it percolates into the subgrade. The quantity of water that may be held can be determined by

$$V = 1 - \frac{\gamma_d}{G_s \gamma_w}$$

where V is the volume of water in one cubic foot of soil or aggregate,  $\gamma_d$  is the dry unit weight of the soil or aggregate,  $G_s$  = specific gravity of the soil or aggregate, and  $\gamma_w$  is the unit weight of water, usually taken as 62.4 lb/ft<sup>3</sup>. The volume of water storage available in the base and subbase must exceed that expected to infiltrate during the design storm.

### **Subgrade**

If a subgrade has an inadequate permeability, it will tend to have a high percentage of minus No. 200 sieve fines and may also be plastic. Such materials are likely to lose strength in the presence of moisture and may pose structural and behavior problems (e.g., some clays are highly expansive when their moisture content increases). In addition, as the subgrade permeability drops, it will take increasingly long times for the water within the pavement structure to percolate into the soil. Consequently, the subgrade permeability under pavements to be subjected to vehicular traffic should be equal to 10<sup>-3</sup> cm/sec in most cases to ensure a successful application of permeable pavement concepts. Ideally, the subgrade should have less than 5 percent passing the No. 200 sieve, but subgrades with up to 25 percent passing may be adequate depending on their specific characteristics and the site conditions. It may be feasible to design adequate systems for other soils, but this will require some significant engineering effort to achieve success. Such applications must be examined carefully on a case-by-case basis. Obviously pedestrian walkways and plazas not subject to traffic loads can be designed for more impermeable subgrades.

### **Filter Requirements**

As water flows through granular materials, fine particles can be dislodged from one material and deposited in the pores of the next material. This will result in clogging and loss of permeability in the zones where these fine particles accumulate. To prevent this, materials adjacent to one another must meet filter criteria which essentially ensures that the relative particle sizes for two adjacent materials are compatible, and this internal erosion of particles will not occur. Meeting these requirements in a permeable pavement is crucial and essentially requires checking filter criteria for jointing and bedding materials (if two different materials are used, the bedding material and the base course, the base and the subbase course, and the subbase and subgrade interfaces.) Table 4 shows filter criteria that are commonly used in the U.S. and Canada. If the criteria cannot be met, an alternative material must be substituted for one of the materials, an intermediate material at least 4 in. thick that can meet the filter criteria must be placed between the layers, or a geosynthetic filter cloth can be used to separate the layers. Meeting filter requirements may prove to be the difficult part, but it is crucial to the long-term success of the project.

| Table 4. Recommended Filter Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                  |

| Notes: (1) $C_u = D_{60}/D_{10}$<br>(2) $D_x$ is particle size at which x percent of the particles are finer. Determined from gradation curve. $D_{10}$ is the size particle of a soil or aggregate gradation for which 10 percent of the particles are smaller and 90 percent are coarser.<br>(3) Water flow is from layer 2 to layer 1. See example problem in Appendix A for detailed discussion and example of application.<br>(4) $O_x$ is geotextile opening size corresponding to x particle size based on dry glass bead sieving. Hence $O_{95}$ is the geotextile opening size for which 95 percent of the holes are smaller. AOS is apparent opening size is essentially the same but normally is defined as a sieve number rather than a size (ASTM D 4751). POA is percent open area (for woven fabrics only). Permeability of the soil and geotextile (nonwoven only) are designated $k_S$ and $k_G$ respectively. |                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                  |

## Construction

Care is needed during construction to prevent contamination and plugging of the voids in the drainage and filter materials. This can arise from a variety of sources: dirt and mud tracked onto surfaces by construction surfaces, sedimentation from storm-water runoff from adjacent areas where adequate drainage and protection has not been provided, wind-blown particles from adjacent areas that are stripped of cover and left unprotected during construction, etc. It is best if construction traffic can be kept off of the drainage and filter materials, but on large projects this may not be practical. In such cases, it may be prudent to establish a on-site station to rinse off equipment tires and undercarriages before they are allowed to travel on these materials. If a drainage or filter material is contaminated by construction activities it will have to be removed and replaced. It is prudent to always inspect the surface of each layer just prior to placement of the next layer to ensure inadvertent contamination has not occurred.

## Use with Existing Runoff Design Methods

The two most common methods of estimating rainfall runoff and flows are the old "Rational" method and the newer Soil Conservation Service or SCS method. In the Rational method peak flows are calculated using a runoff coefficient or cover factor that varies from 0.1 for porous undeveloped lands to 0.95 for impervious paved areas. The Soil Conservation Service uses a "curve number" or CN that varies with the soil type and land use. The CN might vary from around 30 for a meadow with permeable soils to 98 for impervious roofs and pavements. Both methods of determining rainfall flows are used in the U.S. today. The SCS method is well documented (U.S. Soil Conservation Service 1986) and is coming into increasingly wider acceptance. The rational method is simple to use, but is best suited to small drainage basins of 200 acres or less.

**SCS Method.** The SCS method is always based on the 24 hour rainfall, and the designer or regulatory agency selects the storm recurrence period (e.g., two-year, a 24-hour storm, a ten-year 24-hour storm, etc.). This design storm is used to establish the design 24 -hour precipitation for which facilities will be designed and upon which runoff calculations will be based. The following discussion provides only a brief introduction to the SCS method, and the reader is referred to the SCS documentation (U.S. Soil Conservation Service 1986) or other appropriate professional references on this topic for complete explanation of the system and its limitations and assumptions. The basic calculation in the Soil Conservation Service method is the determination of the depth of runoff, and this is accomplished using the following equation:

$$D = \frac{(P - I)^2}{(P - I + S)}$$

where D = depth of runoff (in.)

P = depth of 24 hour rainfall

I = initial abstraction or loss of rainfall before runoff begins, often approximately 0.2S

S =  $(1000/CN) - 10$

CN = curve number which is a function of the drainage area's soil and land use

Since SF-Rima<sup>™</sup> paving stone is a new product and concept, there is no established method of incorporating it into the SCS system. However, it is possible to estimate the approximate CN value that would be appropriate for a properly designed SF-Rima<sup>™</sup> surface. If one uses the long-term design infiltration rate of 1.1 in. per hour discussed earlier as the infiltration before runoff begins and if the initial abstraction of 0.2S is accepted, the equivalent curve number or CN for SF-Rima<sup>™</sup> paving stone can be estimated to be

$$S = \frac{I_a}{0.2} = \frac{1.1}{0.2} = 5.5 = \frac{1,000}{CN} - 10$$

and

$$CN = \frac{1,000}{15.5} = 64.5$$

With these assumptions a paved area with SF-Rima<sup>™</sup> stone at a period late in its life would have an approximate curve number, CN, of 65. Table 5 provides a sample of different curve numbers for different conditions and reveals the SF-Rima<sup>™</sup> stone would have infiltration rates superior to a gravel-road and intermediate between a grass covered lawn with a B soil group and a C soil group. To use this estimated CN value, the designer should also check that the water storage capacity within the pavement will be adequate to store the water until it has a chance to infiltrate into the subgrade. Since the initial abstraction,  $I_a$ , of SF-Rima<sup>™</sup> is based on infiltration and storage into granular materials, there is no difference in CN number for different subgrade soils in Table 5. However, as noted earlier, SF-Rima<sup>™</sup> stone is best suited for well-drained soils and its use on fine-grained or clayey soils would require intensive engineering and study to be sure that it would function adequately.

| Table 5. Sample SCS Curve Numbers (CN) for Different Conditions                                                                                                                                                                                                                                                                                                                                                                              |                                                 |                         |    |    |    |

| Notes: Table is illustrative only to show relative SF-Rima™ CN value. Consult Soil Conservation Service (1986) for comprehensive tables and definitions. Soil group A soils are well-drained sandy and gravelly soils, B soils are moderately well-drained with mixed fine and coarse soil particle texture, C soils are moderately fine to fine textured with low infiltration rates, and D soils are clay soils with high runoff potential |                                                 |                         |    |    |    |

**Rational Method.** The rational method is over 100 years old and is described in almost any handbook on runoff calculations or hydraulic design. Over its long history some different variations have developed. The fundamental basis of the rational method is the following equation to calculate peak flow, Q, which was originally intended to be used to size culverts:

$$Q = CIA$$

where Q = peak flow in cubic feet per second  
 I = design rainfall intensity in inches per hour  
 A = drainage area in acres  
 C = runoff coefficient

The runoff coefficient reflects the drainage areas cover, soil, slopes, etc. (e.g., C for forest = 0.1 to 0.3, C for turf or meadow = 0.1 to 0.4, C for pavement = 0.8 to 1.0, etc.). There are a variety of different compilations for suggested C values which provide different values for similar site conditions. An appropriate C value for SF-Rima<sup>™</sup> stone can be estimated as

$$C = \frac{I-1.1}{I}$$

Where I is the design rainfall intensity in in./hr and 1.1 in./hr is the long-term design infiltration rate. This assumes 100 percent runoff of all water that is not infiltrated through the SF-Rima joints, and the designer needs to confirm the internal water storage capacity within the pavement is adequate to handle the total volume of water infiltrated by the design storm. Once the internal storage capacity within the joints, bedding layer, base, and subbase is full, runoff would be 100 percent.

## STRUCTURAL DESIGN CONSIDERATIONS

The pavement must have the structural design capacity to withstand the anticipated loads. There are two fundamental aspects to providing structural capacity. First, the materials used within the pavement system must be structurally sound and able to withstand the loads. Second, the thickness of the pavement must be sufficient to distribute the surface loads over a large enough area to avoid shear deformations in the subgrade.

### Material Requirements

Material requirements identified for hydraulic design considerations were very stringent in order to achieve the desired long-term infiltration capacities. Materials used in the pavement (joint filler, bedding layer, base, subbase, and filters as needed) are essentially granular materials and in most cases are crushed materials. This should provide a high degree of strength. All of these materials must be nonplastic (ASTM D 4318) which is more stringent than normally used in pavement construction. However, because of the large volumes of water passing through the pavement structure, it will be necessary to avoid plastic materials which are vulnerable to losing strength when wet. The permeability requirements generally require that all of the materials have little to no fines which also avoids development of pore pressures under load and loss of strength.

Pavement materials are compacted for two reasons: (1) to avoid densification under traffic and (2) to achieve strength and other engineering properties in the field at least equal to those assumed in design. From a water infiltration point of view, we wish to limit compaction as increased compaction translates into reduced permeability. However, compaction levels to be achieved in the field are based on engineering requirements and generally should not be waived without careful evaluation of the implications. Rollings and Rollings (1996) provides an

extensive discussion of compaction and its effects on soils and aggregates. In general, it will be necessary for all portions of trafficked SF-Rima<sup>TM</sup> pavements to be compacted to levels equivalent to those used in conventional pavements.

The very rapid draining nature and very low fine content of materials used in SF-Rima<sup>TM</sup> pavements should avoid problems with frost and frost heave within the pavement structure. In the unusual combination where water from rain or thawing snow is caught within the pavement system by sustained freezing temperatures the existing water in the system will expand by 9 percent. However, the lack of fines within the base, subbase, bedding layer, and joint filling material prevents highly destructive ice lenses formed by the migration of unfrozen water to the freezing zone from occurring within the SF-Rima<sup>TM</sup> pavement system. This ice lens formation is the phenomenon that causes the frost heaves in conventional pavements in severe climates that are so destructive to pavements and aggravating to motorists. The open void structure of the materials used in the SF-Rima<sup>TM</sup> pavement allows room to accommodate some volume expansion from freezing. In the unusual situation where the whole system is saturated and then is rapidly frozen some heave is possible, but the modular nature of the SF-Rima<sup>TM</sup> pavement surface accommodates such heave far better than conventional pavement surfaces. This product has been used successfully in Germany for over 10 years now and has demonstrated its ability to perform satisfactorily under wet and cold winter conditions. In frost regions, the effects of freezing on the subgrade soils will have to be evaluated as for any other pavement.

### **Thickness Design Methods**

Modular concrete systems such as SF-Rima<sup>TM</sup> provide a high-quality pavement surface. However, these are flexible pavements as are asphalt concrete surfaced pavements. It is the overall thickness and quality of the base and subbase and strength of the subgrade that provide the structural capacity of the pavement. SF-Rima<sup>TM</sup> is a wearing surface, and like all flexible pavement surfaces, its contribution to the pavement structural capacity is modest. SF-Rima<sup>TM</sup> will not make up for inadequate base, subbase, or thickness in the pavement.

Considerable work has been done examining behavior of conventional concrete paving blocks with relatively narrow sand filled joints. These studies are extensively reported and discussed in the proceedings of the international conferences on concrete paving blocks that are held every four years. SF Concrete Technology or the authors of this report can assist the reader desiring more detail on this topic in locating these references. Rollings et al (1992) provides a summary and contrast of different structural design concepts for these conventional concrete paving block pavements. These past studies have confirmed that these pavements behave as flexible pavements and provided basic approaches for structural design. Structurally, SF-Rima<sup>TM</sup> behaves as does a conventional block pavement. It has wider joints which will tend to reduce its stiffness somewhat, but it also has a high-quality crushed aggregate as a joint filler rather than sand which should tend to increase its resistance to deformation. Because extensive structural testing has not been carried out with SF-Rima<sup>TM</sup>, it is probably best to use a conservative approach to interpreting design guidance for conventional blocks. There are three fundamental approaches to structural thickness design of block pavements that can be adapted to use with SF-Rima<sup>TM</sup>. Only a quick summary of how to adapt existing design methods can be provided here.

**Equivalent Thickness.** In this approach, a conventional asphalt concrete pavement thickness is designed using any existing design method. Then the SF-Rima<sup>TM</sup> stone is simply used as a direct one-for-one substitution of the existing design. The 80-mm thick SF-Rima<sup>TM</sup> stone and 1-in. thick bedding layer simply comprise the top 4 in. of the existing design requirements. The subgrade strength will have a major impact on the total design thickness. The base and subbase and filter courses as required are used to provide the remainder of the pavement thickness. In many cases, particularly if traffic loads are relatively light, hydraulic design considerations (water volume storage, filter requirements, etc.) may control the thickness of the pavement rather than structural load supporting requirements. This approach is easy, and it is easily adapted to situations where an agency requires a specific design approach.

**AASHTO.** The AASHTO design method or some modification of it is widely used by state departments of transportation. This design approach is based on the AASHTO road tests and uses an empirical equation to relate passes of an equivalent 18 kip axle load to the structural capacity of the pavement (represented by a structural number or SN) and the serviceability index of the pavement. The major problem with adapting SF-Rima<sup>TM</sup> to this design approach is identifying an appropriate layer coefficient ( $a_1$ ) for determining the structural number of the pavement. Rada et al (1990) estimated that an appropriate AASHTO layer coefficient ( $a_1$ ) for conventional paving blocks and bedding layer would be initially 0.26 with it increasing with traffic as the system locks up and stiffens until a value of 0.44 at 10,000 equivalent axle load repetitions. This should be adequate for SF-Rima<sup>TM</sup> also.

**Layered Elastic Design.** Several pavement design methods have been published in recent years that use the layered elastic analytical model to calculate strains in the pavement and use these calculations as a basis for design of the pavement. Each layer in the pavement has to be represented by a modulus of elasticity and Poisson's ratio to allow the calculations to be made. Obviously, SF-Rima<sup>TM</sup> is not a continuous, linearly elastic medium so an equivalent effective modulus and Poisson's ratio are needed to allow design with this technique. A variety of investigators have used different techniques to determine an effective modulus for conventional blocks, and an effective modulus in the range of 150,000 to 650,000 psi appears reasonable for conventional block pavement surfaces (Rollings et al 1992). For SF-Rima<sup>TM</sup>, with which we have less experience than conventional paving block, a lower design value in the range of 200,000 psi would appear prudent at this time. Poisson's ratio should be taken as appropriate for a granular material and should probably be 0.30 to 0.35.

## CONCLUSIONS

Our view on the world today is changing. Concepts of *sustainable development* or *green development* have moved from the esoteric world of the academic and the polarized rhetoric of the activist to the pragmatic worlds of development, engineering, and construction. SF-Rima<sup>TM</sup> permeable paving stones provide us with a tool with which we can design new approaches to control storm water. Rather than being forced to deal with the massive quantities of runoff from our paved surfaces, we can now develop methods of allowing portions of this water to enter the pavement and infiltrate into the native soils. This reduces the quantity of runoff for which we must make provisions, reduces downstream pollution and sedimentation, and allows for desirable

recharge of our natural ground-water system. With SF-Rima™ a whole new approach to dealing with storm water is available and that is fully compatible with modern concepts of sustainable development.

While SF-Rima™ is new in North America, it has a decade of successful past use in Germany. Because of this past experience and lack of any similar experience in North America, this document has relied heavily on German experiences and practices and has been purposely conservative in interpretation of available information. Not every site or subgrade is suitable for a permeable pavement, and this document has tried to identify those conditions under which the greatest success can be expected. Proper selection of materials to use with the SF-Rima™ paving stones is crucial, and this document has suggested appropriate materials for use as the joint filler, bedding layer, and in the base and subbase courses. The water flow within the pavement can wash particles from one layer to another so it is crucial that filter criteria such as that in Table 4 be met. Since this is a new product, existing runoff design methods and structural pavement design methods do not specifically address SF-Rima™ systems. Available information has been used to provide methods of adapting the two most commonly used runoff design methods and three different pavement structural design methods to accommodate SF-Rima™, and its unique characteristics. As more experience is gained with this product here in North America, practices with SF-Rima™ will also evolve further.

APPENDIX A: EXAMPLE DESIGN PROBLEM

This example is illustrative only and is to demonstrate the steps and considerations involved in designing an SF-Rima™ pavement. Several aspects are highly simplified in this example to allow a simple presentation of the concepts. Actual designs should be done by professionals who are cognizant of the technical and regulatory issues involved in this type of engineering work.

A parking lot for a new car dealership is to be built to minimize runoff using a SF-Rima™ surface. The rational method will be used for storm-water design, and the design storm intensity for this example will be 2 in./hr (the actual design storm is selected based on local regulatory requirements or if there is none, it is a matter for professional engineering judgement based on local climate, site conditions, and criticality of the facilities that may be affected by storm-water runoff). The subgrade soil is a poorly-graded sand. A crushed fine aggregate is available for the joint filling material, and a crushed aggregate meeting the Corps of Engineers requirements for a rapid draining material in Table 3 is available for the base course material. The gradations for the subgrades and these construction materials are shown in Figure A1.

Figure A1. Material Gradations for Example Problem and Showing Calculation of D<sub>10</sub> Value for the Subgrade

### Site Suitability

The subgrade is a poorly graded sand with only 4 percent passing the No. 200 sieve which would lead one to expect a permeability of  $10^{-2}$  to  $10^{-4}$  cm/sec based on Table 2. Hazen's equation (pg 8) would estimate a permeability of  $1.0$  to  $1.5 \times 10^{-2}$ . More sophisticated analysis and testing could be done in the field or laboratory, but it appears that the subgrade will meet or exceed the desired target permeability of  $5.4 \times 10^{-3}$  cm/sec or better. For the purpose of this example, the other site suitability limitations (e.g., depth to water table, slope, adjacent facilities, etc.) given earlier in the *Site Selection* portion of this report will be presumed to be met.

### Materials

The joint, bedding, and base course materials meet the limitations on suggested gradations and should have adequate permeability. Other requirements relating to quality, soundness, and durability will be presumed to be met for this example.

### Filter Requirements

Table 4 provides the filter requirements for preventing piping within the pavement materials, and these are expressed in terms of relative ratios of critical particle sizes. These are selected from Figure A1 in exactly the same manner as the  $D_{10}$  value for the subgrade was done for the calculation with Hazen's equation. These critical particle sizes are shown in Table A1 and are determined directly from the gradation curves in Figure A1.

| Table A1. Critical Particle Sizes in mm                                                                                                                                                                                                                           |          |          |          |          |          |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|----------|----------|----------|----------|
| Soil                                                                                                                                                                                                                                                              | $D_{10}$ | $D_{15}$ | $D_{50}$ | $D_{60}$ | $D_{85}$ |
| Subgrade                                                                                                                                                                                                                                                          | 0.10     | 0.12     | 0.25     | 0.32     | 0.63     |
| Base                                                                                                                                                                                                                                                              | 2.0      | 2.8      | 11       | 15       | 25       |
| Joint/Bedding Material                                                                                                                                                                                                                                            | 1.1      | 1.3      | 1.6      | 1.8      | 2.7      |
| Notes: $D_x$ is defined to be the particle size in mm from a soil's gradation curve for which x percent of the soil's particle are smaller, e.g., $D_{10}$ is the particle size for which 10 percent of a soil's particles are smaller and 90 percent are larger. |          |          |          |          |          |

These critical particle sizes are then used to check the filter criteria in Table 4. The Federal Highway/Corps of Engineers criteria from Table 4 will be used for this example and the results are shown in Table A2.

| Table A2. Comparison with Filter Criteria |                 |                 |                 |                       |
|-------------------------------------------|-----------------|-----------------|-----------------|-----------------------|
| Parameter                                 | $D_{15}/D_{15}$ | $D_{15}/D_{85}$ | $D_{50}/D_{50}$ | $C_u = D_{60}/D_{10}$ |
| FHWA/COE Criteria from Table 4            | $\geq 5$        | $\leq 5$        | $\leq 25$       | $\leq 20$             |
| Joint/Bedding Material to Base Course     | 2.2             | 1.04            | 6.88            | 7.5 (base)            |
| Base Course to Subgrade                   | 0.04            | 0.005           | 0.02            | 3.2 (subgrade)        |
| Subgrade to Base Course                   | 23.3            | 4.46            | 44              | 7.5 (base)            |

To properly interpret the filter criteria of Table 4, it is useful to understand the origin and intent of the various requirements. The  $D_{15}/D_{15}$  and  $D_{15}/D_{85}$  ratios are the original criteria developed from empirical tests for filters for soil mechanics applications during the first half of the twentieth century. The  $D_{15}/D_{15}$  ratio ensures that the permeability of the material (layer 1 in Table 4, also often referred to as the filter layer in soil mechanics texts) into which the water flows is much higher than the soil from which it exits. This avoids developing seepage pressures at the interface between the layers. For the SF-Rima™ pavement it ensures that the underlying material can drain the water in the layer above very rapidly, and no backup occurs in the upper layer. The  $D_{15}/D_{85}$  ratio checks that fine particles in layer 2 (often referred to as the protected soil in soil mechanics texts) cannot be carried by flowing water into the matrix of layer 1. The  $D_{50}/D_{50}$  ratio is another check added later to avoid internal erosion of particles. The  $C_u$  limitation tries to avoid problems with segregation (separating of the material into pockets of coarse and fine material in the course of its being handled by equipment) within the material during placement. The limitation that a filter material contain less than 5 percent passing the No. 200 sieve ( $D_5$  of layer 1  $\geq 0.074$  in Table 4) was added for filters in pavement systems that were between a subsurface drainage layer and another material in the pavement that was to be protected from internal erosion. This requirement was meant to minimize the amount of fine material in the filter that was available to wash into a drainage layer; desirable but again not mandatory.

For this example problem, we want to consider three potential interfaces where problems may develop as water flows from (1) the joint and bedding layer material (layer 2 in Table 4) to the base course material (layer 1 in Table 4), (2) base course to the subgrade, and (3) subgrade to the base course. The calculations for the filter criteria are shown in Table A2, and we will now examine the implications for each interface.

Joint/Bedding Layer to Base Course. The  $D_{15}/D_{85}$  and the  $D_{50}/D_{50}$  protection against internal migration of particles are easily met. Similarly, the desirable requirements for  $C_u$  and  $D_5$  are met. The problem arises with the  $D_{15}/D_{15}$  ratio to ensure high permeability; it fails to reach the desired level. Because this is a permeability issue as opposed to filtration, addition of a geotextile at the interface will not solve the problem. Ideally, either a finer bedding layer or a coarser base course is needed. The criteria for filters suggests that if the currently selected jointing/bedding material is used the  $D_{15}$  of the base course should be at least 6.5 mm which requires an open-graded aggregate. This can be met by changing to the open-graded aggregate

in Table 3, an ASTM size No. 57 stone for the base course, or by a coarser gradation of the rapid-draining material in Table 3. Alternatively, the joint/bedding layer could be changed so that its  $D_{15}$  value is no more than 0.56 mm. This is finer than the suggested gradation for joint/bedding materials so a change in the base course is needed.

Base Course to Subgrade. The permeability requirement ( $D_{15}/D_{15}$ ) is not met, but this is to be expected since the objective of the pavement is to allow infiltration to occur over time. The length of time this requires will be discussed in a following section. The requirements for internal erosion and piping and  $C_u$  are met.

Subgrade to Base Course. Normally water will flow from the base course to the subgrade, but the situation can be reversed. This may occur because of a rise in the water table or during the spring thaw period or more likely due to dynamic pressures of traffic or by water flowing in from the shoulders or sides of the pavement. These materials fail the  $D_{50}/D_{50}$  criteria for protection against internal erosion of particles (i.e., finer particles in the sand may wash into the base course material). This can be remedied by using a finer-graded subbase material between the base course and subgrade or by placing a geotextile to serve as a filter between the two materials.

In this example problem, the materials do not meet the specified filter requirements and alternate materials must be used. However, the remaining design calculations will be examined to illustrate the design steps.

### Storm-Water Runoff Calculations

The runoff coefficient for the Rational Method (pg 16) can be estimated for a SF-Rima<sup>TM</sup> pavement as

$$C = \frac{I-1.1}{I} = \frac{2-1.1}{2} = 0.45$$

Hence, the peak flow will be

$$Q = CIA = 0.45 \times 2 \times A = 0.9 \text{ cfs per acre of the site}$$

For this storm intensity, 1.1 in. of the rain will infiltrate into the pavement and only 0.9-in. has to be accommodated in another storm-water control system. This surface storm-water control system can then use other modern infiltration concepts such infiltration basins, subsurface reservoirs, or wells (Ferguson 1994) to obtain the maximum ecological benefit.

Conventional asphalt or concrete pavements would typically have C values of 0.8 to 1.0. Consequently, use of a SF-Rima<sup>TM</sup> pavement system has reduced the surface runoff to approximately half that required for a conventional pavement.

### Storage Capacity

The base course must provide sufficient storage capacity to hold the design storm water that infiltrates through the SF-Rima™ surface. To determine this one needs to know the dry density and the specific gravity of the base course material (pg 12). The dry density of the base course can be determined in the laboratory by running an appropriate compaction test representative of the final placement conditions (e.g., 95% modified density, 100% standard density, etc., see Rollings and Rollings 1996 for a discussion of compaction tests and specifications). The specific gravity of aggregates is also a simple laboratory test, and many aggregates will have a value of approximately 2.65. For this example, we will use a in-situ dry density of 135 lb/ft<sup>3</sup> and a specific gravity of 2.65. Then the volume of water that can be held within the voids in one cubic foot of base course aggregate will be

$$V = 1 - \frac{\gamma_d}{G_s \gamma_w} = 1 - \frac{135}{2.65 \times 62.4} = 0.18 \text{ ft}^3$$

Regulatory requirements will generally determine what quantity of water must be retained on site for the design storm. For example, if regulatory directives mandated that a 2-hour storm must be retained on site for our example, each square foot of SF-Rima™ pavement would have to be able to store 2.2-in. depth of water (2 x the long-term infiltration capacity of 1.1 in./hr) within the base course below. A 2.2-in. depth of water on 1 square foot (144 in.<sup>2</sup>) is 0.18 ft<sup>3</sup> or, coincidentally, the same volume as is available for storage in 1-cubic foot of base course aggregate in our example problem. Consequently, a full foot of base course aggregate thickness would be required to provide the necessary storage capacity for the regulatory requirement of a two hour storm retention for our problem.

The equations used for determining the permeability of a soil sample using a falling head permeameter (see Rollings and Rollings 1996 or any text on soil mechanics for these equations) can be adapted to give a rough approximation of how long it will take for the water in the base to drain out if the underlying subgrade is already saturated (i.e., steady-state flow into the subgrade is established). If the subgrade is not already saturated, the time will be shorter. The equation for this calculation is

$$t = \frac{D}{k} \ln \frac{D + h_b}{D}$$

where: t = time for water to drain out of base course

D = depth to the water table

k = permeability of the subgrade

h<sub>b</sub> = thickness of the base

If in our problem, the depth to the water table is 6 ft (1.8 m) and the subgrade permeability k, is 1 x 10<sup>-3</sup>, the one-foot (0.305-m) depth of base course following a 2 year design storm will

completely drain in about

$$t = \frac{180 \text{ cm}}{10^{-3} \text{ cm/sec}} \ln \frac{180 \text{ cm} + 30.5 \text{ cm}}{180 \text{ cm}} = 28,175 \text{ sec.}$$

This is roughly 8 hours. If the subgrade was a clayey sand (SC) or lean clay (CL) the permeability would be more on the order of  $10^{-7}$ . Substituting that permeability in the above equation would result in a drainage time of approximately 9 years. This illustrates the important impact that subgrade permeability has on the performance of permeable pavements.

### Structural Design

The pavement must also be structurally designed for the loads to be applied. Several approaches to this are described in the report. The simplest is to design a flexible pavement (asphalt surfaced) using the local state department of transportation methods and simply directly substitute the SF-Rima™ for the required thickness on a one-to-one basis (SF-Rima™ stone provides 3.1-in. of thickness, bedding layer is 1-in., and the base and subbase thicknesses are used to obtain the additional thickness needed to equal the total design thickness over the subgrade). In our example, the structural requirements will be modest (lightly loaded car dealership parking lot), and by almost any method, the design thickness for the base course for structural requirements will be less than the one-foot thickness required to hold the regulated storm. The thickness of base and subbase will always be the thickest needed for hydraulic storage requirements or structural design requirements.

## **1.0 INTRODUCTION**

This report presents the geotechnical engineering study performed by Condor Earth Technologies, Inc. (Condor) for the proposed storage caves at The Culinary Institute of America at Greystone. The site is about 1,250 feet southeast of the Deer Park Drive/St. Helena Highway Intersection. Figure 1 shows the approximate site location.

The entry tunnels for the caves will extend from an existing loading dock retaining wall and beneath an existing patio (an exterior concrete pavement). Section 2.0 presents a more detailed description of the proposed caves.

Condor presented our scope of work for this geotechnical engineering study in our December 16, 2015 Proposal and our April 8, 2016 Addendum. The purpose of the work was to:

- Provide geologic and geotechnical engineering data
- Develop conclusions regarding the potential for geologic hazards for the proposed improvements described in Section 2.0
- Develop geotechnical engineering conclusions and recommendations for design and construction of the proposed improvements described in Section 2.0.
- Address construction issues related to ground conditions and existing improvements above the proposed tunnels.

Condor will design the tunnels. We will present tunnel drawings and ground support calculations separately.

The design team provided Condor the following drawings:

- March 25, 1974 topographic survey map by H.J. Brunnier Associates, Engineers (Brunnier)
- April 14, 1995 structural engineering drawings by Culley Associates, Inc. (Culley)
- February 1, 2016 draft cave layout by Architectural Resources Group
- May 13, 2016 topographic survey map by Albion Surveyors & Land Use Consultants (Albion)

The Culley drawings are structural engineering plans and details for the patio (described as the “Terrace”). The Brunnier drawings show the topography that existed at the site before the patio existed and the Albion survey shows existing topography plus information from a recent underground utility survey. Condor used information from these three drawing sets for our engineering evaluations presented in this report and for our design of tunnel ground support.

Condor previously investigated site and subsurface conditions for a proposed storage cave southeast of the currently proposed cave site. The team then revised the conceptual design. We drilled borings B-1 and

B-2 for the former caves location, and we drilled B-3 and excavated test pits for the currently proposed location (see Figure 2). We used data from B-1 and B-2 for our geotechnical engineering study for the currently proposed caves. This report presents data from B-1 and B-2.

Condor will incorporate the recommendations in this report for our design of tunnel ground support. Condor and the construction team will use the data, information, discussions, conclusions, and recommendations for construction.

## 2.0 PROJECT DESCRIPTION

Figure 2 shows the pertinent aspects of existing site conditions and the proposed storage caves. The project will include constructing entry tunnels extending from two portals at the loading dock retaining wall. The loading dock retaining wall is a reinforced concrete wall over an older masonry retaining wall at the northwest end of the building. The contractors will create portals/entry tunnels by saw-cutting the perimeter of the portal openings on the loading dock retaining wall, demolishing/ removing the concrete within the saw cuts, exposing ground retained by the loading dock wall, and then mining the entry tunnels behind the openings. The portal openings will be 10 feet high and 10 feet wide.

A reinforced concrete frame will be doweled to the loading dock wall face around the sides and top of the perimeters of the portals to improve the structural capacity of the wall (which will be compromised by making the portal openings). The frame will be constructed before saw cutting and demolition.

The tunnel widths will be 8 to 14 feet. The cross section shapes will be constant radius with level inverts. The ground cover over the crowns of the entry tunnels will be 2 to 4 feet. Cover will be up to about 50 feet at the southwest side of the caves (where tunnels extend beneath the northeasterly descending hillside ground surface).

The tunnels will extend beneath an existing patio, retaining walls, a driveway, underground utilities, and landscape areas. The tunnels may be near an old masonry retaining wall buried beneath the existing ground surface (if it was not removed). The Brunnier drawings show this old retaining wall. Section 5.0 summarized pertinent information regarding the existing improvements.

Underground utilities may conflict with the proposed tunnel excavations. Such utilities, where known, would be removed, and excavations made for removal would be backfilled before tunnel construction.

Cave construction will consist of excavating the tunnels using mechanical means (backhoe, milling head, and/or roadheader), and sequentially supporting the excavations with reinforced shotcrete (initial support followed by final support). The tunnel floors will be cast-in-place reinforced concrete placed after completing the tunnel liner.

If the geotechnical engineering aspects of the project to be constructed vary significantly from Condor's description, then we should re-evaluate the conclusions and recommendations contained in this report.

## 3.0 SCOPE OF WORK

Condor's scope of work consisted of the following:

- Performing a site and subsurface investigation, as described in Section 4.0
- Presenting geologic data and information
- Presenting subsurface data

- Developing geotechnical engineering conclusions and recommendations for the following:
  - Anticipated subsurface and groundwater conditions at excavations for the tunnels
  - Seismic design according to the 2013 California Building Code (CBC) method
  - Seismicity
  - Potential for geologic hazards
  - Footings at the portal inverts (for design of frames around the portal openings)
  - Lateral earth pressures for evaluating the existing loading dock retaining wall (for design of frames around the portal openings) and the existing site retaining walls (for design of ground support for tunnels beneath site retaining walls)
  - Ground strength/stiffness parameters and criteria for design of tunnel ground support
  - Construction considerations

#### 4.0 SITE AND SUBSURFACE INVESTIGATION

Condor's site investigation consisted of observing, documenting and evaluating the geotechnical engineering aspects of the existing site conditions at the proposed tunnels and portals for the caves. This work included reviewing and evaluating the drawings by Culley, Brunnier, and Albion.

Condor investigated subsurface conditions by drilling three borings (B-1 through B-3) and excavating four test pits (TP-1 through TP-4). As mentioned in Section 1.0, Condor drilled B-1 and B-2 for a previously proposed site and used the data from these borings for this geotechnical engineering study.

Figure 2 shows the approximate test pit locations, approximate boring locations, and the pertinent aspects of site surface conditions. Appendix A contains the test pit logs, boring logs and core photographs. Section 5.0 presents a description of site conditions and Section 8.0 presents a description of subsurface conditions.

Condor's subcontractor drilled the borings using a CME-55 drill rig with augers and PQ-size rock coring equipment. They drilled the borings vertically. The boring depths were about 27.1 to 39.9 feet.

Our subcontractor circulated drilling fluids during drilling. They advanced the borings by making continuous core runs after drilling the first 2.5 to 5 feet using an auger. Each core run was about 2.5 to 5 feet long. They drove a split-spoon sampler with metal liners using a 140-pound hammer falling 30 inches (between core runs or after tripping-out auger). They used an auto-hammer hammer. The outside diameter of the sampler was about 3 inches and the diameter of the liners was about 2.5 inches. The boring log shows the number of blows made to drive the sampler over three consecutive 6-inch increments.

A Condor geologist performed the following:

- Observed the drilling
- Logged soil cuttings, the retrieved core, and split-spoon samples
- Recorded core recovery for the core runs (as a measured/estimated percentage of the total core run length) and blow-counts for the split-spoon sample
- Recorded other pertinent data
- Placed the retrieved core into boxes
- Capped and labeled the sample liners
- Photographed the retrieved core

Soon after they completed drilling, our subcontractor backfilled the borings with neat cement grout.

Laborers excavated the test pits using shovels and picks. A Condor geotechnical engineer and geologist obtained disturbed samples in bags and relatively undisturbed samples by hand hammering a drive sampler with a metal sample liner below nearly level surfaces in the test pits. The sampler has an approximate outside diameter of 2.5 inches and the diameter of the liners was about 2 inches. Condor logged exposed ground conditions, logged exposed foundation conditions (including measured dimensions and depths), recorded other pertinent data, labeled bag samples, and capped/labeled liner samples.

Condor classified soil using the Unified Soil Classification System and the visual-manual procedure, and characterized the engineering properties of the rock using the rock property terms presented in Appendix A.

Condor delivered the sample and retrieved core to our office for further examination and we selected samples for laboratory tests. We delivered the selected samples to our subcontracted laboratories. The laboratories performed the tests that follow:

- Particle size distribution
- Liquid and plastic limits
- Moisture content and dry density
- Staged triaxial consolidated undrained shear strength with pore pressure measurements
- Corrosivity

Appendix B contains the laboratory test reports and the logs in Appendix A summarize the test results.

