**BOLD** type indicates maximum parking demand.

(1) 45 students now staying in dorms on CIA campus, 70% of these students have cars. Also project that 85% of students living off-site, and not at Vineyard Lodge housing, drive to/from campus on a 70/30 split AM/PM.

(2) 42 @ 1.5 per car.

(3) 70 patrons @ 2.0 per car

Source: Crane Transportation Group based upon input from Culinary Institute of America

**BOLD** type indicates maximum parking demand.

(1) 24 students now staying in dorms on CIA campus, 70% of these students have cars. Also project that 85% of students living off-site, and not at Vineyard Lodge housing, drive to/from campus on a 70/30 split AM/PM.

(2) 30 @ 1.5 per car.

(3) 40 patrons @ 2.0 per car

Source: Crane Transportation Group based upon input from Culinary Institute of America

## **SIGNAL WARRANTS**

## Appendix

### SIGNAL WARRANT DEFINITIONS (California Manual on Uniform Traffic Control Devices\*)

#### Section 4C.02 Warrant 1, Eight-Hour Vehicular Volume

**Support:**

The Minimum Vehicular Volume, Condition A, is intended for application at locations where a large volume of intersecting traffic is the principal reason to consider installing a traffic control signal.

The Interruption of Continuous Traffic, Condition B, is intended for application at locations where Condition A is not satisfied and where the traffic volume on a major street is so heavy that traffic on a minor intersecting street suffers excessive delay or conflict in entering or crossing the major street.

It is intended that Warrant 1 be treated as a single warrant. If Condition A is satisfied, then the criteria for Warrant 1 is satisfied and Condition B and the combination of Conditions A and B are not needed. Similarly, if Condition B is satisfied, then the criteria for Warrant 1 is satisfied and the combination of Conditions A and B is not needed.

**Standard:**

**The need for a traffic control signal shall be considered if an engineering study finds that one of the following conditions exist for each of any 8 hours of an average day:**

- A. The vehicles per hour given in both of the 100 percent columns of Condition A in Table 4C-1 exist on the major-street and the higher-volume minor-street approaches, respectively, to the intersection; or**
- B. The vehicles per hour given in both of the 100 percent columns of Condition B in Table 4C-1 exist on the major-street and the higher-volume minor-street approaches, respectively, to the intersection.**

**In applying each condition the major-street and minor-street volumes shall be for the same 8 hours. On the minor street, the higher volume shall not be required to be on the same approach during each of these 8 hours.**

**Option:**

If the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 64 km/h or exceeds 40 mph, or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, the traffic volumes in the 70 percent columns in Table 4C-1 may be used in place of the 100 percent columns.

**Guidance:**

The combination of Conditions A and B is intended for application at locations where Condition A is not satisfied and Condition B is not satisfied and should be applied only after an adequate trial of other alternatives that could cause less delay and inconvenience to traffic has failed to solve the traffic problems.

**Standard:**

**The need for a traffic control signal shall be considered if an engineering study finds that one of the following conditions exist for each of any 8 hours of an average day:**

- A. The vehicles per hour given in both of the 80 percent columns of Condition A in Table 4C-1 exist on the major-street and the higher-volume minor-street approaches, respectively, to the intersection; and**

---

\* FHWA's MUTCD 2014 edition (FHWA's MUTCD 2009 Edition, including Revisions 1 & 2, as amended for use in California)

- B. The vehicles per hour given in both of the 80 percent columns of Condition B in Table 4C-1 exist on the major-street and the higher-volume minor-street approaches, respectively, to the intersection.**

**These major-street and minor-street volumes shall be for the same 8 hours for each condition; however, the 8 hours satisfied in Condition A shall not be required to be the same 8 hours satisfied in Condition B. On the minor street, the higher volume shall not be required to be on the same approach during each of the 8 hours.**

Option:

If the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 64 km/h or exceeds 40 mph, or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, the traffic volumes in the 56 percent columns in Table 4C-1 may be used in place of the 80 percent columns.

### **Section 4C.04 Warrant 3, Peak Hour**

Support:

The Peak Hour signal warrant is intended for use at a location where traffic conditions are such that for a minimum of 1 hour of an average day, the minor-street traffic suffers undue delay when entering or crossing the major street.

**Standard:**

**This signal warrant shall be applied only in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time.**

**The need for a traffic control signal shall be considered if an engineering study finds that the criteria in either of the following two categories are met:**

- A. If all three of the following conditions exist for the same 1 hour (any four consecutive 15-minute periods) of an average day:**
- 1. The total stopped time delay experienced by the traffic on one minor-street approach (one direction only) controlled by a STOP sign equals or exceeds: 4 vehicle-hours for a one-lane approach; or 5 vehicle-hours for a two-lane approach, and**
  - 2. The volume on the same minor-street approach (one direction only) equals or exceeds 100 vehicles per hour for one moving lane of traffic or 150 vehicles per hour for two moving lanes, and**
  - 3. The total entering volume serviced during the hour equals or exceeds 650 vehicles per hour for intersections with three approaches or 800 vehicles per hour for intersections with four or more approaches.**
- B. The plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher-volume minor-street approach (one direction only) for 1 hour (any four consecutive 15-minute periods) of an average day falls above the applicable curve in Figure 4C-3 for the existing combination of approach lanes.**

Option:

If the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 64 km/h or exceeds 40 mph, or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, Figure 4C-4 may be used in place of Figure 4C-3 to satisfy the criteria in the second category of the Standard.

### **Section 4C.08 Warrant 7, Crash Experience**

Support:

The Crash Experience signal warrant conditions are intended for application where the severity and frequency of crashes are the principal reasons to consider installing a traffic control signal.

Standard:

The need for a traffic control signal shall be considered if an engineering study finds that all of the following criteria are met:

- A. Adequate trial of alternatives with satisfactory observance and enforcement has failed to reduce the crash frequency; and**
- B. Five or more reported crashes, of types susceptible to correction by a traffic control signal, have occurred within a 12-month period, each crash involving personal injury or property damage apparently exceeding the applicable requirements for a reportable crash; and**
- C. For each of any 8 hours of an average day, the vehicles per hour (vph) given in both of the 80 percent columns of Condition A in Table 4C-1 (see Section 4C.02), or the vph in both of the 80 percent columns of Condition B in Table 4C-1 exists on the major-street and the higher-volume minor-street approach, respectively, to the intersection, or the volume of pedestrian traffic is not less than 80 percent of the requirements specified in the Pedestrian Volume warrant. These major-street and minor-street volumes shall be for the same 8 hours. On the minor street, the higher volume shall not be required to be on the same approach during each of the 8 hours.**

Option:

If the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 40 mph, or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, the traffic volumes in the 56 percent columns in Table 4C-1 may be used in place of the 80 percent columns.

- a. Basic minimum hourly volume.
- b. Used for combination of Conditions A and B after adequate trial of other remedial measures.
- c. May be used when the major-street speed exceeds 64 km/h or exceeds 40 mph or in an isolated community with a population of less than 10,000.
- d. May be used for combination of Conditions A and B after adequate trial of other remedial measures when the major-street speed exceeds 64 km/h or exceeds 40 mph or in an isolated community with a population of less than 10,000.

(1) 45 students now staying in dorms on CIA campus, assume 70% of these students have cars. Also project that 85% of students living off-site, and not at Vineyard Lodge housing, drive to/from campus on a 70/30 split AM/PM.

(2) 42 @ 1.5 per car.

(3) 70 patrons @ 2.0 per car

(4) “With Project” reductions 4:00 – 5:00 PM: 10 inbound, 25 outbound

# CRANE TRANSPORTATION GROUP CULINARY INSTITUTE OF AMERICA MASTER PLAN TRAFFIC AND PARKING EVALUATION VINEYARD LODGE HOUSING ON PRATT AVENUE

## I. INTRODUCTION

This report has been prepared to address the changes to traffic and parking resulting from the proposed remodel and expansion of the Vineyard Lodge housing on Pratt Avenue in St. Helena. The housing is occupied exclusively by CIA-Greystone students. Resident students are not allowed to park at Greystone; they must utilize the existing CIA shuttle service, bike or walk to and from the Lodge and the Greystone facility. As part of its Master Plan, the CIA will utilize a larger bus than it uses today (32 seats) as well as its two other shuttles currently in use (22 & 14 seats, respectively,) to transport students between Vineyard Lodge and Greystone, thereby maintaining the same number of daily, all-day shuttle trips that occur today (i.e., pick-ups/drop-offs every 15 minutes). The CIA would make rental cars available to students for transport needs not otherwise served by shuttles. The Master Plan would move much of the restaurant service and several other functions to the former Copia site in Napa where a new CIA facility is in the planning stages. The new CIA-Copia facility will allow larger conferences and public events that create the greatest traffic and parking demand at Greystone to be relocated. The Master Plan includes expanding and improving classroom space at Greystone to accommodate 100 additional students; all will be housed at the Vineyard Lodge.

The Vineyard Lodge remodel and expansion will consist of the following:

- Demolition of the 15,862 square feet of the existing Vineyard Lodge 1 dormitory (former Marlinda facility). It will be replaced by the construction of three new lodges.
- The three lodges will contain 164 new beds primarily in single rooms, with a few double units. Combined with the 60 beds in the existing Vineyard Lodge 2, there will be a maximum occupancy of 224 residents on-site. The on-site parking will total 72 spaces.

Traffic counts were conducted by Crane Transportation Group at the Vineyard Lodge driveway on Thursday, May 12, 2016, concurrent with Vineyard Lodge parking lot counts. Counts were also underway on the same day at the nearest major intersection, Pratt Avenue/S.R. 29.

The following analysis focuses on weekday traffic at the Pratt Avenue/S.R. 29 intersection and parking demand at Vineyard Lodge.

2016 volumes have been seasonally adjusted consistent with Caltrans' PeMS (Performance Measurement System) peak season data for S.R. 29 to represent peak season conditions. The proposed CIA Master Plan is projected for completion and full operation in year 2018. For the Vineyard Lodge site, the plan includes:

- expansion of the Lodge from 101 beds to 224 beds, with 72 parking spaces.
- limit parking permits to 31% of Vineyard Lodge residents (69 permits), with the remaining three spaces to be utilized for "shared" rental cars. Creation of one-way circulation via a new driveway

- with a one-way entrance and one-way exit onto Pratt Avenue.
- relocation of many existing activities from Greystone to the former Copia site in the City of Napa to make room for expanded and improved classroom space at Greystone, and expand the public accessibility of the CIA presence in the Napa Valley, through development of the former Copia site.
- Continued CIA-provision of “shared” rental cars for students when needed.

Initially, the expected growth in existing (non-project) traffic along S.R.29 was projected in order to develop year 2018 peak season traffic conditions. Year 2035 volumes were taken from the modeling output from the ongoing St. Helena General Plan update. Trip generation and distribution projections were then developed for the very slight increase in traffic traveling to and from the Vineyard Lodge site, along with an overall decrease in traffic to and from the Greystone site due to the move to Napa of many of the CIA-Greystone functions.

## II. SUMMARY OF FINDINGS

1. The CIA Vineyard Lodge Master Plan is a part of a larger Master Plan to relocate CIA facilities at Greystone in St. Helena, to a new facility at the former Copia site in Napa, then improve classroom space at Greystone to serve an additional 100 students. It proposes to add housing for an additional 123 students at its Vineyard Lodge site. Between existing housing at Greystone and the new housing at Vineyard Lodge, the CIA will have housing for 271 of its total 300 students. Students residing at Vineyard Lodge will continue to use daily shuttles to go to and from the Vineyard Lodge housing and the Greystone campus, and other transportation support will be provided for students as needed. Parking permits will strictly limit the total number of student vehicles at Vineyard Lodge.
2. Existing “Without Project” Conditions: During the existing peak traffic hour on a summer/fall 2016 weekday, with 2016 (without project) volumes, the Pratt Avenue/S.R. 29-128 (Main Street) intersection would experience AM peak hour LOS D operation, with 30.3 seconds average delay for turns from westbound Pratt Avenue and PM peak hour LOS E operation, with 39.3 seconds average delay for turns from westbound Pratt Avenue.
3. Year 2018 “Without Project” Conditions: During the peak traffic hour on a summer/fall 2018 weekday, with 2018 (without project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 (Main Street) intersection would experience AM peak hour LOS E operation, with about 35.9 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with 64.0 seconds average delay for turns from westbound Pratt Avenue. PM peak hour would experience LOS E operation, with 36.4 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with 93.4 seconds average delay for turns from westbound Pratt Avenue.
4. Year 2035 “Without Project” Conditions: During the peak traffic hour on a summer/fall 2035 weekday, with 2035 (without project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 (Main Street) intersection would experience AM peak hour LOS F

operation, with 87.1 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with extreme delay (over 120 seconds average delay) for turns from westbound Pratt Avenue. PM peak hour would experience LOS F operation, with about 92.1 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with extreme delay (over 120 seconds average delay) for turns from westbound Pratt Avenue.

5. Volumes at the Pratt Avenue/ SR 29-128 intersection would not meet the 8-hour urban warrant, or urban peak hour warrant #3 criteria for signalization during either of the weekday peak traffic hours for 2018 or 2035 without Master Plan conditions, however, by 2035, volumes approach meeting both signal warrants #1 and #3 criteria. Please see the warrant tables and charts in the **Appendix. Table 3** provides results for signalized operation, with LOS A, B or C for all conditions. Warrant, #7, the signal warrant pertaining to accident data, is not met for the five years of reported crash data at the intersection. A roundabout is not considered feasible at this intersection due to space constraints, as detailed in a memorandum prepared by Summit Engineering (10/21/16) showing the layout of a 150-foot roundabout diameter overlay of the intersection. The memorandum is included in the appendix to this study.
6. The civil engineer for the Las Alcobas Hotel, Riechers Spence Associates, prepared a design<sup>1</sup> for the Pratt Avenue/ Las Alcobas Hotel Driveway/SR 29-128 intersection northbound left turn lane with a length of 150 feet. This length would be more than adequate to accommodate the projected maximum storage demand.
7. Existing “With Project” Conditions: The Pratt Avenue/S.R. 29-128 intersection would experience AM peak hour LOS D operation, with 30.5 seconds average delay for westbound Pratt Avenue (an increase in average delay of 0.2 second), and LOS E operation, with 39.6 seconds average delay during the PM peak hour for turns on the westbound Pratt Avenue approach (an increase in average delay of 0.3 second). The project increment of 4 outbound trips from Vineyard Lodge would add about 6 percent additional traffic to the westbound intersection approach during the existing AM and PM peak hours, adding to the existing lengthy delays.
8. Year 2018 “With Project” Conditions: During the peak traffic hour on a summer/fall weekday morning and afternoon, with 2018 (with Master Plan, i.e., “with project”) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience AM peak hour LOS E operation, with 35.1 seconds average delay for westbound Pratt Avenue (a decrease in average delay of 0.8 second), and LOS F operation, with 64.9 seconds average delay during the PM peak hour for turns on the Las Alcobas Hotel Driveway approach (an increase in average delay of 0.9 second). The intersection would experience PM peak hour LOS E operation with 35.4 seconds average average delay (an increase in average delay of 1 second). Westbound Pratt Avenue turns would experience extreme delays (LOS F) without the Master Plan project during the AM and PM peak hours; the project increment of 4 trips would add to the existing lengthy delays; it would add 5.5 percent additional traffic to the westbound intersection approach during the AM and PM peak hours. .

---

<sup>1</sup> January 6, 2015.

9. Year 2035 “With Project” Conditions: With 2035 (with Master Plan) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience AM peak hour LOS F operation, with 83.6 seconds average delay for turns from the Las Alcobas Hotel Driveway approach (a decrease in average delay of 3.5 seconds), and PM peak hour LOS F operation, with 88.3 seconds average delay for turns from the Las Alcobas Hotel Driveway approach (a decrease in average delay of 3.8 seconds). Westbound Pratt Avenue turns would experience extreme delays (LOS F with over 120 second delays) without the Master Plan project during the AM and PM peak hours; the project increment of 4 trips would add to the existing extreme delays, and would add 5 percent additional traffic to the westbound intersection approach during the AM and PM peak hours.
10. Volumes at the Pratt Avenue/ SR 29-128 intersection would not meet the 8-hour urban warrant, or urban peak hour warrant #3 criteria for signalization during either of the weekday peak traffic hours for 2018 or 2035 with Master Plan conditions. However, as with 2035 without Master Plan conditions, volumes approach meeting both signal warrants #1 and #3. Please see the warrant tables and charts in the **Appendix. Table 3** provides results for signalized operation, with LOS A, B or C for all conditions. Warrant, #7, the accident warrant, is not met for the five years of reported crash data at the intersection. A roundabout is not considered feasible at this intersection due to space constraints, as detailed in a memorandum prepared by Summit Engineering (10/21/16) showing the layout of a 150-foot roundabout diameter overlay of the intersection. The memorandum is included in the appendix to this study.
11. Sight lines would be acceptable for drivers turning from the project driveway to Pratt Avenue, based upon the criteria provided in the Caltrans March 2014 *Highway Design Manual*. Sight lines to the east and west would extend over 500 feet. Based upon travel speeds of 30 miles per hour at the site for vehicles traveling east and west on Pratt Avenue, the required stopping sight distance would be 200 feet. At higher speeds, such as 45 or 50 miles per hour, the required stopping sight distance would be up to 430 feet (for a 50 mph speed). Therefore, sight lines would be acceptable assuming that no landscaping is planted along the site frontage that would ultimately grow and block driver views.
12. City parking code for dormitory facilities is two spaces for the “resident owner” and one space for each guest room (interpreted here as “each bed”). This would result in a requirement of 226 parking spaces, or 154 spaces more than planned for the new facility. The proposal of 72 parking spaces for a 224-bed dormitory would result in a ratio of 0.32 spaces per bed, more equivalent to a ratio used for senior assisted living housing than for student dorms. However, the CIA-operated facility functions very much like an assisted living facility, as almost all transport is controlled by the facility management on an all-day basis. Unlike assisted living facilities, rules are enforced for residents strictly limiting vehicle parking permits, and providing shared cars plus rental car options by the facility management (CIA). The CIA has a record of effective management of this lodging facility extending for over twelve years, thus, the 72-space parking total will be enforced

to ensure that student parking space demand does not exceed available supply. Parking enforcement will be required (parking permits will need to be displayed and monitored whenever the Lodge is at or near capacity). At maximum occupancy the facility will have no capacity for visitor parking.

13. The project would not result in significant impacts to traffic and transportation as evaluated per the City's significance criteria (listed in Section IV.D). The project would not have significant impacts as defined by the City of St. Helena's transportation impact criteria. Due to the project's reduction of through traffic on SR 29-128 (Main Street) and minor increase of traffic on the Pratt Avenue westbound approach to Main Street, "with project" conditions result in a reduced overall traffic volume at the Pratt Avenue/S.R. 29-128 intersection. Project volumes would not result in a "letter" change in intersection Level of Service operation, and would result in minor increased delay due to 4 additional westbound trips, 3 of which would be added to westbound Pratt Avenue left turns during the AM and PM peak hours – adding to the existing extreme delays on the westbound Pratt Avenue approach. Project traffic would not result in signal warrant #1 or #3 being met.

### III. PROPOSED PROJECT

The Culinary Institute of America at Greystone (the "CIA") currently has an enrollment of close to 200 students at its 2555 Main Street property. The CIA currently has housing for 47 students in dormitories on its Main Street site and 101 students on its Vineyard Lodge property at 830 Pratt Avenue. The CIA recently purchased the American Center for Wine Food & the Arts ("Copia") in the City of Napa. The acquisition of Copia will allow the CIA to reduce activities at its Greystone campus by relocating employees, programs, and event activities to Copia. As a result, the CIA proposes a new master plan for its Greystone campus in which it will renovate portions of the Greystone interior to provide additional and more efficient educational facilities. As part of the Master Plan the CIA proposes expanding student enrollment by 100 students to 300. At the same time it proposes to add housing for an additional 123 students at its Vineyard Lodge site. Between existing housing at Greystone and the new housing at Vineyard Lodge, the CIA will have housing for 271 of its 300 students. Students residing at Vineyard Lodge will continue to use daily shuttles to go to and from the Vineyard Lodge housing and the Greystone campus.

The proposed CIA Master Plan is projected for completion and full operation in year 2018. The plan includes:

- expansion of the Associate in Occupational Studies in Culinary Arts (AOS) degree program from 200 to 300 students
- expansion of Vineyard Lodge from 101 beds to 224 beds, with 72 parking spaces.
- limit parking permits to 31% of Vineyard Lodge residents (69 permits).
- creation of one-way circulation via a new driveway with a one-way entrance and one-way exit onto Pratt Avenue.
- relocation of many existing activities from Greystone to the former Copia site in the City of Napa to make room for expanded and improved classroom space at Greystone, and expand the public accessibility of the CIA presence in the Napa Valley, through development of the former Copia site.

- continued CIA-provision of "shared" rental cars for students when needed.
- relocation of existing weekday activities from Greystone to the former Copia site in the City of Napa, specifically:
  - 5 of the existing 10 administrative staff will move
  - 14 (all) participants in the Strategic Initiatives Group program will move
  - 1 of the existing 6 purchasing staff will move
  - 26 of the existing 42 Continuing Ed and Food Enthusiast Program students will move
  - Shift # 2 restaurant staff (10 staff) will all move, and restaurant patrons served will be half of existing levels, all served by students on site. The Wine Spectator at Greystone Restaurant (WSGR) is currently operated as a 190 seat restaurant open 362 days per year with lunch and dinner service. The CIA has also operated a teaching kitchen for a number of years in the Flavor Discovery Center (FDC) that allowed students in the Farm to Table component of their educational program to have educational experiences from growing and harvesting the food, to preparing and serving the food in an educational setting with 58 seats. In conjunction with the use permit amendments contemplated under this Master Plan, the WSGR will be eliminated. The program in the FDC will then become the CIA's remaining restaurant (aside from the Café) and will continue to be student-run but will serve meals only five days a week for 36 weeks (180 days) per year.
  - Tourist activity will decrease due to the elimination of the 190-seat WSGR and relocation of many of the enthusiast programs to Copia.

## IV. EXISTING CONDITIONS (WITHOUT PROJECT)

### A. SITE DESCRIPTION, ROADWAYS, SIDEWALKS, BIKEWAYS AND PUBLIC TRANSIT

Vineyard Lodge is located along the west side of the two-lane Pratt Avenue in the northern part of the City of St. Helena (see **Figure 1**). The Vineyard Lodge driveway connection is provided along Pratt Avenue (see **Figure 2**). The driveway has single entry and exit lanes, but both lanes are wide enough to provide two-way (inbound and outbound) traffic flow. There are no directional markings on the Vineyard Lodge driveway connections to Pratt Avenue.

**State Route 29-128 (SR 29)** is a two-lane north-south highway in the City of St. Helena. At the Pratt Avenue tee intersection the roadway is 48 feet wide curb to curb. A 75-foot-long left turn lane is provided on the southbound SR 29 approach to Pratt Avenue. Curb, gutter and sidewalk line both sides of the highway at Pratt Avenue. North of Pratt Avenue there is a tree-lined, unsurfaced pedestrian path along the west side of the highway and an unsurfaced bicycle-pedestrian path along the east side of the highway.

**Pratt Avenue** is a two-lane collector roadway connecting SR 29 with Silverado Trail. It is about 40 feet wide in the vicinity of SR 29. Pratt Avenue is stop sign controlled on its approach to SR 29 and the westbound approach lane is 20 feet wide, allowing left and right turning vehicles to separate. Fronting Vineyard Lodge, the Pratt Avenue travel lanes are about 25.5 feet wide, and along the north side (the Vineyard Lodge frontage), there is a 13-foot wide, 160+-foot long parking bay. Sidewalks are in place fronting the project site, but sidewalks are discontinuous along the north and south sides Pratt Avenue.

**Figure 3** shows existing lane geometries and intersection control.

### ***Bicycle and Multi-Use Path Facilities***

St. Helena's existing and proposed bicycle network is defined in the *St. Helena Bicycle Plan*, which is tied into, and consistent with, the *Napa Countywide Bicycle Plan*. As stated in the Plan, the network includes Class I paths, Class II bicycle lanes, and Class III bike routes in order to maximize connectivity throughout the community and to destinations beyond St. Helena.

Bicycle Facilities relevant to the project area are defined below, consistent with the *St. Helena Bicycle Plan (January 2012)*.

#### **Class I - Multi-Use Path**

Class I bicycle facilities, known as bike paths, are multi-use facilities that provide a completely separated right-of-way for the exclusive use of bicycles and pedestrians with cross flows of motorized traffic minimized.

#### **Class II Bike Lane**

Class II facilities, known as bike lanes, provide a striped and signed lane for one-way bicycle travel on a street or highway. The minimum width for bike lanes ranges between four and five feet depending upon the edge of roadway conditions (curbs). Bike lanes are demarcated by a six-inch white stripe, signage and pavement legends.