## 5.0 SITE CONDITIONS

Figure 2 shows the pertinent aspects of site conditions. There is a patio (exterior concrete pavement) and other site improvements on the ground surface above the proposed cave tunnels. The landscape/paved driveway areas beyond the patio slope down to the east and northeast. A recent underground utility survey and site survey revealed the presence of underground utilities beneath the landscape and driveway area (and near the proposed tunnels).

The patio is elevated above the adjacent ground surface and bordered by a concrete retaining wall up to 4 feet high (that retains the ground that the patio bears on). A continuous footing supports the retaining wall. There are tie beams (reinforced concrete) aligned in a northwest/southeast direction beneath the patio slab.

Drawings for the Terrace (patio) indicate that Culley designed the retaining wall footings as 8-inches thick, 18-inches wide, centered along the wall centerline, and bottomed at 3 feet (minimum) below the final ground surface below the wall. Our test pits exposed portions of this footing (see Section 8.0). The drawings show that the design wall thickness is 12 inches.

The drawings show that Culley designed the tie beams with an 18-inch width and to bottom at 18 inches below the terrace surface.

Figure 2 shows the location of the old masonry retaining wall shown on the Brunnier drawings, which may still be in-place and buried beneath the existing ground surface. Data and our evaluations show that

the top of this wall is/was near or above the present-day ground surface. In addition, they show that the base of the wall (not including the foundations) is/was about 3.5 to 4 feet below the existing ground surface.

## 6.0 SITE GEOLOGY

Figure 3 shows the approximate site location on a published geologic map. The figure shows that the site is in an area with Pumiceous ash-flow tuff. Condor's borings and test pits encountered volcanoclastic alluvium of the Sonoma Volcanics beneath artificial fill. Section 8.0 contains information regarding conditions encountered in the test pits and borings.

## 7.0 EARTHQUAKE FAULTS

Figure 4 shows the approximate site location on a map showing known earthquake faults within at least 60 kilometers (km) of the site. The faults are grouped as "Historic" (evidence of movement over the last 150 years), "Holocene" (evidence of movement over the last approximately 150 to 15,000 years), "Late Pleistocene" (evidence of movement over the last approximately 15,000 to 130,000 years), and "Early Quaternary" (evidence of movement over the last approximately 130,000 to 1.6 million years). The nearest significant fault/fault-zones follow (group, fault/fault zone name - distance/direction from site):

- Historic: Green Valley Fault Zone (Historic segment) – about 43 km to the southwest; West Napa Fault (historic segment) – about 24 km to the southeast
- Holocene: Rodgers Creek Fault Zone – about 20 km to the southwest
- Late Pleistocene: Maacama Fault Zone – about 15 km to the west/southwest
- Early Quaternary: West Napa Fault Zone (early Quaternary segment) – about 1.6 km to the south

No known faults traverse the site.

A segment of the West Napa Fault is now historic because of movement that occurred from the 2014 South Napa earthquake. The epicenter was about 31 km to the south/southeast of the site and the approximate northern limit of rupture was about 24 km south/southeast of the site, based on available information for the United States Geological Survey.

## 8.0 SUBSURFACE CONDITIONS

B-3 and the test pits encountered artificial fill over volcanoclastic alluvium. The fill extended to as deep as 7 feet below the patio ground surface. B-1 and B-2 encountered volcanoclastic alluvium below the driveway pavement.

The fill encountered is stiff to very stiff lean clay to lean sandy clay (CL). The exception to this is in TP-4, where that excavation encountered fill consisting of sand. This sand fill appears to be underground utility trench backfill.

The encountered volcanoclastic alluvium is severely weathered and has the consistency of stiff to very stiff lean clay with sand/lean sandy clay (CL), stiff sandy silt (ML), and medium dense to dense clayey sand (SC). The borings encountered cobble- to boulder-sized volcanic rock in the soil-like matrix. The volcanic rock encountered is hard and strong.

Our test pits encountered no groundwater during excavation in April 2016. Drilling fluids would have obscured any groundwater encountered in the borings.

TP-1, TP-3 and TP-4 encountered the downslope sides of footings supporting the retaining walls around the border of the patio. Where encountered, the top of footing is about 2 feet below the existing ground surface, is relatively level, and extends at least 8 inches downslope from the downslope face of the wall stem. Where the footing bottom was exposed (in TP-1 and TP-4), it extends about 12 inches below the top of footing (or to a depth of 3 feet below the ground surface).

## 9.0 CONCLUSIONS AND RECOMMENDATIONS

Based on our evaluation, Condor concludes that construction of the proposed improvements described in Section 2.0 is feasible from a geotechnical engineering standpoint.

Condor anticipates that excavations for the tunnels, where free of existing improvements, will expose up to 2 feet of artificial fill over volcanoclastic alluvium. We anticipate that the fill will consist of stiff to very stiff lean clay to sandy lean clay (CL). We anticipate that the volcanoclastic alluvium will be severely weathered and will have the consistency of stiff to very still lean clay with sand/sandy lean clay (CL), sandy silt (ML), and medium dense to dense clayey sand (SC). We anticipate that the volcanoclastic alluvium will contain cobble-to boulder-sized volcanic rock that is strong and hard.

The tunnel excavations may encounter footings supporting existing retaining walls, the old buried masonry retaining wall, unknown underground utilities, and other unknown underground facilities. Condor anticipates that a masonry footing supports the old wall. There may be granular backfill in unknown underground utility trenches or behind the old retaining wall.

Some underground utilities may be removed where they conflict with the proposed tunnels. The Contractor would backfill excavations for removed utilities according to recommendations in this report (cementitious backfill or compacted clay backfill). New trenches should be set back at least 3 feet from tunnel excavations.

Condor anticipates that minor to moderate groundwater seepage will occur in ground around the tunnels and behind the portals during the wet season, as water perched over clay layers, as water in ground fractures, and as water in granular backfill.

Condor anticipates that the primary geotechnical engineering issues to address are:

- The possible need to remove existing underground utilities (and backfill the excavations)
- Construction considerations related to mining in conditions with low ground cover and the need to reduce distress of existing site improvements
- Developing recommended ground parameters and loading conditions for tunnel ground support

Excavations made to remove underground utilities or for other reasons, and that extend to within 2 to 3 feet of the proposed tunnel excavations, should be backfilled in a manner intended to facilitate subsequent tunneling. Condor recommends that such excavations be backfilled with controlled density fill or compacted clayey soil. Granular backfill should not be used because such material would be more likely to ravel into tunnel excavations. This could cause fallout voids that could undermine existing improvements. In addition, the cost of backfilling fallouts during tunnel construction is higher. Section 9.4 presents specific recommendations.

Ground failures during tunnel excavation and prior to placing support could damage existing site improvements over tunnel excavations. Because ground cover is low, even small ground failures at the

tunnel crowns during excavation could undermine improvements. There may be unknown granular artificial fill exposed in tunnel excavations (backfill of unknown former excavations). Such ground may have relatively low stability. Tunnel excavations may encounter known or unknown footings. For these reasons, the Contractor may need to place initial support quickly. They should be prepared to provide temporary shoring to facilitate excavation through granular fill and to excavate existing concrete and masonry footings. Section 9.8 presents specific recommendations.

The tunnel liner needs to be designed to carry both loads from the ground weight and loads imposed on them from the existing site improvements and traffic. Re-supporting existing retaining walls by structurally connecting them to tunnel liners may be required. Section 9.5 presents specific recommendations.

The subsections that follow present Condor's conclusions and recommendations. Where referred to herein, "Geotechnical Engineer" means Condor, Condor's representative or other qualified geotechnical engineer.

### 9.1 SEISMIC DESIGN

Condor recommends using the following values for seismic design according to the 2013 CBC:

|             |                                                |
|-------------|------------------------------------------------|
| Site Class: | C                                              |
| $S_S$ :     | 1.500 g (where g is acceleration from gravity) |
| $S_1$ :     | 0.600 g                                        |
| $S_{MS}$ :  | 1.500 g                                        |
| $S_{M1}$ :  | 0.780 g                                        |
| $S_{DS}$ :  | 1.000 g                                        |
| $S_{D1}$ :  | 0.520 g                                        |

### 9.2 SEISMICITY

Condor estimated peak ground-surface acceleration ( $PGA_M$ ) using the geotechnical engineering design criteria for seismic design in Section 9.1 and other design procedures in the CBC (ASCE 7-10). Based on the results and procedures, Condor recommends using a design peak ground-surface acceleration of 0.5 g. We note that the 2014 South Napa earthquake caused a PGA acceleration of about 0.1 g at the site.

### 9.3 GEOLOGIC HAZARDS

Figure 5 shows the approximate site location on a geologic map showing landslide deposits. The map shows that there are no landslides at our upslope of the site. Condor saw no indication of natural landslides at the site (from our observation/evaluation of site conditions and subsurface conditions encountered in our test pits and borings), but observed collapse features and surface ground instability south of the proposed storage cave area (related to the collapse of historic tunnels). We therefore conclude that the potential for landslides is low in the area of the storage caves and that no additional evaluation and mitigation for landslides is required in that area.

The site is not located within an Earthquake Fault Hazard Zone (Bryant and Hart, 2007), and there are no known faults at the site. The nearest know fault zone is 1.6 km from the site (see Section 6.0). Condor therefore concludes that the potential for ground surface rupture from faulting is low, and that no additional evaluation or mitigation for fault hazards is required.

Our site and subsurface evaluation reveals that there is no loose sand beneath the site. Condor therefore concludes that the potential for liquefaction, ground displacement from liquefaction, and cyclic densification is low. In addition, we conclude that no additional evaluation or mitigation for these hazards is required.

Figure 6 shows the approximate site location on an ultramafic rock map. The map shows that the site is not in an area with ultramafic rock (ground that is more likely to contain naturally occurring asbestos). Furthermore, Condor observed no ultramafic rock on the project site and our borings encountered no such rock. Condor concludes that the risk of hazards from naturally occurring asbestos for the project is low, and that no additional evaluation or mitigation for this hazard potential is required.

Figure 7 shows the approximate site location on a radon hazard map for the state of California. The Environmental Protection Agency-recommended action level is 4 picocuries per liter. The map shows Napa County in Zone 3, defined as an area having a low potential for radon levels (less than 2 picocuries per liter). Condor therefore concludes that the potential for radon hazard is low, and that no additional evaluation or mitigation for this hazard is required.

Condor's subsurface data and our evaluations indicate that the soil at the site has a low to medium plasticity. It therefore has a low potential for volume changes from wetting/drying and is not considered "expansive soil." We therefore conclude that hazards associated with expansive soil are low and that no additional evaluations or mitigation is required. Condor should evaluate the potential for volume-changes for imported fill material.

## **9.4 EARTHWORK**

The subsections that follow present Condor's recommendations for earthwork.

### **9.4.1 Excavations**

The Contractor is responsible for the stability of temporary excavations and their excavation work should comply with applicable Cal/OSHA regulations (California Construction Safety Orders). A competent person shall determine the soil type and requirements for temporary cutslope heights and inclinations during excavation. The Contractor's competent person should regularly monitor all open cuts for evidence of incipient stability failures.

Section 9.8 presents Condor's conclusions and recommendations regarding excavation and support sequence for constructing tunnels for the caves.

### **9.4.2 Subgrade Preparation**

Section 9.9 presents specific recommendations for preparing tunnel floor subgrades.

Subgrades that become dry and/or disturbed should be scarified, moisture conditioned to near optimum to facilitate compaction, and recompacted. The Geotechnical Engineer should approve subgrades soon before they are covered.

Subgrade preparation is generally not required for bottoms of utility trenches unless there is unsuitable or unstable material exposed. We anticipate that bottoms of utility trenches will expose suitable and adequately stable ground.

### 9.4.3 Utility Trenches

Below-grade utilities should be bedded and backfilled according to the requirements of the service provider (utility company) and the county. Where there are no specific requirements, Condor recommends placing free-draining bedding sand or crushed-rock with a maximum particle size of  $\frac{3}{8}$ -inch from 3 inches below to 1 foot above the conduit or pipe. Bedding sand should have a sand equivalent of at least 30. Bedding material and backfill should not be jetted or ponded into place but should be mechanically compacted.

### 9.4.4 Engineered Fill

Engineered fill should have less than 2 percent by dry weight of vegetation and deleterious material and should meet the particle-size distribution requirements presented on the table that follows:

| Sieve Designation          | Minimum Percent Passing by Dry Weight |
|----------------------------|---------------------------------------|
| 4-inch square              | 100                                   |
| $\frac{3}{4}$ -inch square | 70                                    |
| U.S. No. 4                 | 60                                    |

To improve ground stability for tunnel excavations, backfill of any excavation within 2 to 3 feet of tunnel excavations should be cohesive. It may consist of soil material with a Unified Soil Classification System classification of CL, ML, CL-ML or SC (lean clay to sandy lean clay, silt, silty clay or clayey sand). Otherwise, the backfill material near tunnel excavations may consist of control density fill with a 28-day compressive strength of at least 100 pounds per square inch (psi).

Soil fill placed within 12 inches of building slab-on-grade floors, exterior pavements should be select fill with a plasticity index of 15 or less. Otherwise, fill should have a liquid limit of 50 or less and a plasticity index of 20 or less. Aggregate layers beneath floor slabs may be included in the total thickness of select fill.

Engineered soil fill should be moisture conditioned to near optimum (to facilitate compaction) and compacted to at least 90 percent (based on ASTM Test Method D-1557). Trench backfill placed more than 5 feet beyond the edges of structures, pavements, slabs-on-grade, or other improvements may be compacted to 85 percent (based on ASTM Test Method D-1557). Soil fill should be placed in horizontal lifts that are less than 8 inches in uncompacted thickness, and each lift should be compacted to the requirements prior to placing subsequent lifts.

## 9.5 TUNNEL GROUND SUPPORT

Condor recommends using the Mohr-Coulomb failure criteria to model the ground. We developed parameters based on our subsurface data and experience.

Condor developed an idealized subsurface profile to use for tunnel liner analyses. A summary of our subsurface profile follows:

| Depth Increment (feet below patio) | Material Description    | Strength Parameters or Index                                                                                                                  | Total Unit Weight (pcf) |
|------------------------------------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| 0 to 7                             | Fill                    | Internal friction angle = 24 degrees<br>Cohesion = 170 pounds per square foot (psf)<br>Young's Modulus = 10,000 psi<br>Poisson's Ratio = 0.35 | 125                     |
| 7 to 80                            | Volcaniclastic Alluvium | Internal friction angle = 31 degrees<br>Cohesion = 250 psf<br>Young's Modulus = 12,000 psi<br><br>Poisson's Ratio = 0.35                      | 120                     |

Condor recommends modeling plastic behavior and a dilation angle of 0 degrees and residual shear strengths equivalent to peak strengths. We recommend using a total stress ratio of 0.5.

The tunnel liners should be designed to carry loads from the ground weight, improvements (existing and proposed), and traffic imposed on ground above (and adjacent to) tunnels. Condor should re-evaluate design of any proposed improvements over the tunnel after plans for such improvements are available. We recommend using a surface pressure of 250 psf to model traffic surcharge. If existing retaining walls have footings that are mined, the tunnel liner should be designed to carry the wall loads. Section 9.7 presents criteria for evaluating retaining wall loads.

Condor recommends placing drain strips behind tunnel liners and subdrains beneath tunnel floors. Because we anticipate that there will be little groundwater seepage and because there will be drainage, we conclude that the ground support analysis may assume that no pore pressures from groundwater are imposed on the liners. Tunnel floor subdrains should slope to the portals to facilitate subdrain discharge. Water seepage mitigation may be added to the tunnel liner to reduce groundwater infiltration that will typically otherwise occur in some locations.

Sequential placement of the slab-on-grade floor at the tunnel invert is not desirable because cave construction typically requires back and forth equipment traffic from the portals for excavation, mucking, and tunnel liner construction. The design may include footings at the liner base or subinverts placed for initial support, if necessary.

## 9.6 FOOTINGS

Footings at the proposed tunnel inverts, if needed, may be designed using a net allowable bearing capacity of 4,000 psf for dead plus normal duration live loads. This value may be increased by one-third for total load conditions, including wind and seismic.

For resistance to lateral loads, base friction resistance may be calculated using an ultimate friction coefficient of 0.35. Passive resistance may be calculated using a uniform pressure of 3,300 psf (rectangular distribution) for transient loads, such as seismic loads, and an equivalent fluid unit-weight

(triangular distribution) of 200 pcf for sustained loads. We reduced the allowable passive pressure by a factor of 1.5 from the ultimate value to limit the foundation movement required to mobilize passive pressure. Both passive pressure and base friction may be combined in calculating total lateral resistance without reduction. Passive resistance contributed by the top 12 inches of soil should be neglected unless a concrete slab-on-grade or pavement covers the ground. Gaps between footings or keyway and the adjacent ground should be completely backfilled using engineered fill, concrete or lean cement slurry with a 28-day unconfined compressive strength of at least 100 psi.

## 9.7 RETAINING WALLS

Condor developed geotechnical engineering criteria to evaluate loads imposed by the existing loading dock retaining wall and the existing site retaining walls near the patio. Active earth pressures may be used to evaluate unrestrained retaining walls where the top of the wall is free to translate or rotate. To develop active earth pressures, the walls should be capable of deflecting by at least  $0.004H$  (where  $H$  is the height of the wall). At-rest earth pressures should be used to evaluate retaining walls where the wall top is restrained such that the deflections required to develop active soil pressures cannot occur. We recommend using the following equivalent fluid unit-weights.

| Equivalent Fluid Unit Weight (pcf) |                   |                    |
|------------------------------------|-------------------|--------------------|
| Backfill Slope                     | Active Conditions | At-Rest Conditions |
| Level                              | 45                | 75                 |

The static lateral earth pressures should be applied behind the wall from the finish ground surface down to the footing heel.

## 9.8 CONSTRUCTION CONSIDERATIONS

Condor anticipates that the ground exposed in tunnel excavations will be cohesive soil with moderate strength. We therefore anticipate that standup time for the proposed tunnel excavations will be moderate, and that sequential excavation followed by ground support (initial tunnel liner construction followed by final tunnel liner and floor construction) is feasible. Standup time is the time elapsed after tunnel excavation and before completing initial support where unsupported ground is stable.

There is, however, the possibility that tunnel excavations will encounter soft or loose cohesionless granular fill from previous site development or from natural alluvial processes. Such material, if encountered, may be less stable, may result in shorter standup time, and may pose the need for shoring in advance of excavation (spiling, ground grouting, etc.).

As discussed in section 9.0, ground failures during tunnel excavation and prior to placing support could damage existing site improvements over tunnel excavations. Condor therefore recommends that that Contractor be prepared to improve ground stability where tunnel excavations expose any unknown granular fill. In addition, we recommend that the Contractor excavate tunnels in a single heading while completing initial ground support from invert edge, across the arch, and to the adjacent invert edge.

Condor recommends that the Contractor review available site and subsurface data and to evaluate the best approach to sequential excavation and support. The Contractor is responsible for temporary support and timing for initial support placement for safety. Condor, in consultation with the Contractor, should determine final support requirement based on the strength and stiffness of encountered ground and the Contractor's method of excavation and support.

As discussed in Section 9.0, tunnel excavations may encounter concrete footings, masonry footings, or other underground obstructions. The Contractor should be prepared to excavate footings or other unknown obstructions.

Where subgrades for tunnel floors are soft/loose, the contractors should stabilize subgrades to provide adequate pavement support as follows:

- Overexcavate to a depth of at least 12 inches
- Where overexcavation bottoms are firm, backfill them with crushed rock or lean concrete
- Where overexcavation bottoms are soft/loose, backfill them with lean concrete; otherwise, place a subgrade stabilization geotextile over the overexcavation bottom and backfill overexcavations with crushed rock

A subgrade stabilization geotextile such as Mirafi 500X may be adequate. Where subgrades are very soft and wet, then a heavier geotextile, such as Mirafi HP 570 may be required. The Geotechnical Engineer should approve procedures for overexcavating, backfilling, and geotextiles. Subgrades beneath pavements should be firm and free of significant deflections under relatively heavy construction equipment. The Contractor should “proof roll” subgrades and stabilize deflecting areas before covering them.

## 10.0 ADDITIONAL SERVICES

Because subsurface conditions at this site vary, it is not possible to include all construction details related to geotechnical engineering aspects of the project in designs. Geotechnical engineering recommendations depend on the possible need for adjustment in the field during construction. The adjustments depend on conditions revealed during construction that Condor could previously only assume based on limited data from the site investigation. Therefore, Condor or another qualified firm should perform geotechnical engineering observations and tests during construction. The purpose of the work during construction will be to check for subsurface conditions that vary from the conditions encountered during site investigation and to develop supplemental geotechnical engineering recommendations, as necessary. In addition, the purpose is to verify that the Contractor follows the general intent of our recommendations during construction and that they perform the geotechnical engineering aspects of the work according to the approved designs.

Because Condor understands the intent of the geotechnical engineering recommendations best, we recommend that Condor perform or direct future phases of tunnel civil/geotechnical engineering work, including field engineering, inspection and testing.

## 11.0 LIMITATIONS

The geotechnical engineering conclusions and recommendations presented in this report are intended for planning and design of the proposed improvements described in Section 2.0. These conclusions and recommendations may not apply if:

- The report is used for a different site or project
- The recommendations presented in this report are not followed
- Any other change is made that materially alters the proposed project

Condor based the conclusions and recommendations presented in this report on data obtained from the site investigation described in Section 4.0. Subsurface conditions may vary between and around the investigated locations. Should varied conditions be discovered during construction, then additional

investigation, testing evaluations and development of supplemental recommendations may be required. Any person associated with the project who observes conditions or features of the site or its surrounding areas that are different from those described in the report should report them immediately to Condor for evaluation.

Implementation of our recommendations requires an adequate testing and observation program during construction as described in Section 10.0. If Condor does not perform this testing and observation, then the Geotechnical Engineer that is responsible for observation and testing should thoroughly review this report and agree with its conclusions and recommendations or, otherwise, they should provide alternative recommendations.

Condor prepared this report according to the generally accepted standards of geotechnical engineering practice that exist in Napa County at the time of issue. No other warranty, express or implied, is made. It is the Owner Representative's responsibility to see that all parties to the project, including the designers, Contractors and Subcontractors, are made aware of this report in its entirety.

Changes in the standards of practice in the field of geotechnical engineering, changes in site conditions such as new excavations or fills, new agency regulations, or modifications to the proposed project warrant professional review of this report. Because of this, there is a practical limit to the usefulness of this report without critical professional review. We suggest that 2 years be considered a reasonable time for the validity of this report.

## 12.0 CLOSURE

## **APPENDIX A**

### **Log Legend and Soil Classification, Rock Properties, Boring Logs, and Core Photographs**

**WEATHERING**

**Severely Weathered** – minerals decomposed to soil, but rock fabric and structure are preserved.

**Highly Weathered** – abundant fractures coated with oxides, carbonates, sulphates, mud, etc., thorough discoloration, rock disintegration, mineral decomposition.

**Moderately Weathered** – some fracture coating, moderate or localized discoloration, little to no effect on cementation, slight mineral decomposition.

**Slightly Weathered** – a few stained fractures, slight discoloration, little or no effect on cementation, no mineral decomposition.

**Fresh** – unaffected by weathering agents; no appreciable change with depth.

**FRACTURE, JOINT, OR SHEAR SPACING**

(Spacing in Inches)

|                               |                 |
|-------------------------------|-----------------|
| <b>Very little fractured</b>  | Greater than 48 |
| <b>Occasionally fractured</b> | 12 to 48        |
| <b>Moderately fractured</b>   | 6 to 12         |
| <b>Closely fractured</b>      | 1.25 to 6       |
| <b>Intensely fractured</b>    | 0.5 to 1.25     |
| <b>Crushed</b>                | Less than 0.5   |

**THICKNESS OF SEDIMENTARY ROCK BEDS**

(Thickness in Inches)

|                            |                 |
|----------------------------|-----------------|
| <b>Very thickly bedded</b> | Greater than 72 |
| <b>Thickly bedded</b>      | 24 to 72        |
| <b>Medium bedded</b>       | 8 to 24         |
| <b>Thinly bedded</b>       | 2.5 to 8        |
| <b>Very thinly bedded</b>  | 0.75 to 2.5     |
| <b>Laminated</b>           | 0.25 to 0.75    |
| <b>Thinly laminated</b>    | Less than 0.25  |

**FRACTURE OR LAYER SEPARATION**

(Thickness of Separations in Millimeters)

|                        |              |
|------------------------|--------------|
| <b>Very tight</b>      | < 0.1 mm     |
| <b>Tight</b>           | 0.1 – 0.5 mm |
| <b>Moderately open</b> | 0.5 – 2.5 mm |
| <b>Open</b>            | 2.5 – 10 mm  |
| <b>Very wide</b>       | > 10 mm      |

**FRACTURE OR LAYER ROUGHNESS**

|                                |                                        |
|--------------------------------|----------------------------------------|
| <b>Very Rough</b>              | - Non-continuous, Hard joint rock wall |
| <b>Slightly Rough</b>          | - Hard joint rock wall                 |
| <b>Slightly Rough and Soft</b> | - Soft joint rock wall                 |
| <b>Slickensided</b>            | - Open and continuous with gouge       |
| <b>Soft Gouge</b>              | - Open and continuous with soft gouge  |

**STRUCTURE**

**Intact/Massive** – intact rock specimens with few widely spaced discontinuities.

**Blocky** – well interlocked, undisturbed rock mass, consisting of cubical blocks formed by three intersecting joint sets.

**Very blocky** – interlocked, partially disturbed, with multi-faceted angular blocks formed by 4 or more joint sets.

**Disturbed/Seamy** – folded with angular blocks, formed by many intersecting joint sets, persistence of bedding planes or schistosity.

**Disintegrated** – poorly interlocked, heavily broken, mix of angular and rounded rock pieces.

**Laminated/Sheared** – lack of blockiness due to close spacing of shear planes.

**STRENGTH**

**Plastic** or very low strength.

**Friable** – crumbles easily by rubbing with fingers.

**Weak** – an unfractured specimen of such material will crumble under light hammer blows.

**Moderately strong** – specimen will withstand a few heavy hammer blows before breaking.

**Strong** – specimen will withstand a few heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.

**Very strong** – specimen will resist heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.

**HARDNESS**

**Soft** – reserved for plastic material alone.

**Low hardness** – can be gouged deeply or carved easily with a knife blade.

**Moderately hard** – can be readily scratched by a knife blade; scratch leaves a heavy trace of dust and is readily visibly after the powder has been blown away.

**Hard** – can be scratched with difficulty; scratch produced a little powder and is often faintly visible.

**Very hard** – cannot be scratched with knife blade; leaves a metallic streak.

**GROUND WATER**

CONDOR EARTH TECHNOLOGIES, INC.  
LOG OF TEST PIT - 1

**Project:** Culinary Institute of America at Greystone  
2555 Main Street  
St. Helena, CA  
**Location:** See Figure 2  
**Approx. Elev. (ft):**  
**Approx. Depth (ft):** 3  
**Approx. Length (ft):** 5.5  
**Project No.:** 6658  
**Logged By:** A. Kositsky  
**Orientation:** N 10 ° W  
**Date:** 4/18/16  
**Equipment:** shovel, slide hammer

Corrosivity Analysis – ASTM Test Methods

Dear Ms. Kentta:

Pursuant to your request, CERCO Analytical has analyzed the soil sample submitted on January 05, 2016. Based on the analytical results, this brief corrosivity evaluation is enclosed for your consideration.

Based upon the resistivity measurement, this sample is classified as “moderately corrosive”. All buried iron, steel, cast iron, ductile iron, galvanized steel and dielectric coated steel or iron should be properly protected against corrosion depending upon the critical nature of the structure. All buried metallic pressure piping such as ductile iron firewater pipelines should be protected against corrosion.

The chloride ion concentration reflects none detected with a detection limit of 15 mg/kg.

The sulfate ion concentration is 15 mg/kg and is determined to be insufficient to damage reinforced concrete structures and cement mortar-coated steel at this location.

The pH of the soil is 7.36, which does not present corrosion problems for buried iron, steel, mortar-coated steel and reinforced concrete structures.

The redox potential is 410-mV, which is indicative of aerobic soil conditions.

This corrosivity evaluation is based on general corrosion engineering standards and is non-specific in nature. For specific long-term corrosion control design recommendations or consultation, please call *JDH Corrosion Consultants, Inc.* at (925) 927-6630.

We appreciate the opportunity of working with you on this project. If you have any questions, or if you require further information, please do not hesitate to contact us.

Very truly yours,  
CERCO ANALYTICAL, INC.

## INTRODUCTION

This report presents the results of our geotechnical study for the Vineyard Lodge expansion project to be constructed at the Culinary Institute of America's facilities located at 830 Pratt Avenue in St. Helena, California. The triangular-shaped property extends over relatively level terrain and contains a vineyard lodge building in the southwest corner (based on true north) of the property along Pratt Avenue and a small triangular-shaped building just northwest of the vineyard lodge building. A paved parking lot lies in front of the building to the northeast and is accessed by Pratt Avenue. The site is bounded on the southwestern side by railroad tracks and on the northeastern side by a vineyard. Wastewater treatment ponds lie to the north of the property. The site location is shown on Plate 1, Appendix A.

We understand it is proposed to remove the triangular-shaped building and construct a new building northwest of the main building and parking area. The new building is to have a concrete slab-on-grade floor. New parking that extends off the existing lot is also planned adjacent to the proposed building. Smaller proposed improvements include two new trellis areas, a new dumpster enclosure, and new walkways.

Actual foundation loads are not known at this time. We anticipate the loads will be typical for the light to moderately heavy type of construction planned and that wall and isolated column loads will range from about 1 to 3 kips per lineal foot and 30 to 40 kips, respectively.

Grading plans are not available, but we anticipate that the planned grading will be the minimum amount needed to construct a level building pad and provide the building site and paved areas with positive drainage, and could include cuts and fills on the order of 1 to 4 feet.

Utility plans are not available, but we have assumed for this study that the project utilities will extend no deeper than 8 feet below the existing ground surface. If project

utilities extend deeper, supplemental exploration may be required to evaluate the soil conditions within and below the utility excavations.

### SCOPE

The purpose of our study, as outlined in our Professional Service Agreement dated February 25, 2008, was to generate geotechnical information for the design and construction of the project. Our scope of services included reviewing selected published geologic data pertinent to the site; evaluating subsurface conditions with test borings and laboratory tests; analyzing the field and laboratory data; and presenting this report with the following geotechnical information:

1. A brief description of soil and groundwater conditions observed during our study;
2. A discussion of seismic hazards that may affect the proposed improvements; and
3. Conclusions and recommendations regarding:
  - a. Primary geotechnical engineering concerns and mitigating measures, as applicable;
  - b. Site preparation and grading including remedial grading of weak, porous, compressible surface soils;
  - c. Foundation types, design criteria, and estimated settlement behavior;

Geotechnical Study Report

Vineyard Lodge Expansion  
Project Number: 5310.02.04.2

- d. Support of concrete slabs-on-grade;
- e. Preliminary pavement thickness based on our experience with similar soils and projects and the results of one R-value test on the anticipated subgrade soils;
- f. Utility trench backfill;
- g. Geotechnical engineering drainage improvements; and
- h. Supplemental geotechnical engineering services.

## **STUDY**

### **Site Exploration**

We reviewed our previous geotechnical studies in the vicinity and selected geologic references pertinent to the site. The geologic literature reviewed is listed in Appendix B.

On April 28, 2008, we performed a geotechnical reconnaissance of the site and explored the subsurface conditions by drilling six test borings to depths ranging from about 5½ to 18½ feet. The borings were drilled with a truck-mounted drill rig equipped with 8-inch diameter, hollow stem augers at the approximate locations shown on the Exploration Plan, Plate 2. The test boring locations were determined approximately by pacing their distance from features shown on the Exploration Plan and should be considered accurate only to the degree implied by the method used. Our geologist located

and logged the borings and obtained samples of the materials encountered for visual examination, classification and laboratory testing.

Relatively undisturbed samples were obtained from the borings at selected intervals by driving a 2.43-inch inside diameter, split spoon sampler, containing 6-inch long brass liners, using a 140-pound hammer dropping approximately 30 inches. The sampler was driven 12 to 18 inches. The blows required to drive each 6-inch increment were recorded and the blows required to drive the last 12 inches, or portion thereof, were converted to equivalent Standard Penetration Test (SPT) blow counts for correlation with empirical data. Disturbed samples were also obtained at selected depths by driving a 1.375-inch inside diameter (2-inch outside diameter) SPT sampler, without liners or rings, using a 140-pound hammer dropping approximately 30 inches. The sampler was driven 12 to 18 inches, the blows to drive each 6-inch increment were recorded, and the blows required to drive the final 12 inches, or portion thereof, are provided on the test boring logs. A disturbed "bulk" sample was also obtained from the test borings and placed in a plastic bucket.

The logs of the test borings showing the materials encountered, groundwater conditions, converted blow counts, and sample depths are presented on Plates 3 through 8. The soils are described in accordance with the Unified Soil Classification System, outlined on Plate 9.

The test boring logs show our interpretation of subsurface soil and groundwater conditions on the date and at the locations indicated. Subsurface conditions may vary at other locations and times. Our interpretation is based on visual inspection of soil samples, laboratory test results, and interpretation of drilling and sampling resistance. The location of the soil boundaries should be considered approximate. The transition between soil types may be gradual.

**Laboratory Testing**

The samples obtained from the borings were transported to our office and re-examined by the project engineer to verify soil classifications, evaluate characteristics, and assign tests pertinent to our analysis. Selected samples were laboratory tested to determine their water content, dry density, classification (Atterberg Limits, grain size distribution), shear strength, expansion potential (Expansion Index - EI) and R-value. Some test results are presented on the test boring logs. Results of the classification, shear strength, and R-value tests are presented on Plates 10 through 14.

**SITE CONDITIONS****General**

Napa County is located within the California Coast Range geomorphic province. This province is a geologically complex and seismically active region characterized by sub-parallel northwest-trending faults, mountain ranges and valleys. The oldest bedrock units are the Jurassic-Cretaceous Franciscan Complex and Great Valley sequence sediments originally deposited in a marine environment. Subsequently, younger rocks such as the Tertiary-age Sonoma Volcanics group, the Plio-Pleistocene-age Clear Lake Volcanics and sedimentary rocks such as the Guinda, Domengine, Petaluma, Wilson Grove, Cache, Huichica and Glen Ellen formations were deposited throughout the province. Extensive folding and thrust faulting during late Cretaceous through early Tertiary geologic time created complex geologic conditions that underlie the highly varied topography of today. In valleys, the bedrock is covered by thick alluvial soils. The site is located near the center of the Napa Valley floor. The Napa Valley is a long, narrow northwest-trending alluvial plain flanked by northwest-trending mountain ridges.

**Geology and Soils**

The United States Geological Survey (USGS) geologic maps (R.W. Graymer, et al., 2007) indicate the property is underlain by Holocene Epoch alluvial fan deposits. The alluvial fan deposits are shown to comprise moderately to poorly sorted and moderately to poorly bedded sand, gravel, silt, and clay, which were deposited where streams emanate from upland regions onto valley floors or plains.

Mapping by the U.S. Soil Conservation Service (Soil Survey Staff, 2008) has classified soil over the portions of the property proposed for development as belonging to the Bale clay loam series. The Bale clay loam series comprises two soil horizons. The topsoil is shown to be a clay loam that exhibits medium plasticity (LL = 30-50; PI = 10-25) and moderate shrink-swell potential, and extends from a depth of 0 to 24 inches. The subsoil is shown to be a stratified loam to gravelly sandy loam that exhibits low plasticity (LL = 15-20; PI = NP-5) and low shrink-swell potential, and extends from a depth of 24 to 60 inches. Runoff over these soils is slow. The hazard of erosion is slight. The risk of corrosion is given as high (topsoil) and low (subsoil) for uncoated steel, and moderate (topsoil and subsoil) for concrete. Performing corrosivity tests to verify these values was not part of our requested and/or proposed scope of work. Should the need arise, we would be pleased to provide a proposal to evaluate these characteristics.

**Landslides**

The USGS maps of landslides (Dwyer, 1976) do not indicate large-scale slope instability at the planned Vineyard Lodge Expansion site, and we did not observe active landslides at the site during our study.

## **Surface**

The property extends primarily over relatively level alluvial terrain outside of the Napa River flood plain. The proposed building site is covered with seasonal grass and weeds and is located adjacent to the existing facility. Natural drainage consists of sheet flow over the ground surface that concentrates in man made surface drainage elements such as roadside ditches, and natural drainage elements such as swales and creeks.

In general, the ground surface is moderately hard. However, soils in the area that appear hard and strong when dry will typically lose strength rapidly and settle under the loads of fills, foundations and slabs as their moisture content increases and approaches saturation. This typically occurs because the surface soils are weak, porous and compressible.

## **Subsurface**

Our borings and laboratory tests indicate that the portion of the site we studied is blanketed to depths of 6 to 8 feet with clayey soils that are weak, porous and compressible to a depth of 2 to 3 feet. As mentioned, porous soils appear hard and strong when dry but become weak and compressible as their moisture content increases towards saturation. These soils exhibit low plasticity ( $LL = 35$ ;  $PI = 15$ ) and low expansion potential ( $EI = 52$ ). The surface soils are locally covered by 1 to 2 feet of heterogeneous fill. Heterogeneous fill is a material with varying density, strength, compressibility and shrink-swell characteristics that often has an unknown origin and placement history. The Liquid Limit ( $LL$ ) and Plasticity Index ( $PI$ ) for the fill soils matched the underlying natural soils (described above), while the Expansion Index was 46. These surface materials are underlain by interbedded sand and gravel with varying amounts of clay and cobbles. A detailed description of subsurface conditions found in our borings is given on Plates 3 through 8, Appendix A.