#### **Class III Bike Route**

Class III facilities, known as bike routes, provide signs for shared use with motor vehicles within the same travel lane on a street or highway. Bike routes may be enhanced with warning or guide signs and shared lanes marked with pavement stencils. While Class III routes do not provide measures of separation, they have an important function in providing continuity to the bikeway network.

Figure 1 of the St. Helena Bike Plan shows the following for study roadways:

State Route 29 (Main Street) northbound from Pratt Avenue, is proposed as a link in the planned countywide Vine Trail Alignment, with a Class I Multi-Use Bike Path northbound, extending past the CIA-Greystone facility, north as far as Calistoga. Just east of S.R. 29 (Main Street) on Pratt Avenue, the Vine Trail Alignment loops north to connect to a proposed York Creek Class I Multi-Use Bike Path, then rejoins S.R. 29 just north of Pratt Avenue. State Route 29 (Main Street) southbound is an existing Primary Class II Bike Route and is proposed to have a Class II Bike Lane.

Eastbound Pratt Avenue between State Route 29 (Main Street) and the railroad tracks is proposed to have a Class II Bike Lane; through this segment, westbound Pratt Avenue is proposed to have a Class I Multi-Use Bike Path and is a link in the planned Countywide Vine Trail Alignment. Eastbound Pratt Avenue between the railroad tracks and Silverado Trail, which includes the portion of Pratt Avenue fronting the Vineyard Lodge site, is proposed to have a Class III Bike Route. These facilities would connect with matching improvements on State Route

20 (Main Street) north of Pratt Avenue, and on Silverado Trail north and south of Pratt Avenue.

### ***Public Transit***

The *VINE* is the region's bus system for the County of Napa. Two routes pass through St. Helena along S.R. 29: routes 10 and 29. Route 10 provides service from Calistoga to Napa, including stops in St. Helena, Rutherford and Oakville, running seven days a week, all day and including weekends. Route 29, the Vine Express, is a commuter bus operating from early morning through late afternoon, Monday through Friday. The Vine Express extends from Calistoga to the Vallejo Ferry Terminal and El Cerrito BART. Service hours are Monday through Friday, 5:20 am to 9:10 pm, Saturday 6:00 am to 8:10 pm, and Sundays 8:30 am to 7:00 pm.

The bus stops nearest the project site are two Route 10 northbound stops located at the Pratt Avenue/SR 29 (Main Street) intersection and opposite CIA Greystone, on the east side of the highway.

The *St. Helena Shuttle* is an on-demand shuttle service available for a fee of \$1.00 per trip. Service is available Monday through Friday 7:00 am to 9:00 PM, Friday and Saturday 7:00 am to 11:00 pm, and Sunday (May through November) 11:00am to 9:00 pm.

*VINE Go* is an origin to destination, shared ride service which provides demand response for persons with disabilities in the cities of Calistoga, St. Helena, Napa, American Canyon, the Town of Yountville and the unincorporated areas of Napa County. VINE Go is the ADA paratransit service complementary to the fixed route operators and runs at times corresponding to the fixed routes.

## **B. OPERATION OF THE PRATT AVENUE/S.R. 29-128 (MAIN STREET) INTERSECTION**

### **1. Volumes**

Traffic counts were conducted by Crane Transportation Group at the Pratt Avenue/S.R. 29-128 intersection on Thursday, May 12, from 7:00 AM to 6:00 PM. The peak hours of total traffic passing through the intersection was determined to be 7:45 to 8:45 AM and 4:00 to 5:00 PM on Thursday. Students residing at Vineyard Lodge do not attend classes on weekends, thus this analysis focuses on weekday activities.

In order to determine traffic conditions during the peak summer/fall tourist season and a time of peak activity at CIA, the May counts were adjusted based upon Caltrans' seasonal traffic count information (PeMS data) for Highway 29 in St. Helena. Resultant peak season Thursday peak hour volumes are presented in **Figure 4**.

### **2. Analysis Methodology**

Transportation engineers and planners commonly use a grading system called level of service (LOS) to measure and describe the operational status of the local roadway network. LOS is a

description of the quality of a roadway facility's operation, ranging from LOS A (indicating free-flow traffic conditions with little or no delay) to LOS F (representing oversaturated conditions where traffic flows exceed design capacity, resulting in long queues and delays). Intersections, rather than roadway segments between intersections, are almost always the capacity controlling locations for any circulation system.

**Signalized Intersections.** For signalized intersections, the 2010 *Highway Capacity Manual* (Transportation Research Board, National Research Council) methodology was utilized. With this methodology, operations are defined by the level of service and average control delay per vehicle (measured in seconds) for the entire intersection. For a signalized intersection, control delay is the portion of the total delay attributed to traffic signal operation. This includes delay associated with deceleration, acceleration, stopping, and moving up in the queue. **Table 1** summarizes the relationship between delay and LOS for signalized intersections.

**Unsignalized Intersections.** For unsignalized (all-way stop-controlled and side-street stop-controlled) intersections, the 2010 *Highway Capacity Manual* (Transportation Research Board, National Research Council) methodology for unsignalized intersections was utilized. For side-street stop-controlled intersections, operations are defined by the level of service and average control delay per vehicle (measured in seconds), with delay reported for the stop sign controlled approaches or turn movements, although overall delay is also typically reported for intersections along state highways. For all-way stop-controlled intersections, operations are defined by the average control delay for the entire intersection (measured in seconds per vehicle). The delay at an unsignalized intersection incorporates delay associated with deceleration, acceleration, stopping, and moving up in the queue. **Table 2** summarizes the relationship between delay and LOS for unsignalized intersections.

### 3. Existing Peak Season Operation

**Table 3** shows that during the peak traffic hour on a summer/fall 2016 weekday, with 2016 (without Master Plan project) volumes, the Pratt Avenue/S.R. 29-128 intersection would experience AM peak hour LOS D operation, with 30.3 seconds average delay for westbound Pratt Avenue turns, and PM peak hour LOS E operation with 39.3 seconds average delay for westbound Pratt Avenue turns.

## C. SIGNAL WARRANT EVALUATION – PRATT AVENUE/S.R. 29-128 (MAIN STREET)

### 1. Analysis Methodology

Traffic signals are used to provide an orderly flow of traffic through an intersection. Many times they are needed to offer side street traffic an opportunity to access a major road where high volumes and/or high vehicle speeds block crossing or turn movements. They do not, however, increase the capacity of an intersection (i.e., increase the overall intersection's ability to accommodate additional vehicles) and, in fact, often slightly reduce the number of total vehicles that can pass through an intersection in a given period of time. Signals can also cause an increase in traffic accidents if installed at inappropriate locations.

There are 9 possible tests for determining whether a traffic signal should be considered for installation. These tests, called "warrants", consider criteria such as actual traffic volume, pedestrian volume, presence of school children, and accident history. The intersection volume data together with the available collision histories were compared to warrants contained in the *Manual on Uniform Traffic Control Devices* (MUTCD), Federal Highway Administration, 2014, California Supplement, which has been adopted by the State of California as a replacement for *Caltrans Traffic Manual*. Section 4C of the MUTCD provides guidelines, or warrants, which may indicate need for a traffic signal at an unsignalized intersection. As indicated in the MUTCD, satisfaction of one or more warrants does not necessarily require immediate installation of a traffic signal. It is merely an indication that the local jurisdiction should begin monitoring conditions at that location and that a signal may ultimately be required.

In this report, at the request of the City traffic engineer, Warrant 3, the peak hour volume warrant, has been applied to volumes at the SR 29-128/Pratt Avenue intersection. This warrant is often used as an initial check of signalization needs since peak hour volume data is typically available and this warrant is usually the first one to be met. Warrant 3 is based on a curve and takes only the hour with the highest volume of the day into account. In addition, Warrant #1, the test for the highest eight hour volumes is also included, and the accident warrant (Warrant #7) has been evaluated at the SR 29-128/Pratt Avenue intersection based upon accident data provided by the City of St Helena through the SWITRS (Statewide Integrated Traffic Records System) data base. The feasibility of a roundabout at this location is constrained by existing structures: a residence on the east, a new hotel access driveway (including a historic wall) on the west, as well as right-of-way limitations. A roundabout is not considered feasible at this intersection due to space constraints.

## 2. Existing Conditions

Tables 4a and 4b show that volumes at the Pratt Avenue/ SR 29-128 intersection would not meet urban warrant #1 (the warrant for the 8 highest volume hours) or urban peak hour warrant #3 criteria for signalization during either of the weekday peak traffic hours (AM or PM) for existing conditions. Please see the tables and warrant charts in the **Appendix**.

Warrant #7, the Crash Experience signal warrant conditions are intended for application where the severity and frequency of crashes are the principal reasons to consider installing a traffic control signal.

California MUTCD, Chapter 4C specifies that the need for a traffic control signal shall be considered if an engineering study finds that *all* of the following criteria are met:

- a. Adequate trial of alternatives with satisfactory observance and enforcement has failed to reduce the crash frequency; and
- b. Five or more reported crashes, of types susceptible to correction by a traffic control signal, have occurred within a 12-month period, each crash involving personal injury or property damage apparently exceeding the applicable requirements for a reportable crash; and

- c. For each of any 8 hours of an average day, the vehicles per hour (vph) given in both of the 80 percent columns of Condition A in Table 4C-1 (see Section 4C.02), or the vph in both of the 80 percent columns of Condition B in Table 4C-1 exists on the major-street and the higher-volume minor-street approach, respectively, to the intersection, or the volume of pedestrian traffic is not less than 80 percent of the requirements specified in the Pedestrian Volume warrant. These major-street and minor-street volumes shall be for the same 8 hours. On the minor street, the higher volume shall not be required to be on the same approach during each of the 8 hours.

Accident data provided by the City of St. Helena from SWITRS (Statewide Integrated Traffic Reporting System) revealed that over the past five years, there have not been five or more reported crashes at this intersection within any 12-month period. At most, there were 4 crashes between 10/21/11 and 10/24/12. There were three reported crashes in 2011, one in 2012, two in 2013 and 2014, and one in 2015. The appendix includes the accident data provided by the City.

#### **D. CITY OF ST. HELENA GENERAL PLAN (1993) SIGNIFICANCE CRITERIA USED IN TRAFFIC IMPACT EVALUATIONS**

The City of St. Helena's adopted transportation impact criteria (1993 General Plan) are as follows:

- a. All signalized intersections in St. Helena should maintain LOS C except along Main Street, where LOS D is permitted. Exceptions to this policy are that lower service levels shall be permitted at any location where the existing LOS does not meet this standard and in which case the LOS cannot be worsened any further.
- b. All signalized intersections must maintain LOS C. If the LOS degrades below LOS C, an evaluation of the need for traffic signalization shall be undertaken according to standard Caltrans signal warrants as described below. If signals are not initially warranted, the location shall continue to be monitored for signal warrants on a regular basis.

### **V. FUTURE YEAR 2018 and YEAR 2035 (WITHOUT PROJECT) CONDITIONS**

#### **A. ANALYSIS HORIZON YEARS FOR WITHOUT PROJECT OPERATING CONDITIONS**

##### **1. Overview**

CIA management projects that the proposed Master Plan could be fully completed by 2018, and General Plan projections extend to year 2035. Therefore, these horizon years have been used for evaluation.

## 2. Year 2018 and Year 2035 Base Case (Without Master Plan) Traffic Volumes

Year 2018 weekday AM and PM peak hour (without project) volumes have been developed using traffic growth projections developed for S.R.29-128 in St. Helena as part of the General Plan traffic model. Projections contained in the model show an approximate 2.25 percent per year growth rate for S.R.29-128 traffic between 2015 and 2035. These rates have been applied to the year 2016 summer/fall AM and PM peak hour volumes to achieve 2018 projections at the study intersections (see **Figure 5**); in addition, volumes from the Las Alcobas Hotel Driveway opposite Pratt Avenue, have been added.<sup>2</sup> Year 2035 weekday AM and PM peak hour volumes are derived directly from the General Plan projections at the Pratt Avenue/S.R. 29-128 intersection, with intersection geometrics and volumes at the CIA driveway factored to be consistent with the General Plan projections (see **Figures 6 and 7**).

## 3. Year 2018 Peak Season Base Case (Without Master Plan Project) Intersection Operation

**Table 3** shows that during the peak traffic hour on a summer/fall 2018 weekday, with 2018 (without project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 (Main Street) intersection would experience AM peak hour LOS E operation, with about 35.9 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with 64.0 seconds average delay for turns from westbound Pratt Avenue. PM peak hour would experience LOS E operation, with 36.4 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with 93.4 seconds average delay for turns from westbound Pratt Avenue.

## 4. Year 2035 Peak Season Base Case (Without Master Plan Project) Intersection Operation

**Table 3** shows that during the peak traffic hour on a summer/fall 2035 weekday, with 2035 (without project) volumes, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 (Main Street) intersection would experience AM peak hour LOS F operation, with 87.1 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with extreme delay (over 120 seconds average delay) for turns from westbound Pratt Avenue. PM peak hour would experience LOS F operation, with about 92.1 seconds average delay for turns from the eastbound Las Alcobas Hotel Driveway, and LOS F operation, with extreme delay (over 120 seconds average delay) for turns from westbound Pratt Avenue.

---

<sup>2</sup> The Las Alcobas Hotel will have 68 rooms, a spa for guests only, a 40-seat quality restaurant and one special event per month. Source: *Traffic Impact Report for Las Alcobas Hotel, St Helena, CA* May 29, 2015, prepared for Caltrans District 4 by Crane Transportation Group.

## **B. SIGNAL WARRANT EVALUATION**

### **1. Year 2018 and Year 2035 Without Project Conditions**

Volumes at the Pratt Avenue/ SR 29-128 intersection would not meet warrant #1 criteria (the eight-hour signal warrant) or urban peak hour warrant #3 criteria for signalization during either of the weekday peak traffic hours for 2018 or 2035 without Master Plan conditions. However, by 2035, volumes approach meeting both signal warrant (warrant #1 and #3) criteria. Please see the tables and warrant charts in the **Appendix. Table 3** provides results for signalized operation, with LOS A, B or C for all conditions. The feasibility of a roundabout at this location is constrained by existing structures: a residence on the east, a new hotel access driveway and historic wall on the west, as well as right-of-way limitations. A roundabout is not considered feasible at this intersection due to extreme space constraints, as detailed in a memorandum prepared by Summit Engineering (10/21/16) showing the layout of a 150-foot roundabout diameter overlay of the intersection. The memorandum is included in the appendix to this study.

## **C. PROPOSED LEFT TURN LANE DESIGN**

The civil engineer for the Las Alcobas Hotel, Riechers Spence Associates, prepared a design<sup>3</sup> for the proposed northbound left turn lane with a length of 150 feet. This length would be more than adequate to accommodate the projected maximum storage demand.

# **VI. CULINARY INSTITUTE OF AMERICA VINEYARD LODGE MASTER PLAN TRAFFIC AND PARKING IMPACTS**

## **A. PROPOSED PROJECT**

The CIA Master Plan would result in the following development or activity that would result in changes to trip generation and parking demand in the Master Plan area.

- New Students at Greystone: 100
- All 100 additional students would be living at the Vineyard Lodge housing on Pratt Avenue in St. Helena and attending weekday classes at the Greystone facility. These students will be shuttled to and from the CIA Greystone campus on weekdays, as they would not be allowed to use a personal vehicle to access classes, consistent with the current practice. Alternatively, some students may walk or bike. Shuttle bus service is currently provided every 15 minutes from early morning (5:30 AM) to end of the student day (9:30 PM).
- For parking analysis purposes, the existing ratio of 31% parking permits issued at Vineyard Lodge will be maintained (i.e.,  $224 \text{ beds} / 0.31 = 69 \text{ total parking}$ )

---

<sup>3</sup> January 6, 2015.

permits). All students, including those with a permit, will be required to use shuttles to and from daily classes.

## **B. PROJECT TRIP GENERATION**

This study is based upon CIA management-approved projections regarding the planned relocation of programs and staff from the Greystone campus to the new facility in Napa, and the intention to maximize use of CIA-managed housing for students. The CIA can provide housing at lower cost than students can find off-site, outside of CIA facilities. The CIA provides all needed transportation for its students, including rental cars, when needed. All 100 new students will be housed at the expanded Vineyard Lodge, and the additional beds at Vineyard Lodge will also allow additional students to live in CIA housing rather than competing for lodging in St. Helena and other communities. The CIA will maintain its current all-day schedule of shuttle pick-ups/drop-offs, every 15 minutes. By increasing the size of its shuttles, it can maintain the same number of trips to and from Greystone that occur today. These projections have been utilized to determine the net increase or decrease in Thursday AM and PM peak hour traffic due to the proposed Master Plan. As shown in **Figure 8**, the CIA Master Plan project would result in reduced trips to and from the S.R. 29 corridor and the Greystone facility (see the Greystone Trip Generation in the appendix tables showing a decrease of 21 inbound and 3 outbound during the AM peak hour, and 10 inbound and 25 outbound during the PM peak hour) as well as minor trip increases to and from the Vineyard Lodge housing (i.e., 3 inbound and 5 outbound during the AM peak hour, and 7 inbound and 5 outbound during the PM peak hour. On a summer/fall Thursday during the AM and PM peak traffic hours along S.R.29, the Master Plan would be expected to decrease traffic on S.R. 29-128 by 15 two-way trips (AM) and 21 two-way trips (PM) to and from the campus at Greystone. There would be a small component of trips added to Pratt Avenue from the Vineyard Lodge (3 inbound trips and 5 outbound AM peak hour trips and 7 inbound and 5 outbound PM peak hour trips) attributable to students with parking permits traveling to and from downtown St. Helena and the surrounding area.

**CULINARY INSTITUTE OF AMERICA MASTER PLAN  
NET NEW TRIPS SUBTRACTED FROM STATE ROUTE 29 BETWEEN PRATT  
AVENUE AND THE CIA'S GREYSTONE DRIVEWAY**

**WEEKDAY (7:45-8:45 AM)**

|                                                  | <b>NB</b>  | <b>SB</b> |
|--------------------------------------------------|------------|-----------|
| Shuttle Bus To/From Vineyard Lodge Dorms         | 0          | 0         |
| Change due to programs being moved to Napa Copia | - 13       | -2        |
| <b>TOTAL NET NEW TRIPS</b>                       | <b>-13</b> | <b>-2</b> |

**WEEKDAY (4:00-5:00 PM)**

|                                                                                                    | <b>NB</b> | <b>SB</b>  |
|----------------------------------------------------------------------------------------------------|-----------|------------|
| Shuttle Bus To/From Vineyard Lodge Dorms                                                           | 0         | 0          |
| Change due to programs being moved to Napa Copia                                                   | - 6       | -15        |
| <b>TOTAL NET NEW TRIPS on SR 29 (Main Street) between Pratt Avenue and the Greystone driveway.</b> | <b>-6</b> | <b>-15</b> |

\*See appendix tables for reduction in trips due to specific activities at the Greystone facility.

As shown in the Greystone Trip Generation table (see the appendix tables), the 15-trip decrease in Master Plan-related trips during summer/fall Thursday AM peak traffic conditions on SR 29-128 would be primarily related to the reduction in Administrative staff and the SIG program at Greystone; the 21-trip decrease in Master Plan-related trips during summer/fall Thursday PM peak traffic conditions on SR 29-128 would be primarily related to the relocation of the restaurant and staff, decrease in tourist levels, as well as reductions in Administrative staff and the SIG program.

Three pedestrians and two bicyclists were observed walking or biking to and from Vineyard Lodge on the weekday count day during good weather. Most students were observed to board the shuttles entering and exiting the parking lot every 15 minutes from 5:30 AM to 9:30 PM. Due to the frequency of the shuttle service, very little additional pedestrian and bicycle activity would be expected traveling to and from the Greystone facility.

**C. PROJECT IMPACTS TO OPERATION OF THE PRATT AVENUE/ LAS  
ALCOBAS HOTEL DRIVEWAY/S.R. 29-128 (MAIN STREET)  
INTERSECTION**

**Table 3** shows that the Pratt Avenue/S.R. 29-128 intersection would experience AM peak hour LOS D operation, with 30.5 seconds average delay for westbound Pratt Avenue (an increase in average delay of 0.2 second), and LOS E operation, with 39.6 seconds average delay during the PM peak hour for turns on the westbound Pratt Avenue approach (an increase in average delay of

0.3 second). The project increment of 4 outbound trips from Vineyard Lodge would add about 6 percent additional traffic to the westbound intersection approach during the existing AM and PM peak hours, adding to the existing lengthy delays.

With 2018 (with Master Plan project) volumes (see **Figure 9**), during the peak traffic hour on a summer/fall weekday morning and afternoon, the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience AM peak hour LOS E operation, with 35.1 seconds average delay for westbound Pratt Avenue (a decrease in average delay of 0.8 second), and LOS F operation, with 64.9 seconds average delay during the PM peak hour for turns on the Las Alcobas Hotel Driveway approach (an increase in average delay of 0.9 second). The intersection would experience PM peak hour LOS E operation with 35.4 seconds average delay (an increase in delay of 1 second). Westbound Pratt Avenue turns would experience extreme delays (LOS F) without the Master Plan project during the AM and PM peak hours. The project increment of 4 trips would add to the existing lengthy delays; it would add 5.5 percent additional traffic to the westbound intersection approach during the AM and PM peak hours.

With 2035 (with Master Plan) volumes (see **Figure 10**), the Pratt Avenue/Las Alcobas Hotel Driveway/S.R. 29-128 intersection would experience AM peak hour LOS F operation, with 83.6 seconds average delay for turns from the Las Alcobas Hotel Driveway approach (a decrease in average delay of 3.5 seconds), and PM peak hour LOS F operation, with 88.3 seconds average delay for turns from the Las Alcobas Hotel Driveway approach (a decrease in average delay of 3.8 seconds). The westbound Pratt Avenue turns would experience extreme delays (LOS F) without the Master Plan project during the AM and PM peak hours; the project increment of 4 trips would add to the existing extreme delays (LOS F with over 120 second delays), and would add 5 percent additional traffic to the westbound intersection approach during the AM and PM peak hours.

#### **D. SIGNAL WARRANT EVALUATION**

##### **1. Year 2018 and Year 2035 With Master Plan Conditions**

Volumes at the Pratt Avenue/ SR 29-128 intersection would not meet warrant #1 criteria (the hour-hour signal warrant) or urban peak hour warrant #3 criteria for signalization during either of the weekday peak traffic hours for 2018 or 2035 with Master Plan conditions. However, by 2035, volumes approach meeting both signal warrant (warrant #1 and #3) criteria. Please see the warrant charts in the **Appendix**. **Table 3** provides results for signalized operation, with LOS A, B or C for all conditions.

#### **E. SIGHT LINES AT THE VINEYARD LODGE DRIVEWAY**

Sight lines would be acceptable for drivers turning from the project driveway to Pratt Avenue, based upon the criteria provided in the Caltrans March 2014 *Highway Design Manual*. Sight lines to the east and west would extend over 500 feet. Based upon travel speeds of 30 miles per hour at the site for vehicles traveling east and west on Pratt Avenue, the required stopping sight distance would be 200 feet. At higher speeds, such as 45 or 50 miles per hour, the required stopping sight distance would be up to 430 feet (for a 50 mph speed). Therefore, sight lines would be acceptable assuming that no landscaping is planted along the site frontage that would

ultimately grow and block driver views.

## F. VINEYARD LODGE PARKING DEMAND

### 1. Overview

The Vineyard Lodge property currently has 85 parking spaces for its 101 beds. Those spaces are never fully-occupied because most students travel to the Napa Valley without their own vehicle. For example, for its current 96 residents, only 30 parking permits have been issued for on-site parking. The CIA maintains a maximum ratio of beds to parking spaces at 31%. This is possible because it operates daily, on-time shuttles for students and also provides an on-demand car rental operation where students can rent cars on an as-needed basis. This has proven to be highly successful at reducing the need for dedicated parking spaces for the students. Based on the current parking needs, the CIA proposes a total of 72 spaces for the 224 on-site peak occupants. This would allow for the 31% parking maximum (69 spaces) and three spaces for CIA-supplied “shared” rental vehicles, available to students by arrangement.

City parking code for dormitory facilities is two spaces for the “resident owner” and one space for each guest room (interpreted here as “each bed”). This would result in a requirement of 226 parking spaces, or 154 spaces more than planned for the new facility. The proposal of 72 parking spaces for a 224-bed dormitory would result in a ratio of 0.32 spaces per bed, more equivalent to a ratio used for senior assisted living housing than for student dorms. However, the CIA-operated facility functions very much like an assisted living facility, as almost all transport is controlled by the facility management on an all-day basis. Unlike assisted living facilities, rules are enforced for residents strictly limiting vehicle parking permits, and providing shared cars plus rental car options by the facility management (CIA). The CIA has a record of effective management of this lodging facility extending for over twelve years, thus, the 72-space parking total will be enforced to ensure that student parking space demand does not exceed available supply. Parking enforcement will be required (parking permits will need to be displayed and monitored whenever the Lodge is at or near capacity). At maximum occupancy the facility will have no capacity for visitor parking.

### 2. Existing May 2016 Parking Demand

Hourly, on-site parking surveys were conducted by Crane Transportation Group on Thursday, May 12, 2016, considered to be a full-activity “typical” day at the CIA facilities. The weather was clear and mild on both days. **Table 5** shows the record of hourly parking totals. At maximum, there were 42 cars parked in the 85-space parking lot. There were one to three service vehicles parked during the day in the unstriped service parking area to the east of the main building. Parking was not observed to be monitored for permit holders versus visitors. At all surveyed times there were 43 or more available parking spaces in the Vineyard Lodge parking lot.

**Thursday conditions:** There were 96 students in residence, and at maximum, there were 42 cars in the Vineyard Lodge parking lot.

## VII. CONCLUSIONS AND RECOMMENDATIONS

- The project would not result in significant impacts to traffic and transportation as evaluated per the City's significance criteria (listed in Section IV.D). Due to the project's reduction of through traffic on SR 29-128 (Main Street) and minor increase of traffic on the Pratt Avenue westbound approach to Main Street, "with project" conditions result in a reduced overall traffic volume at the Pratt Avenue/S.R. 29-128 intersection. Project volumes would not result in a "letter" change in intersection Level of Service operation, and would result in minor increased delay due to 3 added westbound Pratt Avenue left turns during the AM and PM peak hours – adding to the long delays on the westbound Pratt Avenue approach. Project traffic would not result in signal warrant #1 or #3 being met.
- Recommendation: Maintain any proposed landscaping along the project's Pratt Avenue frontage east and west of the Vineyard Lodge driveway at low heights in order to ensure acceptable sight lines for drivers exiting the site.
- Recommendation: The CIA should require display of parking permits for all student automobiles parked at the Vineyard Lodge site to ensure no spill-over parking by the student residents. Guests of students will need to be informed of the necessity of parking at Greystone and using the shuttles when visiting Vineyard Lodge. Strict parking enforcement will be required (i.e., parking permits will need to be displayed and monitored) whenever the Lodge is at or near capacity.

## **SIGNAL WARRANTS**

## Appendix

### SIGNAL WARRANT DEFINITIONS (California Manual on Uniform Traffic Control Devices\*)

#### Section 4C.02 Warrant 1, Eight-Hour Vehicular Volume

##### Support:

The Minimum Vehicular Volume, Condition A, is intended for application at locations where a large volume of intersecting traffic is the principal reason to consider installing a traffic control signal.

The Interruption of Continuous Traffic, Condition B, is intended for application at locations where Condition A is not satisfied and where the traffic volume on a major street is so heavy that traffic on a minor intersecting street suffers excessive delay or conflict in entering or crossing the major street.

It is intended that Warrant 1 be treated as a single warrant. If Condition A is satisfied, then the criteria for Warrant 1 is satisfied and Condition B and the combination of Conditions A and B are not needed. Similarly, if Condition B is satisfied, then the criteria for Warrant 1 is satisfied and the combination of Conditions A and B is not needed.

##### Standard:

**The need for a traffic control signal shall be considered if an engineering study finds that one of the following conditions exist for each of any 8 hours of an average day:**

- A. The vehicles per hour given in both of the 100 percent columns of Condition A in Table 4C-1 exist on the major-street and the higher-volume minor-street approaches, respectively, to the intersection; or**
- B. The vehicles per hour given in both of the 100 percent columns of Condition B in Table 4C-1 exist on the major-street and the higher-volume minor-street approaches, respectively, to the intersection.**

**In applying each condition the major-street and minor-street volumes shall be for the same 8 hours. On the minor street, the higher volume shall not be required to be on the same approach during each of these 8 hours.**

##### Option:

If the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 64 km/h or exceeds 40 mph, or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, the traffic volumes in the 70 percent columns in Table 4C-1 may be used in place of the 100 percent columns.

##### Guidance:

The combination of Conditions A and B is intended for application at locations where Condition A is not satisfied and Condition B is not satisfied and should be applied only after an adequate trial of other alternatives that could cause less delay and inconvenience to traffic has failed to solve the traffic problems.

##### Standard:

**The need for a traffic control signal shall be considered if an engineering study finds that one of the following conditions exist for each of any 8 hours of an average day:**

- A. The vehicles per hour given in both of the 80 percent columns of Condition A in Table 4C-1 exist on the major-street and the higher-volume minor-street approaches, respectively, to the intersection; and**

---

\* FHWA's MUTCD 2014 edition (FHWA's MUTCD 2009 Edition, including Revisions 1 & 2, as amended for use in California)

- B. The vehicles per hour given in both of the 80 percent columns of Condition B in Table 4C-1 exist on the major-street and the higher-volume minor-street approaches, respectively, to the intersection.**

**These major-street and minor-street volumes shall be for the same 8 hours for each condition; however, the 8 hours satisfied in Condition A shall not be required to be the same 8 hours satisfied in Condition B. On the minor street, the higher volume shall not be required to be on the same approach during each of the 8 hours.**

Option:

If the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 64 km/h or exceeds 40 mph, or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, the traffic volumes in the 56 percent columns in Table 4C-1 may be used in place of the 80 percent columns.

### **Section 4C.04 Warrant 3, Peak Hour**

Support:

The Peak Hour signal warrant is intended for use at a location where traffic conditions are such that for a minimum of 1 hour of an average day, the minor-street traffic suffers undue delay when entering or crossing the major street.

**Standard:**

**This signal warrant shall be applied only in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time.**

**The need for a traffic control signal shall be considered if an engineering study finds that the criteria in either of the following two categories are met:**

- A. If all three of the following conditions exist for the same 1 hour (any four consecutive 15-minute periods) of an average day:**
- 1. The total stopped time delay experienced by the traffic on one minor-street approach (one direction only) controlled by a STOP sign equals or exceeds: 4 vehicle-hours for a one-lane approach; or 5 vehicle-hours for a two-lane approach, and**
  - 2. The volume on the same minor-street approach (one direction only) equals or exceeds 100 vehicles per hour for one moving lane of traffic or 150 vehicles per hour for two moving lanes, and**
  - 3. The total entering volume serviced during the hour equals or exceeds 650 vehicles per hour for intersections with three approaches or 800 vehicles per hour for intersections with four or more approaches.**
- B. The plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher-volume minor-street approach (one direction only) for 1 hour (any four consecutive 15-minute periods) of an average day falls above the applicable curve in Figure 4C-3 for the existing combination of approach lanes.**

Option:

If the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 64 km/h or exceeds 40 mph, or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, Figure 4C-4 may be used in place of Figure 4C-3 to satisfy the criteria in the second category of the Standard.

### **Section 4C.08 Warrant 7, Crash Experience**

Support:

The Crash Experience signal warrant conditions are intended for application where the severity and frequency of crashes are the principal reasons to consider installing a traffic control signal.

Standard:

The need for a traffic control signal shall be considered if an engineering study finds that all of the following criteria are met:

- A. Adequate trial of alternatives with satisfactory observance and enforcement has failed to reduce the crash frequency; and**
- B. Five or more reported crashes, of types susceptible to correction by a traffic control signal, have occurred within a 12-month period, each crash involving personal injury or property damage apparently exceeding the applicable requirements for a reportable crash; and**
- C. For each of any 8 hours of an average day, the vehicles per hour (vph) given in both of the 80 percent columns of Condition A in Table 4C-1 (see Section 4C.02), or the vph in both of the 80 percent columns of Condition B in Table 4C-1 exists on the major-street and the higher-volume minor-street approach, respectively, to the intersection, or the volume of pedestrian traffic is not less than 80 percent of the requirements specified in the Pedestrian Volume warrant. These major-street and minor-street volumes shall be for the same 8 hours. On the minor street, the higher volume shall not be required to be on the same approach during each of the 8 hours.**

Option:

If the posted or statutory speed limit or the 85th-percentile speed on the major street exceeds 40 mph, or if the intersection lies within the built-up area of an isolated community having a population of less than 10,000, the traffic volumes in the 56 percent columns in Table 4C-1 may be used in place of the 80 percent columns.

- a. Basic minimum hourly volume.
- b. Used for combination of Conditions A and B after adequate trial of other remedial measures.
- c. May be used when the major-street speed exceeds 64 km/h or exceeds 40 mph or in an isolated community with a population of less than 10,000.
- d. May be used for combination of Conditions A and B after adequate trial of other remedial measures when the major-street speed exceeds 64 km/h or exceeds 40 mph or in an isolated community with a population of less than 10,000.

## Pratt Avenue/Main St (SR29-128)

### PEAK HOUR VOLUME WARRANT #3

Urban Area

#### 2035 Weekday AM Peak Hour with Project

● 89 vehicles minor approach  
1873 vehicles major approaches

#### 2035 Weekday PM Peak Hour with Project

○ 89 vehicles minor approach  
2099 vehicles major approaches

**BOLD** type indicates maximum parking demand.

(1) 45 students now staying in dorms on CIA campus, 70% of these students have cars. Also project that 85% of students living off-site, and not at Vineyard Lodge housing, drive to/from campus on a 70/30 split AM/PM.

(2) 42 @ 1.5 per car.

(3) 70 patrons @ 2.0 per car

**BOLD** type indicates maximum parking demand.

(1) 45 students now staying in dorms on CIA campus, 70% of these students have cars. Also project that 85% of students living off-site, and not at Vineyard Lodge housing, drive to/from campus on a 70/30 split AM/PM.

(2) 16 @ 1.5 per car.

(3) 35 patrons @ 2.0 per car

(1) 45 students now staying in dorms on CIA campus; 70% of these students have cars. Also project that 85% of students living off-site, and not at Vineyard Lodge housing, drive to/from campus on a 70/30 split AM/PM.

(2) 42 @ 1.5 per car.

(3) 70 patrons @ 2.0 per car

(4) “With Project” reductions 7:45 – 8:45 AM: 21 inbound, 3 outbound

## **TREE PROTECTION GUIDELINES**

1. **Fencing** – A Tree Protection Zone (TPZ) shall be established for all trees to be retained. A woven wire fence anchored with t posts is to be erected at the dripline or 2-feet behind the construction envelope should approved work encroach close to the main stem of protected trees. The 2 foot setback will provide room for the activities during construction to occur. Heavy equipment will be restricted to the construction envelope. All work within the TPZ is to be done by hand or with the use of light equipment. **The fence shall not be altered or removed by anyone other than the Consulting Arborist or his designee. It shall be the contractor's responsibility to maintain the fence.** The fence shall remain on site until all construction activities are complete. The fence can be removed for the installation of the landscape.
2. **Grading** – No grade changes shall occur within the TPZ. If as a result of grading within the construction envelope roots are encountered, the roots shall be pruned properly and neatly back to the Tree Protection Fence or the edge of the excavation. No seals or dressing are necessary. The final pruning cut should be free of all shattered material throughout the circumference of the affected root. **The Consulting Arborist, or his designee, shall be onsite when construction or grading occurs next to the TPZ.**

3. **Trenching/Tunneling** -

- All roots encountered outside the TPZ will be pruned neatly and promptly.
- Roots encountered within the TPZ that are 1 ½" in diameter and smaller shall be pruned neatly. Roots larger than 1 ½" in diameter will be tunneled under leaving all bark intact.
- Backfill trenches with native soils which are free of organic material.

4. **Pruning** - Pruning may be needed to achieve elevations over the proposed structures. Where possible, branches will be thinned to achieve elevation, and where necessary the entire branch will be removed back to the mainstem. All pruning applications shall coincide with the International Society of Arboriculture Guidelines and ANSI Pruning Standards; all prunings are to be overseen by the Consulting Arborist.

5. **Cleaning of Construction Tools or Equipment** - The cleaning of construction tools or equipment (particularly masonry tools) shall occur far from the trees to discourage toxic leachades from entering the TPZ.

6. **Soil Enhancement** - Prior to construction, all trees within the TPZ will be treated by injecting into the surrounding soils, where penetration is possible, a solution of mycorrhizal inducing spores to assist the trees' root system in absorption of micronutrients, mineral and moisture. Where compacted soils are encountered, 3" diameter holes shall be augured through the hard surfaces, or compressed air shall be used to relieve compaction. The goal is to increase water percolation and aeration processes. The holes shall be back filled with a soil medium conducive to root generation; the medium must be approved by the Consulting Arborist. A top dressing of chip mulch, 8" deep but not touching the mainstems of the trees, will be maintained at all times in the TPZ.

7. **Final Landscape Plan** - The final landscape plan shall compliment the biological necessity of the existing trees. The methodology of installations and planting palate must be approved by the Consulting Arborist prior to

*A div. of J. Allan Schneider Corporation CCL #672522*

installation. All plants selected to reside within the TPZ shall be irrigated by drip style emitters. No overhead irrigation is allowed within the TPZ of protected trees.

8. **Rain Water and Landscape Irrigation** – Rain water or excessive gathered landscape irrigation must be dispersed outside the TPZ between the months of May and November.
9. **Notification** – When work is to be performed in the TPZ, the Consulting Arborist, or his designee, shall be onsite. A 48-hour *confirmed notice must be received by the Consulting Arborist* prior to commencing with activities in the TPZ. Onsite Arborist rate is \$120.00 per man, per hour.
10. **Modifications** - Any modifications to activities within the TPZ must be in writing prior to deviation from said plan. The consulting Arborist must approve any and all changes.
11. **Tree Removals** – Only trees approved during the process of application may be removed. If additional trees are to be removed the applicant must get approval from the Planning Department or Public Works. All removals shall be done without damaging preserved trees.
12. These Tree Protection Guidelines shall be reproduced in full on the cover of the development plans. Each TPZ shall be clearly illustrated on page L1.

Respectfully Submitted,

*Joseph Allan Schneider*

### **GENERAL INFORMATION**

This report provides background data and calculations demonstrating no increase in runoff from pre development conditions to post development conditions at the Culinary Institute of America, Vineyard Lodge Expansion located at 830 Pratt Avenue, in Napa County, California (APN 009-010-024).

### **RAINFALL DATA/DESIGN PARAMETERS**

Review of Napa County Road & Street Standards provides the following mathematical models and constant values used in the hydrologic analysis. The charts and figures used to calculate these values are provided in Enclosure A. Additionally, Enclosure B provides further information on the surrounding soil types and locations.

Mean Seasonal Precipitation

$I = 34 \text{ In/Yr.}$

Initial Time of Concentration

$T_c = 10 \text{ min}$

CIA Vineyard Lodge Expansion  
Hydrology Calculations based on Napa County Requirements

Project Parameters:

Normal Annual Precipitation 34 in/yr  
60 Minute Rainfall (P60) 1.05 (10 year)  
Intensity (I) 1.5 (100 year)  
2.49 in/yr (10 year)  
3.19 in/yr (100 year)  
Total Area 2.52 acres  
(Q10 = runoff for 10 year storm event)  
(Q100 = runoff for 100 year storm event)

Pre- Construction Weighted C Factor

| Surface    | Area (ac) | C factor |
|------------|-----------|----------|
| Impervious | 1.14      | 0.90     |
| Pervious   | 1.38      | 0.35     |
| Weighted C |           | 0.60     |

Post Construction Weighted C Factor

| Surface           | Area (ac) | C factor | A*C  |
|-------------------|-----------|----------|------|
| Bioswale          | 0.14      | 0.20     | 0.03 |
| Landscape         | 0.48      | 0.20     | 0.10 |
| Orchard           | 0.28      | 0.45     | 0.13 |
| Impervious        | 0.78      | 0.90     | 0.70 |
| Pervious Pavement | 0.84      | 0.45     | 0.38 |
| Weighted C        |           |          | 0.53 |

Runoff Calculation (Q=CIA)

| Q event | Pre  | Post |
|---------|------|------|
| Q10     | 3.76 | 3.31 |
| Q100    | 4.81 | 4.24 |

CONCLUSION: Post-Construction runoff does not exceed pre-construction runoff

© 2003 LMNO Engineering, Research, and Software, Ltd.

The Rational equation is the simplest method to determine peak discharge from drainage basin runoff. It is not as sophisticated as the [SCS TR-55 method](#), but is the most common method used for sizing sewer systems.

Rational Equation:  $Q=ciA$

The Rational equation requires the following units:

Q = Peak discharge, cfs

c = Rational method runoff coefficient

i = Rainfall intensity, inch/hour

A = Drainage area, acre

Note that our calculation allows you to use a variety of units.

The Rational method runoff coefficient (c) is a function of the soil type and drainage basin slope. A simplified table is shown below. See the references at the bottom of the page for more complete tables including impact of slope.

The Rainfall intensity (i) is typically found from Intensity/Duration/Frequency curves for rainfall events in the geographical region of interest. The duration is usually equivalent to the [time of concentration](#) of the drainage area. The storm frequency is typically stated by local authorities depending on the impact of the development. A 10-yr, 25-yr, 50-yr, or even 100-yr storm frequency may be specified.

#### Simplified Table of Rational Method Runoff Coefficients (see references below)

| Ground Cover      | Runoff Coefficient, c |
|-------------------|-----------------------|
| Lawns             | 0.05 - 0.35           |
| Forest            | 0.05 - 0.25           |
| Cultivated land   | 0.08-0.41             |
| Meadow            | 0.1 - 0.5             |
| Parks, cemeteries | 0.1 - 0.25            |
| Unimproved areas  | 0.1 - 0.3             |

## PROJECT OVERVIEW

The Culinary Institute of America Vineyard Lodge is applying for a Use Permit modification for improvements to the existing dormitory facility located at 830 Pratt Avenue, in St. Helena (APN 009-010-024). The project site is located approximately ¼ mile east of Highway 29, and in the northern portion of the St. Helena city limits. The project site extends over a gently sloping terrain along the valley floor, sloping northeast at approximately 3% or less towards the Napa River.

The Vineyard Lodge site is made up of a single 2.61 acre parcel, with two existing dormitory buildings, Vineyard Lodge 1 and Vineyard Lodge 2, housing 41 and 60 beds, respectively. The Use Permit Application includes demolition of the existing 41-bed dormitory and construction of three new dormitory buildings. The new dormitories will provide a total of 164 new beds, for a net increase of 123 beds. The new dormitories will provide capacity for 224 residents.

The existing sanitary sewage (SS) system serving the dormitories consists of a primary treatment system that discharges primary treated SS into the City of St. Helena sewer system, through an existing 3" SS existing force main and flowmeter located along the southwestern edge of the parcel. The primary treatment system consists of existing 2,000 gallon and 2,500 gallon septic tanks receiving SS from the newer Vineyard Lodge 2 building, and an approximate 2,000 gallon septic tank serving the older Vineyard Lodge 1 building. A pump sump collects SS effluent from both septic tank systems and pumps it into the City of St. Helena sewer collection system via the 3" SS force main. The pump sump has demand activated duplex lead/lag pumps and is controlled by float switches.

The upgraded SS primary treatment system will utilize new septic and pump tanks to serve the proposed buildings and the existing 60-bed dormitory. A new equalization pump tank will be used to collect and store all flows from the site, and discharge to the City of St. Helena sewer system via connection to the existing SS force main. The equalization pump tank will utilize onsite storage capacity and equivalent pumps to maintain the same instantaneous peak flow of the existing facilities. Summit Engineering has prepared the following Wastewater Feasibility Study outlining the proposed SS flows, and associated collection, storage and discharge systems.

## SANITARY SEWAGE MANAGEMENT SYSTEM

Vineyard Lodge intends to utilize and improve the existing SS wastewater management in accordance with all City of St. Helena Department of Public Works wastewater collection requirements. SS flows will undergo primary treatment in septic tanks, which will produce effluent that is of higher quality than residential wastewater. Primary treated effluent will be conveyed to the municipal sewer system through the existing 3-inch diameter SS force main and relocated flowmeter on the parcel.

The proposed SS management system has been sized for a peak daily wastewater flow of approximately 9,605 gallons per day (gpd), a projected net increase of 3,232 gpd over the existing average recorded flow of 6,373 gpd.

 Project No. 2016040

### **SANITARY SEWAGE CHARACTERISTICS**

SS will consist primarily of wastewater generated from dormitory restrooms, showers, and common areas. Typical SS is expected to be similar to residential strength wastewater, with characteristics summarized below:

**TABLE 1. TYPICAL SANITARY SEWER CHARACTERISTICS**

| <b><u>Characteristic</u></b>    | <b><u>Units</u></b> | <b><u>Raw Wastewater Range<sup>1</sup></u></b> |
|---------------------------------|---------------------|------------------------------------------------|
| BOD <sub>5</sub>                | mg/L                | 110 - 220                                      |
| Grease                          | mg/L                | 50-100                                         |
| Total Suspended Solids (TSS)    | mg/L                | 100 - 220                                      |
| Volatile Suspended Solids       | mg/L                | 80 - 165                                       |
| Total Dissolved Solids (TDS)    | mg/L                | 250 - 500                                      |
| Nitrogen                        | mg/L                | 20 - 40                                        |
| Nitrate                         | mg/L                | 0                                              |
| Phosphorous                     | mg/L                | 4 - 8                                          |
| Alkalinity (CaCO <sub>3</sub> ) | mg/L                | 50 - 100                                       |
| Chloride                        | mg/L                | 30 - 50                                        |
| Sulfate                         | mg/L                | 20 - 30                                        |

<sup>1</sup>Typical composition of untreated domestic wastewater, Metcalf & Eddy, "Wastewater Engineering, Third Edition", 1991

### **DORMITORY SANITARY SEWAGE DESIGN FLOWS**

The proposed SS management system at Vineyard Lodge will convey wastewater generated from the dormitory restrooms, showers and common areas. Students will spend a large portion of their day outside of the dormitories, so a lower estimate than the typical daily per capita water use has been used to calculate wastewater generation. The average daily water use for the Pratt Avenue site from May 2014 through May 2015 was 6,373 gpd based on billing records, with a total occupancy of 101 residents, resulting in an average water demand of approximately 63 gpcd. The water use records also include irrigation at the facility, therefore the 63 gpcd wastewater generation estimate is conservative. The Environmental Protection Agency's Onsite Wastewater Treatment Systems manual recommends a daily flow rate of 25-60 gpcd for boarding houses, with 40 gpcd being typical, so the data based flow estimate is in line with industry standards and recommendations.

Revised: September 2, 2016

SUMMIT ENGINEERING, INC.  
Project No. 2016040

Peak Day Wastewater Generation – Existing Dormitory Building

|                                      |    |   |    |      |   |              |            |
|--------------------------------------|----|---|----|------|---|--------------|------------|
| Full-time Residents                  | 60 | x | 63 | gpcd | = | 3,780        | gpd        |
| <b>Existing Building Design Flow</b> |    |   |    |      | = | <b>3,780</b> | <b>gpd</b> |

Additionally, the City of St. Helena Water Neutral Policy for Development provides a method for estimating proposed water demand based on fixture flow rates and use assumptions. The following calculations show that the estimated residential wastewater generation for the proposed buildings should be approximately 35 gpcd.

Peak Day Wastewater Generation – Proposed Dormitory Buildings

| Fixture                                       |   | Flow Rate     |   | Flow Duration          |   | Occupants     |   | Water Use        |
|-----------------------------------------------|---|---------------|---|------------------------|---|---------------|---|------------------|
| Toilet                                        | x | 1.3 gal/flush | X | 3 flushes/day/occupant | X | 164 occupants | = | 640 gpd          |
| Showerhead                                    | x | 1.5 gal/min   | x | 8 min/day/occupant     | X | 164 occupants | = | 1,968 gpd        |
| Sink Faucet                                   | x | 0.5 gal/min   | x | 0.75 min/day/occupant  | X | 164 occupants | = | 62 gpd           |
| Kitchen Faucet                                | x | 1.5 gal/min   | x | 4 min/day/occupant     | X | 164 occupants | = | 984 gpd          |
| Kitchen Faucet (Dishwashing)                  | x | 1.5 gal/min   | x | 1.27 min/day/occupant  | X | 164 occupants | = | 309 gpd          |
| Clothes Washer                                | x | 19.7 gal/load | x | 0.37 load/day/occupant | X | 164 occupants | = | 1,195 gpd        |
| <b>Proposed Design Flow for New Buildings</b> |   |               |   |                        |   |               | = | <b>5,157 gpd</b> |

Manufacturer's specification sheets for the included fixtures are included in Enclosure B. No dishwashers will be installed in the kitchen/common areas. To account for the additional flow required to hand wash dishes, an additional kitchen faucet source was included, equivalent to three times the anticipated dishwasher wastewater generation anticipated in the City of St. Helena Water Neutral Policy guidelines. The estimated dishwasher generation rate is based on 6.3 gal/load, 0.1 load/day/occupant, and 164 occupants, for a total of approximately 103 gallons per day. Therefore 309 gpd was added to the kitchen faucet use, or 1.26 min/occupant/day in addition to the typical 4 min/day/occupant assumed in the Water Neutral Policy. This should adequately account for the amount of additional water used per occupant at the kitchen faucet for dishwashing purposes.