Vineyard Lodge Expansion  
Project Number: 5310.02.04.2

### **Groundwater**

Free groundwater was first detected in our borings at depths ranging from 7 to 11 feet below the ground surface at the time of drilling. When the holes were backfilled 1½ hours after drilling was completed, the water level had risen a depth of about 7 feet. Fluctuation in the groundwater level typically occurs because of a variation in rainfall intensity, duration and other factors such as flooding and periodic irrigation.

### **Flooding**

Our review of the Federal Emergency Management Agency (FEMA) Flood Zone Map for Napa County, California, Unincorporated (NO. 060205) dated February 1, 1980, indicates that the proposed building site is located within Zone “C,” an area of minimal or no flooding. Evaluation of flooding potential is typically the responsibility of the project civil engineer.

## **DISCUSSION AND CONCLUSIONS**

### **Seismic Hazards**

#### **General**

We did not observe subsurface conditions within the portion of the property we studied that would suggest the presence of materials that may be susceptible to seismically induced lurching. Therefore, we judge the potential for the occurrence of this phenomenon at the site to be low.

### Seismicity

Data presented by the Working Group on California Earthquake Probabilities (2007) estimates the chance of one or more large earthquakes (Magnitude 6.7 or greater) in the San Francisco Bay region within the next 30 years to be approximately 63 percent. Therefore, future seismic shaking should be anticipated at the site. It will be necessary to design and construct the proposed Vineyard Lodge expansion project in strict adherence with current standards for earthquake-resistant construction.

### Faulting

We did not observe landforms within the area that would indicate the presence of active faults and the site is not within a current Alquist-Priolo Earthquake Fault Zone (Bryant and Hart, 2007). Therefore, we believe the risk of fault rupture at the site is low. However, the site is within an area affected by strong seismic activity. Several northwest-trending Earthquake Fault Zones exist in close proximity to and within several miles of the site (Bortugno, 1982; Bryant, 1982). The shortest distances from the site to the mapped surface expression of these faults are presented below in Table 1.

**TABLE 1  
ACTIVE FAULT PROXIMITY**

| <b>Fault</b>             | <b>Direction</b> | <b>Distance-Miles</b> |
|--------------------------|------------------|-----------------------|
| San Andreas              | SW               | 32                    |
| Healdsburg-Rodgers Creek | SW               | 12                    |
| Concord-Green Valley     | SE               | 19                    |
| Cordelia                 | SE               | 21                    |
| West Napa                | S                | 9.1                   |
| Maacama                  | NW               | 14                    |
| Konocti                  | NW               | 25                    |
| Hunting Creek            | N                | 18                    |

### Liquefaction

Liquefaction is a rapid loss of shear strength experienced in saturated, predominantly granular soils below the groundwater level during strong earthquake ground shaking due to an increase in pore water pressure. The occurrence of this phenomenon is dependent on many complex factors including the intensity and duration of ground shaking, particle size distribution and density of the soil.

Granular soils were encountered at the site below the groundwater table. Therefore, we performed an analysis of the blow count data from our borings using the methods of Seed and Idriss (1982), Seed and others (1985), and Youd and Idriss (2001). These procedures normalize the blow counts to account for overburden pressure, rod length, hammer energy, and fines (percent of silt and clay) content. Once the blow counts are normalized and adjusted to a clean sand blow count, the critical blow count is then determined. The critical blow count is calculated using the same procedures referenced above and requires a peak ground acceleration and design earthquake magnitude.

Peak ground acceleration (PGA) was determined using the methods in the 2007 California Building Code (CBC) and Chapter 11 of the American Society of Civil Engineers (ASCE) Standard 7-05, titled "Minimum Design Loads for Buildings and Other Structures" (2006). Section 11.8.3 of ASCE Standard 7-05 states that the PGA for liquefaction evaluation can be defined as the design spectral response acceleration at short periods with 5 percent damping ( $S_{DS}$ ) divided by 2.5. The  $S_{DS}$  value is determined using the United States Geological Survey's Earthquake Ground Motion Parameter Java Application (2007). Based on the site's latitude and longitude of 38.514°N and -122.476°W, respectively, the  $S_{DS}$  value Site Class D is 0.818g. Therefore, the PGA used for our evaluation is 0.33g.

The West Napa fault is most likely controlling the ground motions at the site. According to Petersen (1996), the West Napa fault is capable of a  $M_M$  6.5 earthquake. Using this information and the scaling factors presented in Youd and Idriss (2001), the critical blow count at the site ranges from 15 to 20 blows per foot depending on depth.

The normalized and adjusted blow counts at the site exceed this value. Therefore, we judge that the potential for liquefaction at the site is low.

### Densification

Densification is the settlement of loose, granular soils above the groundwater level due to earthquake shaking. Typically, granular soils that would be susceptible to liquefaction, if saturated, are susceptible to densification. As discussed in the "Liquefaction" section, the soils at the site have a low potential for liquefaction. Therefore, we judge that there is a low potential for densification to impact structures at the site.

## Geotechnical Issues

### General

Based on our study, we judge the proposed Vineyard Lodge Expansion can be built as planned, provided the recommendations presented in this report are incorporated into its design and construction. The primary geotechnical concerns during design and construction of the project are:

1. The presence of 2 to 3 feet of weak, porous, compressible, clayey surface soils and heterogeneous fill;
2. The detrimental effects of uncontrolled surface runoff and groundwater seepage on the long-term satisfactory performance of projects of this type, especially those constructed on alluvial fans, given the erosion potential and porous nature of the surface soils; and

3. The strong ground shaking predicted to impact the site during the life of the project.

#### Heterogeneous Fill

Heterogeneous fills of unknown quality and unknown method of placement, such as those found at the project site, can settle and/or heave erratically under the load of new fills, structures, slabs, and pavements. Footings, slabs, and pavements supported on heterogeneous fill could also crack as a result of such erratic movements. Thus, where not removed by planned grading, the heterogeneous fill must be excavated and replaced as an engineered fill if it is to be used for structural support.

#### Weak, Porous Surface Soils

Weak, porous surface soils, such as those found at the improvement area, appear hard and strong when dry but will lose strength rapidly and settle under the load of fills, foundations, slabs, and pavements as their moisture content increases and approaches saturation. The moisture content of these soils can increase as the result of rainfall, periodic irrigation or when the natural upward migration of water vapor through the soils is impeded by, and condenses under fills, foundations, slabs, and pavements. The detrimental effects of such movements can be remediated by strengthening the soils during grading. This can be achieved by excavating the weak soils and replacing them as properly compacted (engineered) fill. Alternatively, satisfactory foundation support could be obtained below the weak surface soils.

Foundation, Slab and Pavement Support - After remedial grading, satisfactory foundation support for the planned lodge expansion can be obtained from spread footings bottomed on the engineered fill. Interior slab-on-grade floors, exterior slabs and pavements can also be satisfactorily supported on the engineered fill. For exterior slabs

and pavements the engineered fill below subgrade need only be 12 inches thick. The trellis structures can be supported on drilled piers.

#### On-Site Soil Quality

All fill materials used in the building area and exterior slab and pavement subgrade must be select, as subsequently described in "Recommendations." We anticipate that, with the exception of organic matter and of rocks or lumps larger than 6 inches in diameter, the excavated material will be suitable for re-use as general and select fill.

#### Select Fill

The select fill can consist of approved on-site soils or import materials with a low expansion potential. The geotechnical engineer must approve the use of on-site soils as select fill during grading.

#### Settlement

Provided remedial grading is performed and the spread footings are installed in accordance with the recommendations presented herein, we estimate that post-construction differential settlements across the building will be about 1 inch.

#### Surface Drainage

Because of topography and location, the site will be impacted by surface runoff from the alluvial fan surface. In addition, the site soils are susceptible to erosion. Surface runoff typically sheet flows over the ground surface but can be concentrated by the planned site grading, landscaping, and drainage. The surface runoff can pond against

structures and seep into the slab rock. Therefore, strict control of surface runoff is necessary to provide long-term satisfactory performance of projects constructed on or near alluvial fans. It will be necessary to divert surface runoff around improvements and provide positive drainage away from structures. This can be achieved by constructing the building pad several inches above the surrounding area and conveying the runoff into man made drainage elements or natural swales that lead downgradient of the site.

#### Excavation Dewatering

Depending on the time of year of construction, groundwater may be encountered near the planned excavation depth, including utility trenches. Therefore, in order to accomplish the planned excavation, it may be necessary to dewater excavations. The dewatering system can consist of a perforated plastic pipe (in a grid array) embedded in free draining rock. The system should discharge to a sump area that is pumped continuously during construction. The general contractor is responsible for the design, operation and maintenance of the temporary dewatering system. If this system is to be incorporated into the final dewatering system of the structure, we should evaluate its performance during excavation.

### RECOMMENDATIONS

#### Seismic Design

Seismic design parameters presented below are based on Section 1613 titled "Earthquake Loads" of the 2007 California Building Code (CBC). Based on CBC Table 1613.5.2, we have determined a Site Class D should be used for the subject site. Using a site latitude and longitude of 38.514°N and -122.476°W, respectively, and the United

States Geological Survey's Earthquake Ground Motion Parameter Java Application (USGS, 2007) we recommend that the following seismic design criteria be used for structures at the site.

Mapped Maximum Considered Earthquake Spectral Response Acceleration:

$$\begin{aligned} S_s (0.2 \text{ second period}) &= 1.205 \text{ g} \\ S_1 (1 \text{ second period}) &= 0.501 \text{ g} \end{aligned}$$

Maximum Considered Earthquake Spectral Response Acceleration for Site Class D:

$$\begin{aligned} S_{MS} (0.2 \text{ second period}) &= 1.226 \text{ g} \\ S_{M1} (1 \text{ second period}) &= 0.752 \text{ g} \end{aligned}$$

Design Spectral Response Acceleration (5% damped) for Site Class D:

$$\begin{aligned} S_{DS} (0.2 \text{ second period}) &= 0.818 \text{ g} \\ S_{D1} (1 \text{ second period}) &= 0.501 \text{ g} \end{aligned}$$

## **Grading**

### **Site Preparation**

Areas to be developed should be cleared of vegetation and debris, including that left by the removal of obsolete structures. Trees and shrubs that will not be part of the proposed development should be removed and their primary root systems grubbed. Cleared and grubbed material should be removed from the site and disposed of in accordance with County Health Department guidelines. We did not observe septic tanks, leach lines or underground fuel tanks during our study. Any such appurtenances found during grading should be capped and sealed and/or excavated and removed from the site, respectively, in accordance with established guidelines and requirements of the County Health Department. Voids created during clearing should be backfilled with engineered fill as recommended herein.

### Stripping

Areas to be graded should be stripped of the upper few inches of soil containing organic matter. Soil containing more than two percent by weight of organic matter should be considered organic. Actual stripping depth should be determined by a representative of the geotechnical engineer in the field at the time of stripping. The strippings should be removed from the site, or if suitable, stockpiled for re-use as topsoil in landscaping.

### Excavations

Following initial site preparation, excavation should be performed as planned or recommended herein. Excavations extending below the proposed finished grade should be backfilled with suitable materials compacted to the requirements given below.

Within building areas and fill areas, including areas outside of the building footprint, the old fill and weak, porous, compressible surface soils should be excavated to a minimum depth of 3 feet below the surface exposed by stripping. The excavation of weak, compressible soils and old fill should also extend at least 12 inches below exterior slab and pavement subgrade where those improvements are not supported on new fill.

The excavation of weak, porous, compressible surface materials should extend at least 5 feet beyond the outside edge of the exterior footings of the proposed buildings and 3 feet beyond the edge of exterior slabs and pavements and the toe of fills outside of building areas. The excavated materials should be stockpiled for later use as compacted fill, or removed from the site, as applicable.

At all times, temporary construction excavations should conform to the regulations of the State of California, Department of Industrial Relations, Division of Industrial Safety or other stricter governing regulations. The stability of temporary cut slopes, such as those constructed during the installation of underground utilities, should be the responsibility of the contractor. Depending on the time of year when grading is performed, and the surface conditions exposed, temporary cut slopes may need to be

excavated to 1½:1, or flatter. The tops of the temporary cut slopes should be rounded back to 2:1 in weak soil zones.

#### Fill Quality

All fill materials should be free of perishable matter and rocks or lumps over 6 inches in diameter and must be approved by the geotechnical engineer prior to use. We judge the on-site soils are generally suitable for use as general and select fill. The suitability of the on-site soils for use as select fill should be verified during grading.

#### Select Fill

Select fill should be free of organic matter, have a low expansion potential, and conform in general to the following requirements:

| SIEVE SIZE                            | PERCENT PASSING<br>(By Dry Weight) |
|---------------------------------------|------------------------------------|
| 6 inch                                | 100                                |
| 4 inch                                | 90 - 100                           |
| No. 200                               | 10 - 60                            |
| Liquid Limit - 40 Percent Maximum     |                                    |
| Plasticity Index - 15 Percent Maximum |                                    |

In general, imported fill, if needed, should be select. Material not conforming to these requirements may be suitable for use as import fill; however, it shall be the contractor's responsibility to demonstrate that the proposed material will perform in an equivalent manner. The geotechnical engineer should approve imported materials prior to use as compacted fill. The grading contractor is responsible for submitting, at least 72 hours (3 days) in advance of its intended use, samples of the proposed import materials for laboratory testing and approval by the soils engineer.

### Fill Placement

The surface exposed by stripping and removal of heterogeneous fill and weak, compressible surface soils should be scarified to a depth of at least 6 inches, uniformly moisture-conditioned to near optimum and compacted to at least 90 percent of the maximum dry density of the materials as determined by ASTM Test Method D-1557. Approved fill material should then be spread in thin lifts, uniformly moisture-conditioned to near optimum, and properly compacted. All structural fills, including those placed to establish site surface drainage, should be compacted to at least 90 percent relative compaction. Only approved select materials should be used for fill within the building areas and within the upper 12 inches of exterior slabs and pavement subgrades.

### Permanent Fill Slopes

In general, fill slopes should be designed and constructed at slope gradients of 2:1 (horizontal to vertical) or flatter, unless otherwise approved by the geotechnical engineer in specified areas. Where steeper slopes are required, retaining walls should be used, and the geotechnical engineer should be consulted regarding the retaining wall design criteria. Fill slopes should be constructed by overfilling and cutting the slope to final grade. "Track walking" of a slope to achieve slope compaction is not an acceptable procedure for slope construction. The geotechnical engineer is not responsible for measuring the angles of these slopes. Denuded slopes should be planted with fast-growing, deep-rooted groundcover to reduce sloughing or erosion. The fill slope inclinations recommended herein address only the stability of the slopes. It should not be inferred that they address the feasibility of landscaping and weed control. Where these are concerns, the slopes should be flattened accordingly.

### Wet Weather Grading

Generally, grading is performed more economically during the summer months when on-site soils are usually dry of optimum moisture content. Delays should be anticipated in site grading performed during the rainy season or early spring due to excessive moisture in on-site soils. Special and relatively expensive construction procedures, including dewatering of excavations and importing granular soils, should be anticipated if grading must be completed during the winter and early spring or if localized areas of soft saturated soils are found during grading in the summer and fall.

Open excavations also tend to be more unstable during wet weather as groundwater seeps towards the exposed cut slope. Severe sloughing and occasional slope failures should be anticipated. The occurrence of these events will require extensive clean up and the installation of slope protection measures, thus delaying projects. The general contractor is responsible for the performance, maintenance and repair of temporary cut slopes.

### Foundation Support

Provided the weak surface soils are removed by or strengthened by remedial grading as recommended herein, the proposed lodge expansion building can be supported on continuous and isolated spread footings that bottom on engineered fill. The planned trellis structures can be supported on drilled, cast-in-place concrete piers as detailed herein.

### Spread Footings

Spread footings should be at least 12 inches wide and should bottom on engineered fill at least 18 inches below pad subgrade. Additional embedment or width may be needed to satisfy code and/or structural requirements.

The bottoms of all footing excavations should be thoroughly cleaned out or wetted and compacted using hand-operated tamping equipment prior to placing steel and concrete. This will remove the soils disturbed during footing excavations, or restore their adequate bearing capacity, and reduce post-construction settlements. Footing excavations should not be allowed to dry before placing concrete. If shrinkage cracks appear in soils exposed in the footing excavations, the soil should be thoroughly moistened to close all cracks prior to concrete placement. The moisture condition of the foundation excavations should be checked by the geotechnical engineer no more than 24 hours prior to placing concrete.

Bearing Pressures - Footings installed in accordance with these recommendations may be designed using allowable bearing pressures of 1800, 2700 and 3600 pounds per square foot (psf), for dead loads, dead plus code live loads, and total loads (including wind and seismic), respectively.

Lateral Pressures - The portion of spread footing foundations extending into select engineered fill may impose a passive equivalent fluid pressure and a friction factor of 350 pcf and 0.35, respectively, to resist sliding. Passive pressure should be neglected within the upper 6 inches, unless the soils are confined by concrete slabs or pavements.

### Drilled Piers

Drilled, cast-in-place, reinforced concrete piers can be used for foundation support for the planned trellis structures. Drilled piers should be at least 12 inches in diameter and

should extend at least 6 feet below planned pad elevation. Where fill is placed to create a pad and the weak, compressible surface soils are not strengthened by grading, the piers should be deepened in direct proportion to the thickness of fill. Larger piers and deeper embedment may be needed to resist the lateral forces imposed by earthquakes per the 2007 California Building Code. Piers should be spaced no closer than 3 pier diameters, center to center.

Skin Friction - The portion of the piers extending below the weak surface soils may be designed using an allowable skin friction of 500 psf for dead load plus long term live loads. This value can be increased by  $\frac{1}{3}$  for total loads, including downward vertical wind or seismic forces. A skin friction value of 350 psf should be used to resist uplift forces due to wind or seismic. End bearing should be neglected because of the difficulty of cleaning out small diameter pier holes, and the uncertainty of mobilizing end bearing and skin friction simultaneously.

Lateral Forces - Lateral loads on piers will be resisted by passive pressure on the soil. An equivalent fluid pressure of 350 pcf acting on two pier diameters should be used. Confinement for passive pressure may be assumed from 3 feet below existing grade. Where fill is placed to create a pad and the weak compressible soils are not strengthened by grading, the confinement depth should increase in direct proportion to the thickness of fill.

Pier Drilling - We encountered groundwater and/or caving-prone soils within the planned pier depth during our study. If groundwater is encountered during drilling, it may be necessary to de-water the holes and/or place the concrete by the tremie method. If caving soils are encountered, it may be necessary to case the holes. Difficult drilling may be required to achieve the required penetration. The drilling subcontractor should review this report, become familiar with site conditions as they pertain to his operation and draw

his own conclusions regarding drilling difficulty, suitable drill rigs and the need for casing and dewatering prior to bidding.

Concrete - Concrete mix design and placement should be done in accordance with the current ADSC and/or ACI specifications. Concrete should not be allowed to mushroom at the top of the piers or below the bottom of grade beams.

### Slab-On-Grade

Provided grading is performed in accordance with the recommendations presented herein, slabs should be underlain by engineered fill. Slab-on-grade subgrade should be rolled to produce a dense, uniform surface. The slabs should be underlain with a capillary moisture break consisting of at least 4 inches of clean, free-draining crushed rock or gravel (excluding pea gravel) at least 1/4-inch and no larger than 3/4-inch in size. Class 2 aggregate base can be used for slab rock under exterior slabs. Interior area slabs should be provided with an underdrain system. The installation of this subdrain system is discussed in the "Geotechnical Drainage" section. Slabs should be designed by the project civil or structural engineer to support the anticipated loads, reduce cracking and provide protection against the infiltration of moisture vapor.

A vapor barrier should be placed under all slabs-on-grade that are likely to receive an impermeable floor finish or be used for any purpose where the passage of water vapor through the floor is undesirable. RGH does not practice in the field of moisture vapor transmission evaluation or mitigation; therefore, we recommend that a qualified person be consulted to evaluate the general and specific moisture vapor transmission paths and any impact on the proposed construction. This person should provide recommendations for mitigation of the potential adverse impact of moisture vapor transmission on various components of the structure as deemed appropriate.

### **Utility Trenches**

The shoring and safety of trench excavations is solely the responsibility of the contractor. Attention is drawn to the State of California Safety Orders dealing with "Excavations and Trenches."

Unless otherwise specified by the County of Napa, on-site, inorganic soil may be used as general utility trench backfill. Where utility trenches support pavements, slabs and foundations, trench backfill should consist of aggregate baserock. The baserock should comply with the minimum requirements in Caltrans Standard Specifications, Section 26 for Class 2 Aggregate Base. Trench backfill should be moisture-conditioned as necessary, and placed in horizontal layers not exceeding 8 inches in thickness, before compaction. Each layer should be compacted to at least 90 percent relative compaction as determined by ASTM Test Method D-1557. The top 6 inches of trench backfill below vehicle pavement subgrades should be moisture-conditioned as necessary and compacted to at least 95 percent relative compaction. Jetting or ponding of trench backfill to aid in achieving the recommended degree of compaction should not be attempted.

### **Pavements**

Based on our study, we believe the near-surface clayey soils will have a low to moderate supporting capacity, after proper compaction, when used as a pavement subgrade. As shown on Plate 12, an R-value of 12 was measured on a bulk sample of near-surface soil obtained near the planned parking area. Because of potential variation in the on-site soils, we selected an R-value of 10 for use in pavement design calculations.

Based on the selected R-value, we have computed pavement sections for Traffic Indices (TI) ranging from 5.0 to 7.0 on Table 2, page 24. The project engineer, in consultation with City/County officials, should choose the pertinent (TI) for this project.

**TABLE 2**  
**PAVEMENT SECTIONS**

| TI  | THICKNESS (feet)    |                              |                               |
|-----|---------------------|------------------------------|-------------------------------|
|     | ASPHALT<br>CONCRETE | CLASS 2<br>AGGREGATE<br>BASE | MINIMUM<br>ENGINEERED<br>FILL |
| 7.0 | 0.30                | 1.25                         | 1.0                           |
| 6.5 | 0.30                | 1.10                         | 1.0                           |
| 6.0 | 0.25                | 1.05                         | 1.0                           |
| 5.5 | 0.25                | 0.90                         | 1.0                           |
| 5.0 | 0.20                | 0.85                         | 1.0                           |

Pavement thicknesses were computed using Method 301 F of the Caltrans Highway Design Manual and are based on a pavement life of 20 years. These recommendations are intended to provide support for the auto and light truck traffic represented by the indicated Traffic Indices. They are not intended to provide pavement sections for heavy concentrated construction storage or wheel loads such as forklifts, parked truck-trailers and concrete trucks or for post-construction concentrated wheel loads such as self-loading dumpster trucks.

In areas where heavy construction storage and wheel loads are anticipated, the pavements should be designed to support these loads. Support could be provided by increasing pavement sections or by providing reinforced concrete slabs. Alternatively, paving can be deferred until heavy construction storage and wheel loads are no longer present. Loading areas for self-loading dumpster trucks should be provided with reinforced concrete slabs at least 6 inches thick, and reinforced with No. 4 bars at 12-inch centers each way. Alternatively, the asphalt concrete section should be increased to at least 8 inches in these areas.

Prior to placement of aggregate base and subbase materials, the upper 6 inches of the pavement subgrade soils should be scarified, uniformly moisture-conditioned to near optimum, and compacted to at least 95 percent relative compaction to form a firm, non-

yielding surface. Aggregate subbase and aggregate base materials should be spread in thin layers, uniformly moisture-conditioned, and compacted to at least 95 percent relative compaction to form a firm, non-yielding surface. The materials and methods used should conform to the requirements of the County of Napa and the current edition of the Caltrans Standard Specifications, except that compaction requirements should be based on ASTM Test Method D-1557. Aggregate used for the base course should comply with the minimum requirements specified in Caltrans Standard Specifications, Section 26 for Class 2 Aggregate Base. Aggregate used for the subbase course should be non-expansive and should comply with the minimum requirements specified in Section 25 for Class 2 Aggregate Subbase.

#### Parking Lot Drainage

Water tends to migrate under pavements and collect in the aggregate courses at low areas on parking lot subgrade soils, such as around storm drain inlets and the thread of paved swales leading to inlets. The ponded water will soften subgrade soils and, under repetitive heavy-wheel loads, will induce inordinately high stresses on the subgrade and pavement components that could result in untimely maintenance. Under-pavement drainage can be improved and maintenance reduced by replacing a 12-inch wide strip (extending at least 15 feet on either side of the inlet) of the select subbase layer or subgrade soils with a subdrain consisting of ¾-inch or 1½-inch free-draining Class 1 Permeable Material. The drain rock should be outletted into the storm drain inlet. Storm drain trenches can be made to serve as pavement subdrains. We should be consulted to verify the suitability of storm drain trenches as pavement subdrains in a case-specific basis.

Where pavements will abut landscaped areas, the pavement baserock layer and subgrade soils should be protected against saturation from irrigation and rainwater with a subdrain, similar to that previously discussed. The subdrain should extend to a depth of at least 12 inches below the bottom of the baserock layer. Alternatively, a grouted moisture

cut-off extending at least 12 inches below subgrade should be provided behind or below the curb and gutter.

### Wet Weather Paving

In general, the pavements should be constructed during the dry season to avoid the saturation of the subgrade and base materials, which often occurs during the wet winter months. If pavements are constructed during the winter, a cost increase relative to drier weather construction should be anticipated. Unstable areas may have to be overexcavated to remove soft soils. The excavations will probably require backfilling with imported crushed (ballast) rock. The geotechnical engineer should be consulted for recommendations at the time of construction.

## **Geotechnical Drainage**

### Surface

Surface water should be diverted away from slopes, foundations, and edges of pavements. Surface drainage gradients within 5 feet of building foundations should be constructed with a minimum slope of 2 percent for paved areas and 4 percent for unpaved areas. Where a flatter gradient is required to satisfy design constraints, area drains should be installed with a spacing no greater than about 20 feet. Roofs should be provided with gutters and the downspouts should be connected to closed (glued Schedule 40 PVC or better) conduits discharging well away from foundations, onto paved areas, onto erosion resistant natural drainages, or into the site's surface drainage system. Roof downspouts and surface drains must be maintained entirely separate from the slab underdrains recommended hereinafter.

Water seepage or the spread of extensive root systems into the soil subgrade of footings, slabs or pavements could cause differential movements and consequent distress in these structural elements. Landscaping should be planned with consideration for these potential problems.

### Slab Underdrains

Where interior slab subgrades are less than 6 inches above adjacent exterior grade and where migration of moisture through the slab would be detrimental, slab underdrains should be installed to dispose of surface and/or groundwater that may seep and collect in the slab rock. Slab underdrains should consist of trenches that extend at least 6 inches below the bottom of the slab rock and slope to drain by gravity. The slab underdrain trenches should be at least 6 inches wide and spaced no further than 15 feet, both ways. Additional drain trenches should be installed, as necessary, to drain all isolated under slab areas. Four-inch diameter perforated pipe (SDR 35 or better) sloped to drain to outlets by gravity should be placed in the bottom of the trenches. Slab underdrain trenches should be backfilled to subgrade level with clean, free draining slab rock. An illustration of this system is shown on Plate 15. If slab underdrains are not used, it should be anticipated that water will enter the slab rock, permeate through the concrete slab and ruin floor coverings.

### Maintenance

Periodic land maintenance will be required. Surface and subsurface drainage facilities should be checked frequently, and cleaned and maintained as necessary or at least annually. A dense growth of deep-rooted ground cover must be maintained on all slopes to reduce sloughing and erosion. Sloughing and erosion that occurs must be repaired promptly before it can enlarge.

### **Supplemental Services**

RGH Consultants, Inc. (RGH) recommends that we be retained to review the project plans and specifications to determine if they are consistent with our recommendations. In addition, we should be retained to observe construction, particularly site excavations, compaction of fills and backfills, foundation and subdrain installations, and perform field and laboratory testing. As part of these services, we recommend that prior to construction a meeting be held at the site that includes, but is not limited to, the owner or owner's representative, the general contractor, the grading contractor, the foundation contractor, the underground contractor, any specialty contractors, the project civil engineer, other members of the project design team and RGH. This meeting should serve as a time to discuss and answer questions regarding the recommendations presented herein and to establish the coordination procedure between the contractors and RGH.

If, during construction, we observe subsurface conditions different from those encountered during the explorations, we should be allowed to amend our recommendations accordingly. If different conditions are observed by others, or appear to be present beneath excavations, RGH should be advised at once so that these conditions may be evaluated and our recommendations reviewed and updated, if warranted. The validity of recommendations made in this report is contingent upon our being notified and retained to review the changed conditions.

If more than 18 months have elapsed between the submission of this report and the start of work at the site, or if conditions have changed because of natural causes or construction operations at, or adjacent to, the site, the recommendations made in this report may no longer be valid or appropriate. In such case, we recommend that we be retained to review this report and verify the applicability of the conclusions and recommendations or modify the same considering the time lapsed or changed conditions. The validity of recommendations made in this report is contingent upon such review.

These supplemental services are performed on an as-requested basis and are in addition to this geotechnical study. We cannot accept responsibility for items that we are not notified to observe or for changed conditions we are not allowed to review.

### **LIMITATIONS**

This report has been prepared by RGH for the exclusive use of the Culinary Institute of America and its consultants as an aid in the design and construction of the proposed Vineyard Lodge expansion project described in this report.

The validity of the recommendations contained in this report depends upon an adequate testing and monitoring program during the construction phase. Unless the construction monitoring and testing program is provided by our firm, we will not be held responsible for compliance with design recommendations presented in this report and other addendum submitted as part of this report.

Our services consist of professional opinions and conclusions developed in accordance with generally accepted geotechnical engineering principles and practices. We provide no warranty, either expressed or implied. Our conclusions and recommendations are based on the information provided to us regarding the proposed construction, the results of our field exploration, laboratory testing program, and professional judgment. Verification of our conclusions and recommendations is subject to our review of the project plans and specifications, and our observation of construction.

The test borings represent subsurface conditions at the locations and on the date indicated. It is not warranted that they are representative of such conditions elsewhere or at other times. Site conditions and cultural features described in the text of this report are those existing at the time of our field exploration on April 28, 2008, and may not necessarily be the same or comparable at other times.

Geotechnical Study Report  
May 16, 2008

Vineyard Lodge Expansion  
Project Number: 5310.02.04.2

The scope of our services did not include an environmental assessment or a study of the presence or absence of toxic mold and/or hazardous, toxic or corrosive materials in the soil, surface water, groundwater or air (on, below or around this site), nor did it include an evaluation or study for the presence or absence of wetlands. These studies should be conducted under separate cover, scope and fee and should be provided by a qualified expert in those fields.

## KEY TO TEST DATA

## Consol - Consolidation

LL - Liquid Limit (in %)

PL - Plastic Limit (in %)

Gs - Specific Gravity

SA - Sieve Analysis

■ - "Undisturbed" Samples

☒ - Bulk or Disturbed Sample

■ - Standard Penetration Test

□ - Sample Attempt With No Recovery

## Shear Strength, psf

Tx 320 (2600)

TxCU 320 (2600)

DS 2750 (2600)

UC 2000

FVS 470

LVS 700

SS - Shrink Swell

EXP - Expansion

P - Permeability

## Confining Pressure, psf

- Unconsolidated Undrained Triaxial

- Consolidated Undrained Triaxial

- Consolidated Drained Direct Shear

- Unconfined Compression

- Field Vane Shear

- Laboratory Vane Shear

Note: All strength tests on 2.8-in. or 2.4-in. diameter sample, unless otherwise indicated.

# Important Information About Your Geotechnical Engineering Report

*Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.*

*The following information is provided to help you manage your risks.*

## Geotechnical Services Are Performed for Specific Purposes, Persons, and Projects

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical engineering study conducted for a civil engineer may not fulfill the needs of a construction contractor or even another civil engineer. Because each geotechnical engineering study is unique, each geotechnical engineering report is unique, prepared *solely* for the client. No one except you should rely on your geotechnical engineering report without first conferring with the geotechnical engineer who prepared it. *And no one — not even you — should apply the report for any purpose or project except the one originally contemplated.*

## Read the Full Report

Serious problems have occurred because those relying on a geotechnical engineering report did not read it all. Do not rely on an executive summary. Do not read selected elements only.

## A Geotechnical Engineering Report Is Based on A Unique Set of Project-Specific Factors

Geotechnical engineers consider a number of unique, project-specific factors when establishing the scope of a study. Typical factors include: the client's goals, objectives, and risk management preferences; the general nature of the structure involved, its size, and configuration; the location of the structure on the site; and other planned or existing site improvements, such as access roads, parking lots, and underground utilities. Unless the geotechnical engineer who conducted the study specifically indicates otherwise, do not rely on a geotechnical engineering report that was:

- not prepared for you,
- not prepared for your project,
- not prepared for the specific site explored, or
- completed before important project changes were made.

Typical changes that can erode the reliability of an existing geotechnical engineering report include those that affect:

- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light industrial plant to a refrigerated warehouse,

- elevation, configuration, location, orientation, or weight of the proposed structure,
- composition of the design team, or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes—even minor ones—and request an assessment of their impact. *Geotechnical engineers cannot accept responsibility or liability for problems that occur because their reports do not consider developments of which they were not informed.*

## Subsurface Conditions Can Change

A geotechnical engineering report is based on conditions that existed at the time the study was performed. *Do not rely on a geotechnical engineering report* whose adequacy may have been affected by: the passage of time; by man-made events, such as construction on or adjacent to the site; or by natural events, such as floods, earthquakes, or groundwater fluctuations. *Always* contact the geotechnical engineer before applying the report to determine if it is still reliable. A minor amount of additional testing or analysis could prevent major problems.

## Most Geotechnical Findings Are Professional Opinions

Site exploration identifies subsurface conditions only at those points where subsurface tests are conducted or samples are taken. Geotechnical engineers review field and laboratory data and then apply their professional judgment to render an opinion about subsurface conditions throughout the site. Actual subsurface conditions may differ—sometimes significantly—from those indicated in your report. Retaining the geotechnical engineer who developed your report to provide construction observation is the most effective method of managing the risks associated with unanticipated conditions.

## A Report's Recommendations Are *Not* Final

Do not overrely on the construction recommendations included in your report. *Those recommendations are not final*, because geotechnical engineers develop them principally from judgment and opinion. Geotechnical engineers can finalize their recommendations only by observing actual

subsurface conditions revealed during construction. *The geotechnical engineer who developed your report cannot assume responsibility or liability for the report's recommendations if that engineer does not perform construction observation.*

### **A Geotechnical Engineering Report Is Subject to Misinterpretation**

Other design team members' misinterpretation of geotechnical engineering reports has resulted in costly problems. Lower that risk by having your geotechnical engineer confer with appropriate members of the design team after submitting the report. Also retain your geotechnical engineer to review pertinent elements of the design team's plans and specifications. Contractors can also misinterpret a geotechnical engineering report. Reduce that risk by having your geotechnical engineer participate in prebid and preconstruction conferences, and by providing construction observation.

### **Do Not Redraw the Engineer's Logs**

Geotechnical engineers prepare final boring and testing logs based upon their interpretation of field logs and laboratory data. To prevent errors or omissions, the logs included in a geotechnical engineering report should *never* be redrawn for inclusion in architectural or other design drawings. Only photographic or electronic reproduction is acceptable, *but recognize that separating logs from the report can elevate risk.*

### **Give Contractors a Complete Report and Guidance**

Some owners and design professionals mistakenly believe they can make contractors liable for unanticipated subsurface conditions by limiting what they provide for bid preparation. To help prevent costly problems, give contractors the complete geotechnical engineering report, *but* preface it with a clearly written letter of transmittal. In that letter, advise contractors that the report was not prepared for purposes of bid development and that the report's accuracy is limited; encourage them to confer with the geotechnical engineer who prepared the report (a modest fee may be required) and/or to conduct additional study to obtain the specific types of information they need or prefer. A prebid conference can also be valuable. *Be sure contractors have sufficient time to perform additional study.* Only then might you be in a position to give contractors the best information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions.

### **Read Responsibility Provisions Closely**

Some clients, design professionals, and contractors do not recognize that geotechnical engineering is far less exact than other engineering disciplines. This lack of understanding has created unrealistic expectations that

have led to disappointments, claims, and disputes. To help reduce the risk of such outcomes, geotechnical engineers commonly include a variety of explanatory provisions in their reports. Sometimes labeled "limitations" many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely.* Ask questions. Your geotechnical engineer should respond fully and frankly.

### **Geoenvironmental Concerns Are Not Covered**

The equipment, techniques, and personnel used to perform a *geoenvironmental* study differ significantly from those used to perform a *geotechnical* study. For that reason, a geotechnical engineering report does not usually relate any geoenvironmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated environmental problems have led to numerous project failures.* If you have not yet obtained your own geoenvironmental information, ask your geotechnical consultant for risk management guidance. *Do not rely on an environmental report prepared for someone else.*

### **Obtain Professional Assistance To Deal with Mold**

Diverse strategies can be applied during building design, construction, operation, and maintenance to prevent significant amounts of mold from growing on indoor surfaces. To be effective, all such strategies should be devised for the *express purpose* of mold prevention, integrated into a comprehensive plan, and executed with diligent oversight by a professional mold prevention consultant. Because just a small amount of water or moisture can lead to the development of severe mold infestations, a number of mold prevention strategies focus on keeping building surfaces dry. While groundwater, water infiltration, and similar issues may have been addressed as part of the geotechnical engineering study whose findings are conveyed in this report, the geotechnical engineer in charge of this project is not a mold prevention consultant; *none of the services performed in connection with the geotechnical engineer's study were designed or conducted for the purpose of mold prevention. Proper implementation of the recommendations conveyed in this report will not of itself be sufficient to prevent mold from growing in or on the structure involved.*

### **Rely on Your ASFE-Member Geotechnical Engineer for Additional Assistance**

Membership in ASFE/The Best People on Earth exposes geotechnical engineers to a wide array of risk management techniques that can be of genuine benefit for everyone involved with a construction project. Confer with you ASFE-member geotechnical engineer for more information.

Project No. 2016039

## PROJECT OVERVIEW

The Culinary Institute of America (CIA) at Greystone is applying for a Use Permit modification for improvements to an existing educational facility located at 2555 Main St, in St. Helena (APN 009-131-003). The project site is located on the western side of Main St (also Highway 29) north of downtown St. Helena. The project site is situated near the toe of the valley floor, sloping up to the southwest away from Highway 29.

Greystone is made up of a 13.47 acre parcel, with five (5) buildings serving an enrollment of 200 students, and an adjacent 5 acre parcel which provides additional parking. The Use Permit Application includes the elimination of the existing 190-seat Wine Spectator Greystone Restaurant, and a decrease from 68 to 58 seats in the Williams Flavor Discovery Center (FDC). Operation of the FDC will also decrease from the current 362 days per year to 180 days per year (5 days per week for 36 weeks). Some proposed changes to the expected student, staffing and guest counts are included as well. Additional interior site improvements are shown on the Architectural Site Plans (no exterior site work is proposed). The new educational facilities will have the capacity for 300 students per year, compared to the existing 200. Improvements to the existing dishwashing and other kitchen facilities, including replacement with more water and energy efficient equipment, in addition to the change in intensity of the new restaurant, is anticipated to reduce the overall water and wastewater demand for the site, as outlined in the sanitary sewage (SS) management system section.

The Greystone campus currently disposes of all effluent from the SS collection system in the Markham Combined Wastewater System (MCWS) and will continue to utilize this treatment system after the site improvements discussed in this application. Overall, the proposed improvements will lead to a net decrease in flows conveyed and treated at the MCWS, which will not adversely impact the disposal capacity of the MCWS treatment system. Summit Engineering has prepared the following Wastewater Feasibility Study outlining the proposed SS flows and associated treatment and disposal systems.

## SANITARY SEWAGE MANAGEMENT SYSTEM

Greystone intends to utilize the existing, permitted MCWS located at Markham Winery on Highway 29 north of St. Helena for all SS treatment and disposal. The MCWS consists of two aerated ponds, settling, filtration, hypochlorite disinfection and either evaporation or irrigation disposal. Greystone will continue to utilize the onsite primary treatment, including one 3,000 gallon grease interceptor, two 7,500 gallon settling tanks and one 6,000 gallon settling tank, and a pump sump and pump to convey the SS flows to the MCWS. The MCWS has 4 users: CIA, Markham Winery, Freemark Abbey, and the Wine Country Inn. The facility was sized to handle effluent from all 4 properties. The system has adequate capacity to accommodate approximately 15,000 gallons per day (gpd) based on the original water allotment agreement with the City of St. Helena. Waste Discharge Requirements for the MCWS permit Greystone to contribute an annual total of 5.42 million gallons, which is approximately equal to 14,850 gpd. The existing primary treatment system will have excess capacity to accommodate the proposed SS peak flows, as the proposed flow will decrease. More details on the projected peak SS flows are provided below.

Project No. 2016039

### **SANITARY SEWAGE CHARACTERISTICS**

SS will consist primarily of wastewater generated from restrooms, kitchen and dishwashing facilities. Typical SS characteristics are summarized below:

**TABLE 1. TYPICAL SANITARY SEWER CHARACTERISTICS**

| <b><u>Characteristic</u></b>    | <b><u>Units</u></b> | <b><u>Raw Wastewater Range<sup>1</sup></u></b> |
|---------------------------------|---------------------|------------------------------------------------|
| BOD <sub>5</sub>                | mg/L                | 110 - 220                                      |
| Grease                          | mg/L                | 50-100                                         |
| Total Suspended Solids (TSS)    | mg/L                | 100 - 220                                      |
| Volatile Suspended Solids       | mg/L                | 80 - 165                                       |
| Total Dissolved Solids (TDS)    | mg/L                | 250 - 500                                      |
| Nitrogen                        | mg/L                | 20 - 40                                        |
| Nitrate                         | mg/L                | 0                                              |
| Phosphorous                     | mg/L                | 4 - 8                                          |
| Alkalinity (CaCO <sub>3</sub> ) | mg/L                | 50 - 100                                       |
| Chloride                        | mg/L                | 30 - 50                                        |
| Sulfate                         | mg/L                | 20 - 30                                        |

### **SANITARY SEWAGE DESIGN FLOWS**

The SS management system at Greystone will convey primary treated wastewater generated from the restrooms, kitchen and dishwashing facilities. Flows are estimated based on the gallons per capita per day (gpcd) for each user of the facility. In addition to students, Greystone will have instructors, staff, restaurant guests and visitors as follows:

| <b>TOTAL SANITARY SEWAGE DESIGN<br/>FLOW</b>       |     |   |                        |   | <b>=</b>                   | <b>9,867 gpd</b>       | <b>9.23 ac-ft/yr</b>         |

The SS management system is designed to handle wastewater generated from all campus activities at the peak daily demand. Peak SS generation is estimated using the detailed flow distribution above, which distinguishes between the various users and per capita usage estimates per Napa County guidelines. For instructors, administration staff, restaurant staff, and restaurant guests, the peak flow is estimated using 15 gpcd. For the campus store staff, peak flow is estimated at 20 gpcd. For store visitors and hospitality guests, the peak flow is

CIA – Greystone  
Wastewater Feasibility Study  
June 15, 2016

SUMMIT ENGINEERING, INC.  
Project No. 2016039

estimated using 3 gpcd, and the peak flow is estimated using 6 gpcd for café guests. For the students at the facility, peak flow is estimated at 23 gpcd.

The counts and distributions of students, staff and guests are based on the site development plans provided by the project architect. The proposed peak daily SS generation is estimated to be only 9,867 gpd after facility improvements. Additionally, Greystone is proposing to upgrade existing dishwashing and kitchen facilities to highly water and energy efficient equipment, which should result in additional water savings, and as a result, a reduction in wastewater production.

The SS management system was designed to handle the total peak daily SS flow of approximately 15,000 gpd corresponding to the original SS design flow from all operations. The current proposed daily flow of 9,867 gpd is significantly less than the estimated existing SS generation of 12,000 gpd and less than the original design flow of 15,000 gpd. The proposed annual flow was determined based on the proposed operating schedule for the various uses, with the restaurant only operating 180 days per year and the remaining flows conservatively estimated based on feedback from CIA staff. The total estimated annual flow is 3.01 million gallons per year (9.23 ac-ft/year), which is well below the total permitted discharge capacity of 5.42 million gallons per year (16.63 ac-ft/year).

#### **SANITARY SEWAGE CONVEYANCE, TREATMENT AND DISPOSAL**

The SS treatment and disposal system will have the components described below. Refer to Enclosure A for the SS management system schematic.

##### **Gravity Collection**

The gravity collection system is assumed to be designed to provide low maintenance and no infiltration or exfiltration. Piping is likewise assumed to be compatible with sanitary sewer and satisfy Uniform Plumbing Code and local requirements.

##### **Septic Tanks with Effluent Filter**

Solids settling and digestion in the septic tanks helps to reduce BOD and TSS concentrations entering the treatment and disposal system, increasing treatment system efficiency. SS leaving the Greystone building is collected in either a 3,000 gallon grease interceptor and 6,000 gallon settling tank, or two series settling tanks with a total volume of 7,500 gallons. SS flows into a pump tank, where it is pumped into a 3" force main and ultimately to the MCWS for treatment and disposal.

The septic tank size for the SS flows was evaluated based on the Uniform Plumbing Code, as follows:

##### **Uniform Plumbing Code Method:**

$$Volume = 1,125 + 0.75 \times Flow\ Rate$$

$$Volume = 1,125 + 0.75 \times 10,500\ gpd$$

$$Volume = 9,000\ gallons$$

CIA – Greystone  
Wastewater Feasibility Study  
June 15, 2016

SUMMIT ENGINEERING, INC.  
Project No. 2016039

The minimum 9,000 gallon septic tank volume is achieved by the use of the total 13,500 gallons of existing settling tank volume prior to treatment of SS flows at the MCWS. The excess volume increases retention time and should provide greater solids removal compared to the existing flow rate.

#### **Pump Tank**

The pump tank receives combined flow from the parallel (7,500 gal & 6,000 gal) settling tanks and grease interceptor (3,000 gal)/ settling tank trains, and conveys the flow to the MCWS aerated treatment pond. The pump station was sized to accommodate the higher design flows previously planned for the facility; therefore no changes are proposed to the existing pumps at this time.

#### **Flow Measurement**

Flow meters are currently installed in order to determine the CIA facility's total contribution to the MCWS. If necessary, the flowmeters will be calibrated, but no other changes to the flow measuring system are proposed at this time.

### **OTHER CONSIDERATIONS**

#### **ODOR CONTROL**

There should be no noxious odors from a properly designed and operated treatment system. See Alternative Courses of Action for operation alternatives.

#### **GROUNDWATER CONTAMINATION**

The nearest water well to the SS treatment system will be a minimum of 100 feet. No disposal of wastewater effluent will occur within 100 feet of any existing wells.

#### **PROTECTION**

The grease interceptor and settling tanks will be protected to restrict access and potential damage to the system, including the use of locking covers for the settling tanks and bollards to prevent vehicle traffic above the underground tanks.

#### **ALTERNATIVE COURSES OF ACTION**

Should there be any unforeseen operational difficulties for the SS management system, the following additional courses of action would be available if necessary:

- ◆ Temporary pumping and truck transfer of wastewater to an approved treatment plant would be used as additional courses of action
- ◆ Additional stages of treatment to increase effluent quality.

|------------|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | Plant List                            | Plant List should include the common or scientific name of the plant <b>and the expected water use</b> as identified by the following source, or other sources allowed by law.<br><a href="http://ucanr.edu/sites/WUCOLS/Plant_Search/">http://ucanr.edu/sites/WUCOLS/Plant_Search/</a>                                                                                                                       |
| ETo = 44.1 | Reference Evapotranspiration          | The annual evapotranspiration for the St. Helena area is 44.1 as defined by the State Department of Resources                                                                                                                                                                                                                                                                                                 |
| HA         | Hydrozone Area /Planting Description  | The landscaped area having plants with similar water needs and rooting depth, a hydrozone may be irrigated or non-irrigated. Divided into four categories: High Water Use Plants (HW), Moderate Water Use Plants (MW), Low Water Use Plants (LW), Very Low Water Use Plants (VLW)                                                                                                                             |
| LA         | Landscape Area                        | The hydrozone area in square feet                                                                                                                                                                                                                                                                                                                                                                             |
| PF         | Plant Factor (plant water use factor) | A factor, when multiplied by ETo, estimates the amount of water needed by plants. The plant factor ranges, and plant factors are determined by the Department of Water Resources 2000 publication "Water Use Classification of Landscape Species". The City of St. Helena will assume the high number for each range for plant type. Divided into four categories: HW = 0.9, MW = 0.6, LW = 0.3 and VLW = 0.1 |
| IM         | Irrigation Method                     | The type of irrigation to be used in a hydrozone use, divided into three categories: overhead spray, drip or non-irrigated                                                                                                                                                                                                                                                                                    |
| IE         | Irrigation Efficiency                 | The measurement of the amount of water beneficially used divided by the amount of water applied, 0.75 for overhead spray devices and 0.81 for drip systems                                                                                                                                                                                                                                                    |
| ETAF       | Estimate Total Adjustment Factor      | A factor of the Plant Factor divided by the Irrigation Efficiency (PF/IE) Regular landscape areas must be of 0.55 or below for residential and 0.45 or below for non-residential areas, when applied to ETo adjusts for plant factor and irrigation efficiency                                                                                                                                                |
| SLA        | Special Landscape Area                | An area of the landscape dedicated solely to edible plants, recreational area, areas irrigated with recycled water or water features using recycled water                                                                                                                                                                                                                                                     |
| ETWU       | Estimated Total Water Use             | The estimated water use (in gallons per year) that the project would use for the landscape based on plant selection and irrigation efficiency. Where .62 is a conversion factor that converts acre inches per acre per year to gallon per square foot per year.<br><b><math>ETo \times .62 \times ETAF \times LA = ETWU</math> (gallons per year)</b>                                                         |
|            | Planting Description                  | Provide details on the location of the area, reference plans or common names.<br><i>i.e.</i> Front Lawn, back north east of property                                                                                                                                                                                                                                                                          |
| MAWA       | Maximum Applied Water Allowance       | The upper limit of the annual applied water for the established landscaped area. The ETWU should not exceed the MAWA.<br><b><math>(ETo) (0.62) [(ETAF \times LA) + ((1) \times SLA)] = MAWA</math></b>                                                                                                                                                                                                        |

# City of St. Helena Water Efficient Landscape Worksheets

## Section A: HYDROZONE INFORMATION TABLE

Please complete the hydrozone table(s) for each hydrozone. Use as many tables as necessary to provide the information for each landscape area per hydrozone. If you have more than ten hydrozones, please attach additional page(s) with your application as necessary to complete hydrozone information for all portions of your project and calculation of your project's Estimated Total Water Use (ETWU).

1. The plant factor used shall be from sources identified above or other sources allowed by law
2. Individual hydrozones that mix plants of moderate and low water use shall use the higher water using plant factor
3. Use 44.1 as the ETo for the City of St. Helena
4. \*ETAF must be below .55 for residential and below .45 for non-residential

## City of St. Helena Water Efficient Landscape Worksheets

## Section A: HYDROZONE INFORMATION TABLE

Please complete the hydrozone table(s) for each hydrozone. Use as many tables as necessary to provide the information for each landscape area per hydrozone. If you have more than ten hydrozones, please attach additional page(s) with your application as necessary to complete hydrozone information for all portions of your project and calculation of your project's Estimated Total Water Use (ETWU).

1. The plant factor used shall be from sources identified above or other sources allowed by law.
2. Individual hydrozones that mix plants of moderate and low water use shall use the higher water using plant factor.
3. Use 44.1 as the ETo for the City of St. Helena.
4. \*ETAF must be below .55 for residential and below .45 for non-residential.

|                         |                      |              |                   |                       | D                                      | 0                             |
|                         |                      |              |                   |                       | E                                      | 0                             |

### Section B: Calculations

Use the subtotal calculations from Section A to complete the following:

|                                                                                                        |         |           |
|--------------------------------------------------------------------------------------------------------|---------|-----------|
| 1. What is the Average ETAF for regular landscape area of your project?<br>(B÷A) = Average ETAF        | .26     | Ave ETAF  |
| 2. What is the sitewide ETAF for your project?<br>(B+D)÷(A+C) = sitewide ETAF                          | .26     | Site ETAF |
| 3. What is the MAWA (Maximum Applied Water Allowance) for your project?<br>(44.1) (.62) (B + D) = MAWA | 236,809 | MAWA      |
| 4. What is the ETWU total for your project? (E+F) = Total ETWU                                         | 236,821 | ETWU      |

If you feel this worksheet does not reflect the annual Maximum Applied Water Allowance (MAWA) for your project, please explain in the box below.

### Thank you for completing your Water Efficient Landscape Worksheet!

Please remember your Landscape Documentation Package **IS NOT COMPLETE** until all of the necessary attachments have been received (see top of page 3). After you submit your application to the City of St. Helena for review and approval, and the irrigation and landscape is installed, a **Certificate of Completion** is required to verify compliance with the ordinance.

# City of St. Helena

## Certificate of Completion

## 1. SUMMARY

---

A Phase I Environmental Site Assessment (ESA) was conducted for property located at 830 Pratt Avenue in St. Helena, California (Plate 1). The parcel is hereafter referred to as the "subject site".

The subject site consists of a convalescent hospital. There are two structures located on site. There is no evidence of prior use or disposal of hazardous materials was found during the investigation.

Kleinfelder's Phase I ESA of the subject site revealed no Recognized Environmental Conditions at the site.

These conclusions and a summary of our findings are discussed in greater detail in Chapter 7. This report is subject to the limitations explained in Chapter 8.

## 2. INTRODUCTION

---

Meibeyer Law Group retained Kleinfelder to conduct a Phase I ESA of the property located at 830 Pratt Avenue in St. Helena, California; referred to herein as the "site." The purpose of this assessment is to assist the client in evaluating Recognized Environmental Conditions regarding known or suspected releases of hazardous substances on or near the subject site. A Recognized Environmental Condition is defined by the American Society of Testing and Materials (ASTM) *Standard Practice for Phase I Environmental Site Assessments, Phase I Environmental Site Assessment Process* (E1527-00), as "the presence or likely presence of hazardous substances or petroleum products under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater or surface water of the property." Kleinfelder performed this Phase I ESA in accordance with the scope and limitations of the ASTM standard and our authorized proposal and contract 41-YP3-813 dated November 21, 2003.

### 2.1 REPORT FORMAT

The following sections describe Kleinfelder's work scope:

- Section 3, **Site Setting**, is a compilation of information concerning the site's location, physical setting, and geologic and hydrogeologic conditions.
- Section 4, **History of the Site**, summarizes the history of land use at the site and on adjoining properties. The history was developed by conducting interviews, reviewing information provided to Kleinfelder by the client and by consulting various resources such as aerial photographs, agency files, and historic maps.
- Section 5, **Records Review**, is a compilation of Kleinfelder's review of several databases available from the Federal, State, and local regulatory agencies regarding hazardous substance use, storage, or disposal at the subject site; and for off-site facilities up to a one-mile radius around the site. This chapter includes interviews with the owner.
- Section 6, **Site Reconnaissance**, describes Kleinfelder's site observations during the site reconnaissance and observations of adjacent parcels.
- Section 7, **Findings and Conclusions**, is a presentation of our findings and conclusions regarding the information in Chapters 3 through 6; and presents our opinion regarding the presence of Recognized Environmental Conditions of concern at the site.
- Section 8 presents our **Limitations**.

### 3. SITE SETTING

---

This section describes the condition of the site at the time the Phase I ESA was conducted and provides information about local geologic conditions that can affect the migration of contaminants in soil and groundwater.

#### 3.1 SITE DESCRIPTION

The site is located at 830 Pratt Avenue in St. Helena, California (Plate 1). The subject site consists of a convalescent hospital (Marlina Convalescent Hospital). There is one main hospital building and one out building on site which is used for laundry and storage. The topography in the area is flat.

Surrounding land use consists of vineyards and residential properties.

The information presented in Table 3.1 describes the physical location of the subject site. This information was obtained from maps, public records, and interviews.

**TABLE 3.1: SITE SETTING**

| <b>DESIGNATION</b>                                                                                                                                             | <b>DESCRIPTION</b>                                                                                                                                                                                                               |

| <b>Location</b>                                                                                                                                                | East of Highway 29, north side of Pratt Avenue.                                                                                                                                                                                  |
| <b>Township &amp; Range</b>                                                                                                                                    | Township 8 North, Range 6 West (This area is not sectioned), Mount Diablo Baseline and Meridian.                                                                                                                                 |
| <b>Assessor's Parcel Number</b>                                                                                                                                | 009-010-024                                                                                                                                                                                                                      |
| <b>Approximate Acreage</b>                                                                                                                                     | 2.61 acres                                                                                                                                                                                                                       |
| <b>Current Use</b>                                                                                                                                             | Marlina Convalescent Hospital                                                                                                                                                                                                    |
| <b>Potable Water Supply</b>                                                                                                                                    | City of St. Helena                                                                                                                                                                                                               |
| <b>Waste Water System</b>                                                                                                                                      | City of St. Helena                                                                                                                                                                                                               |
| <b>USGS TOPOGRAPHIC QUADRANGLE</b><br>St. Helena, California 7.5 Minute Series. 1960, photorevised 1993                                                        | The site is mapped on the St. Helena, California 7.5 Minute Series Quadrangle with an average elevation of 260 feet above sea level. The subject site is shown as two structures. The remaining portions of the site are vacant. |
| <b>MUNGER MAP</b><br>( <a href="ftp://ftp.consrv.ca.gov/pub/oil/maps/Dist6/W6-4/MapW6-4.pdf">ftp://ftp.consrv.ca.gov/pub/oil/maps/Dist6/W6-4/MapW6-4.pdf</a> ) | No oil and gas wells or plugged and abandoned dry holes were depicted on site.                                                                                                                                                   |

### 3.2 SITE SOILS

According to the Soil Survey of Napa County soils at the site are mapped as Brentwood clay loam.

The soil consists of slopes from 0 to 5 percent. Permeability is moderately slow and the soil is well drained.

### 3.3 REGIONAL AND LOCAL GEOLOGY

#### 3.3.1 Regional Geology

The site lies within the Coast Range Geologic Province of California. This province is characterized by northwest trending mountain ranges and intervening valleys, which are a reflection of the dominant northwest structural trend in bedrock of the region. The basement rock in the northwest portion of this province is dominantly highly deformed sedimentary, metamorphic and volcanic rock of the Franciscan Complex of Upper Jurassic to Cretaceous Age.

#### 3.3.2 Local Geology

In the site vicinity, quaternary alluvial deposits have overlain this area locally (USGS, Santa Rosa Quadrangle, 1992).

### 3.4 GROUNDWATER

There are no published maps or data reports for groundwater flow direction in this area. General groundwater depth and direction may be influenced by local pumping, rainfall, and irrigation patterns. Evaluation of such factors is beyond the scope of this assessment.

#### 4. HISTORY OF THE SITE

The history of the site was researched to identify obvious uses of the site from the present to first developed use or back to 1940, whichever is earlier. The objective was to evaluate the likelihood that past uses resulted in Recognized Environmental Conditions. Table 4.1 summarizes the information reviewed during this assessment. Kleinfelder used this information to establish the site history.

**TABLE 4.1: HISTORICAL INFORMATION REVIEWED**

| HISTORICAL SOURCE                  | YEARS REVIEWED                                                                         | AVAILABILITY                                                        |

#### 4.1 AERIAL PHOTOGRAPHS

##### 1957

A single-family residence and an outbuilding are located on site. The remaining portions of the site are vineyards. The surrounding land use is rural residential and agricultural (vineyards). Railroad tracks are located adjacent to the west border.

##### 1965

A single family residence and two large outbuildings are located on site. The remaining portions of the site are vineyards. The surrounding land use is rural residential and agricultural. The railroad tracks are present.

##### 1968

There are two structures located on site. The structures appear to be the present day convalescent hospital and an outbuilding. The remaining portions of the site are vacant. The surrounding land use is vacant fields and rural residential properties. The railroad tracks are present.

##### 1975 and 1981

The convalescent hospital and outbuilding are shown on site. The remaining portions of the site are vacant. A cleared dirt area is located along the south border of the site. This area appears to be cleared for the future parking lot development. The surrounding land use are vacant fields and rural residential. Waste water ponds are located adjacent to the north corner of the subject site. The railroad tracks are present.

##### 1988 and 1993

The subject site is shown as the convalescent hospital and outbuilding. A paved parking lot is located to the east of the hospital. The northern one-half of the site is vacant. The surrounding land use is agricultural, waste water ponds, rural residential and railroad tracks.

##### 1995, 1997 and 2000

The 1995, 1997 and 2000 aerial photographs are essentially unchanged from the 1988 and 1993 photographs, however, a mound is located in the north corner of the subject site.

#### 4.2 HISTORICAL TOPOGRAPHIC MAPS

##### **St. Helena, 15 Minute Series, 1902, 1 inch = 5,208 feet**

There is a single structure located on site. The remaining portions of the site are vacant.

##### **St. Helena, 15 Minute Series, 1960, 1 inch = 5,208 feet**

There are two structures located on site. The remaining portions of the site are shown as vineyards.

##### **St. Helena, 7.5 Minute Series, 1960, 1 inch = 2,000 feet**

There are two structures located on site. The remaining portions of the site are shown as vineyards.

##### **St. Helena, 7.5 Minute Series, 1960 photorevised 1980, 1 inch = 2,000 feet**

There are two structures located on site. The remaining portions of the site are shown as vineyards.

##### **St. Helena, 7.5 Minute Series, 1960 photorevised 1993, 1 inch = 2,000 feet**

There are two structures on site. The remaining portions of the site are shown as vacant.

#### 4.3 CITY DIRECTORIES

Polk City Directory does not have the street or site addresses listed in the 1961 through 1975 directories. The Haines Criss Cross Directory does list the site as a residence from 1980 to 1995 and the Marlina Convalescent Hospital from 1999 to 2003.

#### 4.4 INTERVIEWS

##### *Mr. Matt Demchuck, administrator for convalescent hospital*

Mr. Demchuck has been the administrator on site for approximately 8 years. He stated that the hospital was built in two phases in the 1960's. Mr. Demchuck has been the administrator on site for approximately 8 years. A generator with a diesel backup is located to the east of the building. The associated oil is replaced every few years and disposed of properly. Mr. Demchuck stated that oxygen tanks are stored on site. These tanks are on permit with the county. Mr. Demchuck

stated that the asphalt, concrete, and soil pile in the north end of the property originated from the landscape work conducted on the south border of the site. The subject site has three septic tanks on site, two large tanks and one small tank. The site is presently connected to city sewer and the tanks are no longer used. The site is also connected to the city water system. There are no wells located on site. There are no hazardous materials stored on site.

## 5. RECORDS REVIEW

### 5.1 REGULATORY AGENCY DATABASE REVIEW

The purpose of the records review is to obtain and review records that would help to reveal Recognized Environmental Conditions at or in the area around site.

Federal, State and local regulatory agencies publish databases or "lists" of businesses and properties that handle hazardous materials or waste, or are known locations of a release of hazardous substances. These databases are available for review or purchase at the regulatory agencies, or they can be obtained through a commercial database service. Kleinfelder contracted with a commercial database service, Environmental Data Resources, Inc., to review the agency lists for references to the site and any listings within the appropriate ASTM minimum search distance from the site. The executive summary and maps from the database search report are included in Appendix A, Regulatory Agency Database Summary. The Federal and State databases reviewed are summarized on Table 5.1.

**TABLE 5.1: RECORDS REVIEWED/SEARCH DISTANCES**

| LIST           | SEARCH RADIUS   | FINDINGS     |
|----------------|-----------------|--------------|
| <b>FEDERAL</b> |                 |              |
| NPL            | 1 - mile        | None Listed. |
| CERCLIS        | ½ - mile        | None Listed. |
| CORRACTS       | 1 - mile        | None Listed. |
| RCRIS-TSD      | ½ - mile        | None Listed. |
| RCRIS-GEN      | ¼ - mile        | None Listed. |
| ERNS           | Target Property | None Listed. |
| <b>STATE</b>   |                 |              |
| BEP, AWP       | 1 - mile        | None Listed. |
| CAL-SITES      | 1 - mile        | None Listed. |
| CORTESE        | 1 - mile        | 3 Listed.    |
| LUST           | ½ - mile        | 3 Listed.    |
| UST            | ½ - mile        | None Listed. |
| SLIC           | ½ - mile        | None Listed. |
| SWIS           | ¾ - mile        | None Listed. |

A summary of facilities listed in the databases is presented in the executive summary of the EDR report, and each facility is cross-referenced with a radius map showing the location of the listed facility with respect to the subject property. Kleinfelder conducted a review of the EDR report to assess which listings have a significant potential to impact the subject property. Factors used to screen the listed properties include distance to the site, geology, presumed or known direction of groundwater flow, type and magnitude of hazardous material release, and nature of sensitive receptors. Those considered to have a significant potential to impact the site were then subjected to a file review at appropriate regulatory agencies. Based on the review of the EDR report, there are no on site or adjacent facilities which may have a potential to impact the subject property. A copy of the EDR report is included in Appendix C of this report.

The database report shows that:

- The subject site not listed in the databases referenced above.
- Three Leaking Underground Storage Tank (LUST) sites are located within ½ mile of the subject site (these sites are also listed on the CORTESE database).
  1. Beringer Vineyards (200 Main Street) – This facility is approximately 1,600 feet southwest of the subject site. This facility was impacted by miscellaneous motor vehicle fuels. The county closed the case on June 27, 1997. Due to the closed status of this facility, it is Kleinfelder's opinion that this facility does not pose an adverse impact to the subject site.
  2. Abruzzini Property (1030 Fulton Lane) – This facility is located approximately 2,000 feet southeast of the subject site. The soil at this facility was impacted by gasoline. The county closed the case on May 15, 1992. Due to the closed status of this facility, it is Kleinfelder's opinion that this facility does not pose an adverse impact to the subject site.
  3. Helen Paschich Estate (1078 Fulton Avenue) – This facility is located approximately 2,100 feet southeast of the subject site. The soil at this facility was impacted by miscellaneous motor vehicle fuels. The county closed the case on December 10, 1992. Due to the closed status of this facility, it is Kleinfelder's opinion that this facility does not pose an adverse impact to the subject site.

## 5.2 REGULATORY AGENCY CONTACTS

Local and state regulatory agencies were contacted for reasonably ascertainable and practically reviewable information regarding Recognized Environmental Conditions present at or adjacent to the site. The information was obtained by interviewing agency representatives or reviewing local agency records.

**TABLE 5.2: AGENCY CONTACTS SUMMARY**

| AGENCY                                                                          | TYPE OF INFORMATION AND RESULTS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Napa County Department of Environmental Management (NCDEM)</b>               | Kleinfelder did contact NCDEM, for the following properties: the subject site (830 Pratt Avenue) and the adjacent property to the west (1000 Pratt Avenue). According to Ms. Pam Johnston of NCDEM the only file available was for 1000 Pratt Avenue facility. A gas cylinder leaked in April of 1991 and no further action was required for this incident. In addition, Kleinfelder reviewed the waste water pond file for the 1000 Pratt Avenue facility. This property is owner by Beringer Winery. The ponds adjacent to the subject site are aerated treatment ponds. There was no additional information concerning the ponds within the file. |
| <b>Napa County Agricultural Commissioner's Office (NCACO)</b>                   | According to the agricultural commissioner's office, pesticide and herbicide reports are kept on file for approximately 2 years by the agricultural commissioner's office. Due to the subject site not being used for agricultural purposes in the past 2 years, information was not requested for this site.                                                                                                                                                                                                                                                                                                                                        |
| <b>California State Fire Marshal Pipeline Safety Office (CSFMPO)</b>            | Kleinfelder contacted the CSFM via fax. A response from the CSFM was not made available to Kleinfelder before the production of this report. If the information obtained changes the conclusions given within this report an addendum will be issued.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>State of California, Department of Conservation, Division of Oil and Gas</b> | No oil or gas wells are depicted on or adjacent to the subject site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 6. SITE RECONNAISSANCE

---

Kleinfelder representative, Jennifer Gomez, conducted a site reconnaissance on December 5, 2003, to assess and photograph present site conditions. The approximate parcel and site boundaries are shown on Plate 2 and color photographs of the site are shown on Plate 3. The 2000 aerial photograph of the subject site is shown on Plate 4. Site conditions discussed below are limited to readily apparent environmental conditions observed on the date of site reconnaissance.

### 6.1 ON-SITE OBSERVATIONS

The subject site consists primarily of a convalescent hospital. Kleinfelder did not access the occupied areas within the hospital. Kleinfelder did observe the oxygen tank storage area. An outbuilding is located to the north of the main hospital building. The outbuilding is used for storage and laundry activities. Located within the storage portion of the outbuilding are autoparts stored on shelves and other miscellaneous items (i.e. tools, ladders, etc.). The area adjacent to the outbuilding has storage of hospital supplies, linen storage bins, wood pallets, and a boat. There does not appear to be evidence of hazardous material storage in this area. A paved parking lot is located to the east of the main hospital building and the northern one-half portion of the subject site consists of a vacant grass field. A mound containing asphalt, concrete, unearthed trees/shrubs and soil is located in the north corner of the subject site. The mound appears to have originated from the subject site. Two propane tanks are located on the west side of the paved parking lot. In addition, a generator is located in this area. A small amount of oil staining was observed near the generator, which is housed on a concrete walkway.

Site observations are tabulated in Table 6.1.

TABLE 6.1: SITE OBSERVATIONS

| General Observations                                                      | Remarks                                      | Observed | Not Observed |
|---------------------------------------------------------------------------|----------------------------------------------|----------|--------------|
| Hazardous chemical and petroleum products in connection with known use.   |                                              |          | X            |
| Fill dirt from an unknown source.                                         |                                              |          | X            |
| Aboveground storage tanks (ASTs)                                          | There are two propane tanks located on site. | X        |              |
| Underground storage tanks (USTs)                                          |                                              |          | X            |
| Odors                                                                     |                                              |          | X            |
| Pools of Liquid                                                           |                                              |          | X            |
| Drums                                                                     |                                              |          | X            |
| Hazardous chemical and petroleum products in connection with unknown use. |                                              |          | X            |
| Unidentified substance containers                                         |                                              |          | X            |

TABLE 6.1 (CONTINUED)  
SITE OBSERVATIONS

| Interior and exterior observations or environmental conditions that may involve the use, storage, disposal or generation of hazardous substances or petroleum products. |                                                                                            | Observed | Not Observed |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|----------|--------------|
| Chemical storage or agricultural chemical mixing areas                                                                                                                  |                                                                                            |          | X            |
| Asbestos, and lead based paints                                                                                                                                         | Due to the age of the structures asbestos and/or lead based paints may be present on site. |          | X            |
| Polychlorinated biphenyls (PCBs)                                                                                                                                        |                                                                                            |          | X            |
| Pits, Ponds, or Lagoons                                                                                                                                                 |                                                                                            |          | X            |
| Stained soil or pavement                                                                                                                                                | A small amount of oil staining was present near the generator.                             | X        |              |
| Stressed vegetation                                                                                                                                                     |                                                                                            |          | X            |
| Hazardous Waste Storage                                                                                                                                                 |                                                                                            |          | X            |

| Loading and unloading areas                                                                                                                                             |                                                                                                                                      |          | X            |
| Burned or buried debris                                                                                                                                                 |                                                                                                                                      |          | X            |

## 6.2 OFF-SITE OBSERVATIONS

Kleinfelder conducted a brief drive-by survey of the parcels adjacent to the site on the same day as the site reconnaissance. A summary of the off-site properties is summarized in the following table:

**TABLE 6.2**  
**SURROUNDING PROPERTIES**

|              |                                                                      |
|--------------|----------------------------------------------------------------------|
| <b>North</b> | Waste water ponds, railroad tracks, and vineyards.                   |
| <b>South</b> | Pratt Avenue, beyond which is a rural residence.                     |
| <b>East</b>  | A dirt drive path, beyond which is a vineyard and waste water ponds. |
| <b>West</b>  | Railroad tracks beyond which is a vineyard.                          |

## 7. CONCLUSIONS

---

Kleinfelder performed this Phase I ESA in accordance with the scope and limitations of ASTM Practice E1527-00. The purpose of this assessment was to evaluate the likelihood of Recognizable Environmental Conditions resulting from the present or past usage, storage, or disposal of hazardous substances or petroleum hydrocarbons at the subject site and in the surrounding area. Kleinfelder's findings and conclusions are presented below.

### 7.1 FINDINGS

Kleinfelder's Phase I ESA of the subject site revealed no Recognized Environmental Conditions at the site.

### 7.2 OTHER ISSUES

There are six issues of environmental concern for the subject site.

- A small amount of oil staining was observed on the pavement near the generator and on the concrete floor of the storage outbuilding. The oil staining appears to meet the definition of a "*de minimus*" condition under ASTM.
- Three septic systems are located on site. The exact location is unknown. These tanks are not presently used due to the fact that the site is connected to the city sewer system. The tanks should be properly abandoned in accordance with applicable regulations.
- Railroad tracks are located adjacent to the subject site. Various pesticides, herbicides, or waste oil may have been used for weed control along the railroad tracks. If desired, soil sampling can be conducted to verify whether or not contamination is present.
- Waste water ponds are located adjacent to the northeast of the subject site. Kleinfelder was not able to reasonably ascertain specific information concerning these ponds. It is Kleinfelder's experience that waste water ponds associated with the large wineries are permitted and are monitored regularly; however, regulatory compliance was beyond the scope of this assessment.
- Kleinfelder did not receive a response concerning pipelines within the area from the CSFM office prior to the production of this report. If the information obtained by Kleinfelder changes the conclusions given within this report an addendum will be issued.

- The 1957 and 1965 aerial photographs of the site show a single-family residence and out buildings. Information was not readily available due to the age of the structure. It is unknown if subsurface structures (i.e. septic tank, water well, underground storage tank) are present.

### 7.3 CONCLUSIONS

Kleinfelder's assessment of the site revealed no Recognized Environmental Conditions related to the subject site.

## 8. LIMITATIONS

Phase I ESAs are non-comprehensive by nature and are unlikely to identify all environmental problems or eliminate all risk. The attached report is a qualitative assessment. Kleinfelder offers a range of investigative and engineering services to suit the needs of our clients, including more quantitative investigations. Although risk can never be eliminated, more detailed and extensive investigations yield more information, which may help you understand and better manage your risks. Since such detailed services involve greater expense, we ask our clients to participate in identifying the level of service that will provide them with an acceptable level of risk. Please contact the signatories of this report if you would like to discuss this issue of risk further.