The 164 occupants total within the three new buildings should produce an approximate total of 5,157 gpd of wastewater based on the proposed fixtures, which equates to 31.5 gpcd. The wastewater design flow rate for the proposed buildings has been increased to 35 gpcd to provide an additional factor of safety. The total SS generation of each dormitory building (existing and proposed), after the 41-bed dormitory is demolished, is as follows:

DESIGN CRITERIA – Existing Building to Remain

Peak Day

|                             |    |   |    |      |   |              |            |
|-----------------------------|----|---|----|------|---|--------------|------------|
| Full-time Students          | 60 | x | 63 | gpcd | = | 3,780        | gpd        |
| <b>Existing Design Flow</b> |    |   |    |      | = | <b>3,780</b> | <b>gpd</b> |

CIA – Vineyard Lodge  
 Wastewater Feasibility Study  
 June 15, 2016  
 Revised: September 2, 2016

SUMMIT ENGINEERING, INC.  
 Project No. 2016040

#### DESIGN CRITERIA – Three New Lodge Buildings

##### Peak Day

|                                            |     |   |         |   |                  |
|--------------------------------------------|-----|---|---------|---|------------------|
| Full-time Students                         | 164 | x | 35 gpcd | = | 5,740 gpd        |
| <b>New Buildings Total Design Flow</b>     |     |   |         |   | <b>5,740 gpd</b> |
| <b>TOTAL PEAK DAY FLOW = ALL BUILDINGS</b> |     |   |         | = | <b>9,520 gpd</b> |

**TOTAL SITE DESIGN FLOW = 9,520 gpd**

The SS management system will be designed to handle a peak daily SS flow of 3,780 gpd from the existing building, and 5,740 gpd from new buildings, for a total SS flow of 9,520 gpd.

#### SANITARY SEWAGE CONVEYANCE, TREATMENT AND DISPOSAL

The SS treatment and disposal system will have the components described below. Refer to Enclosure A for the SS management system schematic. The overall system will include:

- ◆ An existing pump station and new septic tank for the existing Vineyard Lodge 2 building.
- ◆ A new septic/pump tank for Building A
- ◆ A new septic tank for Building B (shared with the Vineyard Lodge 2 building)
- ◆ A new septic tank for Building C
- ◆ A combined effluent equalization pump tank, which will collect and store wastewater from the entire site, and discharge to the existing 3-inch SS force main.

#### Gravity Collection

The gravity collection system from the new lodge buildings will be designed to provide low maintenance and no infiltration or exfiltration. Piping shall be compatible with sanitary sewage and satisfy Uniform Plumbing Code and local requirements.

#### Septic Tanks

Although not required prior to discharge to the City sewer system, septic tanks are provided and sized per UPC guidelines. Solids settling and digestion in the septic tanks helps to reduce BOD and TSS concentrations entering the City sewer system, reducing the potential for clogging and hydrogen sulfide attack of the pumping and transmission system. Septic tank sizing is determined as follows:

##### Uniform Plumbing Code Method:

$$Volume = 1,125 + 0.75 \times Flow Rate$$

##### Individual Tankage Requirements

CIA – Vineyard Lodge  
Wastewater Feasibility Study  
June 15, 2016  
Revised: September 2, 2016

SUMMIT ENGINEERING, INC.  
Project No. 2016040

|                                      |       |     |   |      |   |       |     |   |                 |
|--------------------------------------|-------|-----|---|------|---|-------|-----|---|-----------------|
| Building A                           | 2,450 | gpd | x | 0.75 | + | 1,125 | gpd | = | 2,962           |
| Building B                           | 1,855 | gpd | x | 0.75 | + | 1,125 | gpd | = | 2,516           |
| Building C                           | 1,400 | gpd | x | 0.75 | + | 1,125 | gpd | = | 2,175           |
| (E) Vineyard Lodge 2                 | 2,700 | gpd | x | 0.75 | + | 1,125 | gpd | = | 3,150           |
| <b>TOTAL TANKAGE - ALL BUILDINGS</b> |       |     |   |      |   |       |     |   | <b>= 10,803</b> |

Primary tanks will be provided for each building, and sized according to the guidelines listed above:

- ◆ Building A will have 3,000 gallons of primary retention in a combined septic and pump tank, with effluent from the septic compartment pumped to the combined equalization pump storage tank described in detail below.
- ◆ Building B will have a separate 2,500 primary tank, with effluent flowing by gravity into the combined equalization tank.
- ◆ A new 5,000 gallon septic tank will be installed adjacent to Building C.
- ◆ The existing pump sump located outside of the existing VL2 building will be redirected to the new 5,000 septic tank outside Building C, with the existing 2,000 and 2,500 gallon tanks serving VL2 removed or abandoned in-place.

Overall, the total recommended primary tank volume of 10,800 gallons will be exceeded by the available 13,000 gallons of septic tankage upstream of the equalization pump tank. SS should enter the septic tanks at approximately residential strength, and the proposed septic tank capacity will provide settling and decomposition within the tanks. The resulting primary treated effluent entering the City's collection system will therefore exceed residential sewage quality as required by the City of St. Helena.

#### Equalization Pump Tank

Effluent from the septic tanks will be collected in a combined 5,000 gallon equalization pump tank that will be utilized for equalization volume and peak flow storage. The equalization tank will provide approximately 12.5 hours of retention time at the peak daily flowrate of 9,520 gpd, and is sufficiently sized to allow for only off-peak discharge to the City sewer. In order to calculate the water level within the tank during the design day, a typical diurnal wastewater generation curve was developed according to the data provided by Crites and Tchobanoglous (*Small and Decentralized Wastewater Management Systems*, pg. 188). The diurnal flow pattern of residential wastewater flow was normalized so that the hourly inflow to the equalization tank is the product of the peak flow factor and the average daily wastewater generation (Figure 1).

CIA – Vineyard Lodge  
 Wastewater Feasibility Study  
 June 15, 2016  
 Revised: September 2, 2016

SUMMIT ENGINEERING, INC.  
 Project No. 2016040

Figure 1. Typical diurnal pattern of wastewater generation from residential sources

The existing pump utilized to convey SS to the city sewer system is sized at 30 gpm and will be programmed to provide a dose volume of approximately 400 gallons, or just less than a 13.3 minute pump cycle. This will allow the pump to operate on an average of once per hour (24 doses total) throughout the design day, although the doses will be distributed across only non-peak hours (12pm to 5pm and 10pm to 5am). The following table shows a volume balance on the equalization tank throughout the design day, with inflow determined by the average daily flow and peak flow factor from the diurnal curve, and outflow governed by dosing to the city sewer.

Equalization Tank Volume, 24-hour period

| Time:    | Inflow<br>(gal) | Pump<br>Doses | Outflow<br>(gal) | Initial<br>Volume<br>(gal) | End<br>Volume<br>(gal) |

This equalization pump tank will utilize the existing (or comparably sized) pumps without increasing their peak pumping capacity. As a result, there will be no increase to the instantaneous flow rate to the City sewer system, and therefore no adverse effect on the sewer system capacity. The equalization storage is utilized to prevent pump operation during the assumed peak hours of 7AM through 12 PM, and 5 PM through 10 PM, possibly reducing the instantaneous peak flow to the City sewer, since the current discharge pattern is on-demand. The maximum volume within the tank is expected to be less than 5,000 gallons at all times, with the overnight hours between 10 PM and 6 AM being used to empty the tank. At no point in time will the instantaneous peak flow entering the City sewer system exceed 30 gpm, to coincide with the peak flow of the current pump sump. The existing pump sump is sized for the capacity of receiving sewers within the City's collection system, and will not be increased in size in order to maintain the existing peak flow to the City sewer system.

#### **Flow Measurement**

The existing flow meter will be relocated and utilized to measure the discharge of SS flows into the City's collection, pumping and treatment system and for facility record keeping.

#### **City of St. Helena Sewer System**

No increases in peak flows are proposed to the City sewer system, and the timed dosing of primary treated effluent during off-peak hours should prevent any adverse impacts to the City sewers. Therefore, a detailed capacity analysis of City's sewer system components is not required.

### **OTHER CONSIDERATIONS**

#### **ODOR CONTROL**

There should be no noxious odors from a properly designed and operated treatment system. See Alternative Courses of Action for operation alternatives.

CIA – Vineyard Lodge  
Wastewater Feasibility Study  
June 15, 2016  
Revised: September 2, 2016

SUMMIT ENGINEERING, INC.  
Project No. 2016040

### **PROTECTION**

The primary treatment septic system will be protected to restrict access and potential damage to the system, including the use of locking covers for the septic tanks and bollards to prevent vehicle traffic above the underground tanks where located adjacent to traffic areas. Tanks installed in traffic areas will be H-20 traffic rated.

### **ALTERNATIVE COURSES OF ACTION**

Should there be any unforeseen operational difficulties for the SS management system, the following additional courses of action would be available if necessary:

- ◆ Temporary pumping and truck transfer of wastewater to an approved treatment plant would be used as additional courses of action.
- ◆ Additional stages of primary treatment to increase effluent quality discharged to the sewer system.
- ◆ Installation of additional pump tank storage to increase storage and reduce the peak discharge to the municipal sewer system.
- ◆ Alteration of the pump timer and control scheme to adjust the dosing schedule as necessary, if capacity issues in the city sewer system are identified.

**L-1**

**SELECTRONIC™**  
**ELECTRONIC PROXIMITY LAVATORY FAUCET**

### GENERAL DESCRIPTION:

Electronic faucet with proximity operation. Vandal-resistant solid brass construction with single post mounting. Operates on DC (battery) or AC permanent power. Water pressure range from 20 to 125 psi. Single inlet 15" flexible stainless steel hose with 3/8" compression fitting for spout connection.

### PRODUCT FEATURES:

**Vandal-Resistant Brass Body:** Durable - Excellent in high use applications.

#### Power Options:

- **Battery** - Approx. 4 years with Lithium Battery CR-P2
- **Plug-In - Integral** low voltage transformer (115 VAC supply) with 6 foot long power supply.

#### Easy and Flexible Installation:

Single post mounting with optional 4" and 8" Deck plate. Water resistant solenoid enclosure mounts to wall.

#### Integrated; Easy Service Strainer:

Patented integrated strainer enclosed in removable debris cup protects the solenoid valve and aerator from debris. Perforated stainless steel strainer is low maintenance and can be easily accessed.

#### Temperature Mixing:

Optional thermostatic mixing valve meets ASSE 1016 performance and anti-scald requirements at 0.5 GPM. Mixing valve will connect directly to solenoid inlet and is housed in matching enclosure.

#### End Device:

Choice of 0.5 GPM (1.9 L/min) pressure compensating, vandal-resistant spray or 1.5 GPM (5.7L/min) pressure compensating, vandal-resistant aerator.

### CODES AND STANDARDS:

These products meet or exceed the following codes & standards:

ANSI A117.1  
ASME A112.18.1  
CSA B 125  
NSF 61/Section 9

**ADA Compliant**

### MODEL NUMBER:

#### DC POWERED; single inlet

- ☒ **6055.105** with cast spout, 0.5 GPM pressure compensating, vandal-resistant spray.
- ☐ **6055.102** with cast spout, 1.5 GPM pressure compensating, vandal-resistant aerator.

#### AC POWERED; single inlet

- ☐ **6056.105** with cast spout, 0.5 GPM pressure compensating, vandal-resistant spray. Includes AC power supply.
- ☐ **6056.102** with cast spout, 1.5 GPM pressure compensating, vandal-resistant aerator. Includes AC power supply.

#### MULTI AC POWERED; single inlet

- ☐ **6057.105** with cast spout, 0.5 GPM pressure compensating, vandal-resistant spray. One power supply (sold separately) can operate up to 15 faucets in series. 10' extension cable included.
- ☐ **6057.102** with cast spout, 1.5 GPM pressure compensating, vandal-resistant aerator. One power supply (sold separately) can operate up to 15 faucets in series. 10' extension cable included.

#### OPTIONAL 4" or 8" Deck plates

- ☐ **605P.400** 4" brass deck plate with 1/4" fixation studs and quick spin nuts. (6-1/8" x 2-1/8" x 1/2")
- ☐ **605P.800** 8" brass deck plate with 1/4" fixation studs and quick spin nuts. (10-1/8" x 2-3/8" x 1/2")

#### OPTIONAL Mixing Valve

- ☐ **605XTMV** Thermostatic mixing valve, flex hoses 3/8" compression 20" hose length.

### RECOMMENDED SPECIFICATION

Electronic Proximity Lavatory shall feature vandal resistant all brass body with single inlet, and in-line strainer. Shall also feature a low energy use electronically operated solenoid valve and microprocessor controlled proximity sensors. Shall meet ANSI A112.18.1M and ANSI 117.1 codes. Fitting shall be American Standard Model # 6055\_\_\_\_, 6056\_\_\_\_, 6057\_\_\_\_.

## Sloan ECOS® Flushometers

### ECOS 8111-1.28

WC-1

#### ► Code Number

3370448

#### ► Description

Exposed, Battery Powered, Sensor Activated ECOS® Model Water Closet Flushometer for floor mounted or wall hung top spud bowls.

#### ► Flush Cycle

Model 8113-3.5 Low Consumption (3.5 gpf/13.2 Lpf)

Model 8111 Low Consumption (1.6 gpf/6.0 Lpf)

#### ► Specifications

Quiet, Exposed, Diaphragm Type, Closet Flushometer for either left or right hand supply with the following features:

- Vacuum Breaker Flush Connection and Spud Coupling, Wall and Spud Flanges
- Spud Coupling and Flange for 1½" Top Spud
- Flush Accuracy Controlled by CID Technology
- Sweat Solder Adapter with Cover Tube and Cast Set Screw Wall Flange
- Diaphragm, Stop Seat and Vacuum Breaker to be molded from PERMEX® rubber compound for Chloramine resistance
- Infrared Sensor with Multiple-focused, Lobular Sensing Fields for high and low target detection
- Initial Set-up Range Indicator Light (first 10 minutes)
- User friendly three (3) second Flush Delay
- "Low" Flashing LED
- ADA Compliant Battery Powered Infrared Sensor for automatic "No Hands" operation
- 1" I.P.S. Screwdriver Bak-Chek® Angle Stop with free spinning, vandal resistant Stop Cap with Adjustable Tailpiece
- Infrared Sensor with Multiple-focused, Lobular Sensing Fields for high and low target detection
- Latching Solenoid Operator
- Infrared Sensor Range Adjustment Screw
- Fixed Metering Bypass and No External Volume Adjustment to Ensure Water Conservation
- Flex Tube Diaphragm designed for improved life and reduced maintenance
- Engineered Metal Cover with replaceable Lens Window
- Courtesy Flush® Override Button
- Four (4) Size AA Batteries factory installed

Valve Body, Tailpiece and Control Stop shall be in conformance with ASTM Alloy Classification for Semi-Red Brass. Valve shall be in compliance with the applicable sections of ASSE 1037. Installation conforms to ADA requirements.

#### ► Automatic Operation

Sloan ECOS® Flushometers activate via multi-lobular sensor detection to provide the ultimate in sanitary protection and automatic operation. A battery powered infrared sensor sets the flushing mechanism after the user is detected and Completes the flush when the user steps away.

#### ► Functional & Hygienic

Touchless, sensor operation eliminates the need for user contact to help control the spread of infectious diseases. The G2 Optima Plus® Flushometer is provided with an Override Button to allow a "courtesy flush" for individual user comfort.

#### ► Economical

Sloan installed batteries speed installation and provide years of metered flushing to control the use of water and energy. Batteries can be changed without turning off the water.

#### ► Compliance

This space for Architect/Engineer Approval

#### ► ELECTRICAL SPECIFICATIONS

## Visual Impact Assessment

830 Pratt Avenue  
St Helena, CA

### 1. Introduction

The following aesthetic visual impact assessment has been prepared pursuant to the California Environmental Quality Act (CEQA). The purpose of this assessment is to identify any potentially adverse visual impacts that might result from the proposed demolition of a 15,000 sf building and the construction of three residential structures totaling 40,645 sf for the Culinary Institute of America (CIA) located at 830 Pratt Avenue, St Helena, California.

Several Federal Resource Agencies have developed methodologies for assessing visual impacts on the environment including the US Department of Agriculture Forest Service (USDA\_FS), US Department of the Interior Bureau of Land Management (USDI\_BLM), and The US Department of Transportation, Federal Highway Administration (USDOT-FHWA). However, no federal resource agency has addressed levels of impact intensity or significance of proposed impacts required by CEQA.

CEQA requires an evaluation of the potential to cause significant visual impacts to a project. However, CEQA does not specify criteria or specific standards to arrive at the significance of impacts. As a result, an evaluation of impacts on the visual and aesthetic qualities of a project by necessity builds upon CEQA Guidelines and the specific items addressed in Appendix G of the CEQA environmental checklist. The methodology assigned by the BLM fits this project because agricultural land qualities and wide long views predominate. This approach includes:

- Project description and visual Setting
- Identification of sensitive view points
- Analyzing existing visual quality and character of identified views
- Assessing the project's impact to those views compared to existing visual quality and character, and
- Proposed methods to mitigate any potentially significant visual impacts

### 2. Project Description & Visual Setting

#### Project Description

**Location:** Located east of State Highway 29 (Hwy 29) in Napa County within the incorporated limits of St Helena, California the property at 830 Pratt Avenue is a triangular shaped site. The east west street is a relatively flat area of the Napa Valley "floor" with visual access to the site's existing landscape. The project site is immediately bounded by Vineyard Road to the east, Pratt Avenue to the south, and an existing railroad right-of-way to the west (Figure 1).

**Existing Conditions:** Current building features within the project site can be described in three distinct areas. The southerly one-third of the site fronting on Pratt Avenue contains Vineyard Lodge I, a 15,050 sf single story residential structure with the remaining land area is surface parking. The second one-third contains a two story 12,848 sf residential building identified as Vineyard Lodge II. The most northerly one-third of the site is currently unimproved and vacant.

**Proposed Project:** The Culinary Institute of America (CIA) proposes to remove Vineyard Lodge I, and construct three (3) residential structures clustered around a central courtyard. The additional 40,645 sf, located within the most southerly one-third of the property will add 164 beds in buildings varying in height from 29'-0" to 40'-2". The following table illustrates specific information for each structure within the grouping:

|                   | <i>Building Description</i>                | <i>Bldg Height</i>                                          | <i>Setback from Street</i>                                                                 |
|-------------------|--------------------------------------------|-------------------------------------------------------------|--------------------------------------------------------------------------------------------|

Visual Impact Assessment  
830 Pratt Avenue  
St Helena, CA

### 3. Methodology

*Documents Identified & Field Inspection:* Visual Impacts were identified by evaluating plan drawings and landscape plans taking into account the existing project setting, and analyzing visual simulations of project features at key viewpoints. Interpretation of existing visual character and surrounding land use was based on field visits conducted in July 2016. Research of the regulatory setting for the project was undertaken, including review of city planning documents and policies.

*Visual Changes & Impacts Defined:* Aesthetics and urban design are subjective fields, and visual changes that are favored or accepted by one may not be acceptable by another. The effects of visual changes are open to interpretation. Generally, a visual change is considered adverse if the project introduces obtrusive elements substantially out of character with the existing land use or substantially obscures a scenic view or vista available to sensitive receptors. In addition, visual change is considered adverse if it would damage scenic resources like trees, historic buildings, or other features of the visual environment that contribute to the scenic public setting. This visual analysis characterizes the visual setting and identifies important visual features and resources, in addition to scenic vistas experienced from within. View groups are identified, including sensitive view groups, in order to understand the potential visual changes that could be experienced with implementation of a proposed project.

Further, St Helena's General Plan cites as a community goal the nomination of Hwy 29 as a California Scenic Highway. This assessment will take into account the potential to effect visual quality and character of eligible scenic resources, any identified historic resources, as well as from viewpoints that are likely to represent the experience of highly sensitive view groups.

### 4. Regulatory Setting

*State Standards:* Appendix G of the California Environmental Quality Act Guidelines contains a checklist of environmental effects that may be considered significant. Under the category of "Aesthetics," a project may be considered to have a significant visual impact on the environment if it will:

- A. Have a substantial adverse effect on a scenic vista;
- B. Substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
- C. Substantially degrade the existing visual character or quality of the site and its surroundings;
- D. Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area.

The CEQA checklist questions are incorporated with other evaluation methods suited to the environment to determine the potential significance of the impacts generated by the proposed project.

*Local Standards:* At the local level, the City of St Helena has established policies regarding protection of views. Within the current St Helena General Plan, The Residential Neighborhoods topic within the Land Use and Growth Management chapter, and The Gateway, Edges and Views topic of the Community Design chapter identify protection and enhancement policies affecting view protection.

*Visual Quality Rating:* The before and after "visual quality" of viewpoints can be numerically rated according to the presence of seven key landscape components: landform, vegetation, water, color, adjacent scenery, scarcity, and cultural modifications.<sup>1</sup> By comparing the difference in visual quality from the baseline to post project visual conditions, the severity of project related visual impacts could be quantified. However, in some cases, visual changes caused by projects may actually have a beneficial visual effect, which enhances scenic quality. The table below illustrates the visual quality rating system for viewpoints.

While most components of the visual landscape can be objectively rated by this system, the rating of cultural or manmade modifications can be a potentially subjective element. Therefore, it is important to assess project

---

<sup>1</sup> Rating scale based on the Bureau of Land Management's (BLM) "Scenic Quality Rating Criteria"

Visual Impact Assessment  
830 Pratt Avenue  
St Helena, CA

effects relative to the “visual character” of the project setting. Visual character is qualitatively defined by eight important descriptive character components: form, line, color, texture, dominance, scale, diversity, and continuity.

### VISUAL QUALITY RATING SYSTEM

| KEY FACTORS                   |                                                                                                                                                                                                                                                                                                 | RATING CRITERIA & SCORE                                                                                                                                                                                                       |                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| LANDFORM                      | High vertical relief as expressed in prominent cliffs, spires, or massive rock outcrops, or severe surface variation or highly eroded formations including major badlands or dune systems; or detail features dominant and exceptionally striking and intriguing such as glaciers.<br>SCORE = 5 | Steep canyons, mesas buttes, cinder cones and drumlins; or interesting erosional patterns or variety in size and shape of landforms; or detail features which are interesting though not dominant or exceptional<br>SCORE = 3 | Low rolling hills, foothills, or flat valley bottoms; or few or no interesting landscape features.<br><br>SCORE = 1 |
| VEGETATION                    | A variety of vegetative types as expressed in interesting forms, textures, and patterns<br>SCORE = 5                                                                                                                                                                                            | Some variety of vegetation, but only one or two major types.<br>SCORE = 3                                                                                                                                                     | Little or no variety or contrast in vegetation.<br>SCORE = 1                                                        |
| WATER                         | Clear and clean appearing, still, or cascading white water, any of which are a dominant factor in the landscape.<br>SCORE=5                                                                                                                                                                     | Flowing or still, but not dominant in the landscape.<br><br>SCORE=3                                                                                                                                                           | Absent, or present but not noticeable.<br><br>SCORE=1                                                               |
| COLOR                         | Rich color combinations, variety or vivid color; or pleasing contrasts in the soil, vegetation, water or snowfields.<br>SCORE=5                                                                                                                                                                 | Some intensity or variety in colors and contrast of the soil, rock, and vegetation, but not a dominant scenic element.<br>SCORE=3                                                                                             | Subtle color variation, contrast, or interest, generally mute tones.<br>SCORE=1                                     |
| INFLUENCE OF ADJACENT SCENERY | Adjacent scenery greatly enhances visual quality.<br><br>SCORE=5                                                                                                                                                                                                                                | Adjacent scenery moderately enhances overall visual quality.<br><br>SCORE=3                                                                                                                                                   | Adjacent scenery has little or no influence on the overall visual quality.<br>SCORE=1                               |
| SCARCITY                      | One of a kind; or unusually memorable, or very rare within region. Consistent chance for exceptional wildlife or wildflower viewing, etc.<br>SCORE=5                                                                                                                                            | Distinctive, though somewhat similar to others within the region.<br><br>SCORE=3                                                                                                                                              | Interesting within its setting but fairly common within the region.<br><br>SCORE=1                                  |
| CULTURAL MODIFICATIONS        | Modifications add favorably to visual variety while promoting visual harmony.<br><br>SCORE=2                                                                                                                                                                                                    | Modifications add little or no visual variety to the area, and introducing not discordant elements.<br><br>SCORE=0                                                                                                            | Modifications add variety but are very discordant and promote strong disharmony<br>SCORE=-4                         |
| TOTAL SCORE:                  |                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                               |                                                                                                                     |

Visual Impact Assessment  
830 Pratt Avenue  
St Helena, CA

Projects that create a high level of contrast to the existing visual character of a project setting are more likely to generate adverse visual impacts due to the inherent visual compatibility. Conversely, projects that create a low level of contrast to the existing visual character are less likely to generate adverse visual impacts due to inherent visual compatibility. On this basis, project modifications are quantified and evaluated for impact assessment purposes.