The scope of work on this project was presented in our proposal 41-YP3-813 dated November 21, 2003, and subsequently approved by Ms. Lynn Sletto of Meibeyer Law Group. Please be aware our scope of work was limited to those items specifically identified in the proposal. Environmental issues not specifically addressed in the proposal or this report were beyond the scope of our work and not included in our evaluations.

Kleinfelder performed this environmental site assessment in general accordance with the guidelines set forth in the ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (Designation E-1527-00). No warranty, either expressed or implied is made.

Land use, site conditions (both on-site and off-site) and other factors will change over time. Since site activities and regulations beyond our control could change at any time after the completion of this report; our observations, findings and opinions can be considered valid only as of the date of the site visit. This report should not be relied upon after 180 days from the date of its issuance (ASTM Standard E-1527-00, Section 4.5).

Any party other than the client who would like to use this report shall notify Kleinfelder of such intended use by executing the "Application for Authorization to Use" contained in Appendix D of this document. Based on the intended use of the report, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party.

## Environmental Data Resources, Inc. City Directory Abstract

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist professionals in evaluating potential liability on a target property resulting from past activities. ASTM E 1527-00, Section 7.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. The ASTM standard requires a review of *reasonably ascertainable standard historical sources*. *Reasonably ascertainable means information that is publicly available, obtainable from a source with reasonable time and cost constraints, and practically reviewable.*

To meet the prior use requirements of ASTM E 1527-00, Section 7.3.4, the following *standard historical sources* may be used: aerial photographs, fire insurance maps, property tax files, land title records (although these cannot be the sole historical source consulted), topographic maps, city directories, building department records, or zoning/land use records. ASTM E 1527-00 requires *"All obvious uses of the property shall be identified from the present, back to the property's obvious first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historical sources as are necessary, and that are reasonably ascertainable and likely to be useful."* (ASTM E 1527-00, Section 7.3.4, page 12.)

EDR's City Directory Abstract includes a search and abstract of available city directory data.

### City Directories

City directories have been published for cities and towns across the U.S. since the 1700s. Originally a list of residents, the city directory developed into a sophisticated tool for locating individuals and businesses in a particular urban or suburban area. Twentieth century directories are generally divided into three sections: a business index, a list of resident names and addresses, and a street index. With each address, the directory lists the name of the resident or, if a business is operated from this address, the name and type of business (if unclear from the name). While city directory coverage is comprehensive for major cities, it may be spotty for rural areas and small towns. ASTM E 1527-00 specifies that a *"review of city directories (standard historical sources) at less than approximately five year intervals is not required by this practice."* (ASTM E 1527-00, Section 7.3.4, page 12.)

### NAICS (North American Industry Classification System) Codes

NAICS is a unique, all-new system for classifying business establishments. Adopted in 1997 to replace the prior Standard Industry Classification (SIC) system, it is the system used by the statistical agencies of the United States. It is the first economic classification system to be constructed based on a single economic concept. To learn more about the background, the development and difference between NAICS and SIC, visit the following Census website: <http://www.census.gov/epcd/www/naicsdev.htm>.

#### 4. SUMMARY

- *City Directories:*

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1961 through 2003. (These years are not necessarily inclusive.) A summary of the information obtained is provided in the text of this report.

## Environmental Data Resources, Inc. Aerial Photography Print Service

Environmental Data Resources, Inc.'s (EDR) Aerial Photography Print Service is a screening tool designed to assist professionals in evaluating potential liability on a target property resulting from past activities. ASTM E 1527-00, Section 7.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. The ASTM standard requires a review of *reasonably ascertainable standard historical sources*. *Reasonably ascertainable means information that is publicly available, obtainable from a source with reasonable time and cost constraints, and practically reviewable.*

To meet the prior use requirements of ASTM E 1527-00, Section 7.3.2, the following *standard historical sources* may be used: aerial photographs, fire insurance maps, property tax files, land title records (although these cannot be the sole historical source consulted), topographic maps, city directories, building department records, or zoning/land use records. ASTM E 1527-00 requires *"All obvious uses of the property shall be identified from the present, back to the property's obvious first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historical sources as are necessary, and that are reasonably ascertainable and likely to be useful."* (ASTM E 1527-00, Section 7.3.2, page 11.

### Aerial Photographs

Aerial photographs are a valuable historical resource for documenting past land use and can be particularly helpful when other historical sources (such as city directories or fire insurance maps) are not reasonably ascertainable. The EDR Aerial Photograph Print Service includes a search of aerial photograph collections flown by public and private agencies for the state of California. EDR's professional field-based researchers provide digitally reproduced historical aerial photographs at approximately ten year intervals.

## Environmental Data Resources, Inc. Historical Topographic Map Report

Environmental Data Resources, Inc.'s (EDR) Historical Topographic Map Report is designed to assist professionals in evaluating potential liability on a target property, and its surrounding area, resulting from past activities. ASTM E 1527-00, Section 7.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. The ASTM standard requires a review of *reasonably ascertainable standard historical sources*. *Reasonably ascertainable is defined as information that is publicly available, obtainable from a source with reasonable time and cost constraints, and practically reviewable.*

To meet the prior use requirements of ASTM E 1527-00, Section 7.3.2, the following *standard historical sources* may be used: aerial photographs, city directories, fire insurance maps, topographic maps, property tax files, land title records (although these cannot be the sole historical source consulted), building department records, or zoning and use records. ASTM E 1527-00 requires *"All obvious uses of the property shall be identified from the present, back to the property's obvious first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historical sources as are necessary, and that are reasonably ascertainable and likely to be useful."* (ASTM E 1527-00, Section 7.3.2 page 11.)

EDR's Historical Topographic Map Report includes a search of available public and private color historical topographic map collections.

### Topographic Maps

A topographic map (topo) is a color coded line-and-symbol representation of natural and selected artificial features plotted to a scale. Topos show the shape, elevation, and development of the terrain in precise detail by using contour lines and color coded symbols. Many features are shown by lines that may be straight, curved, solid, dashed, dotted, or in any combination. The colors of the lines usually indicate similar classes of information. For example, topographic contours (brown); lakes, streams, irrigation ditches, etc. (blue); land grids and important roads (red); secondary roads and trails, railroads, boundaries, etc. (black); and features that have been updated using aerial photography, but not field verified, such as disturbed land areas (e.g., gravel pits) and newly developed water bodies (purple).

For more than a century, the USGS has been creating and revising topographic maps for the entire country at a variety of scales. There are about 60,000 U.S. Geological Survey (USGS) produced topo maps covering the United States. Each map covers a specific quadrangle (quad) defined as a four-sided area bounded by latitude and longitude. Historical topographic maps are a valuable historical resource for documenting the prior use of a property and its surrounding area, and due to their frequent availability can be particularly helpful when other standard historical sources (such as city directories, fire insurance maps, or aerial photographs) are not reasonably ascertainable.

FORM-004

## EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property. Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

### FEDERAL ASTM STANDARD

**ERNS:** The Emergency Response Notification System records and stores information on reported releases of oil and hazardous substances. The source of this database is the U.S. EPA.

A review of the ERNS list, as provided by EDR, and dated 12/31/2002 has revealed that there are 7 ERNS sites within approximately 0.25 miles of the target property.

### SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified:

## EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the government records search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. Search distances are per ASTM standard or custom distances requested by the user.

### STATE OR LOCAL ASTM SUPPLEMENTAL

**HAZNET:** The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, has revealed that there is 1 HAZNET site within approximately 0.25 miles of the target property.

**UST:** The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, and dated 04/02/2003 has revealed that there are 4 UST sites within approximately 0.5 miles of the target property.

| What Happened :                               | RP's neighbor advised her of physical failure of the dike which caused this release. The fluids flowed into York Creek which feeds into the Napa River. The Napa River is not believed to be a source of drinking water. Samples have been taken to determi |

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

**Elapsed ASTM days:** Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

### FEDERAL ASTM STANDARD RECORDS

#### **NPL: National Priority List**

Source: EPA

Telephone: N/A

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/22/03

Date Made Active at EDR: 08/26/03

Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 08/04/03

Elapsed ASTM days: 22

Date of Last EDR Contact: 11/03/03

#### **NPL Site Boundaries**

Sources:

EPA's Environmental Photographic Interpretation Center (EPIC)

Telephone: 202-564-7333

EPA Region 1

Telephone 617-918-1143

EPA Region 3

Telephone 215-814-5418

EPA Region 4

Telephone 404-562-8033

EPA Region 6

Telephone: 214-655-6659

EPA Region 8

Telephone: 303-312-6774

#### **Proposed NPL: Proposed National Priority List Sites**

Source: EPA

Telephone: N/A

Date of Government Version: 06/10/03

Date Made Active at EDR: 08/26/03

Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 08/04/03

Elapsed ASTM days: 22

Date of Last EDR Contact: 11/03/03

#### **CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System**

Source: EPA

Telephone: 703-413-0223

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 09/11/03

Date Made Active at EDR: 10/29/03

Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 09/24/03

Elapsed ASTM days: 35

Date of Last EDR Contact: 09/24/03

#### **CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned**

Source: EPA

Telephone: 703-413-0223

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Date of Government Version: 09/11/03  
 Date Made Active at EDR: 10/29/03  
 Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 09/24/03  
 Elapsed ASTM days: 35  
 Date of Last EDR Contact: 09/24/03

**CORRACTS:** Corrective Action Report

Source: EPA

Telephone: 800-424-9346

CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 09/17/03  
 Date Made Active at EDR: 11/11/03  
 Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 10/01/03  
 Elapsed ASTM days: 41  
 Date of Last EDR Contact: 09/08/03

**RCRIS:** Resource Conservation and Recovery Information System

Source: EPA

Telephone: 800-424-9346

Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 09/10/03  
 Date Made Active at EDR: 10/01/03  
 Database Release Frequency: Varies

Date of Data Arrival at EDR: 09/11/03  
 Elapsed ASTM days: 20  
 Date of Last EDR Contact: 11/18/03

**ERNS:** Emergency Response Notification System

Source: National Response Center, United States Coast Guard

Telephone: 202-260-2342

Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/02  
 Date Made Active at EDR: 02/03/03  
 Database Release Frequency: Annually

Date of Data Arrival at EDR: 01/27/03  
 Elapsed ASTM days: 7  
 Date of Last EDR Contact: 10/27/03

**FEDERAL ASTM SUPPLEMENTAL RECORDS**

**BRS:** Biennial Reporting System

Source: EPA/NTIS

Telephone: 800-424-9346

The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/01/01  
 Database Release Frequency: Biennially

Date of Last EDR Contact: 10/01/03  
 Date of Next Scheduled EDR Contact: 12/15/03

**CONSENT:** Superfund (CERCLA) Consent Decrees

Source: EPA Regional Offices

Telephone: Varies

Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: N/A  
 Database Release Frequency: Varies

Date of Last EDR Contact: N/A  
 Date of Next Scheduled EDR Contact: N/A

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

**ROD: Records Of Decision**

Source: EPA

Telephone: 703-416-0223

Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 07/09/03

Database Release Frequency: Annually

Date of Last EDR Contact: 10/08/03

Date of Next Scheduled EDR Contact: 01/05/04

**DELISTED NPL: National Priority List Deletions**

Source: EPA

Telephone: N/A

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 07/22/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 11/03/03

Date of Next Scheduled EDR Contact: 02/02/04

**FINDS: Facility Index System/Facility Identification Initiative Program Summary Report**

Source: EPA

Telephone: N/A

Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 07/25/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 10/07/03

Date of Next Scheduled EDR Contact: 01/05/04

**HMIRS: Hazardous Materials Information Reporting System**

Source: U.S. Department of Transportation

Telephone: 202-366-4555

Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 03/31/03

Database Release Frequency: Annually

Date of Last EDR Contact: 10/23/03

Date of Next Scheduled EDR Contact: 01/19/04

**MLTS: Material Licensing Tracking System**

Source: Nuclear Regulatory Commission

Telephone: 301-415-7169

MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 10/16/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 10/07/03

Date of Next Scheduled EDR Contact: 01/05/04

**MINES: Mines Master Index File**

Source: Department of Labor, Mine Safety and Health Administration

Telephone: 303-231-5959

Date of Government Version: 08/27/03

Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 10/01/03

Date of Next Scheduled EDR Contact: 12/29/03

**NPL LIENS: Federal Superfund Liens**

Source: EPA

Telephone: 202-564-4267

Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Date of Government Version: 10/15/91  
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 08/25/03  
Date of Next Scheduled EDR Contact: 11/24/03

**PADS: PCB Activity Database System**

Source: EPA

Telephone: 202-564-3887

PCB Activity Database. PADS Identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 06/30/03  
Database Release Frequency: Annually

Date of Last EDR Contact: 11/12/03  
Date of Next Scheduled EDR Contact: 02/09/04

**DOD: Department of Defense Sites**

Source: USGS

Telephone: 703-648-5920

This data set consists of federally owned or administered lands, administered by the Department of Defense, that have any area equal to or greater than 640 acres of the United States, Puerto Rico, and the U.S. Virgin Islands.

Date of Government Version: 04/01/03  
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 11/12/03  
Date of Next Scheduled EDR Contact: 02/09/04

**STORMWATER: Storm Water General Permits**

Source: Environmental Protection Agency

Telephone: 202 564-0746

A listing of all facilities with Storm Water General Permits.

Date of Government Version: N/A  
Database Release Frequency: Quarterly

Date of Last EDR Contact: N/A  
Date of Next Scheduled EDR Contact: N/A

**US BROWNFIELDS: A Listing of Brownfields Sites**

Source: Environmental Protection Agency

Telephone: 202-566-2777

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: 07/15/03  
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 09/15/03  
Date of Next Scheduled EDR Contact: 12/15/03

**RMP: Risk Management Plans**

Source: Environmental Protection Agency

Telephone: 202-564-8600

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

Date of Last EDR Contact: N/A  
Date of Next Scheduled EDR Contact: N/A

**RAATS: RCRA Administrative Action Tracking System**

Source: EPA

Telephone: 202-564-4104

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95  
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 09/08/03  
Date of Next Scheduled EDR Contact: 12/08/03

**TRIS: Toxic Chemical Release Inventory System**

Source: EPA

Telephone: 202-260-1531

Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/01  
Database Release Frequency: Annually

Date of Last EDR Contact: 09/23/03  
Date of Next Scheduled EDR Contact: 12/22/03

**TSCA: Toxic Substances Control Act**

Source: EPA

Telephone: 202-260-5521

Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/98  
Database Release Frequency: Every 4 Years

Date of Last EDR Contact: 09/02/03  
Date of Next Scheduled EDR Contact: 12/08/03

Date of Last EDR Contact: 10/20/03  
Date of Next Scheduled EDR Contact: 01/19/04

**FTTS: FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)**

Source: EPA/Office of Prevention, Pesticides and Toxic Substances

Telephone: 202-564-2501

FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act). To maintain currency, EDR contacts the Agency on a quarterly basis.

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Date of Government Version: 10/16/03  
Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/23/03  
Date of Next Scheduled EDR Contact: 12/22/03

### STATE OF CALIFORNIA ASTM STANDARD RECORDS

#### **AWP: Annual Workplan Sites**

Source: California Environmental Protection Agency  
Telephone: 916-323-3400

Known Hazardous Waste Sites. California DTSC's Annual Workplan (AWP), formerly BEP, identifies known hazardous substance sites targeted for cleanup.

Date of Government Version: 08/31/03  
Date Made Active at EDR: 09/17/03  
Database Release Frequency: Annually

Date of Data Arrival at EDR: 09/02/03  
Elapsed ASTM days: 15  
Date of Last EDR Contact: 09/02/03

#### **CAL-SITES: Calsites Database**

Source: Department of Toxic Substance Control  
Telephone: 916-323-3400

The Calsites database contains potential or confirmed hazardous substance release properties. In 1996, California EPA reevaluated and significantly reduced the number of sites in the Calsites database.

Date of Government Version: 08/31/03  
Date Made Active at EDR: 09/17/03  
Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 09/02/03  
Elapsed ASTM days: 15  
Date of Last EDR Contact: 09/02/03

#### **CHMIRS: California Hazardous Material Incident Report System**

Source: Office of Emergency Services  
Telephone: 916-845-8400

California Hazardous Material Incident Reporting System. CHMIRS contains information on reported hazardous material incidents (accidental releases or spills).

Date of Government Version: 12/31/02  
Date Made Active at EDR: 08/07/03  
Database Release Frequency: Varies

Date of Data Arrival at EDR: 07/11/03  
Elapsed ASTM days: 27  
Date of Last EDR Contact: 08/25/03

#### **CORTESE: "Cortese" Hazardous Waste & Substances Sites List**

Source: CAL EPA/Office of Emergency Information  
Telephone: 916-323-9100

The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

Date of Government Version: 04/01/01  
Date Made Active at EDR: 07/26/01  
Database Release Frequency: No Update Planned

Date of Data Arrival at EDR: 05/29/01  
Elapsed ASTM days: 58  
Date of Last EDR Contact: 10/27/03

#### **NOTIFY 65: Proposition 65 Records**

Source: State Water Resources Control Board  
Telephone: 916-445-3846

Proposition 65 Notification Records. NOTIFY 65 contains facility notifications about any release which could impact drinking water and thereby expose the public to a potential health risk.

Date of Government Version: 10/21/93  
Date Made Active at EDR: 11/19/93  
Database Release Frequency: No Update Planned

Date of Data Arrival at EDR: 11/01/93  
Elapsed ASTM days: 18  
Date of Last EDR Contact: 10/20/03

#### **TOXIC PITS: Toxic Pits Cleanup Act Sites**

Source: State Water Resources Control Board  
Telephone: 916-227-4364

Toxic PITS Cleanup Act Sites. TOXIC PITS identifies sites suspected of containing hazardous substances where cleanup has not yet been completed.

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Date of Government Version: 07/01/95  
 Date Made Active at EDR: 09/26/95  
 Database Release Frequency: No Update Planned

Date of Data Arrival at EDR: 08/30/95  
 Elapsed ASTM days: 27  
 Date of Last EDR Contact: 11/03/03

**SWF/LF (SWIS): Solid Waste Information System**

Source: Integrated Waste Management Board  
 Telephone: 916-341-6320

Active, Closed and Inactive Landfills. SWF/LF records typically contain an inventory of solid waste disposal facilities or landfills. These may be active or inactive facilities or open dumps that failed to meet RCRA Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 09/12/03  
 Date Made Active at EDR: 10/16/03  
 Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 09/15/03  
 Elapsed ASTM days: 31  
 Date of Last EDR Contact: 09/15/03

**WMUDS/SWAT: Waste Management Unit Database**

Source: State Water Resources Control Board  
 Telephone: 916-227-4448

Waste Management Unit Database System. WMUDS is used by the State Water Resources Control Board staff and the Regional Water Quality Control Boards for program tracking and inventory of waste management units. WMUDS is composed of the following databases: Facility Information, Scheduled Inspections Information, Waste Management Unit Information, SWAT Program Information, SWAT Report Summary Information, SWAT Report Summary Data, Chapter 15 (formerly Subchapter 15) Information, Chapter 15 Monitoring Parameters, TPCA Program Information, RCRA Program Information, Closure Information, and Interested Parties Information.

Date of Government Version: 04/01/00  
 Date Made Active at EDR: 05/10/00  
 Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 04/10/00  
 Elapsed ASTM days: 30  
 Date of Last EDR Contact: 09/12/03

**LUST: Leaking Underground Storage Tank Information System**

Source: State Water Resources Control Board  
 Telephone: 916-341-5740

Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.

Date of Government Version: 04/02/03  
 Date Made Active at EDR: 04/25/03  
 Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 04/16/03  
 Elapsed ASTM days: 9  
 Date of Last EDR Contact: 10/14/03

**CA BOND EXP. PLAN: Bond Expenditure Plan**

Source: Department of Health Services  
 Telephone: 916-255-2118

Department of Health Services developed a site-specific expenditure plan as the basis for an appropriation of Hazardous Substance Cleanup Bond Act funds. It is not updated.

Date of Government Version: 01/01/89  
 Date Made Active at EDR: 08/02/94  
 Database Release Frequency: No Update Planned

Date of Data Arrival at EDR: 07/27/94  
 Elapsed ASTM days: 6  
 Date of Last EDR Contact: 05/31/94

**CA UST:**

**UST: Active UST Facilities**

Source: SWRCB  
 Telephone: 916-341-5700

Active UST facilities gathered from the local regulatory agencies

Date of Government Version: 04/02/03  
 Date Made Active at EDR: 04/30/03  
 Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 04/16/03  
 Elapsed ASTM days: 14  
 Date of Last EDR Contact: 10/14/03

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

**VCP: Voluntary Cleanup Program Properties**

Source: Department of Toxic Substances Control

Telephone: 916-323-3400

Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

Date of Government Version: 08/31/03

Date Made Active at EDR: 09/17/03

Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 09/02/03

Elapsed ASTM days: 15

Date of Last EDR Contact: 09/02/03

**INDIAN UST: Underground Storage Tanks on Indian Land**

Source: EPA Region 9

Telephone: 415-972-3368

Date of Government Version: N/A

Date Made Active at EDR: N/A

Database Release Frequency: Varies

Date of Data Arrival at EDR: N/A

Elapsed ASTM days: 0

Date of Last EDR Contact: N/A

**CA FID UST: Facility Inventory Database**

Source: California Environmental Protection Agency

Telephone: 916-445-6532

The Facility Inventory Database (FID) contains a historical listing of active and inactive underground storage tank locations from the State Water Resource Control Board. Refer to local/county source for current data.

Date of Government Version: 10/31/94

Date Made Active at EDR: 09/29/95

Database Release Frequency: No Update Planned

Date of Data Arrival at EDR: 09/05/95

Elapsed ASTM days: 24

Date of Last EDR Contact: 12/28/98

**HIST UST: Hazardous Substance Storage Container Database**

Source: State Water Resources Control Board

Telephone: 916-341-5700

The Hazardous Substance Storage Container Database is a historical listing of UST sites. Refer to local/county source for current data.

Date of Government Version: 10/15/90

Date Made Active at EDR: 02/12/91

Database Release Frequency: No Update Planned

Date of Data Arrival at EDR: 01/25/91

Elapsed ASTM days: 18

Date of Last EDR Contact: 07/26/01

**STATE OF CALIFORNIA ASTM SUPPLEMENTAL RECORDS****AST: Aboveground Petroleum Storage Tank Facilities**

Source: State Water Resources Control Board

Telephone: 916-341-5712

Registered Aboveground Storage Tanks.

Date of Government Version: 07/01/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 11/03/03

Date of Next Scheduled EDR Contact: 02/02/04

**CLEANERS: Cleaner Facilities**

Source: Department of Toxic Substance Control

Telephone: 916-225-0873

A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaner's agents; linen supply; coin-operated laundries and cleaning; drycleaning plants, except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.

Date of Government Version: 03/11/03

Database Release Frequency: Annually

Date of Last EDR Contact: 10/20/03

Date of Next Scheduled EDR Contact: 01/05/04

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

**CA WDS: Waste Discharge System**

Source: State Water Resources Control Board

Telephone: 916-657-1571

Sites which have been issued waste discharge requirements.

Date of Government Version: 09/22/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/24/03

Date of Next Scheduled EDR Contact: 12/22/03

**DEED: List of Deed Restrictions**

Source: Department of Toxic Substances Control

Telephone: 916-323-3400

The use of recorded land use restrictions is one of the methods the DTSC uses to protect the public from unsafe exposures to hazardous substances and wastes.

Date of Government Version: 10/07/03

Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 10/08/03

Date of Next Scheduled EDR Contact: 01/05/04

**NFA: No Further Action Determination**

Source: Department of Toxic Substances Control

Telephone: 916-323-3400

This category contains properties at which DTSC has made a clear determination that the property does not pose a problem to the environment or to public health.

Date of Government Version: 08/31/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/02/03

Date of Next Scheduled EDR Contact: 12/01/03

**EMI: Emissions Inventory Data**

Source: California Air Resources Board

Telephone: 916-322-2990

Toxics and criteria pollutant emissions data collected by the ARB and local air pollution agencies.

Date of Government Version: 12/31/01

Database Release Frequency: Varies

Date of Last EDR Contact: 10/20/03

Date of Next Scheduled EDR Contact: 01/19/04

**REF: Unconfirmed Properties Referred to Another Agency**

Source: Department of Toxic Substances Control

Telephone: 916-323-3400

This category contains properties where contamination has not been confirmed and which were determined as not requiring direct DTSC Site Mitigation Program action or oversight. Accordingly, these sites have been referred to another state or local regulatory agency.

Date of Government Version: 08/31/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/02/03

Date of Next Scheduled EDR Contact: 12/01/03

**SCH: School Property Evaluation Program**

Source: Department of Toxic Substances Control

Telephone: 916-323-3400

This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category depending on the level of threat to public health and safety or the environment they pose.

Date of Government Version: 08/31/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/02/03

Date of Next Scheduled EDR Contact: 12/01/03

**NFE: Properties Needing Further Evaluation**

Source: Department of Toxic Substances Control

Telephone: 916-323-3400

This category contains properties that are suspected of being contaminated. These are unconfirmed contaminated properties that need to be assessed using the PEA process. PEA In Progress indicates properties where DTSC is currently conducting a PEA. PEA Required indicates properties where DTSC has determined a PEA is required, but not currently underway.

**HAZNET:** Hazardous Waste Information System  
Source: California Environmental Protection Agency  
Telephone: 916-255-1136

**Facility and Manifest Data.** The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

### EDR PROPRIETARY HISTORICAL DATABASES

**EDR Historical Gas Station and Dry Cleaners:** EDR has searched select national collections of business directories and has collected listings of potential dry cleaner and gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning and gas station/filling station/service station establishments. The categories reviewed included, but were not limited to: *gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, dry cleaner, cleaners, laundry, laundromat, cleaning/laundry, wash & dry, etc.*

This information is meant to assist and complement environmental professionals in their conduct of environmental site assessments, and is not meant to be a substitute for a full historical investigation as defined in ASTM E1527. The information provided in this proprietary database may or may not be complete; i.e., the absence of a dry cleaner or gas station/filling station/service station site does not necessarily mean that such a site did not exist in the area covered by this report.

*(A note on "dry cleaning" sites: it is not possible for EDR to differentiate between establishments that use PERC on-site as a cleaning solvent and sites that function simply as drop-off and pick-up locations or that are traditional wet cleaning/laundry facilities. Therefore, it is essential for environmental professionals to incorporate professional judgment in the evaluation of each site.)*

**Former Manufactured Gas (Coal Gas) Sites:** The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

#### **Disclaimer Provided by Real Property Scan, Inc.**

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

### BROWNFIELDS DATABASES

**VCP: Voluntary Cleanup Program Properties**  
Source: Department of Toxic Substances Control  
Telephone: 916-323-3400

Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

Date of Government Version: 08/31/03  
Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/02/03  
Date of Next Scheduled EDR Contact: 12/01/03

#### **US BROWNFIELDS: A Listing of Brownfields Sites**

Source: Environmental Protection Agency  
Telephone: 202-566-2777

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: N/A  
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: N/A  
Date of Next Scheduled EDR Contact: N/A

#### **OTHER DATABASE(S)**

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

**Oil/Gas Pipelines:** This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

#### **Electric Power Transmission Line Data**

Source: PennWell Corporation  
Telephone: (800) 823-6277

This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

**Sensitive Receptors:** There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

#### **AHA Hospitals:**

Source: American Hospital Association, Inc.  
Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

#### **Medical Centers: Provider of Services Listing**

Source: Centers for Medicare & Medicaid Services  
Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

#### **Nursing Homes**

Source: National Institutes of Health  
Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

#### **Public Schools**

Source: National Center for Education Statistics  
Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

**Elapsed ASTM days:** Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

### FEDERAL ASTM STANDARD RECORDS

#### **NPL: National Priority List**

Source: EPA

Telephone: N/A

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/22/03

Date Made Active at EDR: 08/26/03

Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 08/04/03

Elapsed ASTM days: 22

Date of Last EDR Contact: 11/03/03

#### **NPL Site Boundaries**

#### **Proposed NPL: Proposed National Priority List Sites**

Source: EPA

Telephone: N/A

Date of Government Version: 06/10/03

Date Made Active at EDR: 08/26/03

Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 08/04/03

Elapsed ASTM days: 22

Date of Last EDR Contact: 11/03/03

#### **CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System**

Source: EPA

Telephone: 703-413-0223

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 09/11/03

Date Made Active at EDR: 10/29/03

Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 09/24/03

Elapsed ASTM days: 35

Date of Last EDR Contact: 09/24/03

#### **CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned**

Source: EPA

Telephone: 703-413-0223

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Date of Government Version: 09/11/03  
 Date Made Active at EDR: 10/29/03

 Date of Last EDR Contact: 09/08/03

### **RCRIS:** Resource Conservation and Recovery Information System

Source: EPA  
 Telephone: 800-424-9346

Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 09/10/03  
 Date Made Active at EDR: 10/01/03

### **ERNS:** Emergency Response Notification System

Source: National Response Center, United States Coast Guard  
 Telephone: 202-260-2342

Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/02  
 Date Made Active at EDR: 02/03/03  
 Database Release Frequency: Annually

Date of Data Arrival at EDR: 01/27/03  
 Elapsed ASTM days: 7  
 Date of Last EDR Contact: 10/27/03

### **FEDERAL ASTM SUPPLEMENTAL RECORDS**

#### **BRS:** Biennial Reporting System

Source: EPA/NTIS  
 Telephone: 800-424-9346

The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/01/01  
 Database Release Frequency: Biennially

Date of Last EDR Contact: 10/01/03  
 Date of Next Scheduled EDR Contact: 12/15/03

#### **CONSENT:** Superfund (CERCLA) Consent Decrees

Source: EPA Regional Offices  
 Telephone: Varies

Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: N/A  
 Database Release Frequency: Varies

Date of Last EDR Contact: N/A  
 Date of Next Scheduled EDR Contact: N/A

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

**ROD: Records Of Decision**

Source: EPA

Telephone: 703-416-0223

Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 07/09/03

Database Release Frequency: Annually

Date of Last EDR Contact: 10/08/03

Date of Next Scheduled EDR Contact: 01/05/04

**DELISTED NPL: National Priority List Deletions**

Source: EPA

Telephone: N/A

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 07/22/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 11/03/03

Date of Next Scheduled EDR Contact: 02/02/04

**FINDS: Facility Index System/Facility Identification Initiative Program Summary Report**

Source: EPA

Telephone: N/A

Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 07/25/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 10/07/03

Date of Next Scheduled EDR Contact: 01/05/04

**HMIRS: Hazardous Materials Information Reporting System**

Source: U.S. Department of Transportation

Telephone: 202-366-4555

Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 03/31/03

Database Release Frequency: Annually

Date of Last EDR Contact: 10/23/03

Date of Next Scheduled EDR Contact: 01/19/04

**MLTS: Material Licensing Tracking System**

Source: Nuclear Regulatory Commission

Telephone: 301-415-7169

MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 10/16/03

Database Release Frequency: Quarterly

Date of Last EDR Contact: 10/07/03

Date of Next Scheduled EDR Contact: 01/05/04

**MINES: Mines Master Index File**

Source: Department of Labor, Mine Safety and Health Administration

Telephone: 303-231-5959

Date of Government Version: 08/27/03

Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 10/01/03

Date of Next Scheduled EDR Contact: 12/29/03

**NPL LIENS: Federal Superfund Liens**

Source: EPA

Telephone: 202-564-4267

Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/91  
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 08/25/03  
Date of Next Scheduled EDR Contact: 11/24/03

**PADS: PCB Activity Database System**

Source: EPA

Telephone: 202-564-3887

PCB Activity Database. PADS Identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 06/30/03  
Database Release Frequency: Annually

Date of Last EDR Contact: 11/12/03  
Date of Next Scheduled EDR Contact: 02/09/04

**DOD: Department of Defense Sites**

Source: USGS

Telephone: 703-648-5920

This data set consists of federally owned or administered lands, administered by the Department of Defense, that have any area equal to or greater than 640 acres of the United States, Puerto Rico, and the U.S. Virgin Islands.

Date of Government Version: 04/01/03  
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 11/12/03  
Date of Next Scheduled EDR Contact: 02/09/04

**STORMWATER: Storm Water General Permits**

Source: Environmental Protection Agency

Telephone: 202 564-0746

A listing of all facilities with Storm Water General Permits.

Date of Government Version: N/A  
Database Release Frequency: Quarterly

Date of Last EDR Contact: N/A  
Date of Next Scheduled EDR Contact: N/A

**US BROWNFIELDS: A Listing of Brownfields Sites**

Source: Environmental Protection Agency

Telephone: 202-566-2777

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: 07/15/03  
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 09/15/03  
Date of Next Scheduled EDR Contact: 12/15/03

**RMP: Risk Management Plans**

Source: Environmental Protection Agency

Telephone: 202-564-8600

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

Date of Next Scheduled EDR Contact: N/A

**RAATS: RCRA Administrative Action Tracking System**

Source: EPA  
Telephone: 202-564-4104

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95  
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 09/08/03  
Date of Next Scheduled EDR Contact: 12/08/03

**TRIS: Toxic Chemical Release Inventory System**

Source: EPA  
Telephone: 202-260-1531

Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/01  
Database Release Frequency: Annually

Date of Last EDR Contact: 09/23/03  
Date of Next Scheduled EDR Contact: 12/22/03

**TSCA: Toxic Substances Control Act**

Source: EPA  
Telephone: 202-260-5521

Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/98  
Database Release Frequency: Every 4 Years

Date of Last EDR Contact: 09/02/03  
Date of Next Scheduled EDR Contact: 12/08/03

**FTTS INSP: FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)**

Date of Last EDR Contact: 09/02/03

#### **CHMIRS: California Hazardous Material Incident Report System**

Source: Office of Emergency Services  
Telephone: 916-845-8400

California Hazardous Material Incident Reporting System. CHMIRS contains information on reported hazardous material incidents (accidental releases or spills).

Date of Government Version: 12/31/02  
Date Made Active at EDR: 08/07/03  
Database Release Frequency: Varies

Date of Data Arrival at EDR: 07/11/03  
Elapsed ASTM days: 27  
Date of Last EDR Contact: 08/25/03

#### **CORTESE: "Cortese" Hazardous Waste & Substances Sites List**

Source: CAL EPA/Office of Emergency Information  
Telephone: 916-323-9100

The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

Date of Government Version: 04/01/01  
Date Made Active at EDR: 07/26/01  
Database Release Frequency: No Update Planned

Date of Data Arrival at EDR: 05/29/01  
Elapsed ASTM days: 58  
Date of Last EDR Contact: 10/27/03

#### **NOTIFY 65: Proposition 65 Records**

Source: State Water Resources Control Board  
Telephone: 916-445-3846

Proposition 65 Notification Records. NOTIFY 65 contains facility notifications about any release which could impact drinking water and thereby expose the public to a potential health risk.

Date of Government Version: 10/21/93  
Date Made Active at EDR: 11/19/93  
Database Release Frequency: No Update Planned

Date of Data Arrival at EDR: 11/01/93  
Elapsed ASTM days: 18  
Date of Last EDR Contact: 10/20/03

#### **TOXIC PITS: Toxic Pits Cleanup Act Sites**

Source: State Water Resources Control Board  
Telephone: 916-227-4364

Toxic PITS Cleanup Act Sites. TOXIC PITS identifies sites suspected of containing hazardous substances where cleanup has not yet been completed.

Database Release Frequency: Varies

Date of Last EDR Contact: 10/20/03  
Date of Next Scheduled EDR Contact: 01/19/04

**REF: Unconfirmed Properties Referred to Another Agency**

Source: Department of Toxic Substances Control  
Telephone: 916-323-3400

This category contains properties where contamination has not been confirmed and which were determined as not requiring direct DTSC Site Mitigation Program action or oversight. Accordingly, these sites have been referred to another state or local regulatory agency.

Date of Government Version: 08/31/03  
Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/02/03  
Date of Next Scheduled EDR Contact: 12/01/03

**SCH: School Property Evaluation Program**

Source: Department of Toxic Substances Control  
Telephone: 916-323-3400

This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category depending on the level of threat to public health and safety or the environment they pose.

Date of Government Version: 08/31/03  
Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/02/03  
Date of Next Scheduled EDR Contact: 12/01/03

**NFE: Properties Needing Further Evaluation**

Source: Department of Toxic Substances Control  
Telephone: 916-323-3400

This category contains properties that are suspected of being contaminated. These are unconfirmed contaminated properties that need to be assessed using the PEA process. PEA in Progress indicates properties where DTSC is currently conducting a PEA. PEA Required indicates properties where DTSC has determined a PEA is required, but not currently underway.

### EDR PROPRIETARY HISTORICAL DATABASES

**EDR Historical Gas Station and Dry Cleaners:** EDR has searched select national collections of business directories and has collected listings of potential dry cleaner and gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning and gas station/filling station/service station establishments. The categories reviewed included, but were not limited to: *gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, dry cleaner, cleaners, laundry, laundromat, cleaning/laundry, wash & dry, etc.*

This information is meant to assist and complement environmental professionals in their conduct of environmental site assessments, and is not meant to be a substitute for a full historical investigation as defined in ASTM E1527. The information provided in this proprietary database may or may not be complete; i.e., the absence of a dry cleaner or gas station/filling station/service station site does not necessarily mean that such a site did not exist in the area covered by this report.

*(A note on "dry cleaning" sites: it is not possible for EDR to differentiate between establishments that use PERC on-site as a cleaning solvent and sites that function simply as drop-off and pick-up locations or that are traditional wet cleaning/laundry facilities. Therefore, it is essential for environmental professionals to incorporate professional judgment in the evaluation of each site.)*

**Former Manufactured Gas (Coal Gas) Sites:** The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

#### Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

### BROWNFIELDS DATABASES

**VCP: Voluntary Cleanup Program Properties**  
Source: Department of Toxic Substances Control  
Telephone: 916-323-3400

Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

Date of Next Scheduled EDR Contact: 12/01/03

### US BROWNFIELDS: A Listing of Brownfields Sites

Source: Environmental Protection Agency  
Telephone: 202-566-2777

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: N/A  
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: N/A  
Date of Next Scheduled EDR Contact: N/A

### OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

**Oil/Gas Pipelines:** This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

**Sensitive Receptors:** There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

### AHA Hospitals:

Source: American Hospital Association, Inc.  
Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

### Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services  
Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

### Nursing Homes

Source: National Institutes of Health  
Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

### Public Schools

Source: National Center for Education Statistics  
Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

## GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

### GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

### TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

### TARGET PROPERTY TOPOGRAPHY

|                               |                             |
|-------------------------------|-----------------------------|
| USGS Topographic Map:         | 2438122-E4 SAINT HELENA, CA |
| General Topographic Gradient: | General NE                  |
| Source:                       | USGS 7.5 min quad index     |

### SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

## GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

### HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

|----------------------------------------------------|---------------------------------------------------------|

### HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

#### Site-Specific Hydrogeological Data\*:

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

## GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

### GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

### GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

### DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

|                       |                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Soil Component Name:  | BALE                                                                                                                                               |
| Soil Surface Texture: | clay loam                                                                                                                                          |
| Hydrologic Group:     | Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.           |
| Soil Drainage Class:  | Somewhat poorly. Soils commonly have a layer with low hydraulic conductivity, wet state high in profile, etc. Depth to water table is 1 to 3 feet. |

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: MODERATE

Depth to Bedrock Min: > 60 inches

Depth to Bedrock Max: > 60 inches

## **OTHER SOIL TYPES IN AREA**

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: silt loam  
loam  
very gravelly - loam  
very stony - loam  
gravelly - loam  
very gravelly - sand  
clay  
silty clay loam

Surficial Soil Types: silt loam  
loam  
very gravelly - loam  
very stony - loam  
gravelly - loam  
very gravelly - sand  
clay  
silty clay loam

Shallow Soil Types: sandy clay loam  
gravelly - loam

## GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

gravelly - clay loam  
sandy loam  
clay loam

Deeper Soil Types: silty clay loam  
gravelly - fine sandy loam  
silt loam  
clay  
weathered bedrock  
sand and gravel  
cobble - clay loam

### ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

## GEOCHECK® - PHYSICAL SETTING SOURCE MAP FINDINGS RADON

### AREA RADON INFORMATION

State Database: CA Radon

#### Radon Test Results

| Zip   | Total Sites | > 4 pCi/L | Pct. > 4 pCi/L |
|-------|-------------|-----------|----------------|
| 94574 | 5           | 0         | 0.00           |

Federal EPA Radon Zone for NAPA County: 3

Note: Zone 1 indoor average level > 4 pCi/L.  
 : Zone 2 indoor average level >= 2 pCi/L and <= 4 pCi/L.  
 : Zone 3 indoor average level < 2 pCi/L.

Federal Area Radon Information for Zip Code: 94574

Number of sites tested: 2

| Area                    | Average Activity | % <4 pCi/L   | % 4-20 pCi/L | % >20 pCi/L  |
|-------------------------|------------------|--------------|--------------|--------------|
| Living Area - 1st Floor | 1.200 pCi/L      | 100%         | 0%           | 0%           |
| Living Area - 2nd Floor | Not Reported     | Not Reported | Not Reported | Not Reported |
| Basement                | 2.800 pCi/L      | 100%         | 0%           | 0%           |

## PHYSICAL SETTING SOURCE RECORDS SEARCHED

### TOPOGRAPHIC INFORMATION

#### **USGS 7.5' Digital Elevation Model (DEM)**

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002. 7.5-Minute DEMs correspond to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps.

### HYDROLOGIC INFORMATION

**Flood Zone Data:** This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

**NWI:** National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

### HYDROGEOLOGIC INFORMATION

#### **AQUIFLOW<sup>®</sup> Information System**

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

### GEOLOGIC INFORMATION

#### **Geologic Age and Rock Stratigraphic Unit**

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

#### **STATSGO: State Soil Geographic Database**

Source: Department of Agriculture, Natural Resources Conservation Services

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

### ADDITIONAL ENVIRONMENTAL RECORD SOURCES

#### **FEDERAL WATER WELLS**

##### **PWS: Public Water Systems**

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

##### **PWS ENF: Public Water Systems Violation and Enforcement Data**

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

##### **USGS Water Wells: USGS National Water Inventory System (NWIS)**

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

## PHYSICAL SETTING SOURCE RECORDS SEARCHED

### STATE RECORDS

#### California Drinking Water Quality Database

Source: Department of Health Services

Telephone: 916-324-2319

The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

#### California Oil and Gas Well Locations for District 2, 3, 5 and 6

Source: Department of Conservation

Telephone: 916-323-1779

### RADON

#### State Database: CA Radon

Source: Department of Health Services

Telephone: 916-324-2208

Radon Database for California

#### Area Radon Information

Source: USGS

Telephone: 703-356-4020

The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

#### EPA Radon Zones

Source: EPA

Telephone: 703-356-4020

Sections 307 & 309 of IRRA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

### OTHER

#### Airport Landing Facilities: Private and public use landing facilities

Source: Federal Aviation Administration, 800-457-6656

#### Epicenters: World earthquake epicenters, Richter 5 or greater

Source: Department of Commerce, National Oceanic and Atmospheric Administration

**California Earthquake Fault Lines:** The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

## **APPENDIX D**

**APPLICATION FOR AUTHORIZATION TO USE  
PHASE I ENVIRONMENTAL SITE ASSESSMENT  
APN 009-010-024  
830 PRATT AVENUE  
ST. HELENA, CALIFORNIA**

File Number: 38603

Report Date: December 15, 2003

TO: Kleinfelder, Inc.  
780 Chadbourne Road, Suite D  
Fairfield, California 94585  
Telephone: (707) 429-4070  
Fax: (707) 429-4162

**To Whom It May Concern:**

Applicant understands and agrees that the Phase I Environmental Site Assessment (ESA) for the subject site is a copyrighted document, that Kleinfelder, Inc., is the copyright owner and that unauthorized use or copying of the ESA is strictly prohibited without the express written permission of Kleinfelder, Inc. Applicant understands that Kleinfelder, Inc., may withhold such permission at its sole discretion, or grant such permission upon such terms and conditions as it deems acceptable.

Applicant agrees to accept the contractual terms and conditions between Kleinfelder, Inc. and Meibeyer Law Group, originally negotiated for preparation of this ESA. Use of this document without permission releases Kleinfelder, Inc. its owners, employees and subcontractors from any liability that may arise from use of this report.

PLANTING NOTES:

1. ALL PLANTS AND LAWN TO BE IRRIGATED WITH AN AUTOMATED IRRIGATION SYSTEM.
2. ALL PROPOSED PLANT MATERIALS SHALL BE APPROVED BY THE LANDSCAPE ARCHITECT PRIOR TO INSTALLATION AND WILL BE REJECTED IF NOT IN CONFORMANCE WITH INDUSTRY STANDARDS. PLANTS SHALL BE PRUNED PRIOR TO INSPECTION.
3. PLANTING AREAS SHALL BE CLEARED OF ALL WEEDS AND DEBRIS PRIOR TO SOIL PREPARATION. IN THE CASE OF PERNICIOUS PERENNIAL WEEDS, A SYSTEMATIC HERBICIDE SHALL BE APPLIED PRIOR TO CLEARING. IF PARTICULARLY DIFFICULT WEEDS SUCH AS WILD ONION ARE ENCOUNTERED, THE LANDSCAPE ARCHITECT AND OWNERS SHALL BE ADVISED PRIOR TO PROCEEDING.
4. ALL PLANTING OPERATIONS SHALL BE PERFORMED BY PERSONNEL FAMILIAR WITH THIS TYPE OF WORK AND UNDER THE SUPERVISION OF A QUALIFIED PLANTING FOREMAN.
5. THE LANDSCAPE CONTRACTOR SHALL SUPPLY AND CULTIVATE 2 INCHES OF NITROLIZED FIR BARK AND 1 INCH OF 3/16" MINUS LAVA STONE INTO THE TOP 6 INCHES OF ALL PLANTING AREAS. ROTOTILL IN LIFTS AS REQUIRED, OR HAND WORK NEAR ROOT SYSTEMS OF EXISTING TREES.
6. ALL PLANT MATERIAL SHALL BE DELIVERED TO THE JOBSITE FOR INSPECTION. PRIOR TO PLANTING, THE CONTRACTOR SHALL CONFIRM LOCATIONS OF ALL PLANTS WITH THE LANDSCAPE ARCHITECT. THE CONTRACTOR SHALL GIVE 3 DAYS NOTICE OF PLANT DELIVERY AND PLACEMENT.
7. ON COMPLETION OF PLANTING AND IRRIGATION INSTALLATION, ALL PLANTED AREAS SHALL RECEIVE A UNIFORM LAYER OF 2 INCHES OF FIR BARK WOOD MULCH. CONTRACTOR SHALL PROVIDE A SAMPLE OF MULCH PRIOR TO ORDERING.
8. THE LANDSCAPE CONTRACTOR SHALL MAKE NO CHANGES TO THE PLANT LAYOUT WITHOUT CONSENT OF THE LANDSCAPE ARCHITECT.
9. THE LANDSCAPE CONTRACTOR SHALL GUARANTEE ALL NEW PLANTINGS FOR A 6 MONTH PERIOD OR UNTIL THERE IS EVIDENCE OF POSITIVE GROWTH. THE GUARANTEE PERIOD SHALL BEGIN AFTER FINAL INSPECTION AND APPROVAL.
10. ANY PLANTS THAT DIE OR ARE DAMAGED SHALL BE REPLACED IMMEDIATELY.

IRRIGATION NOTES

1. LAYOUT OF PIPING, VALVES AND HEADS IS DIAGRAMMATIC AND MAY BE FIELD ADJUSTED FOR OPTIMUM COVERAGE AND EASE OF INSTALLATION AND MAINTENANCE. LAYOUT OF THE MAIN LINE, LATERALS AND VALVES IS FOR VISUAL CLARITY AND SHOULD BE LOCATED IN PLANTING BEDS AT ALL TIMES. PARALLEL PIPES IN A COMMON TRENCH SHOULD HAVE 3" MIN. HORIZONTAL SEPARATION.
2. THE CONTRACTOR SHALL VERIFY ALL EXISTING CONDITIONS AND COORDINATE SLEEVE LOCATIONS, WATER PRESSURE, CONTROLLER LOCATION, AND EXISTING UNDERGROUND UTILITIES AND STRUCTURES WITH FDC PRIOR TO ANY EXCAVATION. ALL DAMAGE CAUSED BY OR DURING THE PERFORMANCE OF THIS WORK SHALL BE REPAIRED AT NO ADDITIONAL COST TO THE OWNER.
3. PROVIDE 18" OF COVER OVER MAIN LINES AND 12" OF COVER OVER LATERALS. ALL TRENCHING WITHIN OR NEAR THE DRIPLINES OF EXISTING TREES SHALL BE APPROVED BY THE ARBORIST PRIOR TO PROCEEDING.
4. ALL BACKFILL MATERIAL SHALL BE CLEAN AND FREE OF ROCKS AND DEBRIS AND SHALL BE COMPACTED TO ORIGINAL SOIL DENSITY. SLEEVES SHALL EXTEND 12" BEYOND PAVING EDGES.
5. THE CONTRACTOR SHALL MAINTAIN AN ACCURATE AS-BUILD DRAWING OF THE INSTALLED SYSTEM AND PROVIDE IT TO THE OWNER UPON COMPLETION OF THE WORK.

STATEMENT OF COMPLIANCE:

I HAVE COMPLIED WITH THE CRITERIA OF THE ORDINANCE AND APPLIED THEM FOR THE EFFICIENT USE OF WATER IN THE LANDSCAPE DESIGN PLAN.

## Introduction

The Culinary Institute of America (CIA) is proposing to expand the student housing facility located at 830 Pratt Avenue, St. Helena, CA. Existing buildings would be demolished and new housing buildings would be constructed. Figure 1 shows the current proposed site layout. This memorandum provides an assessment of noise and vibration impacts associated with construction and operation of the facility. The discussion has been formatted to be consistent with the California Environmental Quality Act (CEQA) checklist for noise impacts.

## Noise Discussion

### Terminology

#### Noise

Sound is mechanical energy (vibration) transmitted by pressure waves over a medium such as air or water. Noise is generally defined as unwanted sound that annoys or disturbs people. Sound is characterized by various parameters that include the rate of oscillation of sound waves (frequency), the speed of propagation, and the pressure level or energy content (amplitude). In particular, the sound pressure level is the most common descriptor used to characterize the loudness of an ambient (existing) sound level. Although the decibel (dB) scale, a logarithmic scale, is used to quantify sound intensity, it does not accurately describe how sound intensity is perceived by human hearing. The human ear is not equally sensitive to all frequencies in the entire spectrum, so noise measurements are weighted more heavily for frequencies to which humans are sensitive in a process called "A-weighting," written as "dBA" and referred to as "A-weighted decibels". Table 1 provides definitions of sound measurements and other terminology used in this discuss, and Table 2 summarizes typical A-weighted sound levels for different noise sources.

In general, human sound perception is such that a change in sound level of 1 dB cannot typically be perceived by the human ear, a change of 3 dB is just noticeable, a change of 5 dB is clearly noticeable, and a change of 10 dB is perceived as doubling or halving the sound level.

For a point source such as a stationary compressor or construction equipment, sound attenuates based on geometry at rate of 6 dB per doubling of distance. For a line source such as free flowing traffic on a freeway, sound attenuates at a rate of 3 dB per doubling of distance (Caltrans 2013a). Atmospheric conditions including wind, temperature gradients, and humidity can change how sound propagates over distance and can affect the level of sound received at a given location. The degree to which the ground surface absorbs acoustical energy also affects sound propagation. Sound that travels over an acoustically absorptive surface such as grass attenuates at a greater rate than sound that travels over a hard surface such as pavement. The increased attenuation is typically in the range of 1 to 2 dB per doubling of distance. Barriers such as buildings and topography that block the line of sight between a source and receiver also increase the attenuation of sound over distance.

**Table 1. Definition of Sound Measurements**

| Sound Measurements                                 | Definition                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Decibel (dB)                                       | A unitless measure of sound on a logarithmic scale, which indicates the squared ratio of sound pressure amplitude to a reference sound pressure amplitude. The reference pressure is 20 micro-pascals.                                                                                              |
| A-Weighted Decibel (dBA)                           | An overall frequency-weighted sound level in decibels that approximates the frequency response of the human ear.                                                                                                                                                                                    |
| Maximum Sound Level (L <sub>max</sub> )            | The maximum sound level measured during the measurement period.                                                                                                                                                                                                                                     |
| Minimum Sound Level (L <sub>min</sub> )            | The minimum sound level measured during the measurement period.                                                                                                                                                                                                                                     |
| Equivalent Sound Level (Leq)                       | The equivalent steady state sound level that in a stated period of time would contain the same acoustical energy.                                                                                                                                                                                   |
| Percentile-Exceeded Sound Level (L <sub>xx</sub> ) | The sound level exceeded "x" percent of a specific time period. L <sub>10</sub> is the sound level exceeded 10 percent of the time.                                                                                                                                                                 |
| Day-Night Level (L <sub>dn</sub> )                 | The energy average of the A-weighted sound levels occurring during a 24-hour period, with 10 dB added to the A-weighted sound levels occurring during the period from 10:00 p.m. to 7:00 a.m.                                                                                                       |
| Community Noise Equivalent Level (CNEL)            | The energy average of the A-weighted sound levels occurring during a 24-hour period with 5 dB added to the A-weighted sound levels occurring during the period from 7:00 p.m. to 10:00 p.m. and 10 dB added to the A-weighted sound levels occurring during the period from 10:00 p.m. to 7:00 a.m. |
| Peak Particle Velocity (Peak Velocity or PPV)      | A measurement of ground vibration defined as the maximum speed (measured in inches per second) at which a particle in the ground is moving relative to its inactive state. PPV is usually expressed in inches/sec.                                                                                  |
| Frequency: Hertz (Hz)                              | The number of complete pressure fluctuations per second above and below atmospheric pressure.                                                                                                                                                                                                       |

## Vibration

Operation of heavy construction equipment, particularly pile driving and other impacts devices such as pavement breakers create seismic waves that radiate along the surface of the earth and downward into the earth. These surface waves can be felt as ground vibration. Vibration from operation of this equipment can result in effects ranging from annoyance of people to damage of structures. Varying geology and distance will result in different vibration levels containing different frequencies and displacements. In all cases, vibration amplitudes will decrease with increasing distance.

Perceptible ground-borne vibration is generally limited to areas within a few hundred feet of construction activities. As seismic waves travel outward from a vibration source, they excite the particles of rock and soil through which they pass and cause them to oscillate. The actual distance

Culinary Institute of America Vineyard Lodge Noise Study  
 June 15, 2016  
 Page 5 of 15

that these particles move is usually only a few ten-thousandths to a few thousandths of an inch. The rate or velocity (in inches per second) at which these particles move is the commonly accepted descriptor of the vibration amplitude, referred to as the peak particle velocity (PPV).

Table 3 summarizes typical vibration levels generated by construction equipment (FTA 2006).

**Table 3. Vibration Source Levels for Construction Equipment**

| Equipment                    | PPV at 25 feet |
|------------------------------|----------------|
| Pile driver (impact)         | 0.644 to 1.518 |
| Pile drive (sonic/vibratory) | 0.170 to 0.734 |
| Vibratory roller             | 0.210          |
| Hoe ram                      | 0.089          |
| Large bulldozer              | 0.089          |

Vibration amplitude attenuates over distance and is a complex function of how energy is imparted into the ground and the soil conditions through which the vibration is traveling. The following equation can be used to estimate the vibration level at a given distance for typical soil conditions (FTA 2006). PPV<sub>ref</sub> is the reference PPV from TableXII-3:

$$PPV = PPV_{ref} \times (25/Distance)^{1.5}$$

Tables 4 and 5 summarize guidelines developed by Caltrans for damage and annoyance potential from transient and continuous vibration that is usually associated with construction activity. Equipment or activities typical of continuous vibration include: excavation equipment, static compaction equipment, tracked vehicles, traffic on a highway, vibratory pile drivers, pile-extraction equipment, and vibratory compaction equipment. Equipment or activities typical of single-impact (transient) or low-rate repeated impact vibration include: impact pile drivers, blasting, drop balls, "pogo stick" compactors, and crack-and-seat equipment (Caltrans 2013b).

## Regulatory Setting

### City of St. Helena Municipal Code

The City of St. Helena Municipal Code Section 8.24 relates to noise. Section 8.24.10B relates to “unnecessary noises” in general and states the following:

Between the hours of ten p.m. and seven a.m. next ensuing, no commercial or other activity shall be conducted upon any privately owned real property within the city which activity creates noise which can be heard at the property line of any parcel of real property within the city, unless a permit shall first have been secured from the chief of police.

Culinary Institute of America Vineyard Lodge Noise Study  
 June 15, 2016  
 Page 7 of 15

Section 8.24.10C relates to construction noise and states:

1. Monday through Saturday. Construction activities which generate noise that can be heard at the property line of any parcel of real property within the city limits shall be limited to eight a.m. to five p.m. Delivery of materials/equipment and cleaning and servicing of machines/equipment shall be limited to seven a.m. to six p.m. Exceptions to these time restrictions may be granted by the public works director for one of the following reasons: (a) inclement weather affecting work; (b) emergency work; or (c) other work, if work and equipment will not create noise that may be unreasonably offensive to neighbors as to constitute a nuisance. The city engineer must be notified and give approval in advance of such work.
2. Sundays and Holidays (Federal and Local). No construction activities allowed which generate noise that can be heard at the property line of any parcel of real property within the city limits.

## City of St. Helena General Plan

Chapter 8.0 Public Health and Safety Element of the City of St. Helena General Plan includes a section on noise. The purpose of this section of the element is to provide a basis for establishing comprehensive local programs to control and abate environmental noise, and to protect citizens from excessive noise exposure.

The element applies California Noise Insulation Standards sound for limiting interior noise from exterior sources. The Standards set forth an interior standard of 45 dB, CNEL (or Ldn) in any habitable room, and require an acoustical analysis demonstrating how dwelling units have been designed to meet this interior standard where such units are proposed in areas subject to noise levels greater than CNEL (or Ldn) of 60 dB.

If all doors and windows are required to be closed in order to meet the interior noise standards, then the Standard requires that the design of the structure must also specify a ventilation or air conditioning system to provide a habitable interior environment. The ventilation system must not compromise the dwelling unit isolation from the exterior. Wall NC units are not acceptable as a response to this requirement. If any portion of the dwelling must have closed windows, then the entire dwelling must satisfy this ventilation provision.

The element also specifies noise land use compatibility guidelines. For residential land uses the following guidelines are stated:

- Less than 55 Ldn or CNEL – completely compatible
- 55 to 60 Ldn or CNEL – tentatively compatible
- 60 to 65 Ldn or CNEL – normally incompatible
- 65 to 70 Ldn or CNEL – completely incompatible

These compatibility terms are defined as follows:

Completely Compatible: the noise exposure is such that both the indoor and outdoor environments are pleasant, as long as noise sources do not cause the ambient noise to increase more than 5 dBA, and in the absence of intrusive and intermittent noise.

Culinary Institute of America Vineyard Lodge Noise Study  
June 15, 2016  
Page 8 of 15

**Tentatively Compatible:** the noise exposure is great enough to be of concern, but common building construction practices will make the living indoor environment acceptable, even for sleeping quarters, and the outdoor environment will be reasonably pleasant for recreation and play.

**Normally Incompatible:** the noise exposure is so severe that unusual and costly building construction is necessary to ensure some tranquility inside one's home, and barriers must be erected between the site and prominent noise sources to make the outdoor environment tolerable.

**Completely Incompatible:** the noise exposure at the site is so severe that construction costs to make the indoor living environment acceptable would be prohibitive and the outdoor environment would still be intolerable.

## Environmental Setting

### Noise Sensitive Land Uses

The project area is generally rural. A residence is located directly southeast of the project site across Pratt Avenue. A residential subdivision is located further south across Pratt avenue. Several other single family residences are location about 250 feet or further northeast of the project across Pratt Avenue. See Figure 1. A large winery operation is located southwest of the project site.

Figure 2. Noise Monitoring Positions

## Existing Noise Conditions

Traffic on Pratt Avenue is the primary source of noise in the project area but traffic volumes are low. The posted speed is 35 mph. The train track located on the southwest side of the project site has not been in use for many years. However, use of the track by the Napa Wine Train has recently commenced. Trains pass twice a day 7 days per week at approximately 1:00 p.m. and 2:00 p.m.

Noise monitoring was conducted on the project site to characterize existing noise levels in the project area. Noise monitoring positions are shown in Figure 2. Sound levels measured at Position LT-1 are considered to be representative of sound level at the residence located directly across Pratt Avenue. A short-term (15-minute) measurement was taken using a Larson-Davis 831 Type 1 sound level meter at Position ST-1 on Friday April 29 beginning at 11:10 a.m. During this time 14 automobiles and 1 heavy truck passed the project site. The posted speed is 35 mph. The equivalent sound level measured during this period was 55.4 dBA.

Unattended continuous sound level measurements were also taken at Positions LT-1 and LT-2 using Piccolo Type 2 sound level meters starting on Friday April 29 and continuing through Wednesday May 4. The Napa Wine Train was not operating during this time. The existing CIA facility was unoccupied as students were on break. These measured noise levels therefore represent the lowest noise levels likely to be encountered in the area. Table 6 summarizes measured sound levels values at each position.

**Table 6. Summary of Measured Long-Term Sound Levels**

| Position                                                            | Day          |              |              |              |
|---------------------------------------------------------------------|--------------|--------------|--------------|--------------|
| LT-1                                                                | Saturday     | Sunday       | Monday       | Tuesday      |
| Daytime $L_{eq}$ Range (dBA)                                        | 53.9 to 60.4 | 55.3 to 60.6 | 51.8 to 61.2 | 51.2 to 61.4 |
| Nighttime $L_{eq}$ Range (dBA)                                      | 49.1 to 57.2 | 49.1 to 57.7 | 49.1 to 56.1 | 47.7 to 62.0 |
| $L_{dn}$                                                            | 61.6         | 61.2         | 61.7         | 62.7         |
| LT-2                                                                | Saturday     | Sunday       | Monday       | Tuesday      |
| Daytime $L_{eq}$ Range (dBA)                                        | 52.5 to 69.1 | 51.0 to 57.1 | 50.0 to 63.0 | 50.7 to 64.2 |
| Nighttime $L_{eq}$ Range (dBA)                                      | 47.6 to 58.8 | 44.5 to 51.2 | 43.4 to 55.6 | 40.8 to 48.5 |
| $L_{dn}$                                                            | 63.0         | 56.6         | 59.4         | 62.6         |
| Daytime: 7:00 a.m. to 10:00 p.m. Nighttime: 10:00 p.m. to 7:00 a.m. |              |              |              |              |

Overall these noise measurements indicate that the noise environment in the project area is generally quiet and consistent with the rural setting.

## CEQA Checklist Responses

- a. **Would the project expose persons to or generate noise levels in excess of standards established in a local general plan or noise ordinance or applicable standards of other agencies?**

### **Construction Noise**

Construction of the proposed project will involve demolition of existing buildings and construction of new buildings. Details on construction phasing and specific types of equipment have not yet been determined. However, a reasonable assessment of construction noise can be made based on noise levels associated with typical residential construction developed by the U.S. Environmental Protection Agency (EPA 1971). Table 7 summarizes typical noise levels generated by common construction phases. Equipment to be used for demolition is expected to generate noise similar to ground clearing.

**Table 7. Demolition and Construction Noise**

| Construction Phase                  | Housing<br>Distance from Construction (feet)<br>Sound Level (dBA) |    |     |     |     |     |
|-------------------------------------|-------------------------------------------------------------------|----|-----|-----|-----|-----|

| Building/Facility Construction      | 81                                                                | 78 | 75  | 69  | 63  | 57  |
| Finishing and Clean-up              | 86                                                                | 83 | 80  | 74  | 68  | 62  |
| Source: EPA 1971                    |                                                                   |    |     |     |     |     |
| *Demolition expected to be similar. |                                                                   |    |     |     |     |     |

The closest residence is located about 75 feet from the nearest building. The construction noise data in Table 3 indicates that demolition and construction activity could result in noise in the range of 78 to 85 dBA at the nearest residence. Construction activity that occurs outside of the hours identified in Section 8.24.10C of the Municipal Code would result in noise that is in excess the applicable local noise standard. This impact is therefore considered to be significant. Implementation of Mitigation Measure NOI-1 would reduce this impact to a less-than-significant level by limiting construction to the hours allowed in the municipal code.

### **Mitigation Measure NOI-1: Limit hours of noise-generating demolition and construction activity**

The project applicant's construction contractor shall limit the hours when noise-generating demolition and construction activity occurs on the project site in accordance with Section 8.24.10C of the City of St. Helena municipal code. Construction activities which generate noise

Culinary Institute of America Vineyard Lodge Noise Study  
 June 15, 2016  
 Page 11 of 15

that can be heard at the property line of any parcel of real property within the city limits shall be limited to the days of Monday through Saturday between the hours of eight a.m. to five p.m. Delivery of materials/equipment and cleaning and servicing of machines/equipment shall be limited to seven a.m. to six p.m.

#### ***Operational Noise – Traffic***

The traffic study conducted by Crane Transportation Group indicates that during the AM and PM peak hours, the project will add 4 trips (AM) and 8 trips (PM) to Pratt Avenue west of the project site and 4 trips (AM) and 4 trips (PM) trips east of the project site. The existing AM and PM peak hour traffic volumes are 100 and 129 west of the project site respectively and 90 and 117 east of the project site respectively. The addition of eight and four trip from the project in each direction will increase traffic noise by less than 0.5 dB. This is well below the threshold of a perceptible change (3 dB). As such implementation of the proposed project will not substantially increase traffic noise in the area. This impact is therefore less than significant and no mitigation is required.

Measurements taken on the project site indicate that existing traffic noise levels at the project site are in the range of 57 to 63 Ldn. Conventional building construction with windows closed is expected to reduce exterior noise by at least 20 dB at interior locations (FHWA 2011). Accordingly interior noise levels at the new facility are expected to be 45 Ldn or less which is compliance with the City standard for interior noise. This impact is therefore less than significant and no mitigation is required.

#### ***Operational Noise – Napa Wine Train***

Two passages of the Napa Wine Train during daytime hours would result in audible sound at the facility. However, because of the slow speed of the train and the short duration of each passage, this would not result in an adverse effect to the facility. This impact is therefore less than significant and no mitigation is required.

#### ***Operational Noise – Mechanical Systems***

Mechanical systems associated with heating, ventilation, and air conditioning may generate noise. The specific details on the design and location of these systems has not yet been determined. Operation of these systems could result in noise at nearby residences that is above the existing ambient noise level depending on the design and location of the systems. Accordingly, operation of these systems could result in an exceedance of the Municipal Code standard Section 8.24.10B which states that no commercial or other activity may create noise that can be heard at the property line of any private property between the hours of 10:00 p.m. and 7:00 a.m. This impact is therefore considered to be significant. Implementation of Mitigation Measure NOI-2 would reduce this impact to a less-than-significant level by limiting noise generated by mechanical equipment.

#### **Mitigation Measure NOI-2: Design mechanical systems to limit noise**

Mechanical systems for the project shall be designed and operated such that noise is in compliance with Section 8.24.10B of the City of St. Helena municipal code. Mechanical systems

Culinary Institute of America Vineyard Lodge Noise Study  
 June 15, 2016  
 Page 12 of 15

shall be designed such that noise from the operation of the system cannot be heard at the property line of any private property between the hours of 10:00 p.m. and 7:00 a.m.

***Operational Noise – Student Activities***

The facility will have a central quad area that may be used as a gathering place for students. Events such as barbeques and other social events could be held in the quad. Gatherings could include up to 120 students who would live on the site. Residential neighbors near the project site have expressed concern that these gatherings and other activities could generate noise.

A person speaking in a normal voice produces a sound level of about 57 dBA at 1 meter (Harris 1979). This corresponds to a sound level of about 33 dBA at 50 feet. Under a worst case scenario 120 people could be speaking at the same time at an outdoor event in the quad. The cumulative sound level would be about 54 dBA at 50 feet. The nearest residence is about 260 feet from the center of the quad. A sound level of 54 dBA at 50 feet would drop to about 47 dBA at 260 feet assuming attenuation of 6 dB per doubling of distance. In addition the new buildings will surround the quad providing acoustical shielding of at least 5 dB between the quad and the nearest residence. The resulting sound level at the nearest residence would be about 42 dBA. This is well below the measured daytime ambient sound levels that are in the range of 50 to 64 dBA. Note that the existing measured noise levels were taken when the facility was unoccupied by students and represent the lowest noise levels likely to be encountered in the area. This analysis therefore represents a worst-case assessment because existing noise levels with the facility occupied could be slightly higher.

In addition several rules will be in place for limiting noise generated by these activities:

- No amplified music will be allowed outside.
- The current 9:30 p.m. curfew for noise generated by students will be continued and enforced.
- Non-residents would not be allowed to attend events in the quad.

Given the presence of this acoustical shielding and the rules that will be in place, student activities are not expected to result in noise that can be heard at the property line between the hours of 10:00 p.m. and 7:00 a.m. Accordingly, these activities are not expected to result in noise that exceeds applicable local noise standards. This impact is therefore considered to be less than significant. No mitigation is required.

**b. Would the project expose persons to or generate excessive groundborne vibration or groundborne noise levels?**

Construction activity could occur as close as about 75 feet from nearby residences. Table 8 summarizes projected vibration levels at 50 feet for equipment that is likely to be used for this project (FTA 2006).

Culinary Institute of America Vineyard Lodge Noise Study  
 June 15, 2016  
 Page 13 of 15

**Table 8. Vibration Levels for Construction Equipment**

| Equipment        | PPV at 75 feet | Perception*            |
|------------------|----------------|------------------------|
| Vibratory roller | 0.0404         | Distinctly perceptible |
| Large bulldozer  | 0.0171         | Barely perceptible     |
| Loaded trucks    | 0.0146         | Barely perceptible     |
| Jackhammer       | 0.0067         | Barely perceptible     |
| Small bulldozer  | 0.0006         | Not perceptible        |

Source: FTA 2006.  
 \*based on Table 5.

The results in Table 8 indicate that construction activity could result in vibration that is barely to distinctly perceptible at the nearest residence but is not at a level that could cause damage to nearby structures. Because periods of perceptible vibration would be brief and temporary, the project is not expected to expose people to excessive groundborne vibration. This impact is less than significant. No mitigation is required.

Two passages of the Napa Wine Train during daytime hours could result in perceptible ground vibration at the facility. However, because of the slow speed of the train and the short duration of each passage, this would not result in an adverse effect to the facility. This impact is therefore less than significant and no mitigation is required.

**c. Would the project result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?**

***Operational Noise – Traffic***

As discussed above the project applicant has determined that operation of the project will not increase trip generation relative to existing uses on the project site. As such implementation of the proposed project will not increase traffic noise in the area. This impact is therefore less than significant. No mitigation is required.

***Operational Noise – Mechanical Systems***

As discussed above, mechanical systems associated with heating, ventilation, and air conditioning may generate noise. The specific details on the design and location of these systems has not yet been determined. Operation of these systems could result in noise at nearby residences that is above the existing ambient noise level depending on the design and location of the systems. Accordingly, operation of these systems could result in an exceedance of the Municipal Code standard Section 8.24.10B which states that no commercial or other activity may create noise that can be heard at the property line of any private property between the hours of 10 p.m. and 7:00 a.m. This would constitute a substantial permanent increase in noise. This impact is therefore considered to be significant. Implementation of Mitigation Measure NOI-2 would reduce this impact to a less-than-significant level by limiting noise generated by mechanical equipment.

Culinary Institute of America Vineyard Lodge Noise Study

 Page 14 of 15

***Operational Noise – Student Activities***

As discussed above the facility will have a central quad area that may be used as a gathering place for students. Events such as barbeques and other social events could be held in the quad. Gatherings could include up to 120 students who would live on the site. Residential neighbors near the project site have expressed concern that these gatherings and other activities could generate noise. As discussed above the sound level of 120 speaking is predicted to be about 42 dBA at the nearest residences. With existing daytime sound level in the range of 50 to 64 dBA gatherings at the quad are not expected to result in a substantial increase in noise.

In addition, several rules will be in place for limiting noise generated by these activities:

- No amplified music will be allowed outside.
- The current 9:30 p.m. curfew for noise generated by students will be continued and enforced.
- Non-residents would not be allowed to attend events in the quad.

Given the presence of this acoustical shielding and the rules that will be in place, student activities are not expected to result in noise that can be heard at the property line between the hours of 10:00 p.m. and 7:00 a.m. or in a substantial increase above existing conditions. This impact is therefore considered to be less than significant. No mitigation is required.

**d. Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?**

The discussion of construction noise above indicates that construction activity will result in a temporary increase in noise during the construction period. However, with implementation of Mitigation Measure NOI-1 noise from construction activity will be in compliance with City standards. Because of this, the potential temporary increase in noise associated with construction is not considered to be substantial. This impact is therefore considered to be less than significant.

**e. Would the project be located within an airport land use plan area, or, where such a plan has not been adopted, within two miles of a public airport or public use airport and expose people residing or working in the project area to excessive noise levels?**

The proposed project is not located within two miles of a public airport or public use airport and would not expose people residing or working in the project area to excessive noise levels.

**f. Would the project be located in the vicinity of a private airstrip and expose people residing or working in the project area to excessive noise levels?**

The proposed project is not located in the vicinity of a private airstrip and would not expose people residing or working in the project area to excessive noise levels.

| Re:      | Roundabout Feasibility Analysis | Date:        | October 21, 2016     |

A conceptual layout for a roundabout at the intersection of Pratt Ave and Hwy 29 has been completed. Please see the attached concept drawing for details. The roundabout dimensions used for the analysis were confirmed suitable by City staff, and are as follows:

- ♣ Inscribed circle diameter: 130 feet
- ♣ Shoulder width: 2 feet
- ♣ Shared pedestrian/bikeway: 8 feet
- ♣ Overall roundabout diameter: 150 feet

Based on the required roundabout dimensions, and the physical constraints of the intersection, it is evident that a roundabout is infeasible for the following reasons:

1. The intersection is a 3-way intersection, with a driveway connection to the south that serves a hotel complex nearing completion. The intent of a roundabout is to keep traffic moving through the roundabout without stopping. An accident hazard could be created by the roundabout if vehicles need to slow down in the middle of the roundabout to enter a driveway.
2. The driveway mentioned above has a significant existing incline from Pratt Ave to the level of the hotel located on the property. Construction of a roundabout will require a massive grading and retaining wall effort in order to accommodate the size of the roundabout.
3. A historic rock wall is located along the Hwy 29 that will have to be removed in order to accommodate the roundabout.
4. Public ROW easements will have to be negotiated with at least 3 properties in the vicinity of the intersection. In addition, the shared pedestrian/bikeway will encumber on the residence at 1872 Main St on the east corner of the intersection, not to mention obliterating the front and side yard setbacks required by the Zoning Code for MDR.
5. The relocation of 4 utility poles and associated overhead lines will be required, with new locations encroaching further onto affected parcels.