The following designations are used to describe the level of project impacts:

- **Potentially Significant Impact:** Any impact that could potentially permanently lower the visual quality of an identified sensitive viewpoint, and for which no feasible or effective mitigation can be identified.
- **Less Than Significant Impact With Mitigation Incorporated:** Any impact that could potentially permanently lower the visual quality of an identified viewpoint, but can be minimized or screened with mitigation incorporated. Therefore, specific mitigation measures are provided to reduce the impact to a less-than-significant level.
- **Less Than Significant Impact:** Any visible impact that would not potentially lower the visual quality of an identified sensitive viewpoint. In visual impact analysis, a less than significant impact usually occurs when a project's visual modifications can be seen but do not dominate, contrast with, or strongly degrade a sensitive viewpoint.
- **No Impact:** The project would not have an impact from an identified sensitive viewpoint. In visual impact analysis, there is no impact if the project's potential visual modifications cannot be seen from an identified sensitive viewpoint.

*Visual Setting:* Located on the valley floor the project site is flanked by the Mayacamas Mountain Range on the western and northern sides the Vaca Mountains on the eastern side. Several smaller valleys exist within these two ranges. The floor of the main valley undulates to the north and gradually rises from sea level at the valley's southern end to 362 feet (110 m) above sea level at the northern end in Calistoga at the foot of Mount Saint Helena. The setting includes distant views of the Mayacamas and Vaca Mountain ranges with gradual undulating volcanic period landforms that create periodic interruptions in the view experience.

*Visual Character:* The project site is situated at the northern border of St Helena's urban limits where medium density housing development is bordered by agricultural land uses immediately to the north and east. Therefore, the visual character of the project area is comprised of both residential scale single-family residences (south and west) and agricultural uses including processing and storage (north, east, and west).

*Sensitive Viewpoints:* Based upon the CEQA Guidelines checklist and on land uses that are commonly seen by regulatory agencies as visually sensitive, for the purpose of this report potentially sensitive viewpoints would include scenic vistas, scenic highways, residential views, public parks, recreational areas, and / or important historic locations from which the project could potentially be visible.

A scenic vista is defined as an area that is designated, signed, and accessible to the public for the express purpose of viewing and sightseeing. This includes any such areas designate by a federal date, or local agency. A "Scenic Highway" is defined as any stretch of public roadway that is designated as a scenic corridor by a federal, state or local agency. While, not currently listed as a scenic highway, portions of Hwy 29 within the vicinity of the project site have been identified as eligible by the State of California. Further, the City of St Helena has identified submission of Hwy 29 for Scenic Highway status as a goal of its General Plan. As such, this assessment treats Hwy 29 as a scenic resource for assessment purposes (SV1).

Views from public parks, recreational trails, and/or important historic sites have high visual sensitivities. Each are considered sensitive viewpoints. Field inspection and document research identified Beringer Vineyards and the CIA Greystone Campus formerly Greystone Vineyard property are known historic resources within proximity of the proposed project site. No locations were identified where the project site is visible from the Beringer property and therefore removed from consideration. Only Greystone possesses high visual sensitivity. As such, this viewpoint is identified as SV2 and potential impacts to this viewpoint are assessed.

Visual Impact Assessment  
830 Pratt Avenue  
St Helena, CA

*View Groups:* Viewers of project features can be categorized in the following view groups:

- Pedestrians – Pedestrians walking to and from within the project area, or other streets that offer view of the project area.
- Cyclists – cyclists riding to and from along Pratt Avenue and Vineyard Road within the right-of-way adjacent to the project.
- Motorists – automobile and truck drivers and passengers traveling past the project area.
- Residents – residents who live along Pratt Avenue in view of the project area.
- Tourists – visitors/tourists who have traveled along Pratt Avenue with the intention of experiencing the visual resources of the area and wineries to the east.

Pedestrians, Cyclists, and Motorists groups tend to have a more dynamic and a less prolonged view of landscape features elements. Of the five (5) view groups, neighboring residential viewers have a higher visual sensitivity resulting from extended viewing periods than other view groups. For this reason, residential views are typically considered sensitive. Views from public parks, recreational trails, and/or important historic sites have high visual sensitivities and considered sensitive viewpoints

The City of St Helena identified six (6) locations where it is likely the proposed project would have the potential to affect sensitive residential viewer group and other secondary view groups. The six viewpoints (VP1-VP6) are described and the proposed project impacts are analyzed in the following section.

## 5. Potential Project Impacts / Affected Environment

### *Summary of Visual Impacts*

#### **SV1 Viewpoint from Eligible Scenic Hwy 29 at Pratt Avenue toward Project Site:**

The proposed project site is located approximately 1,350 feet east of State Highway (Hwy) 29. Sparsely located mature landscaping and varying changes in terrain characterize the view from this viewpoint. From Hwy 29 the project site is identified by a group of mature trees including a camphor tree in the southwest corner of the property.

Viewed from this location, the pre-project scenic quality rating scores and the post-project scores noted in the SV1 Quality Rating Table indicate the proposed project does not measurably alter the viewer's perception. Therefore, the proposed project would not have an impact on the features viewed from this eligible scenic highway.

| SV1 Scenic Quality Rating |                          |                           |
|---------------------------|--------------------------|---------------------------|
| <i>Criteria</i>           | <i>Pre-Project Score</i> | <i>Post-Project Score</i> |
| Landform                  | 1                        | 1                         |
| Vegetation                | 1                        | 1                         |
| Water                     | 1                        | 1                         |
| Color                     | 1                        | 1                         |
| Adjacent Scenery          | 3                        | 3                         |
| Scarcity                  | 3                        | 3                         |
| Cultural Modifications    | 0                        | 0                         |
| <i>Total Score</i>        | <i>10</i>                | <i>10</i>                 |

Limited view of proposed project. Does not appear not to have an impact on visible resources from this viewpoint.

Visual Impact Assessment  
830 Pratt Avenue  
St Helena, CA

**SV2 Viewpoint from Historic Resource (Hwy 29 at CIA Greystone) looking toward the project site:**

Views of the project site from viewpoints north of Pratt Avenue along Hwy 29 are characterized by an undulating valley floor landscape with clusters of planted mature trees near residential and commercial activities. The viewpoint from the north at the entrance to The Greystone campus of the Culinary Institute of America, across the valley toward the project site is interrupted by Beringer Vineyards production and storage facilities (Figure 2). The current Vineyard Lodge II and adjacent proposed project are located south and east of the Beringer facilities and are minimally visible from this viewpoint.

As illustrated by the SV2 Scenic Quality Rating, the baseline visual quality score for this viewpoint is rated at 10 points. The post-project visual quality score for the same viewpoint is also rated at 10 points. The reviewers found no discernable difference in the two views.

Given the distance from the project site, the character and nature of the existing land uses around the site and the project's visual changes are minimally different from what is presently seen. The scale of project features do not dominate the visual landscape nor do they impede views of the surrounding environment. Therefore, visual impacts from SV2 are less than significant.

Viewed from this location, the pre-project scenic quality rating scores and the post-project scores as noted in the SV2 Quality Rating Table indicate the proposed project does not measurably alter the viewer's perception of the environment and would not have an impact on the features viewed from this historic resource.

| SV2 Scenic Quality Rating |                          |                           |
|---------------------------|--------------------------|---------------------------|
| <i>Criteria</i>           | <i>Pre-Project Score</i> | <i>Post-Project Score</i> |
| Landform                  | 1                        | 1                         |
| Vegetation                | 1                        | 1                         |
| Water                     | 1                        | 1                         |
| Color                     | 1                        | 1                         |
| Adjacent Scenery          | 3                        | 3                         |
| Scarcity                  | 3                        | 3                         |

| <i>Total Score</i>        | <i>10</i>                | <i>10</i>                 |

**VP1 Viewpoint looking west from the center of Pratt Avenue and fifty feet from the eastern corner of the project site:**

The pre-project setting is characterized by a predominance of foreground trees bordering Pratt Avenue and Vineyard Road. From this viewpoint, the existing Vineyard I and II buildings are minor features located in the background behind perimeter landscaping. A narrow portion of the Mayacamas range is visible within the Pratt Avenue right-of-way and hills are viewed through the project site. Through a break in the property's perimeter trees and over existing Lodge I roof, the background hillside beyond Hwy 29 is visible.

The post-project view of the site as evidenced by the VP1 Scenic Quality Rating identifies an impact to this view as the result of replacing the surface parking area and existing interior trees with Buildings A & B at the Pratt Avenue and Vineyard Road corner of the property.

From this viewpoint, the post-project simulation include existing and proposed landscape improvements based on five (5) years of growth. The landscaped perimeter remains a prominent visual feature and acts to screen buildings A & B at Pratt Avenue and Vineyard Road. Retention of existing trees adjacent to the public right-of-way, and the addition of proposed new trees, which over time will further reduce the prominence of the buildings, the visual change is reduced to less than significant.

Visual Impact Assessment  
830 Pratt Avenue  
St Helena, CA

VP1 Scenic Quality Rating

| <i>Criteria</i>        | <i>Pre-Project Score</i> | <i>Post-Project Score</i> |
|------------------------|--------------------------|---------------------------|
| Landform               | 1                        | 1                         |
| Vegetation             | 3                        | 3                         |
| Water                  | 1                        | 1                         |
| Color                  | 1                        | 1                         |
| Adjacent Scenery       | 3                        | 1                         |
| Scarcity               | 1                        | 1                         |
| Cultural Modifications | 0                        | 0                         |
| <i>Total Score</i>     | <i>10</i>                | <i>8</i>                  |

*Proposed project has an impact to this view. New landscape treatment reduces the impact to less than significant.*

**VP2 Viewpoint looking east from the center of Pratt Avenue and fifty feet from the western corner of the project site:**

The pre-project viewpoint illustrates the prominence of existing trees along Pratt Avenue and along the railroad right-of-way largely screen the one-story Vineyard Lodge I. Middle ground hills are visible east along the Pratt Avenue right-of-way. The Vaca Mountain ridgeline is visible beyond the thirty-two foot (32'-0") high Vineyard Lodge II to the north and east.

Portions of proposed project Buildings A & C replace Vineyard Lodge I. The introduction of new landscape trees at or near the railroad right-of-way reduces the visual impact of new construction. The introduction of new construction is a visual change. However, the siting, design, height, materials and color selection contribute to reduce perceived visual changes.

As the VP2 Scenic Quality Ratings indicate, pre-project and post-project scores are the same (10). The difference between the pre-project qualities and the post-project qualities do not measurably alter the viewer's perception of the environment and would not have an impact from this viewpoint.

VP2 Scenic Quality Rating

| <i>Criteria</i>        | <i>Pre-Project Score</i> | <i>Post-Project Score</i> |
|------------------------|--------------------------|---------------------------|
| Landform               | 1                        | 1                         |
| Vegetation             | 3                        | 3                         |
| Water                  | 1                        | 1                         |
| Color                  | 1                        | 1                         |
| Adjacent Scenery       | 3                        | 3                         |
| Scarcity               | 1                        | 1                         |
| Cultural Modifications | 0                        | 0                         |
| <i>Total Score</i>     | <i>10</i>                | <i>10</i>                 |

*The proposed project appears to have no impact on the environment from this viewpoint.*

**VP3 Viewpoint looking west from the center of Pratt Avenue and approximately 200 feet from the eastern corner of the project site:**

The pre-project foreground view is composed of vineyard plantings, trees along Vineyard Road that provide partial views of Vineyard Lodge I and II, and mountain range in the background within the Pratt Avenue right-of-way. The middle ground hillside is visible above the cultural modifications, Vineyard Lodge II.

The post-project simulation view indicates proposed buildings will be visible above the tree line located at the site's perimeter. The siting, design, and overall height of the proposed project are similar to the existing cultural modifications, Vineyard Lodge I and nearby residential properties south of Pratt Avenue. Although the comparison of pre- and post-project views confirms a visual change, the viewers' perception of the surrounding environment is not significantly different in the pre-and post-project views.

Visual Impact Assessment  
830 Pratt Avenue  
St Helena, CA

As a result of the proposed landscape, the VP3 Scenic Quality Rating scores indicate the proposed project does not measurably alter the viewer's perception of the environment and would not have an impact on the features from this viewpoint.

| VP3 Scenic Quality Rating |                          |                           |
|---------------------------|--------------------------|---------------------------|
| <i>Criteria</i>           | <i>Pre-Project Score</i> | <i>Post-Project Score</i> |
| Landform                  | 1                        | 1                         |
| Vegetation                | 3                        | 3                         |
| Water                     | 1                        | 1                         |
| Color                     | 1                        | 1                         |
| Adjacent Scenery          | 3                        | 3                         |
| Scarcity                  | 1                        | 1                         |
| Cultural Modifications    | 0                        | 0                         |
| <i>Total Score</i>        | <i>10</i>                | <i>10</i>                 |

*The proposed project appears to have no impact from this viewpoint.*

**VP4 Viewpoint looking east from the center of Pratt Avenue and approximately 200 feet from the western corner of the project site:**

The pre-project view is composed of planted vineyard in the foreground screening all but the roof and chimneys of Vineyard Lodge I, and the roof of Vineyard Lodge II. Hills to the east-northeast form the visible middle ground throughout the view with a portion of the Vaca Mountains visible in the background.

The post-project view of the site as evidenced by the VP4 Scenic Quality Rating identifies an impact to this view as the result of replacing the single story Vineyard Lodge I with Buildings B & C (Cultural Modifications). The post-project simulation indicates the added landscape features have been located to reduce the presence of the proposed modifications. The design, materials and color selections further contribute to reducing the impact to visual quality.

From this viewpoint, the post-project simulation indicates the proposed landscape and trees reduce the prominence of the proposed cultural modifications to less than significant.

| VP4 Scenic Quality Rating |                          |                           |
|---------------------------|--------------------------|---------------------------|
| <i>Criteria</i>           | <i>Pre-Project Score</i> | <i>Post-Project Score</i> |
| Landform                  | 1                        | 1                         |
| Vegetation                | 3                        | 3                         |
| Water                     | 1                        | 1                         |

| <i>Total Score</i>        | <i>10</i>                | <i>6</i>                  |

*Proposed project has an impact to this view. New landscape treatment reduces the impact to less than significant.*

**VP5 Viewpoint looking north from the south side of Pratt Avenue aligning with driveway adjacent to railroad right-of-way:**

The pre-project view is dominated by mature trees adjacent to the Pratt Avenue right-of-way. Cultural modifications including utility poles, overhead utility lines, rail crossing arms and utility boxes are located in the foreground. The hillside as middle ground is a minor feature from this viewpoint. Similarly, the Vaca Mountains within the railroad right-of-way is a minor component in the background. Trees within the railroad right-of-way help define the western boundary of the project site.

Visual Impact Assessment  
830 Pratt Avenue  
St Helena, CA

Viewed from this location, the pre-project scenic quality rating scores and the post-project scores as noted in the VP5 Scenic Quality Rating indicate the proposed project does not measurably alter the viewer's perception of the environment and would not have an impact from this viewpoint.

| VP5 Scenic Quality Rating |                          |                           |
|---------------------------|--------------------------|---------------------------|
| <i>Criteria</i>           | <i>Pre-Project Score</i> | <i>Post-Project Score</i> |
| Landform                  | 1                        | 1                         |
| Vegetation                | 1                        | 1                         |
| Water                     | 1                        | 1                         |
| Color                     | 1                        | 1                         |
| Adjacent Scenery          | 1                        | 1                         |
| Scarcity                  | 1                        | 1                         |
| Cultural Modifications    | 0                        | 0                         |
| <i>Total Score</i>        | <i>6</i>                 | <i>6</i>                  |

*From VP5 the proposed project appears to have no impact from this viewpoint.*

**VP6 Viewpoint looking north from the south side of Pratt Avenue at the midpoint of the Pratt Avenue frontage of the project site:**

The pre-project view of the project site is located near the center of the Pratt Avenue property line, opposite one of the two entry / exits to the property's surface parking. Mature trees that line the property along Pratt Avenue are located to the east and west. Existing trees at the site's interior partially screen Vineyard Lodge I to the west and Vineyard Lodge II to the North. Minimally visible, the hillside forms the middle ground in this view. A small portion of the Mayacamas range is visible near the center of the viewpoint.

The post-project simulation illustrates Buildings A & B placed on the site set back 20'-0" from the property line. The buildings are screened by the insertion of trees and landscaping replacing existing driveways, which complete the row of trees along Pratt Avenue. The multi-building plan provides the project with a scale and character consistent with Vineyard Lodge II. The architectural features further articulate the structures to blend with the residential qualities of nearby properties along Pratt Avenue.

The cultural modifications score of the VP6 Scenic Quality Rating indicates a reduction in scenic quality. The proposed project provides for increasing the amount of landscaping within the setback along Pratt Avenue to mitigate the reduced visual quality residential and other view groups may experience. Further, the building design, materials and color selections were devised to reduce Building A & C's scale to a residential character and blend into the surrounding land features.

With retention of existing trees adjacent to the public right-of-way and the addition of proposed new trees, which at maturity will further reduce the prominence of the buildings, the visual change is reduced to less than significant.

| VP6 Scenic Quality Rating |                          |                           |

Visual Impact Assessment  
830 Pratt Avenue  
St Helena, CA

## 6. Conclusions

This assessment identified eight sensitive viewpoints. Two long distant viewpoints (SV1 and SV2) that assessed potential impacts from Hwy 29 at Pratt Avenue, an eligible scenic highway, and the CIA at Greystone, a historic resource with a view of the project site. Six viewpoints (VP1-VP6) were selected to study the project form locations that may be seen by nearby residential viewers.

The distant viewpoint (SV1) at Highway 29 and Pratt Avenue, as well as the view from the CIA at Greystone (SV2) resulted in no visual impact in these highly sensitive locations.

Three of the six viewpoints (VP2, VP3, and VP5) were found to have no impact on visual quality. The three remaining, (VP1, VP4, and VP6) were found to have a less than significant impact on visual quality of the surrounding environment. The result of the foregoing analysis indicates the project from both the distant locations (SV1 and SV2) and nearby residential viewpoints (VP1 – VP6) would have a less than significant impact.

WATER AVAILABILITY ANALYSIS**

**PROJECT DESCRIPTION**

The Culinary Institute of America (CIA) consists of a Greystone campus, located at 2555 Main Street, St. Helena, and a Vineyard Lodge campus, located at 830 Pratt Avenue, St Helena. The Greystone campus currently has an enrollment of 200 students and provides housing for 101 students in dormitories at Vineyard Lodge and up to 38 students at Greystone. CIA is proposing a Use Permit amendment to expand enrollment to 300 students and to add dormitories for 123 students and 1 education staff at the Vineyard Lodge campus. CIA also plans to relocate some activities to the Copia Building in Napa to reduce employees and students at the Greystone and Vineyard Lodge campuses. The Vineyard Lodge will upgrade the current student lodges to provide a maximum occupancy of 224 residents.

The Wine Spectator Greystone Restaurant (WSGR), at Greystone, currently operates 362 days a year with 190 seats for lunch and dinner service. This restaurant will be closed and the Flavor Discovery Center (FDC) will take the place of the WSGR. The FDC will serve meals only 180 days per year with an average of 58 guests per day; therefore, reducing overall annual water use at the Greystone campus.

**WATER USE AGREEMENT**

The CIA Vineyard Lodge and Greystone properties currently operate under an amended water use agreement (Resolution No. 2008-77) in which 1,600 gpd of water allotment was transferred from the Greystone property to the Vineyard Lodge property to meet the water demand of a new dormitory building. The resulting current City water allotments for the 2 properties are as follows:

|                         |                                                                         |

Water Availability Analysis

The onsite well at Greystone is currently used for landscape irrigation only, and the well will continue to be used only for landscape irrigation in accordance with the City of St. Helena Municipal Code.

**EXISTING WATER USE**

The existing water demand estimates for the Greystone and Vineyard Lodge campuses are presented in Table 1. The restaurant, café, campus store, and general hospitality at Greystone are closed during the holidays. The Vineyard Lodge is closed to students during the 8 weeks of vacation (spring and summer breaks, Thanksgiving, Christmas and holidays). During these 8 weeks of breaks, 50% of the instructors and education staff are present during 5 weeks, and no instructors or education staff are present for 3 weeks.

Data records from 2014 and 2015 show that the average water use at Greystone during this period was 17,105 gal/day with an annual water use of 18.78 ac-ft, which is above the current allotment. As described in the following pages, the reduction in students and per capita use, accompanied by an increase in water efficiency measures from new dishwashers and appliances, and a leak detection program, will substantially decrease the overall water use at the Greystone site. Leaks have been identified at the site as a major source of water inefficiency and cause for allotment exceedances, and these will be repaired as part of the facility upgrades. Existing landscape irrigation demands are provided by an onsite well at Greystone.

Based on a review of water use and occupancy data at the Vineyard Lodge from 2014 and 2015, the estimated per capita water use is 63 gpd per resident. This number is derived from actual flow data, and includes water used for landscaping which is not metered separately. The estimated existing water use for Vineyard Lodge is approximately 6,373 gpd on average, or 6.03 ac-ft/year, which is above the current water allotment.

Table 1. Estimated Existing Water Use at Greystone &amp; Vineyard Lodge

| Type of Water Use      | Existing Count | Water Demand (gpd) | Water Use (gpcd) | Annual Use (days/year) | Annual Demand (ac-ft./year) |
|------------------------|----------------|--------------------|------------------|------------------------|-----------------------------|

Water Availability Analysis

**PROPOSED WATER USE****Greystone Campus**

The proposed water uses for the Greystone and Vineyard Lodge campuses are presented in the following tables. The WSGR restaurant will be closed and the FDC will only be open 180 days a year. The FDC restaurant will utilize water efficient appliances, further contributing to the reduction in water demand for this site. The café, campus store, and hospitality will remain closed during the holidays. Only 50% of the instructors and education staff will remain present during 5 of the 8 weeks. Please see Enclosure A for detailed water use estimates.

**CIA GREYSTONE & VINEYARD LODGE USE PERMIT ASSISTANCE**

Project No. 2016039 & 2016040

June 14, 2016

Revised September 2, 2016

**SUMMIT ENGINEERING, INC.**

Water Availability Analysis

\* The Environmental Protection Agency's Onsite Wastewater Treatment Systems manual recommends a daily flow rate of 25-60 gpcd for boarding houses

The projected water use for Greystone is approximately 12,147 gal/day peak flow, but when factoring in the annual use, the average daily flow becomes 10,276 gal/day, corresponding to 11.51 ac-ft/year. This estimate is below the current water allotment and less than the existing estimated water use for the site.

**Vineyard Lodge**

Students will spend a large portion of their day outside of the dormitories, so a value less than the typical daily per capita water use estimate is used to calculate proposed water use. Based on billing data, the average daily water use for the Pratt Avenue site from May 2014 through May 2015 was 6,373 gpd based on billing records, with a total occupancy of 101 residents, resulting in an average water demand of approximately 63 gallons per capita per day (gpcd). A flow rate of 65 gpcd is therefore used to be conservative to calculate the water demand for the existing dormitory building that will remain. The vineyard lodge will remain closed to students during the 8 weeks of vacation and closed to instructors and staff for 3 weeks of that vacation period.

For the proposed dormitory buildings, the City of St. Helena Water Neutral Policy for Development provides a method for estimating proposed water demand based on fixture flow rates and use assumptions. The following calculations show that the estimated residential water demand for the proposed buildings should be approximately 35 gpcd due to new water efficient fixtures and appliances, and new plumbing infrastructure.

Table 3. Proposed Dormitory Buildings – Water Demand

| <b>Fixture</b>                               | <b>Flow Rate</b> |      |           | <b>Flow Duration</b> |      |                      | <b>Occupants</b> |     |           | <b>Water Use</b> |                      |

No dishwashers will be installed in the kitchen/common areas. To account for the additional demand required to hand wash dishes, an additional kitchen faucet source was included, equivalent to three times the anticipated dishwasher water demand anticipated in the City of St. Helena Water Neutral

**CIA GREYSTONE & VINEYARD LODGE USE PERMIT ASSISTANCE**

Project No. 2016039 &amp; 2016040

June 14, 2016

Revised September 2, 2016

**SUMMIT ENGINEERING, INC.**

Water Availability Analysis

Policy guidelines. The estimated dishwasher rate is based on 6.3 gal/load, 0.1 load/day/occupant, and 164 occupants, for a total of approximately 103 gallons per day. Therefore 309 gpd was added to the kitchen faucet use, or 1.265 min/occupant/day in addition to the typical 4 min/day/occupant assumed in the Water Neutral Policy. This should adequately account for the amount of additional water used per occupant at the kitchen faucet for dishwashing purposes.

Manufacturer's specification sheets for the included fixtures are included in Enclosure B. The 164 occupants total within the three new buildings should require approximately 5,128 gal/day of domestic water in total, which equates to 31.5 gpcd. For design purposes, an estimated 35 gpcd was used for per capita water demand. Combining the estimated water demand for the existing and proposed buildings, and summing over an annual basis provides the total proposed domestic water use for the Vineyard Lodge.