I hope our conclusion based on the attached site plan have satisfactorily proven the infeasibility of a roundabout at the intersection of Pratt Ave and Hwy 29. Please let me know if you have any questions.

RE: 2555 Main St, the Greystone Site (PL16-042) Use Permit, Design Review

## INTRODUCTION

The historic Greystone Winery, now the home of The Culinary Institute of America (CIA), Greystone campus, is listed on the National Register of Historic Places, the California Register of Historic Resources and is a local St. Helena Landmark. As an 'historical resource', the project is subject to review under the California Environmental Quality Act (CEQA). However, under CEQA Guidelines 15331 Class 31, projects that follow *Standards for Rehabilitation (Rehabilitation Standards)* contained within *The Secretary of the Interior's Standards for the Treatment of Historic Properties* are exempt.

As described in the Use Permit and Design Review documents submitted in June 2016, the CIA proposes to implement a Master Plan with interior improvements to provide additional and more efficient educational facilities within the historic building. As part of this program, three small exterior additions are proposed on the west side of the building. The following summary describes these small additions and evaluates their compliance with the Secretary of the Interior Standards for Rehabilitation.

## PROPOSED PROJECT

Exterior modifications for the proposed project are limited to three small storage additions along the access drive behind the historic winery building. The additions are located to work around existing HVAC units and back-of-house equipment that support the needs of the teaching kitchens. Building and equipment maintenance storage that is currently located in significant ground floor spaces will be relocated to this area:

- The additions will be accessed from the existing roadway, and will be supported on new structure that spans across the existing exterior breezeway in a similar fashion to the support structures for the large HVAC units.
- The additions measure 19'-4" x 59'-10", 19'-4" x 38'-4" and 19'-4" x 37'-8" and are 9'-8 ½" tall. They will be constructed to fit below the height of the existing eave line of the historic building. They will be utilitarian in nature, with painted metal siding, painted metal doors and flat roofs behind small parapets.

**Secretary of the Interior Standards Compliance**

The compliance of the proposed additions is reviewed below with respect to the *Rehabilitation Standards*.

Each of the Standards are listed below in italics, with a response providing a discussion regarding the proposed project's consistency or inconsistency with each standard.

1. *A property shall be used for its historic purpose or be placed in a new use that requires minimal change to the defining characteristics of the building and its site and environment.*

The proposed project is consistent with this Standard. The culinary school use has required minimal change throughout the historic masonry winery building. The addition of three small storage buildings located on the rear of the building will not cause alterations to the character defining features of the building.

2. *The historic character of a property shall be retained and preserved. The removal of historic materials or alteration of features and spaces that characterize a property shall be avoided.*

The proposed project is consistent with this Standard. There is no removal of historic materials for installation of the storage additions.

3. *Each property shall be recognized as a physical record of its time, place, and use. Changes that create a false sense of historical development, such as adding conjectural features or architectural elements from other buildings, shall not be undertaken.*

The proposed project is consistent with this Standard. No features or elements that would create a false sense of history are proposed in the project.

4. *Most properties change over time; those changes that have achieved historic significance in their own right shall be retained and preserved.*

The proposed project is consistent with this Standard. The historic building is being retained in its current configuration, including alterations that have been constructed over time.

*5. Distinctive features, finishes, and construction techniques or examples of craftsmanship that characterize a historic property shall be preserved.*

The proposed project is consistent with this Standard. The distinctive masonry features and finishes will be preserved.

*6. Deteriorated historic features shall be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design, color, texture, and other visual qualities and, where possible, materials. Replacement of missing features shall be substantiated by documentary, physical, or pictorial evidence.*

The proposed project is consistent with this Standard. The proposed project does not include replacement of any character defining features.

*7. Chemical or physical treatments, such as sandblasting, that cause damage to historic materials shall not be used. The surface cleaning of structures, if appropriate, shall be undertaken using the gentlest means possible.*

The proposed project is consistent with this Standard. Surface cleaning is not proposed for this project.

*8. Significant archaeological resources affected by a project shall be protected and preserved. If such resources must be disturbed, mitigation measures shall be undertaken.*

The proposed project is consistent with this Standard. The additions will be constructed over existing structure, so no ground disturbance is anticipated.

*9. New additions, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old*

Architects,  
Planners &  
Conservators

*and shall be compatible with the massing, size, scale, and architectural features to protect the historic integrity of the property and its environment.*

The proposed project is consistent with this Standard. The new additions do not require removal of any historic material. They are located on the rear of the building, so protect the primary views of the significant architectural features that characterize the property. The buildings have been designed to fit beneath the eave of the existing historic building. The scale and massing of the three small additions is minimal compared to the scale and massing of the original structure. The materials proposed differentiate the additions from the historic masonry construction.

*10. New additions and adjacent or related new construction shall be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.*

The proposed project is consistent with this Standard. In the future, the storage additions could be removed, and the original form and integrity of the historic Greystone building would be intact.

#### **Conclusion**

The proposed storage additions are a minor alteration, and meet the Secretary of the Interior Standards for Rehabilitation. As a result of meeting the Standards, the project can be considered as mitigated to a level of less than a significant impact on the historic resource.

| Project Type and Description                   | Project Type: Regulated – This project consists of the demolition of the existing parking lot and dormitory building and the construction of four new dormitory lodges, access drive, and new parking areas. |
| Total Project Site Area                        | 2.95 acres                                                                                                                                                                                                   |
| Total New and Replaced Impervious Surface Area | 70,366 sqft (1.62acres)                                                                                                                                                                                      |
| Total Pre-Project Impervious Surface Area      | 66,211 sqft (1.52acres)                                                                                                                                                                                      |
| Total Post-Project Impervious Surface Area     | 70,366 sqft (1.62acres)                                                                                                                                                                                      |

**II. SETTING****II.A. Project Location and Description**

The CIA Vineyard Lodge project site is approximately 2.95 acres and located at 830 Pratt Ave, St. Helena, CA. The project site is located approximately one mile northwest of the Town of St. Helena, 0.3 miles northeast of State Road 128, 0.2 miles west of York Creek, and has approximate coordinates of 38.513583° N & 122.475675° W. See the Vicinity Map.

**II.B. Existing Site Features and Conditions**

The project site currently consists of a parking lot and two dormitory buildings. The area surrounding the project boundary consists of vineyards and agricultural land. The project site is relatively flat with average slopes approximately 1% towards the eastern portion of the property. The elevation of the project site ranges from 243 to 250 feet above mean sea level (msl). Surface stormwater runoff from the site generally sheet flows towards the trapezoidal ditch located along the northeast property line and outlets via a valley gutter in a road side swale along Pratt Avenue. Drainage from the site eventually discharges to the Napa River.

Based on mapping from the National Resources Conservation Service (NRCS) Web Soil Survey, the project site soils are classified as Bale loam clay (104 and 105); both being in Hydrologic Soil Group "B". According to the NRCS, Hydrologic Soil Group "B" consists of soils having a moderate infiltration rate when thoroughly wet, consisting chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

**CIA VINEYARD LODGE USE PERMIT**

Project No. 2016040

August 18, 2016

**SUMMIT ENGINEERING, INC.**

Stormwater Control Plan

**II.C. Opportunities and Constraints for Stormwater Control**

Landscaped areas located throughout the project site can be utilized for bioretention facilities and self-retaining areas. The soil at the project site also allows for moderate infiltration.

Constraints for drainage at the site include the relative flat site with average slopes of approximately 1%.

**III. LOW IMPACT DEVELOPMENT DESIGN STRATEGIES****III.A. Optimization of Site Layout****III.A.1. Limitation of development envelope**

Project limitations such as the minimal slope at the site require many of the landscape areas to be self-retaining areas. LID Facilities (SCMs) are proposed to be adjacent to the proposed impervious areas not draining to self-treating areas. Landscaped areas shall be provided throughout the site to promote infiltration and treatment.

**III.A.2. Preservation of natural drainage features**

Constructed vegetated swales are currently at the site. The existing drainage pattern for the site shall be preserved where feasible.

**III.A.3. Setbacks from creeks, wetlands, and riparian habitats**

Development is not proposed to be performed within 20 feet or more of nearby creeks and riparian habitats.

**III.A.4. Minimization of imperviousness**

Impervious surfacing of the site shall be minimized with landscaped areas adjacent to proposed improvements.

**III.A.5. Use of drainage as a design element**

Grass-line interceptor swales adjacent to a portion of impervious area shall be utilized for both treatment and aesthetics and convey runoff to LID facilities.

**III.B. Use of Permeable Pavements**

Permeable pavements shall be used on this project for majority of the sidewalk areas as well as the non-accessible parking stalls. Design of the pervious pavers shall be in accordance with the information in "Criteria for Pervious Pavements" on page 4-6 of the BASMAA Post-construction manual.

**III.C. Dispersal of Runoff to Pervious Areas**

Runoff from Area 37 will sheetflow onto the adjacent vineyards and roadside drainage.

**III.D. Stormwater Control Measures**

This project will follow the "Design Guidance for Stormwater Treatment and Control for Projects in Marin, Sonoma, Napa, and Solano Counties (DGSTC)", prepared for the Bay Area Stormwater Management Agencies Association (BASMAA). Bio-retention LID Facilities are sized at a minimum of 4% of the equivalent tributary area, as specified in the Phase II Stormwater National Pollutant Discharge Elimination System (NPDES) Permit.

Bio-retention LID Facilities shall vary in size depending on the impervious areas for which they serve and shall be located adjacent to these areas. These facilities are designed in accordance with the Bioretention Facility Design

**CIA VINEYARD LODGE USE PERMIT**

Project No. 2016040

August 18, 2016

**SUMMIT ENGINEERING, INC.**

Stormwater Control Plan

Criteria beginning on Page 4-3 of the DGSTC, as well as Figures 4-1 and 4-2. Locations of LID facilities can be seen on the Drainage Map attached.

Storm drains shall be utilized throughout the project to direct stormwater from impervious areas, to the bioretention facilities at locations specified in the Stormwater Control Plan. These new pipes shall be sized adequately to handle post project flow rates. Self-retaining areas are designed in accordance with the criteria in "Areas draining to self-retaining areas" on page 4-2 of the DGSTC: a maximum ratio of two parts impervious to one part pervious area.

Running parallel to the access drive, grass-lined interceptor swales shall be utilized to convey and treat runoff from access drive. All swales shall be designed to handle runoff from the 100-year storm event.

Stormwater Control Plan

**DMA 7**, totaling 1,462 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 8**, totaling 1,563 square feet, is comprised of concrete sidewalk. DMA 8 drains to self-retaining area, DMA 9.

**DMA 9**, totaling 845 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 10**, totaling 487 square feet, is comprised of permeable pavement. DMA 10 drains to self-retaining area, DMA 11.

**DMA 11**, totaling 253 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 12**, totaling 4,321 square feet, is comprised of rooftop and concrete sidewalk. DMA 12 drains to Stormwater Control Measure LIDF 3.

**DMA 13**, totaling 2,671 square feet, is comprised of rooftop. DMA 13 drains to Stormwater Control Measure LIDF 4.

**DMA 14**, totaling 1,025 square feet, is comprised of concrete. DMA 14 drains to self-retaining area, DMA 15.

**DMA 15**, totaling 512 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 16**, totaling 2,473 square feet, is comprised of asphalt. DMA 16 drains to self-retaining area, DMA 17.

**DMA 16A**, totaling 1,115 square feet, is comprised of permeable pavers. DMA 16A drains to self-retaining area, DMA 17.

**DMA 17**, totaling 1,805 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 18**, totaling 1,198 square feet, is comprised of rooftop. DMA 18 drains to Stormwater Control Measure LIDF 5.

**DMA 19**, totaling 349 square feet, is comprised of asphalt. DMA 19 drains to self-retaining area, DMA 20.

**DMA 19A**, totaling 265 square feet, is comprised of permeable pavers. DMA 19A drains to self-retaining area, DMA 20.

**DMA 20**, totaling 349 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 21**, totaling 2,667 square feet, is comprised of asphalt and rooftop. DMA 21 drains to Stormwater Control Measure LIDF 6.

**DMA 21A**, totaling 341 square feet, is comprised of permeable pavers. DMA 21A drains to Stormwater Control Measure LIDF 6.

**DMA 22**, totaling 4,112 square feet, is comprised of rooftop. DMA 22 drains to Stormwater Control Measure LIDF 7.

**DMA 22A**, totaling 774 square feet, is comprised of asphalt. DMA 22A drains to Stormwater Control Measure LIDF 7.

**DMA 23**, totaling 452 square feet, is comprised of asphalt. DMA 23 drains to self-retaining area, DMA 20.

**DMA 23A**, totaling 145 square feet, is comprised of permeable pavers. DMA 23A drains to self-retaining area, DMA 20.

Stormwater Control Plan

**DMA 24**, totaling 297 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 25**, totaling 1,357 square feet, is comprised of asphalt and concrete sidewalk. DMA 25 drains to Stormwater Control Measure LIDF 8.

**DMA 25A**, totaling 393 square feet, is comprised of asphalt and concrete sidewalk. DMA 25A drains to Stormwater Control Measure LIDF 8.

**DMA 26**, totaling 2,221 square feet, is comprised of asphalt. DMA 26 drains to Stormwater Control Measure LIDF 9.

**DMA 26A**, totaling 406 square feet, is comprised of permeable pavers. DMA 26A drains to Stormwater Control Measure LIDF 9.

**DMA 27**, totaling 14,164 square feet, is comprised of asphalt. DMA 27 drains to Stormwater Control Measure LIDF 10.

**DMA 27A**, totaling 3,231 square feet, is comprised of asphalt. DMA 27A drains to Stormwater Control Measure LIDF 10.

**DMA 28**, totaling 1,876 square feet, is comprised of asphalt. DMA 28 drains to Stormwater Control Measure LIDF 11.

**DMA 28A**, totaling 1,175 square feet, is comprised of permeable pavement. DMA 28A drains to Stormwater Control Measure LIDF 11.

**DMA 29**, totaling 679 square feet, is comprised of permeable pavement. DMA 29 drains to Stormwater Control Measure LIDF 12.

**DMA 30**, totaling 1,903 square feet, is comprised of asphalt. DMA 30 drains to Stormwater Control Measure LIDF 12.

**DMA 31**, totaling 1,407 square feet, is comprised of asphalt. DMA 31 drains to self-retaining area, DMA 32.

**DMA 32**, totaling 714 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 33**, totaling 1,906 square feet, is comprised of pavers. DMA 33 drains to self-retaining area, DMA 34.

**DMA 34**, totaling 891 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 35**, totaling 891 square feet, is comprised of pavers. DMA 35 drains to self-retaining area, DMA 36.

**DMA 36**, totaling 983 square feet, is a self-retaining area comprised of native grasses and trees. Native flora in the receiving area provides infiltration and treatment opportunities.

**DMA 37**, totaling 8,311 square feet, is comprised of asphalt. DMA 37 drains to surrounding vineyard area, maintaining the existing drainage pattern at this location.

IV.A.3. Information Summary for Bioretention Facility Design

| Total Project Area: 2.95 acres           |                                                     |
|------------------------------------------|-----------------------------------------------------|
| <b>LIDF 1 Area:</b> 390 ft <sup>2</sup>  | <b>DMA 1, 1A, 2, 3 Area:</b> 9,041 ft <sup>2</sup>  |
| <b>LIDF 2 Area:</b> 259 ft <sup>2</sup>  | <b>DMA 4, 4A, 5, 5A Area:</b> 5,607 ft <sup>2</sup> |
| <b>LIDF 3 Area:</b> 173 ft <sup>2</sup>  | <b>DMA 12 Area:</b> 4,321 ft <sup>2</sup>           |
| <b>LIDF 4 Area:</b> 149 ft <sup>2</sup>  | <b>DMA 13 Area:</b> 2,671 ft <sup>2</sup>           |
| <b>LIDF 5 Area:</b> 54 ft <sup>2</sup>   | <b>DMA 18 Area:</b> 1,198 ft <sup>2</sup>           |
| <b>LIDF 6 Area:</b> 157 ft <sup>2</sup>  | <b>DMA 21, 21A Area:</b> 2,667 ft <sup>2</sup>      |
| <b>LIDF 7 Area:</b> 195 ft <sup>2</sup>  | <b>DMA 22, 22A Area:</b> 4,886 ft <sup>2</sup>      |
| <b>LIDF 8 Area:</b> 95 ft <sup>2</sup>   | <b>DMA 25, 25A Area:</b> 1,750 ft <sup>2</sup>      |
| <b>LIDF 9 Area:</b> 132 ft <sup>2</sup>  | <b>DMA 26, 26A Area:</b> 2,627 ft <sup>2</sup>      |
| <b>LIDF 10 Area:</b> 740 ft <sup>2</sup> | <b>DMA 27, 27A Area:</b> 17,395 ft <sup>2</sup>     |
| <b>LIDF 11 Area:</b> 119 ft <sup>2</sup> | <b>DMA 28, 28A Area:</b> 3,051 ft <sup>2</sup>      |
| <b>LIDF 12 Area:</b> 110 ft <sup>2</sup> | <b>DMA 29, 30 Area:</b> 2,582 ft <sup>2</sup>       |

IV.A.4. Self-Treating Areas

There are no self-treating areas on this project site.

IV.A.5. Self-Retaining Areas

Table 3. Self-Retaining Areas

| DMA Region | Area (square feet) |
|------------|--------------------|
| DMA 7      | 1,462              |
| DMA 9      | 845                |
| DMA 11     | 253                |
| DMA 15     | 512                |
| DMA 17     | 1,805              |
| DMA 20     | 349                |

## V. SOURCE CONTROL MEASURES

### V.A. Site activities and potential sources of pollutants

- On-site Storm Drain Inlets
- Parking Areas
- Landscape Maintenance

### V.B. Summary of Maintenance Requirements for Each Stormwater Facility

- Access drive shall be designed according to the latest version of the City of St. Helena Road and Street Standards.
- Parking areas shall be designed to minimize impervious surface areas and graded to direct runoff to nearby Treatment Control BMPs to treat and remove oil and petroleum hydrocarbons.
- Energy dissipaters constructed of rip rap shall be specified at the outlets of new and reconstructed storm drains and swales to minimize erosion.
- Grass lined swales shall be incorporated into the design to treat runoff and minimize erosion.
- Existing trees, shrubs and groundcover shall be preserved where feasible.
- Plant species tolerant of saturated soil conditions shall be specified in landscaped areas to be utilized for stormwater infiltration and treatment.
- Trash storage areas shall be paved and stormwater from adjacent areas shall not be directed to the storage area. Containers shall have lids.
- All roofs, gutters, and downspouts made of unprotected metals shall discharge to landscaped areas designed to infiltrate and detain stormwater runoff.

| On-site Storm Drain Inlets                   | Mark all inlets with the words "No Dumping! Flows to Creek" or similar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <ul style="list-style-type: none"> <li>- Maintain and periodically replace inlet markings.</li> <li>- Provide stormwater pollution prevention information to new site owners, lessees, or operators.</li> <li>- See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance"</li> </ul>                            |
| Landscaping/Pesticide Use/Ground Maintenance | <p>State that final landscaping will accomplish all the following:</p> <ul style="list-style-type: none"> <li>- Preserve existing native trees, shrubs, and ground cover to maximum extent possible</li> <li>- Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution.</li> <li>- Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions.</li> <li>- Consider using pest-resistant plants, especially adjacent to hardscape.</li> </ul> <p>To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.</p> | <ul style="list-style-type: none"> <li>- Maintain landscaping using minimum or no pesticides</li> <li>- See applicable operational BMPs in Fact Sheet SC-41, "building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks</li> <li>- Provide IPM information to new owners, lessees, and operators</li> </ul>           |
| Parking Areas                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>- Sweep parking lots regularly to prevent accumulation of litter and debris. Collect debris from pressure washing to prevent entry into the storm drain system. Collect washwater containing any cleaning agent or degreaser and discharge to the sanitary sewer not to a storm drain.</li> </ul> |

**CIA VINEYARD LODGE USE PERMIT**

Project No. 2016040

August 18, 2016

**SUMMIT ENGINEERING, INC.**

Stormwater Control Plan

**V.C. Features, Materials, and Methods of Construction of Source Control BMPs**

All Source Control BMPs listed in the previous section will be implemented with corresponding and appropriate features, materials, and methods of construction.

**VI. STORMWATER FACILITY MAINTENANCE****VI.A. Ownership and Responsibility for Maintenance in Perpetuity**

The applicant accepts responsibility for interim operation and maintenance of stormwater treatment and flow-control facilities until such time as this responsibility is formally transferred to a subsequent owner. The owner then accepts full responsibility for the proper operation and maintenance of all stormwater facilities.

**VI.B. Summary of Maintenance Requirements for Each Stormwater Facility**

Any maintenance of all bio-retention facilities will be financed and implemented by the owner of the CIA Vineyard Lodge project. All facilities shall be inspected annually and documented. Any necessary repairs to facilities shall also be documented. Updated information, including contact information, must be provided to the municipality if property is sold and whenever designated individuals or contractors change.

**VII. CONSTRUCTION CHECKLIST**

# CRANE TRANSPORTATION GROUP CULINARY INSTITUTE OF AMERICA – GREYSTONE MASTER PLAN PROJECT TRAFFIC AND PARKING EVALUATION

## I. INTRODUCTION

This report has been prepared at the request of the Culinary Institute of America (CIA) to detail the traffic and parking impacts resulting from their proposed Master Plan project at Greystone in St. Helena. It is analyzed in the context of the entire CIA Master Plan, involving changes to the Greystone and Vineyard Lodge facilities in St. Helena, and the move to Napa of some of the existing activities at Greystone. At the request of the City of St. Helena, the traffic and parking impacts of the Master Plan at the Vineyard Lodge facility are addressed in a separate traffic study, closely coordinated with this analysis.

May 2016 full-day (6:00 AM to 6:00 PM) Thursday and Saturday traffic counts and parking surveys were conducted at the CIA Greystone campus, concurrent with full-day Thursday traffic and parking counts at Vineyard Lodge. May 2016 weekday activity levels at the CIA-Greystone facility were found to exceed Saturday levels, thus, the following analysis focuses on weekday traffic at the CIA driveway/State Route (S.R.) 29 intersection and at the Pratt Avenue/S.R. 29-128 intersection. Peak hour traffic counts were conducted by Crane Transportation Group at the Pratt Avenue/S.R. 29-128 intersection on Thursday, May 12, from 7:00 – 9:00 AM and from 4:00 - 6:00 PM. The peak hours of total traffic passing through the intersection were determined to be 7:45 to 8:45 AM and 4:00 to 5:00 PM on Thursday. Volumes have been seasonally adjusted consistent with Caltrans' PeMS (Performance Measurement System) peak season data for S.R. 29-128 to represent peak season conditions.

The proposed CIA Master Plan is projected for completion and full operation in year 2018. The plan includes:

- expansion of the Associate in Occupational Studies in Culinary Arts (AOS) degree program at Greystone from 200 to 300 students and provision of expanded student housing at Vineyard Lodge, and
- relocation of many existing activities from Greystone to the former Copia site in the City of Napa.

Initially, the expected growth in existing (non-project) traffic along S.R.29-128 (Main Street) was projected to develop year 2018 peak season traffic conditions. 2035 traffic volume conditions were provided by the engineers developing the on-going St Helena General Plan Traffic Update.<sup>1</sup> Trip generation and distribution projections were developed for the expected overall decrease in traffic due to the CIA-Greystone Master Plan, with “plus-project” operating conditions determined at the CIA driveway/S.R. 29-128 (Main Street) intersection and Pratt Avenue/Las Alcobas Hotel driveway/S.R. 29-128 (Main Street) intersection. Evaluation included the adequacy of the left turn lane on the northbound S.R. 29-128 (Main Street) intersection approach to the CIA driveway to accommodate peak hour (non-special event)

<sup>1</sup> Currently under preparation by Omni-Means Traffic Engineering.

<sup>2</sup> January 6, 2015.

<sup>3</sup> The Las Alcobas Hotel will have 68 rooms, a spa for guests only, a 40-seat quality restaurant

demand. Post-project, hourly parking demand matrices were developed for weekday and Saturday peak season conditions at Greystone to determine the adequacy of the proposed parking to be provided as part of the Master Plan project. At the City's request, weekday hourly CIA-Greystone trip generation, projected to peak education and tourist activity at the CIA-Greystone facility (summer/fall 2016), was developed. The hourly inbound and outbound activity for a peak season weekday in 2016 is shown in the tables in this study.

## II. SUMMARY OF FINDINGS

1. Drivers exiting the Culinary Institute of America at Greystone now experience delays for turn movements to S.R. 29-128 during peak traffic periods. The average delay for left and right turns combined out of the CIA driveway ranges from 20 to 27 seconds with left turns taking significantly longer than right turns. The narrow width of the CIA driveway precludes a right turning vehicle from being able to pull around a vehicle waiting to make a left turn. During a Thursday afternoon peak traffic hour, 40 percent of all outbound vehicles make a left turn. Left turn movements from northbound State Route 29-128 into the CIA driveway are delayed, on average, 10 seconds during peak traffic periods.
2. The CIA parking demand on a typical weekday (with classes in session but no special events) currently does not exceed the supply of striped on-site parking spaces available to the public. The total supply of on-site parking is 265 parking spaces located primarily in two major parking lots adjacent the historic Greystone building; there is on-site parking for employees and the general public, as well as restaurant valet parking, a loading and unloading area, and spaces for service vehicles. Handicapped-accessible spaces are provided near the Greystone entrance. Peak parking demand on weekdays occurs from late morning until 4:00 PM. On a typical Saturday (with no classes in session or special events), the demand for on-site parking was found to be substantially less than on a typical weekday.
3. With Existing (without project) volumes, the CIA driveway/S.R.29-128 intersection would experience LOS C operation on the CIA driveway approach to the state highway during a weekday AM peak hour, with 20.6 seconds average delay for eastbound CIA driveway turns, and LOS D operation during the PM peak hour, with 29.3 seconds average delay for eastbound CIA driveway turns. The average delay for left turns from northbound S.R.29-128 into the CIA campus would be less than 10 seconds during both the AM and PM peak hours.

During the peak traffic hour on a summer/fall 2016 weekday, with 2016 (without project) volumes, the Pratt Avenue/S.R. 29-128 intersection would experience AM peak hour LOS D operation, with 30.3 seconds average delay for turns from westbound Pratt Avenue, and PM peak hour LOS E operation, with 39.3 seconds average delay for turns from westbound Pratt Avenue.

4. With 2018 (without project) volumes, the CIA driveway/S.R.29-128 intersection would experience LOS C operation on the CIA driveway approach to the state highway during a weekday AM peak hour, with 21.8 seconds average delay for eastbound CIA driveway turns, and LOS D operation during the PM peak hour, with 32.0 seconds average delay for eastbound CIA driveway turns. The average delay for left turns from northbound

S.R.29-128 into the CIA campus would be less than 10 seconds during both the AM and PM peak hours.

During the peak traffic hour on a summer/fall 2018 weekday, with 2018 (without project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience AM peak hour LOS E operation, with 35.9 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with 64.0 seconds average delay for turns from westbound Pratt Avenue. PM peak hour would experience LOS E operation, with 36.4 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with 93.4 seconds average delay for turns from westbound Pratt Avenue.

5. With 2035 (without project) volumes, the CIA driveway/S.R.29-128 intersection would experience LOS E operation on the CIA driveway approach to the state highway during a weekday AM peak hour, with 37.4 seconds average delay for eastbound CIA driveway turns, and LOS F operation during the PM peak hour, with 82.7 seconds average delay for eastbound CIA driveway turns. The average delay for left turns from northbound S.R.29-128 into the CIA campus would be less than 11 seconds during both the AM and PM peak hours.

During the peak traffic hour on a summer/fall 2035 weekday, with 2035 (without project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience AM peak hour LOS F operation, with 87.1 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with extreme delay (over 120 seconds average delay) for turns from westbound Pratt Avenue. PM peak hour would experience LOS F operation, with 92.1 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with extreme delay (over 120 seconds average delay) for turns from westbound Pratt Avenue.

6. Volumes at the Pratt Avenue/ SR 29-128 intersection would not meet the 8-hour urban warrant, or urban peak hour warrant #3 criteria for signalization during either of the weekday peak traffic hours for 2018 or 2035 without Master Plan project conditions, however, by 2035, volumes approach meeting both signal warrants #1 and #3 criteria. Please see the warrant tables and charts in the **Appendix. Table 3** provides results for signalized operation, with LOS A, B or C for all conditions. Warrant, #7, the signal warrant pertaining to accident data, is not met for the five years of reported crash data at the intersection. A round is not considered feasible at this intersection due to space constraints, as detailed in a memorandum prepared by Summit Engineering (10/21/16) showing the layout of a 150-foot round diameter overlay of the intersection. The memorandum is included in the appendix to this study.
7. The civil engineer for the Las Alcobas Hotel, Riechers Spence Associates, prepared a design<sup>2</sup> for the Pratt Avenue/ Las Alcobas Hotel Driveway/SR 29-128 intersection northbound left turn lane with a length of 150 feet. This length would be more than adequate to accommodate the projected maximum storage demand.

---

<sup>2</sup> January 6, 2015.

8. The proposed CIA Master Plan would reduce two-way trips by at least 15 trips to and from S.R.29-128 during a Thursday AM peak hour and by at least 21 trips to and from S.R. 29-128 during a Thursday PM peak hour(see Greystone Trip Generation in Appendix Tables A and B showing a decrease of 21 inbound and 3 outbound during the AM peak hour, and 10 inbound and 25 outbound during the PM peak hour). There would be an increase in trips to and from the Vineyard Lodge (3 inbound trips and 5 outbound AM peak hour trips, and 7 inbound and 5 outbound PM peak hour trips) attributable to students with parking permits traveling to and from downtown St. Helena and the surrounding area.
9. There would be a net decrease in traffic volumes at intersections due to the Master Plan project. With Existing (with project) volumes, the CIA driveway/S.R.29-128 intersection would experience LOS C operation on the CIA driveway approach to the state highway during a weekday AM peak hour, with 19.8 seconds average delay for eastbound CIA driveway turns (a reduction in average delay of 0.8 second), and LOS D operation during the PM peak hour, with 25.2 seconds average delay for eastbound CIA driveway turns (a reduction of 4.1 seconds). The average delay for left turns from northbound S.R.29-128 into the CIA campus would also be slightly reduced, and would remain less than 10 seconds during both the AM and PM peak hours.

With Existing volumes plus the Master Plan project, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience LOS D operation, with 30.5 seconds average delay during the AM peak hour (an increase in average delay of 0.2 second), and LOS E operation, with 39.6 seconds average delay during the PM peak hour for turns on the Las Alcobas Hotel Driveway approach (an increase in average delay of 0.3 second). The project increment of 4 outbound trips from Vineyard Lodge would add 6 percent additional traffic to the westbound intersection approach during the existing AM and PM peak hours, adding to the existing extreme delays.

10. With 2018 (with Master Plan project) volumes, the CIA driveway/S.R.29-128 intersection would experience less average delay by 0.9 seconds (AM) and 4.8 seconds (PM) on the CIA driveway approach to the state highway the weekday AM and PM peak hours, respectively. The average delay for left turns from northbound S.R.29-128 into the CIA campus would be less than 10 seconds during both the AM and PM peak hours.

During the peak traffic hour on a summer/fall weekday morning and afternoon, with 2018 (with Master Plan project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience LOS E operation, with 35.1seconds average delay during the AM peak hour (a decrease in average delay of 0.8 second), and LOS E operation, with 35.4 seconds average delay during the PM peak hour for turns on the Las Alcobas Hotel Driveway approach (a decrease in average delay of 1.0 second). The westbound Pratt Avenue turns would experience extreme delays (LOS F) without the Master Plan project during the AM and PM peak hours;the project increment of 4 outbound trips from Vineyard Lodge would add 6 percent additional traffic to the westbound intersection approach during the existing AM and PM peak hours, resulting in an increased delay of 0.9 seconds (AM) and 1.0 second (PM).

11. With 2035 (with Master Plan) volumes, the CIA driveway/S.R.29-128 intersection would experience less average delay by 2.5 seconds (AM) and 24.9 seconds (PM) on the CIA driveway approach to the state highway during the weekday peak hours. The average delay for left turns from northbound S.R.29-128 into the CIA campus would be less than 11 seconds during both the AM and PM peak hours.

With 2035 (with Master Plan project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience LOS F operation, with 83.6 seconds average delay during the AM peak hour (a decrease in average delay of 3.5 seconds), and 88.3 seconds average delay during the PM peak hour for turns on the Las Alcobas Hotel Driveway approach (a decrease in average delay of 3.8 seconds). The westbound Pratt Avenue turns would experience extreme delays without the Master Plan project during the AM and PM peak hours; the project increment of 4 westbound trips represents 5 percent traffic added to the westbound intersection approach during the AM and PM peak hours, adding to the existing extreme delays.

12. Volumes at the Pratt Avenue/ SR 29-128 intersection would not meet the 8-hour urban warrant, or urban peak hour warrant #3 criteria for signalization during either of the weekday peak traffic hours for 2018 or 2035 without Master Plan conditions, however, by 2035, volumes approach meeting both signal warrants #1 and #3 criteria. Please see the warrant tables and charts in the **Appendix. Table 3** provides results for signalized operation, with LOS A, B or C for all conditions. Warrant, #7, the signal warrant pertaining to accident data, is not met for the five years of reported crash data at the intersection. A round is not considered feasible at this intersection due to space constraints, as detailed in a memorandum prepared by Summit Engineering (10/21/16) showing the layout of a 150-foot round diameter overlay of the intersection. The memorandum is included in the appendix to this study..
13. The maximum year 2035 + Master Plan (non-special event) queue that would be expected in the left turn lane on the northbound S.R.29-128 approach to the CIA driveway would be 3 vehicles during a Thursday PM peak hour. The left turn lane's 150-foot length can accommodate 6 to 7 automobiles.
14. The proposed Master Plan would provide 265 on-site, striped parking spaces. An additional 60 or more vehicles could also be accommodated on-site using valet parking. The typical day maximum hourly (non-special event) on-site parking demand that would be expected after completion of the Master Plan would be 191 vehicles during a peak season weekday and 95 vehicles during a peak season Saturday, thus post-project parking would be more than adequate for typical day, and typical day plus smaller event, activities.
15. Conclusions: The project would not result in significant impacts to traffic and transportation as evaluated per the City's significance criteria (listed in Section IV.D). The project would not result in significant impacts to intersections as defined by the City of St. Helena's transportation impact criteria. Due to the project's reduction of through traffic on SR 29-128 (Main Street), with 2018 and 2035 (with Master Plan) volumes, the CIA driveway/S.R.29-128 intersection would experience less average delay on the CIA

driveway approach to the state highway during the weekday AM and PM peak hours. Due to the project's reduction of through traffic on SR 29-128 (Main Street) and minor increase of traffic on the Pratt Avenue westbound approach to Main Street, "with project" conditions would result in a reduced overall traffic volume at the Pratt Avenue/S.R. 29-128 intersection. Project volumes would not result in a "letter" change in intersection Level of Service operation, and would result in minor increased delay due to 4 additional westbound trips, 3 of which would be added to westbound Pratt Avenue left turns during the AM and PM peak hours – adding to the existing extreme delays on the westbound Pratt Avenue approach. Project traffic would not result in signal warrant #1 or #3 being met.

### III. PROPOSED PROJECT

The Culinary Institute of America at Greystone (the "CIA") currently has an enrollment of close to 200 students at its 2555 Main Street property. The CIA currently has housing for 47 students in dormitories on its Main Street site (45 are currently occupied) and 101 students on its Vineyard Lodge property at 830 Pratt Avenue (96 are currently occupied). The CIA recently purchased the American Center for Wine Food & the Arts ("Copia") in the City of Napa. The acquisition of Copia will allow the CIA to reduce activities at its Greystone campus by relocating employees, programs, and event activities to Copia. As a result, the CIA proposes a new master plan for its Greystone campus in which it will renovate portions of the Greystone interior to provide additional and more efficient educational facilities. As part of the master plan the CIA proposes expanding student enrollment by 100 students to 300. At the same time it proposes to add housing for an additional 123 students at its Vineyard Lodge site. Between existing housing at Greystone and Vineyard Lodge, and the new housing at Vineyard Lodge, the CIA will have housing for 271 of its total 300 students. Students residing at Vineyard Lodge will continue to be required to use shuttles to go to and from the Vineyard Lodge housing and the Greystone campus.

The proposed CIA Master Plan is projected for completion and full operation in year 2018. The plan includes:

- expansion of the Associate in Occupational Studies in Culinary Arts (AOS) degree program from 200 to 300 students,
- expansion of Vineyard Lodge student housing from 101 beds to 224 beds
- relocation of existing weekday activities from Greystone to the former Copia site in the City of Napa, specifically:
  - 5 of the existing 10 administrative staff will move
  - 14 (all) participants in the Strategic Initiatives Group program will move
  - 1 of the existing 6 purchasing staff will move
  - 26 of the existing 42 Continuing Ed and Food Enthusiast Program students will move
  - Shift # 2 restaurant staff (10 staff) will all move, and restaurant patrons served will be half of existing levels, all served by students on site. The Wine Spectator at Greystone Restaurant (WSGR) is currently operated as a 190 seat restaurant open 362 days per year with lunch and dinner service. The CIA has also operated a teaching kitchen for a number of years in the Flavor Discovery Center (FDC) that allowed students in the Farm to Table component of their educational program to have educational experiences from

growing and harvesting the food, to preparing and serving the food in an educational setting with 58 seats. In conjunction with the use permit amendments contemplated under this Master Plan, the WSGR will be eliminated. The program in the FDC will then become the CIA's remaining restaurant (aside from the Café) and will continue to be student-run but will serve meals only five days a week for 36 weeks (180 days) per year.