Table 4. Estimated Proposed Water Use at Vineyard Lodge

| Type of Water Use                   | Proposed Count | Water Use (gpcd) | Water Demand (gpd) | Annual Use (days/year) | Annual Demand (ac-ft./year) |
|-------------------------------------|----------------|------------------|--------------------|------------------------|-----------------------------|
| <u>Existing Dormitory Building:</u> |                |                  |                    |                        |                             |
| Students (bed count)                | 59             | 63 <sup>a</sup>  | 3,717              | 308                    | 3.51                        |

| Students                            | 164            | 35 <sup>b</sup>  | 5,740              | 308                    | 5.43                        |
| <b>TOTAL</b>                        | <b>224</b>     |                  | <b>9,520</b>       |                        | <b>9.00</b>                 |

<sup>a</sup> Based on a review of water use and occupancy data at the Vineyard Lodge from 2014 and 2015, the estimated per capita water use is 63 gpd per resident.

<sup>b</sup> Based on the fixture parameters and flow described above and included in Table 3.

The estimated proposed water use for Vineyard Lodge is approximately 9,605 gal/day peak flow (8.98 ac-ft/year), which is above the current water allotment. It is proposed that the existing water allotment be revised to redistribute excess allotment from Greystone to Vineyard Lodge to account for the increase in demand from the new dormitory buildings.

Revised September 2, 2016

**SUMMIT ENGINEERING, INC.**

Water Availability Analysis

**LANDSCAPE IRRIGATION WATER USE – VINEYARD LODGE**

A landscape area of approximately 32,905 sf is proposed as part of the Vineyard Lodge improvements. The landscaping will consist of 100% low water use xeriscape, and will require approximately 0.73 ac-ft of water per year, or 650 gallons of water per day. This estimate is based on the Water Efficient Landscape Worksheet for the City of St. Helena provided by the project landscape architect. Please refer to the landscape plans and calculations for details.

**CONCLUSION**

Based on the proposed changes to student and employee numbers and session scheduling at Greystone, and the new dormitory buildings at Vineyard Lodge, the combined annual water demand for both sites should be within the existing combined water allotment of 23.1 ac-ft./year. A comparison of the baseline existing and proposed demand, as well as the initial allocation of annual water supply for operational purposes is included in Table 5. Within this table, the demand estimates in gallons per day represent peak demand, and the acre-ft/year values represent annual operations at less than 365 days/year as described previously in this report.

In order to meet the specific needs of each site, CIA proposes to combine the allotments for each property into one water agreement so that water can be used between the two properties as required, while staying under the total existing water allotment of 23.1 ac-ft./year. Approval from the City Council of St. Helena will be sought in order to restructure the water allocation agreement into a shared agreement for the two facilities. Should a shared water agreement not be possible, CIA is proposing an equal redistribution.

Table 5. Proposed Water Allotment for CIA

| Site               | Existing Allotment | Baseline Existing Demand* |              | Proposed Demand |              | Proposed Redistribution |             |

**SUMMIT ENGINEERING, INC.**

Water Availability Analysis

Although the measured baseline existing use is above the current water allotment, because of the changes to the facility's programming and more efficient fixtures, the proposed demand is less than the total water allotment for both properties. CIA proposes the retrofits as well as a reduction in the number of students and restaurant guests described above at the Greystone facility, to offset the increased water use proposed for the Pratt Avenue site. These retrofits and reductions are proposed in accordance with the City of St. Helena Water Neutral Policy for Development (off-site retrofits), and should provide a substantial reduction from the measured existing water demand. Therefore, the zero net water increase between these properties as required by the Water Neutral policy will be met.

**MANUFACTURER'S SPECIFICATION SHEETS FOR FIXTURES**

*American Standard*  
Style That Works Better

**L-1**

**SELECTRONIC™**  
**ELECTRONIC PROXIMITY LAVATORY FAUCET**

### GENERAL DESCRIPTION:

Electronic faucet with proximity operation. Vandal-resistant solid brass construction with single post mounting. Operates on DC (battery) or AC permanent power. Water pressure range from 20 to 125 psi. Single inlet 15" flexible stainless steel hose with 3/8" compression fitting for spout connection.

### PRODUCT FEATURES:

**Vandal-Resistant Brass Body:** Durable - Excellent in high use applications.

**Power Options:**

- **Battery** - Approx. 4 years with Lithium Battery CR-P2
- **Plug-In - Integral** low voltage transformer (115 VAC supply) with 6 foot long power supply.

**Easy and Flexible Installation:**

Single post mounting with optional 4" and 8" Deck plate. Water resistant solenoid enclosure mounts to wall.

**Integrated; Easy Service Strainer:**

Patented integrated strainer enclosed in removable debris cup protects the solenoid valve and aerator from debris. Perforated stainless steel strainer is low maintenance and can be easily accessed.

**Temperature Mixing:**

Optional thermostatic mixing valve meets ASSE 1016 performance and anti-scald requirements at 0.5 GPM. Mixing valve will connect directly to solenoid inlet and is housed in matching enclosure.

**End Device:**

Choice of 0.5 GPM (1.9 L/min) pressure compensating, vandal-resistant spray or 1.5 GPM (5.7L/min) pressure compensating, vandal-resistant aerator.

### CODES AND STANDARDS:

These products meet or exceed the following codes & standards:

ANSI A117.1  
ASME A112.18.1  
CSA B 125  
NSF 61/Section 9

**ADA Compliant**

### MODEL NUMBER:

■ **DC POWERED; single inlet**

- ☒ **6055.105** with cast spout, 0.5 GPM pressure compensating, vandal-resistant spray.
- ☐ **6055.102** with cast spout, 1.5 GPM pressure compensating, vandal-resistant aerator.

■ **AC POWERED; single inlet**

- ☐ **6056.105** with cast spout, 0.5 GPM pressure compensating, vandal-resistant spray. Includes AC power supply.
- ☐ **6056.102** with cast spout, 1.5 GPM pressure compensating, vandal-resistant aerator. Includes AC power supply.

■ **MULTI AC POWERED; single inlet**

- ☐ **6057.105** with cast spout, 0.5 GPM pressure compensating, vandal-resistant spray. One power supply (sold separately) can operate up to 15 faucets in series. 10' extension cable included.
- ☐ **6057.102** with cast spout, 1.5 GPM pressure compensating, vandal-resistant aerator. One power supply (sold separately) can operate up to 15 faucets in series. 10' extension cable included.

■ **OPTIONAL 4" or 8" Deck plates**

- ☐ **605P.400** 4" brass deck plate with 1/4" fixation studs and quick spin nuts. (6-1/8" x 2-1/8" x 1/2")
- ☐ **605P.800** 8" brass deck plate with 1/4" fixation studs and quick spin nuts. (10-1/8" x 2-3/8" x 1/2")

■ **OPTIONAL Mixing Valve**

- ☐ **605XTMV** Thermostatic mixing valve, flex hoses 3/8" compression 20" hose length.

### RECOMMENDED SPECIFICATION

Electronic Proximity Lavatory shall feature vandal resistant all brass body with single inlet, and in-line strainer. Shall also feature a low energy use electronically operated solenoid valve and microprocessor controlled proximity sensors. Shall meet ANSI A112.18.1M and ANSI 117.1 codes. Fitting shall be American Standard Model # 6055\_\_\_\_, 6056\_\_\_\_, 6057\_\_\_\_.

## Sloan ECOS® Flushometers

### ECOS 8111-1.28

WC-1

#### ► Code Number

3370448

#### ► Description

Exposed, Battery Powered, Sensor Activated ECOS® Model Water Closet Flushometer for floor mounted or wall hung top spud bowls.

#### ► Flush Cycle

Model 8113-3.5 Low Consumption (3.5 gpf/13.2 Lpf)

Model 8111 Low Consumption (1.6 gpf/6.0 Lpf)

#### ► Specifications

Quiet, Exposed, Diaphragm Type, Closet Flushometer for either left or right hand supply with the following features:

- Vacuum Breaker Flush Connection and Spud Coupling, Wall and Spud Flanges
- Spud Coupling and Flange for 1½" Top Spud
- Flush Accuracy Controlled by CID Technology
- Sweat Solder Adapter with Cover Tube and Cast Set Screw Wall Flange
- Diaphragm, Stop Seat and Vacuum Breaker to be molded from PERMEX® rubber compound for Chloramine resistance
- Infrared Sensor with Multiple-focused, Lobular Sensing Fields for high and low target detection
- Initial Set-up Range Indicator Light (first 10 minutes)
- User friendly three (3) second Flush Delay
- "Low" Flashing LED
- ADA Compliant Battery Powered Infrared Sensor for automatic "No Hands" operation
- 1" I.P.S. Screwdriver Bak-Chek® Angle Stop with free spinning, vandal resistant Stop Cap with Adjustable Tailpiece
- Infrared Sensor with Multiple-focused, Lobular Sensing Fields for high and low target detection
- Latching Solenoid Operator
- Infrared Sensor Range Adjustment Screw
- Fixed Metering Bypass and No External Volume Adjustment to Ensure Water Conservation
- Flex Tube Diaphragm designed for improved life and reduced maintenance
- Engineered Metal Cover with replaceable Lens Window
- Courtesy Flush® Override Button
- Four (4) Size AA Batteries factory installed

Valve Body, Tailpiece and Control Stop shall be in conformance with ASTM Alloy Classification for Semi-Red Brass. Valve shall be in compliance with the applicable sections of ASSE 1037. Installation conforms to ADA requirements.

#### ► Automatic Operation

Sloan ECOS® Flushometers activate via multi-lobular sensor detection to provide the ultimate in sanitary protection and automatic operation. A battery powered infrared sensor sets the flushing mechanism after the user is detected and Completes the flush when the user steps away.

#### ► Functional & Hygienic

Touchless, sensor operation eliminates the need for user contact to help control the spread of infectious diseases. The G2 Optima Plus® Flushometer is provided with an Override Button to allow a "courtesy flush" for individual user comfort.

#### ► Economical

Sloan installed batteries speed installation and provide years of metered flushing to control the use of water and energy. Batteries can be changed without turning off the water.

#### ► Compliance

This space for Architect/Engineer Approval

#### ► ELECTRICAL SPECIFICATIONS

1480 Main Street  
St. Helena, CA 94574

RE: Culinary Institute of America Expansion

Dear Mr. Housh,

This law firm represents a group of concerned St. Helena citizens ("Citizens"). Our clients are troubled by the size and scale of the Culinary Institute of America ("CIA") expansion of their Greystone campus located at 2555 Main Street ("Greystone Property") and their Vineyard Lodge Housing development on 830 Pratt Avenue in St. Helena ("Vineyard Lodge") (collectively the "Project").

The CIA has applied to the City of St. Helena ("City") to dramatically expand their services. In a city with less than 6000 residents, the environmental impacts of this Project will be significant. The CIA has applied for the following:

- **Increase** the enrolment to the CIA by **100** permanent residents for a total student body of 300 students.
- **Increase** the number of permanent staff by 7 teachers.
- Building of **new** 4468 sf storage cave.
- Three **new** residential buildings for CIA students ("Dormitories")
  - Building A is 17,885 sf (70 Beds)
  - Building B is 11,380 sf (52 Beds)
  - Building C is 11,380 sf (42 Beds)

**Total new Dormitory square footage is 40,645**

**Total number of students at the Vineyard Lodge is 224 (Increase of 123)**

Total of 72 parking places for 224 occupants which requires a Variance.

- Adding over 40,000 square feet of urban use **outside of the Urban Limit Line of the City.**

- Adding to additional traffic to Hwy 29/ Pratt Avenue intersection where the Level of Service (“LOS”) is below the required standards.

#### Standard for Project Review

Under CEQA, an initial study is conducted to determine the level of environmental review required for CEQA compliance. *CEQA Guidelines Section 15063*. With this Project, the City of St. Helena, as the lead agency, conducted an initial study and determined that a mitigated negative declaration is the appropriate environmental review for this Project, rather than an Environmental Impact Report (EIR). As we will outline in this letter, we believe that several Project features were improperly analyzed or overlooked in the initial study and that the Project will have significant environmental impacts. Therefore, a Mitigated Negative Declaration is not the appropriate environmental document for this Project, and the City should initiate an EIR to analyze the environmental impacts of this Project.

CEQA requires the preparation of an EIR whenever it can be fairly argued on the basis of substantial evidence that the project may have a significant environmental impact. *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal. 3d 68, 75. CEQA Guidelines section 15382 defines the term “significant effect on the environment” as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance.”

#### Cumulative Impacts

In addition to evaluating the direct and indirect impacts caused by this Project, the City of St. Helena must also “assess whether a cumulative effect requires an EIR.” *CEQA Guidelines Section 15604 (h)(1)*. According to the CEQA Guidelines, when assessing whether a cumulative effect requires an EIR, the lead agency shall consider whether the cumulative impact is significant and whether the effects of the project are cumulatively considerable. An EIR must be prepared if the cumulative impact may be significant and the project’s incremental effect, though individually limited, is cumulatively considerable. Cumulatively considerable means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. *CEQA Guidelines Section 15064 (h)(1)*.

In order to flesh out the circumstances in which the incremental effects of an individual project are cumulatively considerable the agency must first incorporate mitigation measures into the project such that it’s incremental impact is no longer cumulatively considerable. The initial study should explain why the identified mitigation measures will render the project’s contribution less than cumulatively considerable. *CEQA Guidelines Section 15064 (h)(2)*. Next the agency may determine that a project’s

Mr. Housh  
February 17, 2017  
Page 3 of 7

incremental contribution to cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program which provides specific requirements that will avoid or substantially lessen the cumulative problem...within the geographic area in which the project is located.”

The Court of Appeal in *Communities for a Better Environment v. California Resources Agency* (3d Dist. 2002) 103 Cal. App. 4<sup>th</sup> 98, emphasized that the lead agency must examine the impacts of the project under review against the backdrop of the cumulative conditions, and may not rely on the fact that a particular project’s impacts are small in comparison to a large environmental problem, such as traffic, water quality, or air quality. Accordingly, in considering whether a project’s impacts are “cumulatively considerable” the agency may not employ a “de minimis” rationale because to do so would ignore the potential impacts of the project in combination with past, present or future projects.

This cumulative impact analysis for this Project specifically applies to the traffic impacts. The 1993 St. Helena General Plan specified Roadway and Intersection Criteria to identify potential impacts from proposed development projects. The 1993 General Plan states that: All unsignalized intersections must maintain LOS C. In the initial study completed by the City it states that “with the project, study intersections will improve slightly with the exception of Pratt Ave./ SR Hwy 29 WB which will operate unacceptably under LOS “F” during AM and PM Peak hours with and without the project under both scenarios for baseline and future conditions.” Further, the Project’s traffic study specifically identifies a significant impact. The study states “Westbound Pratt Avenue turns would experience extreme delays (LOS F).... The project increment of 4 trips **would add to the existing lengthy delays**; it would add 5.5 percent additional traffic to the westbound intersection approach during the AM and PM peak hours.”

The Project’s initial study failed to complete a proper cumulative impact analysis. If a cumulative impact analysis was properly done, the City would have concluded that potential impacts of past, current and future impacts on the Hwy 29/ Pratt Avenue intersection creates a potentially significant impact at this location. When an incremental impact of a project is cumulatively considerable, an agency must discuss that impact in an EIR. Since this Project incrementally contributes to a significant impact, an Environmental Impact Report must be conducted in order to properly analyze the cumulative impacts of the Project.

#### Indirect Impacts

Although items like waste water, water supply, and public services have been deemed to be less than a significant impact in the initial study, what is troubling, and it is not contemplated in the initial study, is that this Project is using up the City’s precious and finite resources, and that the approval of this Project could potentially prevent future and more meaningful projects from acquiring conditional use permit approval. With this

Mr. Housh  
 February 17, 2017  
 Page 4 of 7

Project, the City would be adding **100** new City residents for a total of 300 students in perpetuity. If the City uses up their limited public infrastructure and resources on this Project, then it may not have the capacity to approve projects that are necessary for the City like: local serving businesses, family housing, and hotels that produce transient occupancy tax revenue, since those types of projects may push the City over an environmental threshold in terms of the City's ability to provide municipal services like drinking water and proper disposal of wastewater.

The indirect impacts of this Project have not been analyzed and they could be significant. The City has a fragile and limited budget and failing municipal services. The City Manager in an article printed on July 16, 2016 in the St. Helena Star stated that the "city's infrastructure needs are "woefully unmet," and even everyday operations are a struggle. The city's water fund is taking \$1.3 million out of its reserves, the wastewater fund has no reserves left at all..." Every project that is approved by the City, especially large projects like this one, may be the City's last project that it is able to provide services for. The City will most likely not be able to provide for future necessary projects if it adds 100 new residents to the City with this Project. We believe that the change caused by this Project sets into motion a chain of events that would foreseeably culminate in impacts on the physical environment. This potential and foreseeable impact was not analyzed by the lead agency in the initial study.

#### Flaws in Project Proposal

##### **Flaws in Project traffic study:**

The Project's traffic study is one of the most critical aspects of the Project. The Project is located at the northern gateway to St. Helena. Currently, there are severe and obvious delays at the Pratt Avenue/Hwy 29 intersection. Any additional car trips that are added to this already impacted intersection should be considered significant. That is why it is critical that the traffic study is properly conducted. A realistic traffic study will provide the decision makers with the tools they need to make an informed decision.

The traffic study is flawed since it only focuses on weekday (Monday-Thursday) traffic. Traffic impacts at the Hwy 29/ Pratt Avenue intersection are much more severe on Friday, Saturday and Sunday. During those days, there are more travelers on this roadway. The traffic study states that: "Traffic counts (counting cars) were conducted by Crane Transportation Group at the Pratt Avenue/ S.R. 29-128 intersection on Thursday, May 12 from 7:00AM to 6:00PM. The peak hours of total traffic passing through the intersection was determined to be 7:45 to 8:45AM and 4:00 and 5:00PM on Thursday. Students residing at Vineyard Lodge do not attend classes on the weekend, thus the analysis focuses on weekday activities."

Our criticism of this study is that it fails to conduct traffic counts at the peak tourist days during the peak tourist season when traffic is more congested. The study says that it

Mr. Housh  
 February 17, 2017  
 Page 5 of 7

made “adjustments” to the study to account for the tourist season. This is such a critical analysis for the Project, therefore the traffic study should have been conducted on a Friday when the tourist season is actually occurring so that that analysis is able to capture a realistic assessment of the current conditions. Without this real time analysis, the numbers used by the traffic engineer for the baseline are speculative and flawed.

Further, the Project traffic study failed to include a potential future project in the traffic study. The Beringer Winery is located at the Pratt Ave/ Hwy 29 intersection. The Beringer Winery is a very larger winery, and they have applied to modify their use permit. Under CEQA, an initial study must include reasonable foreseeable projects when analyzing project impacts. The Project’s traffic study failed to incorporate Beringer’s increased traffic when analyzing the Project impacts. This must be cured to allow the lead agency to fully understand the existing conditions, the Project impacts, and the cumulative impacts.

Moreover, the Los Alcobas Hotel was included in the traffic study as it is located near the Pratt Ave/Hwy 29 intersection. We believe the traffic inputs that were used in the traffic study are not representative of how the Los Alcobas Hotel will actually function. Since the opening of Los Alcobas Hotel is imminent, we urge the lead agency to analyze the traffic patterns of the Pratt Ave/ Hwy 29 intersection after the Los Alcobas Hotel has opened, so that there is clear and accurate assessment of the traffic at this intersection.

#### **Flawed procedure:**

The Project delicately hinges on the assumption that the CIA is going to be able to successfully prevent the students from possessing and using their own cars in perpetuity, in order to give the perceived notion that that Project’s traffic impacts are not significant. A negative declaration may be defective if it mischaracterizes the proposed project and fails to acknowledge evidence showing that significant effects may occur. *Christward Ministry v. Superior Court (4<sup>th</sup> District 1986) 184 Cal App. 3d 180.*

There are likely flaws in the City’s Project analysis because the initial study failed to limit the use and amount of cars through Project mitigations. The proposed project states that: “All 100 (new) additional students would be living at the Vineyard Lodge housing on Pratt Avenue in St. Helena and attending weekday classes at the Greystone facility. These students will be shuttled to and from the CIA Greystone campus on weekdays, as they would not be allowed to use a personal vehicle to access classes, consistent with the current practice.” Without a doubt, the applicant is attempting to limit the amount of cars that the students utilize in an attempt to make the Project’s traffic impacts less than significant. The problem with this approach is that these restrictions should be part of the project mitigations and not a part of a “standard practice”. If the restrictions on car usage are not a part of the Project mitigations, a violation by the CIA of this use is not enforceable by the lead agency.

Mr. Housh  
 February 17, 2017  
 Page 6 of 7

If all of the students at Vineyard Lodge have and use cars for weekend trips or to participate in jobs outside of St. Helena, then the Project traffic impacts would be significant. Since there is no restriction through a mitigation measure on the number of cars that are allowed, the City is not able to legally enforce whether students can use their cars in the future. If a limitation of car usage is not a part of the Project's mitigations, then this aspect of the Project will be unenforceable by the City. Since, the City has no power to limit the Project's car usage, it is reasonably foreseeable that the Project would create a significant traffic impact since the Project is located at an intersection that currently is operating below the required standards.

#### **What if the CIA moves to Napa?**

The CIA has purchased a large and expensive facility in the City of Napa. They have relocated a large portion of their operations to this southern campus. Since the CIA has a considerable portion of their operations in Napa, what would happen if they decided to move *all* of their operations to Napa, and attempted to sell their St. Helena properties.

If the CIA were to relocate, the Vineyard Lodge property would not be able to stand on its own, due to the Project's restrictions on parking and the lack of cars that would be allowed on the Property. With these severe restrictions, the Pratt Avenue Property would be a tainted asset that has no marketable value.

The Vineyard Lodge cannot operate independent of the Greystone property. Since this is the case, the CIA would only be able to sell both properties as a bundle deal, and the seller would have to comply with the terms of the approved conditional use permit (which most likely works for no one else except for the CIA). These potential conditions make the property a non-marketable asset.

This means that if the CIA were to move all of their operations to the southern campus, this will leave the Pratt Avenue neighborhood with over 40,000 square feet of building that does not have independent value.

Therefore, it is reasonably foreseeable that the CIA would ask the City to allow the use to exist as apartments (with a lack of parking spaces for the tenants). An alternative scenario would be that the CIA would be forced to demolish the Vineyard Lodge because the permitted use only works for their school but fails to meet the needs for any other buyer. With an approval of this Project, the City is essentially pigeon holing the use of the Pratt Avenue Property which is poor land use planning and this could create significant long term issues for the City of St. Helena.

Mr. Housh  
February 17, 2017  
Page 7 of 7

Conclusion

In this communication, we have identified a number of issues and potential significant impacts with this proposed Project. We recommend that the City conduct an EIR to properly analyze all of the Project impacts.

Without a comprehensive environmental analysis the decision makers will be asked to take a "leap of faith" when making a determination on this Project. This is a very large project in size and scope for the City of St. Helena. We strongly believe that an EIR is required. As of now, the proper environmental review has not been conducted.

Very truly yours,

Brian Russell

**Subject:** CIA Dorm Expansion

Dear Ms. Bianco,

I'm a homeowner on Park Street for the last 18 years. It has come to my attention the proposal to expand the dorms and increase the number of students at CIA facility. We have serious concerns about the traffic and the safety impact this project will have in our neighborhood.

The intersection at Pratt Avenue and Main Street is dangerous. There is very limited visibility of cars approaching both south and northbound directions. Cars park on the east side of Hwy 29 block the visibility for the driver on Pratt Ave intending to turn left to Main Street. The drivers heading north usually are accelerating as they approach the Elms tunnel. The angle and limited space to enter/exit Beringer tasting facility has caused many accidents throughout the years. Now, the newly build Las Alcobas Hotel and restaurant will exacerbate the already existing problems in that intersection. It is so hazardous for drivers trying to make a left turn from Pratt Avenue to Main Street that plainly speaking, it is suicidal. I'm aware about the shuttle that runs from the dorms to the CIA, however, the increase number of students will create more trips to and from both facilities, adding to the perils of the situation.

Our neighborhood will be directly affected by adding more students/drivers to the proposed expansion of the CIA dorms. The hazardous conditions on Pratt Ave and Main Street and the closure of Pratt Ave at Silverado Trail will divert more traffic to our neighborhood. It is a serious safety concern given the fact that we have many young families with children walking to school or riding their bikes. The city has already limited resources for first responders and emergency personnel and adding more traffic in this location will exacerbate, jeopardizing safety. These concerns are shared by many other residents in our neighborhood. I hope you, the mayor and council members carefully review and reconsider the approval of this project. At the minimum, it should be amended to address safety concerns expressed by this community.

Thank you for your attention,  
Pierette Titus

**Subject:** CIA dorm expansion

To whom it may concern,

We already have a ton of traffic on Pratt and main, it's practically impossible to turn left. There have actually been traffic accidents on Main Street from this dangerous intersection.

Now Los Alcobos hotel is going to open, making more noise and traffic.

Please do not add to this traffic/ noise problem by expanding the CIA dorm.

Thanks,

Anya Pierce

**Subject:** Stop CIA Pratt ave expansion

To whom it may concern.

This email is in regards to the Pratt Ave CIA Dorm expansion. My name is Jose Martin, My wife Kari and I have lived on Pratt Ave since 1997. We have seen plenty of changes around here since then. However, not too many projects have actually helped the community or improved the City infrastructure.

This is by far one of those projects, there is nothing the City will gain by allowing this project to move forward. No improvements to sewer, wastewater or the pavement on Pratt ave. It will increase traffic, water use, noise, use of city resources and make the intersection at Pratt Ave and Main St. even more difficult and dangerous to use. We see students walking up and down Pratt Ave every day at all times of the day, even late at night when its dark. The lighting on Pratt Ave is bad, there are no sidewalks or bike lanes. The student shuttle is going to increase, (who wants that on their street?) they have two buses now but plan on adding a third.

We do not want to see the additional traffic, noise and wastewater with no economic benefit to the city. We do not want to see the set back of a commercial building be reduced and the max building height should not be allowed to change.

Do not allow this project to move forward without proper planning and stringent requirements that benefit the city and community!

WE ARE AGAINST THIS PROJECT

Hi Lilly,

My name is Terri Reynolds. My family and I live on Park St in Saint Helena. My husband and I have owned our home for the past 11 years. I am writing to respond to you about the CIA dorm expansion being currently considered on Pratt Street. I want you to know that I am opposed to this.

With the 70 room Starwood hotel Los Alcobas opening soon, our neighborhood cannot handle anymore growth and traffic. When I spoke with Noah last month about the hotel's lack of parking spaces, he said that the town had no plans on putting a light in at the corner of Pratt and Main Street. He said that traffic patterns were studied and there was no reason to put one in, but there will be a turn lane. With a possible CIA expansion, there will be a lot more traffic for the Crinella development. Light or no light, people will start using Park Street, as a cut through. It is already used as such when there are accidents on the Trail or 29. Both Pratt and Park get backed up and Park St residents are unable to get out of their driveways when this happens. This is a residential development similar to Signorelli/Chiles area and Sylvaner on the west side where children ride their bikes and scooters in the street. This is also a very desirable community for many young families because of the wide streets with cul du sacs and close proximity to town. I can assure you that none of the residents here will be happy to see to see this neighborhood turn into a busy thoroughway.

It is also extremely difficult making a left out of the development onto Main Street from Crinella. It can take one car several minutes to pull out due to increased traffic. If cars are parked at either corner, it's very hard to see traffic. In addition, people traveling southbound down Highway 29 should be reducing speed as they enter town but they are not. I also often find that if there is a break in traffic coming northbound, the southbound drivers still refuse to let you enter and if traffic has slowed or stopped, they will block you from entering the lane. The other concerns that I have is that the crosswalks at Crinella and Elmhurst are two of the most dangerous in the town. Drivers for the most part simply don't pay enough attention. When my children were younger and attended RLS Elementary, I refused to let them cross the street to walk to school. I was fortunate enough to be able to drive my kids everyday, but not every family can do so. With more traffic in this area, you run the serious risk of pedestrians getting struck by a car. I understand the town is looking to make money and that is why something like Los Alcobas would have been approved with no staff parking, but with 140 new staff members soon to be parking and driving in the area, the CIA expansion is way too much for me.

Thanks for your time.

Sincerely,

Terri Reynolds

Rusty Hinds

St. Helena, CA 94574

Re: 2555 Main Street and 830 Pratt Avenue

Chairperson Kistner and Commissioners,

In response to Mr. Meibeyer's letter to you, dated February 20, 2017, regarding the matter referenced above, I am respectfully submitting the following comments in correction of his misstatements and assumptions regarding the accuracy of my comments, which are factually supported by the underlying documents to the Initial Study/Mitigated Negative Declaration.

**Traffic Issues**

Crane Transportation Group conducted the traffic counts at the Vineyard Lodge driveway on Thursday, May 12, 2016 concurrent with Vineyard Lodge parking lot counts (Traffic Impact Report "TIR", Page 1). The focus of the study was on traffic patterns during the A.M. and P.M. peak hours with emphasis on the trips to and from Vineyard Lodge to Greystone.

My comment on the matter is accurate and states, "The TIR fails to consider the full magnitude of personal trip usage of the 72 permitted cars located at Vineyard Lodge." Given that the Vineyard Lodge driveway traffic study was performed on a weekday and was limited to those hours when most students are in class, proves my point on the limitation in scope and fallacy in the TIR statement, "There would be a small component of trips added to Pratt Avenue from the Vineyard Lodge.....attributable to students with parking permits traveling to and from downtown St. Helena and the surrounding area." The "full magnitude" of student personal car usage, from the Vineyard Lodge driveway, occurs during non-school days and non-school hours (i.e. weekends and holidays) resulting in a far more accurate numerical representation of the potential traffic impact during actual peak weekend traffic patterns in and around St. Helena.

With respect to the Pratt Avenue/Hwy 29 intersection issue, my comments are accurate in stating, "The TIR incorporates a theoretical estimate of the traffic contribution from the Las Alcobas driveway.....The TIR may prove to be inaccurate when actual traffic impacts resulting from the Las Alcobas Hotel begins operating at full capacity.....Since the Las Alcobas Hotel is a

large project (68 guest rooms plus a restaurant serving the general public), with potentially significant impacts in the same area as the proposed project and the proposed Beringer projects, it would be prudent to deny the proposed Vineyard Lodge expansion project until the actual full traffic impacts can be further determined.

### **Noise Issues**

In review of the 15 page Culinary Institute of America Vineyard Lodge Noise Study, prepared by ICF International and dated June 15, 2016, there is no language in support of Mr. Meibeyer's comment in paragraph two of his letter which states, "The students were on break and not attending classes from April 29 until May 2nd, but began arriving back to campus that day." The Noise Study actually states on page 9, "The existing CIA facility was unoccupied as students were on break. These measured noise levels therefore represent the lowest noise levels likely to be encountered in the area."

Given that the only source document made public for review, renders my comment accurate in stating, "The Noise Study was actually conducted in April-May 2016 while there were no students onsite at the Vineyard Lodge. As such, the results of the Noise Study are inaccurate since the actual onsite student noise contribution was not measured and not considered for mitigation." My further comment stating "Key findings of the study were not predicated on the proposed 224 students residing at the Vineyard Lodge." is completely accurate as evidenced by the Noise Study's statement (Page 12), "Gatherings could include up to 120 students who would live onsite." There was no qualifier included in the Noise Study statement, as Mr. Meibeyer suggests, "Further, given the students' schedules, it is reasonable to assume there would at most be a gathering of a maximum of 120 students (a bit more than 50% of the total students) in that area..... " His presumption that no more than 120 students will gather at an event in the Quad furthers my questions raised, "Does this set a maximum outdoor activity limit of 120 students that live onsite?" "What about participation by the other 104 students?"

### **Aesthetic Issues**

With respect to Mr. Meibeyer's comments regarding the Visual Impact Assessment ("VIA"), I read the document thoroughly, several times, and studied the Landscape Plan, prepared by Architectural Resources Group, in infinite detail, prior to preparing my comments. Not only do each of my comments, on the topic, remain valid and accurate, several of those made by Mr. Meibeyer are not supported by the documents made available to the public for review. For example, "In response to the issue of the VIA being conducted in the summer months while deciduous trees still retain their foliage, the author of the VIA has commented as follows: 'The deciduous nature of the existing surrounding landscape was considered when assessing the impacts of the of the proposed project.'" There is no evidence of this statement in the public record. Furthermore, the VIA computer generated renderings, depicting the before project and after project views, reflect all trees with full foliage. With the exception of the four (4) existing camphor trees, located along the southwest corner of Pratt Avenue, and the lone eucalyptus tree, located in the railroad right-of-way on the west side of the property, all of the other mature trees are deciduous and provide no screening in the Fall and Winter months. In addition, Mr. Meibeyer references, "In addition, as can be seen in the Landscape Plan, twenty eight (28) larger 24" boxed

trees will be planted on the property perimeter along with the relocation of 6 mature fruitless Mulberry trees, provided ample screening (while the Sycamore trees are deciduous, they are very large and mature and provide substantial screening the vast majority of the year and still provide some visual filtering during a short period of winter.) The vast majority of the scheduled trees, included in the Landscape Plan, are deciduous and will not provide additional screening during the Fall and Winter months. Further contradicting the landscape screening issue is the conclusion included in the Vineyard Lodge Traffic Impact Report (E. Site Lines at the Vineyard Lodge Driveway, page 16), "Therefore, sight lines would be acceptable assuming **no** landscaping is planted along the site frontage that would ultimately grow and block driver views."

The three story elements of Buildings A and C are not afforded any screening from the existing trees nor the future planned landscaping. These buildings are simply too tall (40'2") and their respective distances located from Pratt Avenue do not diminish the significant degradation of the visual character along Pratt Avenue. Mr. Meibeyer's statement "and continuing to locate a substantial portion of the Pratt Avenue improvements behind the existing camphor trees" is not accurately reflected on the Landscaping Plan inclusive of the 36' tall Building B located along the Pratt Avenue frontage.

### **Summary**

While it was unfortunate that I had to spend the time in response to Mr. Meibeyer's letter, which unsuccessfully attempted to undermine the accuracy and intent of my original comments to the findings in the Applicant's Initial Study/Mitigated Negative Declaration, it is important for each of you to know that I have spent innumerable hours reading, studying and digesting the contents of every document and attachment associated with the Applicant's matter.

Mr. Meibeyer's letter further reinforces my original summary conclusions, which are supported by the contents of the documents, that the Applicant has failed to thoroughly analyze each of the environmental factors that are potentially affected. Several of the technical studies are "nuanced" on a conditional set of variables, or factors, or limited in scope which has a direct bearing on the proper evaluation and classification of the potential impact. Contradictions in findings and conclusions between the Applicant's technical reports and the IS/MND reflect the effect each has on the degree of significance. As a result, the impact is either not properly classified as significant or potentially significant, which would warrant mitigation, or the mitigation measure offered is ineffective in the rendering of significance of impact to less than significant status.

Pursuant to CEQA, Section 21082.2.d "If there is substantial evidence, in light of the whole record before the lead agency, that a project may have a significant effect on the environment, an environmental impact report shall be prepared." In the event the Planning Commission finds that the project should not be denied on the criteria of Design Review or Use Permit findings, the Applicant should be required to perform an EIR to fully delineate the Potentially Significant Impacts to the environment.

I appreciate each of you and your time in consideration of my reply, the content of my original comments (Public Comment 16) and the opportunity to address the issues associated with this most significant project during the scheduled Planning Commission meeting tomorrow night.

Respectfully yours,

Rusty Hinds

cc: Charles Meibeyer  
Brian Russell

# Comments to Culinary Institute of America Campus Master Plan

IS/MND

# IS/MND

- The Initial Study must properly classify project impacts
- Degree of Impact Significance influenced by:
- Conditional or erroneous generation/analysis of data/variables limiting outcomes or conclusions
- Unrecognized, unreconciled contradictions in underlying technical reports
- Mitigation measures that are ineffective

# Aesthetics

- VL high intensity (Building massing, height) is inconsistent with character of surrounding land use. Massing is a “hallmark” metric contemplated by Planning Commission
- Mitigation Measure (AES-1) Landscape Plan is ineffective in properly screening significant visual impact of mass and height
- “Sight lines acceptable assuming no landscaping planted along site frontage that would grow and block drivers views” (TIR, VL exit driveway)
- Potentially significant impact. Not mitigated

KEY

PLANTING NOTES:

- ALL PLANTS AND LAWN TO BE IRRIGATED WITH AN AUTOMATED IRRIGATION SYSTEM. IRRIGATION SOURCE IS TO BE CITY WATER.
- ALL PROPOSED PLANT MATERIALS SHALL BE APPROVED BY THE LANDSCAPE ARCHITECT PRIOR TO INSTALLATION AND WILL BE REJECTED IF NOT IN COMPLIANCE WITH INDUSTRY STANDARDS. PLANTS SHALL BE PRUNED PRIOR TO INSPECTION.
- THE PLANT GROWTH SHALL GOVERN IF ANY DISCREPANCY IS FOUND BETWEEN THE PLANT GROWTH AND THE PLANTING PLANS.
- PLANTING AREAS SHALL BE CLEARED OF ALL WEEDS AND DEBRIS PRIOR TO SOIL PREPARATION. IN THE CASE OF PERENNIAL WEEDS, A SYSTEMATIC HERBICIDE SHALL BE APPLIED PRIOR TO CLEARING. IT PARTICULARLY DIFFICULT WEEDS SUCH AS WILD ONION ARE ENCOUNTERED, THE LANDSCAPE ARCHITECT AND OWNERS SHALL BE ADVISED PRIOR TO PROCEEDING.
- ALL PLANTING OPERATIONS SHALL BE PERFORMED BY PERSONNEL FAMILAR WITH THIS TYPE OF WORK AND UNDER THE SUPERVISION OF A QUALIFIED PLANTING FOREMAN.
- THE LANDSCAPE CONTRACTOR SHALL SUPPLY AND CULTIVATE 2 INCHES OF NETROLIZED FIR BARK AND 1 INCH OF 5/16" MESH LAVA STONE INTO THE TOP 4 INCHES OF ALL PLANTING AREAS. BOTTLES IN LOTS AS REQUESTED, OR HAND WORK NEAR ROOT SYSTEMS OF EXISTING TREES.
- ALL PLANT MATERIAL SHALL BE DELIVERED TO THE JOBSITE FOR INSPECTION. PRIOR TO PLANTING, THE CONTRACTOR SHALL CONFIRM LOCATIONS OF ALL PLANTS WITH THE LANDSCAPE ARCHITECT. THE CONTRACTOR SHALL GIVE 5 DAYS NOTICE OF PLANT DELIVERY AND PLACEMENT.
- ON COMPLETION OF PLANTING AND IRRIGATION INSTALLATION, ALL PLANTED AREAS SHALL RECEIVE A UNIFORM LAYER OF 2 INCHES OF FIR BARK WOOD MULCH. CONTRACTOR SHALL PROVIDE A SAMPLE OF MULCH PRIOR TO PROCEEDING.
- THE LANDSCAPE CONTRACTOR SHALL MAKE NO CHANGES TO THE PLANT LAYOUT WITHOUT CONSENT OF THE LANDSCAPE ARCHITECT.
- THE LANDSCAPE CONTRACTOR SHALL GUARANTEE ALL NEW PLANTING FOR A 6 MONTH PERIOD OR UNTIL THERE IS EVIDENCE OF POSITIVE GROWTH. THE GUARANTEE PERIOD SHALL BEGIN AFTER FINAL INSPECTION AND APPROVAL.
- ANY PLANTS THAT DIE OR ARE DAMAGED SHALL BE REPLACED IMMEDIATELY.

HYDROZONES

| NUMBER | DESCRIPTION          | WATER USE |

DRAWN

CHECKED  
HTV

DRAWING NO.  
L2

# Land Use/Planning

- Site located beyond the Urban Limit Line
- VL high intensity (Massing) is inconsistent with surrounding land use (Agriculture and Residential)
- Project contradictory to G.P. Policy 2.6.5 “Continuation of low intensity uses adjacent to ULL”
- PQP requires high level of scrutiny and vetting
- Project feasibility requires granting of several variances
- Potentially significant impact. Not mitigated

# Parking Demand

- VL: 31% (Applicant)(72 cars, 69+3 cars)
- VL: 49% (TIR vehicle count, May 2016)(99 cars)
- VL: 56% (Hinds 48 cars parked 2/15/17 evening)(125 cars)
- Greystone: 70% (TIR)(157 cars)
- Significant discrepancies in parking demand
- Requires variance
- Potentially significant impact. Mitigation measure of five bicycles does not reduce level of impact significance

# Noise

- Study conducted while VL students on break (Spring 2016)
- Study not predicated on all 224 students residing at VL
- “Gatherings could include up to 120 students that live onsite”
- “Student activities not expected to result in noise at property line from 10:00 p.m. to 7:00 a.m.” College students keep late hours
- Study did not consider noise emanating from VL toward two residential building sites located directly across Pratt Ave.
- Potentially significant impact. Not mitigated

# Population/Housing

- Increased VL residents 101 to 224 (Net increase of 123, 122 %)
- Not consistent with surrounding land use and low density development on parcels located beyond ULL
- Expanded student enrollment adds 100 residents to City population. Not accounted for in ABAG residential increase forecast of 400 by 2040.
- Potentially significant impact. Not mitigated

# Traffic

- VL study only considered A.M. and P.M. peak traffic on weekday
- VL student personal car usage not fully considered (72 cars)
- Pratt/ Hwy 29 intersection study utilizing theoretical Las Alcobas driveway traffic. Beringer reported projects not considered
- Park St./Crinella being used as “cut through” to avoid Pratt intersection not considered
- Potentially significant impact. Not mitigated

# Water

- Applicant water usage exceeded allotment in 2014 and 2015
- Baseline existing demand: 23,478 gpd
- Current allotment: 20,650 gpd
- Proposed water demand: 21,667 gpd (Annual adjusted to 19,796 gpd)
- Demand calculations not strictly a function of newer water saving fixtures and volume offsets from Greystone. Frequency and duration of use differential (theoretical to actual) can be significant.
- Past history is often an indicator of future performance
- Water is a finite resource. Enforcement action/penalty for continued volume exceedance?

# Wastewater

- VL current peak daily flow: 6373 gpd
- VL anticipated peak daily flow: 9605 gpd
- Increase in VL peak daily flow: 3232 gpd (51%)
- Regardless of VL onsite treatment, current capacity of Crinella lift station and city treatment plant, would approval be granted for 51% increase in discharge for all users on Crinella system or citywide?
- Wastewater capacity and treatment is a finite resource.

# Summary

- The Vineyard Lodge expansion project should be denied for the following reasons:
- High intensity (Massing) is inconsistent with character of surrounding land use (Agricultural and Residential). Mitigation measure will not adequately reduce visual degradation of site and surroundings.
- Project is located beyond the ULL and is contradictory to G.P. Policy 2.6.5 “Continuation of low intensity uses adjacent to ULL ” and fails compliance on numerous Design Review and Use Permit criteria as found in the Municipal Code
- Potentially significant impacts not sufficiently identified nor mitigated
- Project feasibility requires granting of several unmerited variances

# Summary

- 1993: Use Permit approved the construction of two dormitories and a third, with Permit amendment, at Greystone campus
- 1993: Use Permit required 1:1 room to parking space ratio
- 1993: City Council certified an Environmental Impact Report
- 1993: CIA requested 200 students. City approved maximum limit of 104. Expanded to 200 in 2008.
- 2017: City facing major challenges with economic development with finite resources. Is expanded CIA enrollment in best interest of City? If yes, solution is expand housing at Greystone Campus

Chairperson Kistner;  
Commissioners Monyette,  
Parker, and Knudsen  
St. Helena Planning Commission  
1480 Main Street  
St. Helena, CA 94574

Re: 2555 Main Street and 830 Pratt Avenue

Chairperson Kistner and fellow Commissioners:

On the Culinary Institute of America's ("CIA's") behalf I want to note that we sincerely appreciate the Commission's time and patience in its review of the substantial materials submitted in this matter. We also truly appreciate the efforts of City staff in guiding the applicant toward the preparation of a full and complete application and, in particular, the thorough and capable Staff Report analyzing the various aspects of this project.

The Staff Report's CEQA analysis, particularly the thoughtful responses to the numerous comments that were received, establishes without doubt that there is no basis for a fair argument that any aspect of the project constitutes a significant environmental effect. The report also exhaustively analyzes the requisite Design Review criteria, General Plan consistency, Use Permit findings, and Variance Findings and concludes that findings have been made to approve the project as submitted.

The CIA recognizes that certain neighbors may have concerns about additional development at 830 Pratt Avenue. As we will discuss further at Tuesday's hearing, the CIA made numerous revisions to the project to address concerns raised at a neighborhood meeting in April, and further concerns raised during the Use Permit process, to minimize impacts to the neighborhood, and City of St. Helena resources. At the same time, the CIA also believes that the housing stock in the City of St. Helena is at a critical level, and has determined that it should not only avoid exacerbating that problem by adding additional students without providing on-campus housing, but that it should make every effort to reduce the number of its existing students that occupies homes and apartments in St. Helena. Through this project, the CIA will provide housing for 260 out of its 300 students – and is the only institution, profit or non-profit,

16480.001 3648581v1

Letter to Commissioners  
February 20, 2017  
Page 2

within the City of St. Helena that provides housing for its students (or employees). As a result, we believe this project is important not only to the CIA, but also to the City of St. Helena.

As noted above, the Staff Report fully responds to comments submitted during the CEQA comment period. Some additional comments regarding CEQA issues were received after the closing of the comment period that were inaccurate and require correction. We also thought it would be beneficial to provide some amplification regarding a few issues in the Staff Report, but believe the Staff Report is an excellent roadmap to Tuesday's discussions.

#### 1. Traffic Issues.

In his submitted comments, Mr. Hinds incorrectly asserts that "The Traffic Impact Report ('TIR') only considers peak A.M. and P.M. shuttle bus trips from Vineyard Lodge to Greystone. The TIR fails to consider the full magnitude of personal trip usage of the 72 permitted cars located at Vineyard Lodge." (R. Hinds Comment Letter p. 8.)

Crane Transportation Group's traffic studies in fact did account for the incremental trips associated with the new students who will reside at the Vineyard Lodge, and determined based on observed trip generation at the Vineyard Lodge driveway that only a small number of additional trips would occur during peak traffic hours in light of the students' class schedules. "There would be a small component of trips added to Pratt Avenue from the Vineyard Lodge (3 inbound trips and 5 outbound AM peak hour trips and 7 inbound and 5 outbound PM peak hour trips) attributable to students with parking permits traveling to and from downtown St. Helena and the surrounding area." (11/2/16 Vineyard Lodge Traffic Study p. 14.) As further explained in the CIA-Greystone Master Plan Traffic Study:

*"Most of the existing traffic activity associated with students living in non-CIA housing off-site occurs at non-peak traffic times (i.e. on weekdays before 7:00 AM, from 1:00 to 2:00 PM or after 8:00 PM), thus, other than shuttles running every 15 minutes between the Vineyard Lodge and Greystone facilities, only low-levels of student-related trips are reflected in project trip generation during the analyzed peak hours. There would be minor trip increases (3 inbound and 5 outbound during the AM peak hour, and 7 inbound and 5 outbound during the PM peak hour) projected to and from the Vineyard Lodge housing, attributable to students with parking permits traveling to and from downtown St. Helena and the surrounding area during after-school hours. The weekday student trip increases are projected at low levels based on the current low-level driveway counts at Vineyard Lodge during the analyzed peak hours." (11/17/16 CIA-Greystone Master Plan Traffic Study p. 17-18 [emphasis added].)*

As shown in Figure 8 of the 11/17/16 Traffic Study (copy attached), these incremental trips would create 4 new left hand turns from Pratt Avenue onto State Route 29. The MND's analysis takes these additional trips into account at the Pratt Avenue/SR HWY 29 WB intersection, and determined that impacts would be less than significant: "[T]he addition of four (4) trips would further degrade the LOS under the AM and PM peak hours. Given the degraded LOS under

---

Letter to Commissioners  
February 20, 2017  
Page 3

Baseline conditions, a warrant analysis was undertaken. *Under baseline conditions with and without the project, the intersections would not meet warrant thresholds. Given that the project would not degrade the LOS to the next lowest level at any of the study intersections impacts would be less than significant.*" (MND p. 51.)

## 2. Noise Issues.

Mr. Hinds also makes a number of incorrect assertions regarding the Noise Study conducted by ICF International, which the MND relies upon to conclude that there are no significant noise impacts under CEQA.

As stated in the City's Response to Comments Response Number 5-2, ICF analyzed baseline noise levels between April 29<sup>th</sup> and May 4<sup>th</sup>, 2016. The students were on break and not attending classes from April 29 until May 2<sup>nd</sup>, but began arriving back to campus that day and were on-site during the balance of the monitoring period. As a result, the baseline noise levels during the initial portion of the monitoring period (when no students were on campus) provide the most conservative method for evaluating project noise impacts associated with an incremental increase in operational noise. ICF accounted for the marginal increase in vehicle trips on Pratt Avenue attributable to the project, and determined that the increase in traffic noise would be well below the threshold of a perceptible change.

Further, given the students' schedules, it is reasonable to assume there would at most be a gathering of a maximum of 120 students (a bit more than 50% of the total students) in that area, which will be enclosed by buildings which provide almost a solid barrier preventing noise from being directed toward neighbors along and across Pratt Avenue. As stated in the ICF report and the MND, the resulting sound level from 120 students talking at once at a quad gathering would be about 42 dBA at the closest existing residence, well below the measured daytime ambient sound levels of 50 to 64 dBA. The rules prohibiting amplified music, imposing noise curfew hours, and restrictions on non-residents accessing the property are in the student handbook and are enforced pursuant to the CIA's student code of conduct, and will continue to be enforced. As stated in the Response to Comments Response 6-2, there were only six calls associated with Vineyard Lodge housing placed to the St. Helena Police Department in 2016, none of which report student noise violations, although three pertained to fire and other alarms. Moreover, during this time period without any noise complaints, the existing dormitory buildings provided essentially no noise buffer toward Pratt Avenue neighbors due to the existence of the large, flat paved parking area along most of the Pratt Avenue frontage.