- Tourist activity will decrease due to the elimination of the 190-seat WSGR and relocation of many of the enthusiast programs to Copia.

## IV. EXISTING CONDITIONS (WITHOUT PROJECT)

### A. SITE DESCRIPTION, ROADWAYS, SIDEWALKS, BIKEWAYS AND PUBLIC TRANSIT

The CIA campus is located along the west side of the two-lane S.R.29-128 highway in the northern part of the City of St. Helena (see **Figure 1**). A single driveway connection is provided to the CIA with a 150-foot-long left turn lane in place on the northbound S.R.29-128 intersection approach (see **Figure 2**). The CIA driveway has single entry and exit lanes and the exit lane does not have enough width on its approach to S.R.29-128 to allow left and right turning vehicles to separate. The S.R.29-128 posted speed limit adjacent to the CIA is 45 miles per hour, although speeds as high as 60 miles per hour were observed during several field surveys. The Culinary Institute of America currently has 265 paved and striped parking spaces, most of which are open to the public, staff and students; valet parking can accommodate an additional 60 or more vehicles on-site during special events.

**State Route 29-128 (SR 29-128)** is a two-lane north-south highway in the City of St. Helena. At the Pratt Avenue tee intersection the roadway is 48 feet wide curb to curb. A 75-foot-long left turn lane is provided on the southbound SR 29-128 approach to Pratt Avenue. Curb, gutter and sidewalk line both sides of the highway at Pratt Avenue. North of Pratt Avenue there is a tree-lined, unsurfaced pedestrian path along the west side of the highway and an unsurfaced bicycle-pedestrian path along the east side of the highway.

**Pratt Avenue** is a two-lane collector roadway connecting SR 29-128 with Silverado Trail. It is 40 feet wide in the vicinity of SR 29-128. Pratt Avenue is stop sign controlled on its approach to SR 29-128 and the westbound approach lane is 20 feet wide, allowing left and right turning vehicles to separate. Fronting the CIA's Vineyard Lodge, the Pratt Avenue travel lanes are 25.5 feet wide, and along the north side (the Vineyard Lodge frontage), there is a 13-foot wide, 160+-foot long parking bay. Sidewalks are in place fronting the project site, but sidewalks are discontinuous along the north and south sides Pratt Avenue.

**Figure 3** shows existing lane geometries and intersection control.

### ***Bicycle and Multi-Use Path Facilities***

St. Helena's existing and proposed bicycle network is defined in the *St. Helena Bicycle Plan*, which is tied into, and consistent with, the *Napa Countywide Bicycle Plan*. As stated in the Plan, the network includes Class I paths, Class II bicycle lanes, and Class III bike routes in order to

maximize connectivity throughout the community and to destinations beyond St. Helena.

Bicycle Facilities relevant to the project area are defined below, consistent with the *St. Helena Bicycle Plan (January 2012)*.

#### Class I - Multi-Use Path

Class I bicycle facilities, known as bike paths, are multi-use facilities that provide a completely separated right-of-way for the exclusive use of bicycles and pedestrians with cross flows of motorized traffic minimized.

#### Class II Bike Lane

Class II facilities, known as bike lanes, provide a striped and signed lane for one-way bicycle travel on a street or highway. The minimum width for bike lanes ranges between four and five feet depending upon the edge of roadway conditions (curbs). Bike lanes are demarcated by a six-inch white stripe, signage and pavement legends.

#### Class III Bike Route

Class III facilities, known as bike routes, provide signs for shared use with motor vehicles within the same travel lane on a street or highway. Bike routes may be enhanced with warning or guide signs and shared lanes marked with pavement stencils. While Class III routes do not provide measures of separation, they have an important function in providing continuity to the bikeway network.

Figure 1 of the St. Helena Bike Plan shows the following for study roadways:

State Route 29 (Main Street) northbound from Pratt Avenue, is proposed as a link in the planned countywide Vine Trail Alignment, with a Class I Multi-Use Bike Path northbound, extending past the CIA-Greystone facility, north as far as Calistoga. Just east of S.R. 29 (Main Street) on Pratt Avenue, the Vine Trail Alignment loops north to connect to a proposed York Creek Class I Multi-Use Bike Path, then rejoins S.R. 29 just north of Pratt Avenue. State Route 29 (Main Street) southbound is an existing Primary Class II Bike Route and is proposed to have a Class II Bike Lane.

Eastbound Pratt Avenue between State Route 29 (Main Street) and the railroad tracks is proposed to have a Class II Bike Lane; through this segment, westbound Pratt Avenue is proposed to have a Class I Multi-Use Bike Path and is a link in the planned Countywide Vine Trail Alignment. Eastbound Pratt Avenue between the railroad tracks and Silverado Trail, which includes the portion of Pratt Avenue fronting the Vineyard Lodge site, is proposed to have a Class III Bike Route. These facilities would connect with matching improvements on State Route 20 (Main Street) north of Pratt Avenue, and on Silverado Trail north and south of Pratt Avenue.

#### ***Public Transit***

The VINE is the region's bus system for the County of Napa. Two routes pass through St. Helena along S.R. 29: routes 10 and 29. Route 10 provides service from Calistoga to Napa, including

stops in St. Helena, Rutherford and Oakville, running seven days a week, all day and including weekends. Route 29, the Vine Express, is a commuter bus operating from early morning through late afternoon, Monday through Friday. The Vine Express extends from Calistoga to the Vallejo Ferry Terminal and El Cerrito BART. Service hours are Monday through Friday, 5:20 am to 9:10 pm, Saturday 6:00 am to 8:10 pm, and Sundays 8:30 am to 7:00 pm.

The bus stops nearest the project site are two Route 10 northbound stops located at the Pratt Avenue/SR 29 (Main Street) intersection and opposite CIA Greystone, on the east side of the highway.

The *St. Helena Shuttle* is an on-demand shuttle service available for a fee of \$1.00 per trip. Service is available Monday through Friday 7:00 am to 9:00 PM, Friday and Saturday 7:00 am to 11:00 pm, and Sunday (May through November) 11:00am to 9:00 pm.

*VINE Go* is an origin to destination, shared ride service which provides demand response for persons with disabilities in the cities of Calistoga, St. Helena, Napa, American Canyon, the Town of Yountville and the unincorporated areas of Napa County. VINE Go is the ADA paratransit service complementary to the fixed route operators and runs at times corresponding to the fixed routes.

## **B. OPERATION OF THE CULINARY INSTITUTE OF AMERICA DRIVEWAY CONNECTION TO STATE ROUTE 29-128, AND THE PRATT AVENUE/STATE ROUTE 29-128 INTERSECTION**

### **1. Volumes**

Traffic counts were conducted by Crane Transportation Group at the CIA Driveway/S.R.29-128 intersection from 6:00 AM to 6:00 PM and on Saturday, May 14, from 1:00 PM to 6:00 PM. Peak hour counts were conducted at the Pratt Avenue/S.R. 29-128 intersection on Thursday, May 12, from 7:00 – 9:00 AM and 4:00 – 6:00 PM. The peak hours of total traffic passing through the intersections were determined to be 7:45 to 8:45 AM and 4:00 to 5:00 PM on Thursday, and from 1:15-2:15 at the CIA Driveway/S.R.29-128 intersection on Saturday. Due to overall activity being greater at the CIA facility on weekdays than on weekends, this analysis focuses on weekday activities.

In order to determine traffic conditions during the peak summer/fall tourist season and a time of peak activity at CIA, the May counts were adjusted based upon Caltrans' seasonal traffic count information (PeMS data) for Highway 29 in St. Helena. Resultant peak season Thursday peak hour volumes are presented in **Figure 4**.

### **2. Analysis Methodology**

Transportation engineers and planners commonly use a grading system called level of service (LOS) to measure and describe the operational status of the local roadway network. LOS is a description of the quality of a roadway facility's operation, ranging from LOS A (indicating free-flow traffic conditions with little or no delay) to LOS F (representing oversaturated conditions where traffic flows exceed design capacity, resulting in long queues and delays).

Intersections, rather than roadway segments between intersections, are almost always the capacity controlling locations for any circulation system.

**Signalized Intersections.** For signalized intersections, the 2010 *Highway Capacity Manual* (Transportation Research Board, National Research Council) methodology was utilized. With this methodology, operations are defined by the level of service and average control delay per vehicle (measured in seconds) for the entire intersection. For a signalized intersection, control delay is the portion of the total delay attributed to traffic signal operation. This includes delay associated with deceleration, acceleration, stopping, and moving up in the queue. **Table 1** summarizes the relationship between delay and LOS for signalized intersections.

**Unsignalized Intersections.** For unsignalized (all-way stop-controlled and side-street stop-controlled) intersections, the 2010 *Highway Capacity Manual* (Transportation Research Board, National Research Council) methodology for unsignalized intersections was utilized. For side-street stop-controlled intersections, operations are defined by the level of service and average control delay per vehicle (measured in seconds), with delay reported for the stop sign controlled approaches or turn movements, although overall delay is also typically reported for intersections along state highways. For all-way stop-controlled intersections, operations are defined by the average control delay for the entire intersection (measured in seconds per vehicle). The delay at an unsignalized intersection incorporates delay associated with deceleration, acceleration, stopping, and moving up in the queue. **Table 2** summarizes the relationship between delay and LOS for unsignalized intersections.

### 3. Existing Peak Season Operation

**Table 3** shows that during the peak traffic hour on a summer/fall 2016 weekday, with 2016 (without Master Plan project) volumes, the CIA driveway/S.R.29-128 intersection would experience LOS C operation on the CIA driveway approach to the state highway during a weekday AM peak hour, with 20.6 seconds average delay for eastbound CIA driveway turns, and LOS D operation during the PM peak hour, with 29.3 seconds average delay for eastbound CIA driveway turns. The average delay for left turns from northbound S.R.29-128 into the CIA campus would be less than 10 seconds during both the AM and PM peak hours.

With 2016 (without Master Plan project) volumes, the Pratt Avenue/S.R. 29-128 intersection would experience LOS D operation, with 30.3 seconds average delay for westbound Pratt Avenue turns during the weekday AM peak hour, and LOS E operation with 39.3 seconds average delay during the weekday PM peak hour.

**C. SIGNAL WARRANT EVALUATION – PRATT AVENUE/S.R. 29-128  
(MAIN STREET)**

**1. Analysis Methodology and Reason for Urban Warrant, Rather than Rural Warrant Analysis**

Traffic signals are used to provide an orderly flow of traffic through an intersection. Many times they are needed to offer side street traffic an opportunity to access a major road where high volumes and/or high vehicle speeds block crossing or turn movements. They do not, however, increase the capacity of an intersection (i.e., increase the overall intersection's ability to accommodate additional vehicles) and, in fact, often slightly reduce the number of total vehicles that can pass through an intersection in a given period of time. Signals can also cause an increase in traffic accidents if installed at inappropriate locations.

There are 9 possible tests for determining whether a traffic signal should be considered for installation. These tests, called "warrants", consider criteria such as actual traffic volume, pedestrian volume, presence of school children, and accident history. The intersection volume data together with the available collision histories were compared to warrants contained in the *Manual on Uniform Traffic Control Devices* (MUTCD), Federal Highway Administration, 2014, California Supplement, which has been adopted by the State of California as a replacement for *Caltrans Traffic Manual*. Section 4C of the MUTCD provides guidelines, or warrants, which may indicate need for a traffic signal at an unsignalized intersection. As indicated in the MUTCD, satisfaction of one or more warrants does not necessarily require immediate installation of a traffic signal. It is merely an indication that the local jurisdiction should begin monitoring conditions at that location and that a signal may ultimately be required.

Caltrans Signal Warrant 3, the peak hour volume warrant, is often used as an initial check of signalization needs since peak hour volume data is typically available and this warrant is usually the first one to be met. Warrant 3 is based on a curve and takes only the hour with the highest volume of the day into account. Warrant 3 employs two charts, one applicable to "urban" conditions, and another applicable to "rural" conditions. The MUTCD states that if the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 40 mph, or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, Figure 4C-4 [rural warrant chart] may be used in place of Figure 4C-3 [urban warrant chart] to evaluate the [warrant criteria].

The Pratt Avenue/S.R. 29-128 (Main Street) intersection *has urban characteristics*, as follows:

- The 85<sup>th</sup> percentile speed on the S.R. 29-128 (Main Street) intersection approaches is less than 40 miles per hour.
- Although the population of the City of St Helena is less than 10,000, S.R. 29-128 (Main Street) through St. Helena is a region-serving highway that experiences urban-type back-ups with slow-moving traffic at Pratt Avenue and stop and go traffic in central St. Helena every weekday afternoon as well as every Saturday and Sunday afternoon due to heavy tourist traffic, commuter through-traffic and local traffic volumes.

- The City of St Helena recognizes the urban character of the highway in its “minimum acceptable LOS D” standard for this intersection.

In the most recent traffic study conducted for this intersection, the *Traffic Impact Report for Las Alcobas Hotel, St Helena, CA*, May 29, 2015, prepared for Caltrans District 4 by Crane Transportation Group, the urban warrant was applied. Caltrans approved the report with no dissenting comment regarding use of urban Warrant 3 for the 2015 study.

In this report, at the request of the City traffic engineer, Warrant #1, the test for the highest eight hour volumes is also included, and the accident warrant (Warrant #7) has been evaluated at the SR 29-128/Pratt Avenue intersection based upon accident data provided by the City of St Helena through the SWITRS (Statewide Integrated Traffic Records System) data base. The feasibility of a roundabout at this location is constrained by existing structures: a residence on the east, a new hotel access driveway (including a historic wall) on the west, as well as right-of-way limitations. A roundabout is not considered feasible at this intersection due to space constraints. (See the **Appendix** for detailed analysis of a roundabout at the SR 29-128/Pratt Avenue intersection.)

## 2. Existing Conditions

Tables 4a and 4b show that volumes at the Pratt Avenue/ SR 29-128 intersection would not meet urban warrant #1 (the warrant for the 8 highest volume hours) or urban peak hour warrant #3 criteria for signalization during either of the weekday peak traffic hours (AM or PM) for existing conditions Please see the tables and warrant charts in the **Appendix**.

Warrant #7, the Crash Experience signal warrant conditions are intended for application where the severity and frequency of crashes are the principal reasons to consider installing a traffic control signal.

California MUTCD, Chapter 4C specifies that the need for a traffic control signal shall be considered if an engineering study finds that *all* of the following criteria are met:

- A. Adequate trial of alternatives with satisfactory observance and enforcement has failed to reduce the crash frequency; and
- B. Five or more reported crashes, of types susceptible to correction by a traffic control signal, have occurred within a 12-month period, each crash involving personal injury or property damage apparently exceeding the applicable requirements for a reportable crash; and
- C. For each of any 8 hours of an average day, the vehicles per hour (vph) given in both of the 80 percent columns of Condition A in Table 4C-1 (see Section 4C.02), or the vph in both of the 80 percent columns of Condition B in Table 4C-1 exists on the major-street and the higher-volume minor-street approach, respectively, to the intersection, or the volume of pedestrian traffic is not less than 80 percent of the requirements specified in the Pedestrian Volume warrant. These major-street and minor-street volumes shall be for the same 8 hours. On the minor street, the higher volume shall not be required to be on the same approach during each of the 8 hours.

Accident data provided by the City of St. Helena from SWITRS (Statewide Integrated Traffic Reporting System) revealed that over the past five years, there have not been five or more reported crashes at this intersection within any 12-month period. At most, there were 4 crashes between 10/21/11 and 10/24/12. There were three reported crashes in 2011, one in 2012, two in 2013 and 2014, and one in 2015. The Appendix includes the accident data provided by the City.

**D. CITY OF ST. HELENA GENERAL PLAN (1993) SIGNIFICANCE  
CRITERIA AND THRESHOLDS OF SIGNIFICANCE USED IN IMPACT  
EVALUATIONS IN ST. HELENA**

The significance criteria used for analyzing and determining the project's level of impact on traffic and transportation are described in this section.

**(1) Thresholds of Significance**

Appendix G of the CEQA Guidelines provides that a project would have a significant transportation and traffic impact if it would:

- Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including, but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths and mass transit;
- Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated road or highways;
- Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks;
- Substantially increase hazards due to a design feature (i.e., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment);
- Result in inadequate emergency access; or
- Conflict with adopted policies, plans or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

The City of St. Helena's adopted transportation impact criteria (1993 General Plan) are as follows:

a. All signalized intersections in St. Helena should maintain LOS C except along Main Street, where LOS D is permitted. Exceptions to this policy are that lower service levels shall be permitted at any location where the existing LOS does not meet this standard and in which case the LOS cannot be worsened any further.

b. All signalized intersections must maintain LOS C. If the LOS degrades below LOS C, an evaluation of the need for traffic signalization shall be undertaken according to standard

Caltrans signal warrants as described below. If signals are not initially warranted, the location shall continue to be monitored for signal warrants on a regular basis.

## V. FUTURE YEAR 2018 and YEAR 2035 (WITHOUT PROJECT) CONDITIONS

### A. ANALYSIS HORIZON YEARS FOR WITHOUT PROJECT OPERATING CONDITIONS

#### 1. Overview

CIA management projects that the proposed Master Plan could be fully completed by 2018, and General Plan projections extend to year 2035. Therefore, these horizon years have been used for evaluation.

#### 2. Year 2018 and Year 2035 Base Case (Without Master Plan) Traffic Volumes

Year 2018 weekday AM and PM peak hour (without project) volumes have been developed using traffic growth projections developed for S.R.29-128 in St. Helena as part of the General Plan traffic model. Projections contained in the model show an approximate 2.25 percent per year growth rate for S.R.29-128 traffic between 2015 and 2035. These rates have been applied to the year 2016 summer/fall AM and PM peak hour volumes to achieve 2018 projections at the study intersections (see **Figure 5**); in addition, volumes from the Las Alcobas Hotel driveway opposite Pratt Avenue, have been added.<sup>3</sup> Year 2035 weekday AM and PM peak hour volumes are derived directly from the General Plan projections at the Pratt Avenue/S.R. 29-128 intersection, with volumes at the CIA driveway factored to be consistent with the General Plan projections (see **Figures 6 and 7**).

#### 3. Year 2018 Peak Season Base Case (Without Master Plan Project) Intersection Operation

**Table 3** shows that during the peak traffic hour on a summer/fall 2018 weekday, with 2018 (without project) volumes, the CIA driveway/S.R.29-128 intersection would experience LOS C operation on the CIA driveway approach to the state highway during a weekday AM peak hour, with 21.8 seconds average delay for eastbound CIA driveway turns, and LOS D operation during the PM peak hour, with 32.0 seconds average delay for eastbound CIA driveway turns. The average delay for left turns from northbound S.R.29-128 into the CIA campus would be less than 10 seconds during both the AM and PM peak hours.

With 2018 (without project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience AM peak hour LOS E operation, with 35.9 seconds

<sup>3</sup> The Las Alcobas Hotel will have 68 rooms, a spa for guests only, a 40-seat quality restaurant and one special event per month. Source: *Traffic Impact Report for Las Alcobas Hotel, St Helena, CA* May 29, 2015, prepared for Caltrans District 4 by Crane Transportation Group.

average delay for turns from the eastbound Las Alcobas Hotel driveway, and LOS F operation, with 64.0 seconds average delay for turns from westbound Pratt Avenue. PM peak hour would experience LOS E operation, with 36.4 seconds average delay for turns from the eastbound Las Alcobas Hotel driveway, and LOS F operation, with 93.4 seconds average delay for turns from westbound Pratt Avenue.

#### **4. Year 2035 Peak Season Base Case (Without Master Plan Project) Intersection Operation**

**Table 3** shows that during the peak traffic hour on a summer/fall 2035 weekday, with 2035 (without project) volumes, the CIA driveway/S.R.29-128 intersection would experience LOS E operation on the CIA driveway approach to the state highway during a weekday AM peak hour, with 37.4 seconds average delay for eastbound CIA driveway turns, and LOS F operation during the PM peak hour, with 82.7 seconds average delay for eastbound CIA driveway turns. The average delay for left turns from northbound S.R.29-128 into the CIA campus would be less than 11 seconds during both the AM and PM peak hours.

With 2035 (without project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128-128 intersection would experience AM peak hour LOS F operation, with 87.1 seconds average delay for turns from the eastbound Las Alcobas Hotel driveway, and LOS F operation, with extreme delay (over 120 seconds average delay) for turns from westbound Pratt Avenue. PM peak hour would experience LOS F operation, with 92.1 seconds average delay for turns from the eastbound Las Alcobas Hotel driveway, and LOS F operation, with extreme delay (over 120 seconds average delay) for turns from westbound Pratt Avenue.

### **B. SIGNAL WARRANT EVALUATION**

#### **1. Year 2018 and Year 2035 Without Project Conditions**

Volumes at the Pratt Avenue/ SR 29-128 intersection would not meet warrant #1 criteria (the eight-hour signal warrant) or urban peak hour warrant #3 criteria for signalization during either of the weekday peak traffic hours for 2018 or 2035 without Master Plan conditions. However, by 2035, volumes approach meeting both signal warrant (warrant #1 and #3) criteria. Please see the tables and warrant charts in the **Appendix. Table 3** provides results for signalized operation, with LOS A, B or C for all conditions. The feasibility of a round at this location is constrained by existing structures: a residence on the east, a new hotel access driveway and historic wall on the west, as well as right-of-way limitations. A round is not considered feasible at this intersection due to extreme space constraints, as detailed in a memorandum prepared by Summit Engineering (10/21/16) showing the layout of a 150-foot round diameter overlay of the intersection. The memorandum is included in the appendix to this study.

### **C. PROPOSED LEFT TURN LANE DESIGN**

The civil engineer for the Las Alcobas Hotel, Riechers Spence Associates, prepared a design<sup>4</sup> for the proposed northbound left turn lane with a length of 150 feet. This length would be more than adequate to accommodate the projected maximum storage demand.

---

<sup>4</sup> January 6, 2015.

## VI. CULINARY INSTITUTE OF AMERICA MASTER PLAN TRAFFIC AND PARKING IMPACTS

### A. PROPOSED PROJECT

The CIA Master Plan would result in the following development or activity that would result in changes to trip generation and parking demand at the Master Plan facilities.

- New Students at Greystone: 100
  - All 100 additional students would be living at the Vineyard Lodge housing on Pratt Avenue in St. Helena and attending weekday classes. These students will be shuttled to and from the CIA Greystone campus on weekdays, as they would not be allowed to use a personal vehicle to access classes, consistent with the current practice. Alternatively, some students may walk or bike. Shuttle bus service is currently provided every 15 minutes from early morning (5:30 AM) to end of the student day (9:30 PM).
  - For traffic and parking analysis purposes, no new students are assumed to be living off-site and commuting to the CIA-Greystone for weekday classes. All new students would reside at the Vineyard Lodge on Pratt Avenue. Some students currently commuting from off-site would be able to find CIA-housing under “with Master Plan” conditions, as 271 beds would be available for the 300-student population.

### B. PROJECT TRIP GENERATION

#### 1. ITE Trip Generation Standard Rates are not Applicable

The standard engineering reference for determining the amount of traffic generated by a specific land use is the Institute of Transportation Engineers (ITE) *Trip Generation* reference manual. However, for a facility with a wide range of activities and programs, such as the CIA’s Greystone facility, there is no applicable “standard” trip generation rate available in the historical data supplied by ITE. Greystone has a wide range of classes, starting at 6:00 AM and continuing as late as 8:00 or 9:00 PM on a daily basis, in addition to a restaurant, café, retail shop, museum, and special events. The majority of students are shuttled to and from class from off-site (Vineyard Lodge) housing operated by the CIA, via shuttles running every 15 minutes from 5:30 AM to 9:30 PM daily. A facility this unique and one-of-a-kind requires hourly projections of programs and parking requirements for all activities. This has been the approach to planning for the Greystone facility since 2003 when the last major Master Plan traffic and parking analysis was prepared for this facility. For this reason, **Tables 7, 8, 9 and 10** were prepared to determine existing and future peak season parking requirements by hour of day, and **Appendix Tables A and B** were prepared to show hourly, all-day inbound and outbound peak season traffic volumes for weekday conditions, based upon driveway traffic counts, and closely tied to the peak season parking tables.

## 2. Management-Approved Projections of Inbound and Outbound Trips Based Upon Current and Planned Programs and Activities at Greystone and Maximized Student Housing Occupancy at Greystone and Vineyard Lodge

This study is based upon CIA management-approved projections regarding the planned relocation of programs and staff from the Greystone campus to the new facility in Napa, and the intention to maximize use of CIA-managed housing for students. The CIA can provide housing at lower cost than students can find off-site, outside of CIA facilities. The CIA provides all needed transportation for its students, including rental cars, when needed. All 100 new students will be housed at the expanded Vineyard Lodge, filling a long-standing need for additional CIA housing. The CIA will maintain its current all-day schedule of shuttle pick-ups/drop-offs, every 15 minutes. By increasing the size of its shuttles, it can maintain the same number of trips that occur today. These projections have been utilized to determine the net increase or decrease in Thursday AM and PM peak hour traffic due to the proposed Master Plan.

As shown in **Figure 8**, the CIA Master Plan project would result in reduced trips to and from the S.R. 29 corridor and the Greystone facility; see the Greystone Trip Generation in **Appendix Tables A and B**, detailing full-day Greystone Trip Generation.

The tables show a decrease of 21 inbound and 3 outbound during the AM peak hour, and 10 inbound and 25 outbound during the PM peak hour). The 15-trip decrease in Master Plan-related trips on SR 29-128 during summer/fall Thursday AM peak traffic conditions would be primarily related to the following reductions:

- reductions in Administrative staff; shown on **Appendix Table A** as “-5” inbound trips
- reductions in the SIG program; shown on **Appendix Table A** as “-16” inbound and “-3” outbound trips

The 21-trip decrease in Master Plan-related trips on SR 29-128 during summer/fall Thursday PM peak traffic conditions would be primarily related to the following:

- reductions in Administrative staff; shown on **Appendix Table B** as “-5” outbound trips
- reductions in the SIG program; shown on **Appendix Table B** as “-15” outbound trips
- reductions in Continuing Ed & Food Enthusiast; shown on **Appendix Table B** as “-1” inbound trip
- reduction in Restaurant Patrons; shown on **Appendix Table B** as “-1” inbound trip.
- reduction in Tourists; shown on **Appendix Table B** as “-5” inbound and “-5” outbound trips.
- reduction in afternoon deliveries; shown on **Appendix Table B** as “-3” inbound trips.

Most of the existing traffic activity associated with students living in non-CIA housing off-site occurs at non-peak traffic times (i.e. on weekdays before 7:00 AM, from 1:00 to 2:00 PM or after 8:00 PM), thus, other than shuttles running every 15 minutes between the Vineyard Lodge and Greystone facilities, only low-levels of student-related trips are reflected in project trip generation during the analyzed peak hours. There would be minor trip increases (3 inbound and 5 outbound during the AM peak hour, and 7 inbound and 5 outbound during the PM peak hour)

projected to and from the Vineyard Lodge housing, attributable to students with parking permits traveling to and from downtown St. Helena and the surrounding area during after-school hours. The weekday student trip increases are projected at low levels based on the current low-level driveway counts at Vineyard Lodge during the analyzed peak hours.

**C. PROJECT IMPACTS TO OPERATION OF THE CIA DRIVEWAY/  
S.R.29-128 INTERSECTION AND PRATT AVENUE/ LAS ALCOBAS  
HOTEL DRIVEWAY/S.R. 29-128 INTERSECTION**

There would be a net decrease in traffic volumes at intersections due to the Master Plan project. Table 3 shows that Existing with project volumes would result in the CIA driveway/S.R.29-128 intersection experiencing LOS C operation on the CIA driveway approach to the state highway during a weekday AM peak hour, with 19.8 seconds average delay for eastbound CIA driveway turns (a reduction in average delay of 0.8 second), and LOS D operation during the PM peak hour, with 25.2 seconds average delay for eastbound CIA driveway turns (a reduction of 4.1 seconds). The average delay for left turns from northbound S.R.29-128 into the CIA campus would also be slightly reduced, and would remain less than 10 seconds during both the AM and PM peak hours.

With Existing volumes plus the Master Plan project, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience LOS D operation, with 30.5 seconds average delay during the AM peak hour (an increase in average delay of 0.2 second), and LOS E

operation, with 39.6 seconds average delay during the PM peak hour for turns on the Las Alcobas Hotel Driveway approach (an increase in average delay of 0.3 second). The project increment of 4 outbound trips from Vineyard Lodge would add 6 percent additional traffic to the westbound intersection approach during the existing AM and PM peak hours, adding to the existing extreme delays.

With 2018 (with Master Plan project) volumes (See Figure 9), the CIA driveway/S.R.29-128 intersection would experience less average delay by 0.9 seconds (AM) and 4.8 seconds (PM) on the CIA driveway approach to the state highway the weekday AM and PM peak hours, respectively. The average delay for left turns from northbound S.R.29-128 into the CIA campus would be less than 10 seconds during both the AM and PM peak hours.

During the peak traffic hour on a summer/fall weekday morning and afternoon, with 2018 (with Master Plan project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience LOS E operation, with 35.1seconds average delay during the AM peak hour (a decrease in average delay of 0.8 second), and LOS E operation, with 35.4 seconds average delay during the PM peak hour for turns on the Las Alcobas Hotel Driveway approach (a decrease in average delay of 1.0 second). The westbound Pratt Avenue turns would experience extreme delays (LOS F) without the Master Plan project during the AM and PM peak hours; the project increment of 4 outbound trips from Vineyard Lodge would add 5.5 percent additional traffic to the westbound intersection approach during the existing AM and PM peak hours, resulting in an increased delay of 0.9 seconds (AM) and 1.0 second (PM).

With 2035 (with Master Plan) volumes, the CIA driveway/S.R.29-128 intersection would experience less average delay by 2.5 seconds (AM) and 24.9 seconds (PM) on the CIA driveway approach to the state highway during the weekday peak hours. The average delay for left turns from northbound S.R.29-128 into the CIA campus would be less than 11 seconds during both the AM and PM peak hours.

With 2035 (with Master Plan project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience LOS F operation, with 83.6 seconds average delay during the AM peak hour (a decrease in average delay of 3.5 seconds), and 88.3 seconds average delay during the PM peak hour for turns on the Las Alcobas Hotel Driveway approach (a decrease in average delay of 3.8 seconds). The westbound Pratt Avenue turns would experience extreme delays without the Master Plan project during the AM and PM peak hours; the project increment of 4 westbound trips represents 5 percent traffic added to the westbound intersection approach during the AM and PM peak hours, adding to the existing extreme delay.

## **D. SIGNAL WARRANT EVALUATION**

### **1. Year 2018 and Year 2035 With Master Plan Conditions**

Volumes at the Pratt Avenue/ SR 29-128 intersection would not meet warrant #1 criteria (the hour-hour signal warrant) or urban peak hour warrant #3 criteria for signalization during either of the weekday peak traffic hours for 2018 or 2035 with Master Plan conditions. However, by 2035, volumes approach meeting both signal warrant (warrant #1 and #3) criteria. Please see the warrant charts in the **Appendix. Table 3** provides results for signalized operation, with LOS A, B or C for all conditions.

## **E. LEFT TURN QUEUE LENGTH AT THE CIA DRIVEWAY/ S.R.29-128 INTERSECTION**

The left turn lane on the northbound S.R.29-128 approach to the CIA driveway is 150 feet long and can accommodate up to 6 to 7 automobiles. Based upon methodology contained in the Institute of Transportation Engineers (ITE) November 2001 *ITE Magazine*,<sup>5</sup> with Base Case + Master Plan traffic volumes (and no special event), the 95th percentile queue storage demand in the left-turn turn pocket during a summer/fall weekday AM and PM peak hour would be 3 vehicles (less than available storage).

## **F. CULINARY INSTITUTE OF AMERICA PARKING DEMAND**

### **1. Overview**

The CIA campus currently has 265 striped parking spaces located primarily in two major parking lots (north lot and south lot) adjacent (east and southeast of) the historic Greystone building; there is on-site parking for employees and the general public, as well as restaurant valet parking, a loading and unloading area, and spaces for service vehicles. Handicapped-accessible spaces are provided near the Greystone entrance. Event valet parking allows for 60 or more additional parking spaces when needed. In addition to regularly scheduled classes and restaurant hours, there are many small-to-large size special events held at the CIA throughout the year. Events occur on all days of the week, during the day as well as in the evening. For major special events that would exceed the on-site supply of parking, the CIA arranges in advance for remote parking and shuttle service.

Parking demand is within the available supply of on-site parking spaces during the peak activity season on weekdays and Saturday throughout the day. All students and staff must self park, while lunch and dinner guests have the choice of self parking or valet parking. Tourists and visitors primarily self park. Parking demand on weekdays and weekends peaks between noon and 2:00 PM. On Saturdays, there are no regular classes and thus few students or teachers are on campus. Administrative staff are largely absent on weekends, however, the number of guests eating at the café and restaurant and the number of drop-in tourists is higher on weekends than on weekdays.

### **2. Existing May 2016 Parking Demand**

Hourly on-site parking surveys were conducted by Crane Transportation Group on May 12 and 14, 2016, a Thursday and a Saturday. The weather was clear on both days.

**Thursday conditions:** There were no special events scheduled on Thursday; there were 50 at lunch and 75 at dinner in the restaurant; the AOS degree program had 154 students in class, and there were 26 attendees in Food Enthusiast classes.

---

<sup>3</sup> *Estimation of Maximum Queue Lengths at Unsignalized Intersections*, by John T. Gard.

**Saturday conditions:** There were 110 at lunch and 100 at dinner in the restaurant; no students were in class, and there were 46 attendees in Food Enthusiast classes. There was a wedding with 150 guests occurring Saturday evening.

As shown in **Tables 5 and 6**, on both days parking demand never exceeded the available supply of on-site spaces.

### 3. Existing Peak Season Parking Demand

There is a wide variety of uses on-going at the Greystone facility. Therefore, a detailed analysis of campus activities was prepared for each hour of the day showing the Master Plan uses for all departments that would remain at the Greystone facility.

Parking counts were conducted at the Greystone parking lots on May 12 and 14, 2016, as presented in **Tables 5 and 6** for weekday and Saturday conditions respectively. As shown, for all time periods there was substantial available parking. The heaviest parking demand occurred at 2:00 PM on Thursday, when 208 cars were parked and there were 57 available parking spaces, and on Saturday at 2:00 PM with 154 cars parked and 6:00 PM when there were 156 cars parked, resulting in 111 and 109 available spaces, respectively.

Projections have been developed of the existing on-site parking demand that could be expected at Greystone during the peak activity season. Projections (by hour) are presented in **Tables 7 and 8** for weekday and Saturday conditions respectively, based upon input from CIA management. As shown, on-site parking demand would total 250 spaces by 2:00 PM on a weekday, and 157 between noon and 2:00 PM on a Saturday.

### 4. Projected Future “With Master Plan” Peak Season Parking Demand

With the CIA Master Plan’s relocated activities and all new students using the CIA shuttle services, a total of 265 paved and striped parking stalls would be provided on the CIA campus. **Tables 9 and 10** provide weekday and Saturday parking demand projections for “with Master Plan” conditions by hour of the day. As shown, for all time periods there would be a substantial amount available parking. The heaviest parking demand would occur at 2:00 PM on Thursday, when 191 cars would be parked, and noon to 2:00 PM on Saturday, when 95 cars would be parked. There would be room for an additional 60 or more vehicles to be parked on-site by valets for events.

Based upon the proposed number of striped spaces, the project would provide more than adequate on-site parking for post-Master Plan peak season regular activities, with valet parking for events. However, with very large special events, use of off-site parking could still be required, as it is today.

## VII. CONCLUSIONS AND RECOMMENDATIONS

- Conclusions: The project would not result in significant impacts to traffic and transportation as evaluated per the City's significance criteria (listed in Section IV.D). The project would not have significant impacts as defined in Appendix G of the CEQA Guidelines, nor would it result in significant impacts to intersections as defined by the City of St. Helena's transportation impact criteria. Due to the project's reduction of through traffic on SR 29-128 (Main Street), with 2018 and 2035 (with Master Plan) volumes, the CIA driveway/S.R.29-128 intersection would experience less average delay on the CIA driveway approach to the state highway during the weekday AM and PM peak hours. Due to the project's reduction of through traffic on SR 29-128 (Main Street) and minor increase of traffic on the Pratt Avenue westbound approach to Main Street, "with project" conditions would result in a reduced overall traffic volume at the Pratt Avenue/S.R. 29-128 intersection. Project volumes would not result in a "letter" change in intersection Level of Service operation, and would result in minor increased delay due to 3 added westbound Pratt Avenue left turns during the AM and PM peak hours – adding to the existing extreme delays on the westbound Pratt Avenue approach. Project traffic would not result in signal warrant #1 or #3 being met.
- Recommendation: It is advised, and it is the current policy of CIA management, to use parking spaces on the south lot parking area for employees (i.e. long duration parkers), leaving the majority of the north lot parking stalls for quicker turnover activities such as student commuters, tourists and guests.