## 3. Parking Issues.

While the staff initially determined a Variance from the parking requirements was required for the project, the applicant has concluded that a variance should not be required for a college dormitory project because parking requirements for such facilities are dramatically less than are suggested for this project. We reach this conclusion because the Municipal Code ("Code") does

---

Letter to Commissioners  
February 20, 2017  
Page 4

not specifically specify the parking requirements for this project because student dormitories are not specifically listed as a residential parking category under Code Section 17.124.030.A. For such unlisted uses, Code Section 17.124.030.H provides that "[t]he planning commission shall determine the parking requirements for uses not specifically listed. In determining such requirements, the planning commission shall use the above requirements as a general rule and guide."

The CIA's student dormitories are dissimilar from the limited residential categories listed in that Code section. The Planning Department assumed that the rooming/boarding/lodging house requirement of one space per guest room, and two spaces for the resident owner, should apply to the student dormitories. But, in the definitions section of the Code's zoning title, dormitories are listed separately from lodging and rooming houses within the broad "hotel" definition. (Code § 17.04.160.) The Code parking requirements recognize that rooming/boarding/lodging houses have distinct features from typical hotels -- even though they are technically a subset of the "hotel" definition in the Code -- and impose a unique, tailored parking requirement for rooming/boarding/lodging houses based on those distinct features (including the typical on-site owner's unit). Because student dormitories are an unlisted use in Code Section 17.124.030, dramatically dissimilar from the listed residential uses, the Planning Commission is authorized to make a project-specific parking determination, using listed use parking requirements as a general rule and guide. We believe the dormitories require an entirely different parking scheme than is applicable to rooming/boarding/lodging houses.

Included with the submittals is the February 2017 Crane Transportation Parking Memo. In that report, Crane concluded that parking opportunities for college students are consistently extremely restricted by those institutions. For example, at UC Davis, students residing in residence halls are not allowed to bring automobiles to campus. At College of Notre Dame de Namur first year students are not allowed to bring automobiles and are expected to utilize public transportation. Crane noted that, nationwide average parking supplies for urban 4-year college sites are 0.3 spaces per total number of students, faculty and staff ("school population") in urban sites, and 0.4 spaces per school population at suburban sites. But, as noted by Crane, 4-year college sites with a mix of classrooms, halls, offices, and student housing are quite different from the proposed student dormitory-only site. Rather, the CIA's student dormitory project shares similar transportation demand management features with other California campuses, including shuttle service and strict on-campus parking permit restrictions. Accordingly, the Crane Transportation Memo concludes that the CIA's program "is highly supportive of students not requiring personal vehicles to travel to and from campus."

Given that students will not require personal vehicles for travel to and from the Greystone Campus, a parking requirement of one space per guest room would require excessive parking not in line with campus parking policies at the CIA or other California colleges. Students with high quality alternative transportation options will display markedly different travel patterns and parking demand compared to guests at rooming/boarding/lodging houses or hotels, who rely on private automobiles for the vast majority of their daily trips. The proposed 0.31 spaces per

---

Letter to Commissioners  
February 20, 2017  
Page 5

student dormitory bed requirement is in line with national average parking supplies for comprehensive campuses. In the project's unique circumstances, this requirement actually provides more student parking than is typical, given that the national averages of 0.3 to 0.4 parking spaces per school population include faculty and staff members far more likely than students to need access to their own private automobiles for commuting. In addition, the proposed 0.31 spaces per room requirement is a similar ratio to an existing residential use listed in the Code's parking section: rest homes, convalescent hospitals, residential care and similar group care facilities, which are required to provide only 0.25 spaces per bed.

The Crane Transportation Memo provides substantial evidence establishing that the Planning Commission should use its independent judgment, as authorized by the Code, to impose a specific parking requirement for a residential land use not otherwise existing in St. Helena. The project proposes 72 parking spaces for its 224 dormitory beds, three of which will be on-demand car rental spaces, exceeding the proposed 0.31 spaces per dormitory bed requirement.

Should the Commission determine, however, that the boarding/lodging/ guest house parking standard does apply, the findings regarding the Parking Variance establish the Variance should be granted.

#### 4. Setback Issues.

As discussed in the Variance findings, the Vineyard Lodge property is the ONLY property on Pratt Avenue east of the railroad tracks where the special 36' setback applies (other than the Beringer vineyard next door that is part of a large parcel that wraps around to Main Street and will never develop structures instead of critical vineyards) that has made a dedication to the City for the full potential width of Pratt Avenue as a collector road. If the City determined at a later date that it needed to expand Pratt Avenue as a collector road it would have to condemn 10' to 20' along Pratt Avenue from all of the rest of the property owners on the northerly side of Pratt Avenue because none of those properties are able to be subdivided which would otherwise trigger the requirement of a free road dedication by the property owner. Moreover, the Pratt Avenue bridge is very narrow, and is intersects Silverado Trail along a blind curve where traffic from the north is traveling at 55 mph or more. As a result, it seems there is a very low/remote likelihood that Pratt Avenue will ever be widened in this area. As such, the proposed buildings will continue to be located 41 feet from the right of way along Pratt Avenue.

In any event, the Variance does not impede the City from constructing a wider roadway along Pratt Avenue because the room for that road widening already exists in the expanded roadway section along a portion of the Vineyard Lodge frontage, and the buildings will be approximately 15' further away from Pratt Avenue than the existing VL 1. Given these practical circumstances, and the fact that the Variance findings are compelling, the Variance should be granted.

#### 5. Aesthetics Issues.

---

Letter to Commissioners  
February 20, 2017  
Page 6

The project was subjected to a rigorous Visual Impact Assessment ("VIA"). the Staff Report at page 10 of 26: "It is worth noting that this BLM [Bureau of Land Management] methodology is the most technical visual impact analysis familiar to staff"). Because the MND only references a limited portion of the VIA a copy is attached for the Commissioners' reference to highlight the object criteria addressed in that report. The VIA focused on the required aesthetics impact areas under CEQA: (1) Would the project have a **substantial adverse effect** on a scenic vista; and (2) would the project **substantially degrade** the existing visual character or quality of the site and its surroundings? After a thorough analysis the report concluded that neither of those adverse effects will result from the project. While views from Pratt Avenue will be different, the key views of the hills and mountains are preserved. Moreover, a change to a neighbor's view may be disappointing or frustrating, but that does not in and of itself create a substantial adverse effect on a scenic vista, or a substantial degradation of the existing visual character/quality of the site and surroundings.

One Commenter disputed the result of the VIA because it was conducted during the summer months when the deciduous Sycamore trees were full of leaves. In response, the author of the VIA has commented as follows: "The Visual Impact Assessment (VIA) for 830 Pratt Avenue took into account the existing physical qualities and characteristics of the surrounding environment including those of existing landscape materials immediately adjacent to the project site along Pratt Avenue."

"The deciduous nature of the existing surrounding landscape was considered when assessing the impacts of the proposed project. Existing and proposed trees and landscape plantings within the project site and additional trees along the right of way in lieu of driveway entrances were taken into account when making the findings."

We further believe it is important to note that this property is effectively an "infill project" that has been in commercial operation for over fifty (50) years; has had no agricultural activity during that time period, and is not a size that lends itself to economically viable agricultural activity - the findings that were made for the property's rezoning to Public: Quasi-Public in 2008. Moreover, the property is bounded on the west by the large Treasury wine storage facility, and to the east and north by sewage treatment ponds. An important feature of the property is its existing, very mature trees on the southwest corner and the easterly border along the Vineyard Road. In addition, as can be seen from the Landscape Plan, twenty eight (28) larger 24" boxed trees will be planted on the property perimeter along with the relocation of 6 mature fruitless Mulberry trees, provided ample screening (while the Sycamore trees are deciduous, they are very large and mature, and provide substantial screening the vast majority of the year, and still provide some visual filtering during a short period in the winter). And, as specified on project plans, the three story sections of the building improvements are located approximately 152 feet from Pratt Avenue, resulting in two story structures entirely along Pratt Avenue, and for a significant distance along the easterly border of the property. In addition, as noted previously, the current VL1 is located approximately 5' from the City's public easement along Pratt Avenue. The

Letter to Commissioners  
February 20, 2017  
Page 7

project enhances aesthetic values by moving the buildings approximately 15' further from Pratt Avenue, and continuing to locate a substantial portion of the Pratt Avenue improvements behind the existing camphor trees.

While the project does not meet the technical requirements of SB 743, the Legislature has exempted "infill projects" from both parking and aesthetic analysis under CEQA to ensure that transit-oriented infill projects are free of CEQA obstacles that would otherwise delay or preclude projects that provide important Greenhouse Gas Reduction and traffic reduction measures. Given the CIA's commitment to minimize traffic through its shuttle operation, and the development of a bike path along Pratt Avenue at a cost of \$130,000, the CIA's project meets the underlying goals of those important policies.

We look forward to discussing these and other issues with you on Tuesday.

Very truly yours,

Charles W. Meibeyer

Chairperson Kistner,  
Commissioners Monnette,  
Parker and Knudsen

Re: Response to Letter of Charles W. Meibeyer, dated February 20, 2017

Chairperson Kisner and Commissioners:

This response is to the letter of Charles W. Meibeyer, dated February 20, 2017. While not addressing all of the statements and discussions set forth in the letter, there are a few discussions that merit a response.

Mr. Meibeyer states in the third paragraph of page 1: "The CIA also believes that the housing stock in the City of St. Helena is at a critical level, and has determined that **it should not only avoid exacerbating that problem by adding additional students without providing on-campus housing**, but that it should make every effort to reduce the number of its existing students that occupies homes and apartments in St. Helena." This statement seems to assume that the CIA will be allowed to add the additional students and that by providing for dormitories the CIA is doing the City a favor. The City does not have to allow the additional 100 students. This is the number of additional students the Applicant has requested. If the CIA cannot demonstrate that they can provide adequate housing that meets design review standards and that will not place undue impacts, burdens and hardships on the City, the CIA should not be allowed to add the requested additional students. If the real goal of the CIA is to "reduce the number of its existing students that occupies homes and apartments in St. Helena," then why does the proposal only make a reduction from 52 outside students to 29 outside students? This is less than a 50% reduction, while they are asking for 100 more students. It would be reasonable for the Planning Commission to make a determination that having a Culinary School limited to 200 students is appropriate in light

of the fact that St. Helena is a small town with limited resources and there may be other projects that would provide more benefits to the City.

#### CIA Community Meeting:

The letter raises the issue of the community meeting. There are some misleading statements related to the community meeting resulting from the fact that the Applicant did not provide specific facts of the project at the meeting. No site plans were provided. No dimensions were provided. I specifically asked, "How far is Building B set back from Pratt Ave?" The answer given by Tom Bensele was "I do not know for sure, we are currently working on that issue." I responded, "Due to the large size of the building it should be set far back from Pratt Ave." When it was revealed at the meeting that the building was two story, I suggested that any buildings fronting on Pratt Ave. should be one story and have a large setback. There was no mention that some of the buildings would be three story or in excess of 40' tall. The CIA may have made revisions in their plans after the community meeting, but these revisions did not address the concerns of the neighbors. The CIA takes pride in stating that they revised their plans to move Building B from a 5' setback to a 20' setback. Was the original 5' setback of a building that is 150' long and 36' high<sup>1</sup> realistic? Additionally, the CIA never called a second meeting of neighbors to show them the actual plans with specifics that were going to be submitted to the City, so that the neighbors could have meaningful input. The CIA seems to put great weight on the fact that they made some revisions to the plans after the community meeting. Based on the massing of the actual plans submitted, it is hard to imagine this is a downsizing from the original plans. The statements in Mr. Meibeyer's letter seem to discount the concerns of the neighbors. At the bottom of Page 6 of his letter, Mr. Meibeyer states: "The project enhances aesthetic values by moving the building approximately 15' further from Pratt Ave, (than VL1) and continuing to locate a substantial portion of the Pratt Avenue improvements behind the existing camphor trees." VL1 (the former Marlinda building) is a one story building with the smallest widths of the building fronting on Pratt. Building B is 150' long, 36' high and is proposed to have a 20' setback. It is hard to believe one could state that Building B "enhances aesthetic values" as stated by Mr. Meibeyer. Additionally, on P. 6 of Meibeyer's letter he states: "Moreover, the property is bounded on the west by the large Treasury wine storage facility, and to the east and north by sewage treatment ponds." This statement is misleading in its characterization of the surrounding

properties. A simply drive-by will confirm this. The Treasury building is set very far back from Pratt Ave. (as large buildings such as this should be) and the property is surrounded by vineyards on the east. The sewage treatment ponds referenced by Mr. Meibeyer are also set back very far from Pratt Ave and cannot be seen from the road. There are also vineyards across the street to the south that were not mentioned. The applicant has stated that they will discuss this topic of the revisions they made after the community meeting further at Tuesday night's meeting. While meaningful community input would have been appreciated, there are many items to discuss at the meeting on Tuesday and the focus now should be on the project that has been proposed. A discussion of what they started with and revised it down to is self-serving and meaningless. There are real concerns related to the project, as proposed. This is where the focus should be.

#### Parking Issues:

The Applicant has requested a variance for parking and has presumably filed an Application seeking a parking variance. Now, one day prior to the Planning Commission meeting, Mr. Meibeyer is taking the position that a parking variance is not required. Section 17.124.030 sets forth the parking required for various types of Residential projects. Although the provision for rooming, boarding or lodging has historically been applied to the subject site (bottom of P. 6 of Staff Report), Mr. Meibeyer has pointed out that "dormitories" come within the Code definition of "Hotel" in Section 17.04.160. There is only a difference of one parking space between the two applicable provisions. Since "dormitories" are listed under the definition of Hotel, the proposed project should be required to have the parking spaces required by Section 17.124.030 A. 3. applicable to hotels, which provides for "one space for each individual guest room, suite, or sleeping or living unit." While the Code drafters did separate the provision applicable to "Rooming, boarding, or lodging houses" they did not provide for a separate provision for dormitories. The fact that "rooming, boarding, and lodging houses" were provided for separately does not somehow remove "dormitories" from the code definition of "Hotel." The Applicant is required to have 173 parking spaces and is required to seek a variance if it wants reduced parking. Mr. Meibeyer discusses parking situations at other campuses in an effort to say that the Applicant should not be required to seek a variance. The proposed dormitory is different from the other campuses named in many respects and the parking needs/demands of

those campuses cannot be determinative of parking needs for the proposed project. The Planning Commission should look to the provisions clearly set forth in our Code that were designed to provide for the purposes set forth in Section 17.04.020 including the public health, safety, general welfare, orderly uses of land, etc. Mr. Meibeyer has also stated that the parking demand for students at the Vineyard Lodge is .31 spaces per student. As stated in the Greystone Traffic Impact Report, the parking demand for students at Greystone is .70. How is this discrepancy explained? The Vineyard Lodge currently has 85 parking spaces with 101 students. While the Applicant states the demand is only .31, this has not been tested since the Vineyard Lodge Traffic Impact Report reflects a ratio of .44 and citizen parking counts prove in excess of .56. There are many occasions when this parking lot is full or nearly full, and clearly exceeds the .31 ratio requested by applicant. I have spent more time discussing the parking issue in a separate paper that specifically discusses variances. (Pratt Avenue Dorm Proposal Variance Discussion)

Setback issues:

This topic has been addressed fully in my submittal entitled Pratt Avenue Dorm Proposal Variance Discussion and will not be repeated here. Section 17.112.050 (adopted in 1994) requires a 36' setback on Applicants property that is measured from the Property Line. The building in question is 36' high and 150' long. Does the City really want a building this large to have a setback of only 20'?

Thank you, sincerely for your time and consideration of these very important issues.

Warm regards,

Donna Hinds

cc: St. Helena Planning  
Brian Russell

---

<sup>1</sup> While Building B is described as a 29'2" building, when measured pursuant to normal architectural practices, the building is 36' high.

**PRATT AVENUE DORM PROPOSAL  
VARIANCE DISCUSSION  
SUBMITTED BY DONNA HINDS  
February 20, 2017**

This supplemental paper is to specifically address the variances requests made by Applicant and to discuss additional areas that require a variance request.

**PRATT AVE. SETBACK VARIANCE:**

In support of their request for a setback variance, the Applicant presents a very circuitous discussion on the interpretation of the special setback for Pratt Ave. (Section 17.112.050). The special setback provision is actually very clear. It states:

A. Front Yard or Setback on Pratt Avenue. A front yard or setback of thirty-six (36) feet shall be required on the northwesterly side of Pratt Avenue from the Southern Pacific Railroad tracks to the Napa River, and a front yard or setback of twenty-four (24) feet shall be required on the southeasterly side of Pratt Avenue from the Southern Pacific Railroad tracks to the Napa River.

The Applicant seems to be unclear as to how to measure the special setback required by this provision. The Applicant looks to a provision in the A-20 Zoning and to a parcel map that was recorded in 1971 to assist in “interpreting” the special Pratt Ave setback provision, and concludes that the setback is determined by measuring from the centerline of Pratt Ave.

It is not necessary, or appropriate, for the Applicant to look to other provisions, or maps, to aid in interpreting Section 17.112.050. The section is very clear, as written, and, therefore, is not subject to the interpretations advocated by the Applicant. Section 17.112.050 provides: “A front yard or setback of thirty-six (36) feet shall be required...” The meaning of “setback” is set forth in Section 17.04.160 B. as follows: “**Setback**’ means the distance by which any use, building or structure is required to be removed **from a property line** contiguous to a public or private right-of-way (excluding alleys), except for such encroachments as are specifically permitted by this title.” “**Front Setback**” is also defined as follows: “Front setback means the shortest **horizontal distance by which any use, building or structure is required to be removed from the front lot line**, except for such encroachments as are specifically permitted by this title.” These definitions of “setback” make it extremely clear that, unless specified otherwise, Code references to “setback” mean a distance measured from the front lot line. To add even more clarity to this provision, Section 17.112.050 A. uses the term “Front Yard” in reference to the special Pratt Ave. setback. “Yard” as defined in section 17.04.160 B. “means an open space established in relation to **interior lot lines** which is required under the provisions of this title, other than a court, on the same lot with a building, which open space shall be **unoccupied and unobstructed from the ground to the sky**, except for such encroachments as are specifically permitted in this title. It is most interesting to note that Section 17.112.050 specifically includes the term “front

yard” with respect to the Pratt Ave. setback but does not reference “front yard” for the other streets named in the same section that require special setbacks. This makes it abundantly clear that the intention of the special Pratt Ave. set back is to not only provide that future buildings would be placed 36’ back from Pratt Ave. but to further emphasize that there be a “front yard” that is “unobstructed from the ground to the sky.” Since Pratt Ave. is defined as a “Collector Street” in the General Plan, it seems evident that the drafters of the special setback on Pratt Ave were insuring that any future construction leave a 36’ area clear for possible future road expansion. The Applicant’s request for a setback variance for Building B (which is 150’ wide and 36’ high) on Pratt Ave should be denied. It is a common zoning principle that the larger the building, the greater the setback. It is appalling that the Applicant is seeking to place this massive building closer than the required setback.

The Applicant lists six (6) houses on Pratt Ave and has analyzed their respective setbacks BY USING GOOGLE EARTH. These houses were all approved and built prior to the 1993 General Plan and prior to Section 17.112.050. The purpose of Section 17.112.050 (1994) was to prohibit any new building encroachments into the special 36’ setback. It did not apply retroactively. The Applicant also points out that the existing Marlinda facility, that it is proposing to demolish, has a 7 foot setback from the property line. Again, this building was constructed in the 1960’s, prior to the applicability of Section 17.112.050.

The Applicant looked to the A-20 zoning provisions to assist in the interpretation of the Pratt Ave. setback provision. While looking to the A-20 zoning was not necessary, on the issue of the setback variance, due to the clarity of the Pratt Ave. setback provision; I do appreciate the Applicant’s understanding that in cases where there is not clarity, it is appropriate to look to the adjacent A-20 zoning. For example, the PQP does not set forth specific setbacks, FARs, etc. For these areas where the PQP is vague, it is helpful to look to the adjacent A-20 zoning for assistance with interpretations.

To approve the setback variance, the Planning Commission must find that:

A. A hardship peculiar to the property, not created by any act of the owner, exists. In this context, personal, family or financial difficulties, loss of prospective profits, neighboring violations, are not hardships justifying a variance.

**HINDS RESPONSE:** As set forth previously, the special setback for Pratt Ave. is very clear and not open to the interpretation of Applicant. The subject property is subject to a 36’ setback measured from the front property line. The neighboring properties on Pratt Ave. were not subject to this special setback as they were all built prior to the adoption of the current Section 17.112.050. (which appears to have been in 1994). The need for the variance is not related to the triangle shape of the property. The portion of the property that Applicant seeks to build on is the remaining portion of the property that is not impacted by the irregularity which has been previously addressed by the construction of Vineyard Lodge II.

**The need for the variance is solely created by the desire of the Applicant to place more buildings on the property than reasonably fit.**

B. The Variance is necessary for the preservation and enjoyment of substantial property rights of the Applicant which are possessed by other properties in the same district and in the same vicinity; and that a Variance, if granted, would not constitute a special privilege of the recipient not enjoyed by his or her neighbors.

**HINDS RESPONSE:** The requested Variance is not necessary for the preservation and enjoyment of the substantial property rights of the Applicant. The Applicant was granted a zoning change in 2008 from A-20 to PQP to enable the construction of the 12,612 square foot Vineyard Lodge II dormitory on the property. This zoning change enabled a much greater use of the Applicant's property than the surrounding neighbors and, in fact, impacted the surrounding neighbors. The Applicant now wants more.

C. The authorization of the Variance will not be of substantial detriment to adjacent properties, and will not materially impair the purpose and intent of this Chapter or the public interest, nor adversely affect the General Plan.

**HINDS RESPONSE:** Approval of a Variance that will allow construction of Building B, which is 150' long and 36' high (when measured to top of gables)\*, to be setback only 20' from the property line will be "of substantial detriment to adjacent properties." A general planning principle is that the larger the building, the bigger the setback. The proposed building is enormous and out of character with Pratt Ave. The authorization of the Variance is in direct conflict with the General Plan. Pratt Ave is defined as a "Collector Street". The General Plan recognizes the need to preserve rights-of-way for Collector Streets. \*Building B is described throughout the City and Applicant documents as 29'2". This building is actually 36' high when properly measured to the top of the gables that run the width of the building.

D. The condition or situation of the specific piece of property for which the Variance is sought is not so general or recurrent in nature as to make reasonably practicable the formulation of a general regulation for such condition or situation

**HINDS RESPONSE:** The Variance requested by the Applicant is not the result of "the condition or situation of the specific property" in that the reason for the requested variance is that the Applicant is trying to place more buildings, and more people on the property than actually fit.

E. The Variance and any buildings or structures permitted by the Variance will not be detrimental to the public health, safety and welfare of the community.

**HINDS RESPONSE:** The Variance, if allowed, will result in buildings or structures that will be detrimental to the public health, safety and welfare of the community

in that they will increase traffic, noise, and will create significant, unmitigated negative visual impacts. Additionally, there are concerns that the 16' access road will not provide sufficient passage for both firefighting trucks and the timely exit of people from the buildings in the event of fire.

#### **PARKING VARIANCE:**

The Applicant is requesting a variance to reduce required parking spaces from 175 spaces required by Code to 72 spaces; **This is 103 parking spaces less than the Code requires.** Of the 72 spaces, 3 will be used for rental cars, leaving 69 available spaces for students and the residential staff for these buildings. Restated, less than 69 students (out of 224 total) will be allowed to have cars (including 4 spaces for disabled parking). Since **155 students will not be allowed to have cars at the Vineyard Lodge**, and an allowance of only three rental cars available for these 155 students to share, the variance request is unreasonable. While Applicant states that this variance request is based on actual demand of the existing students, actual parked car counts indicate that many more students are parking at Vineyard Lodge than actually have permits. There have been several occasions during the last several months when parking counts (performed by Hinds) have far exceeded the 31% demand proposed by Applicant. The variance request is not based on the demand of the students, but rather, is based on the number of spaces the Applicant can fit on the property after designing three (four) very large dorm buildings. This is an artificial number created by the Applicant. These students are not comparable to residents of an elderly care facility. They are college students. These are young, healthy, **social** people who have drivers licenses and will be coming and going from the project at all hours of the day and late night. These students, in the words of the Applicant, will be “urged” not to bring cars with them to school. Many of these students likely already own cars that they will be “urged” to leave behind. This is not a fair request. This unreasonable request upon these young college students will result in the temptation of many students to bring their cars and park in locations throughout our town. They could have other students drop them off or ride their bikes to their cars. Where will they park these cars? At the rental homes of the 29 off-campus students? Along Pratt Ave.? In the Crinella subdivision? In the parking lots of other businesses? This is an unintended consequence that the Planning Commission should strive to avoid by not allowing a parking variance. (As a side note, the traffic study failed to consider the potential use of cars brought by students and parked off-campus).

To approve a parking variance, the Planning Commission must find that:

A. A hardship peculiar to the property, not created by any act of the owner, exists. In this context, personal, family or financial difficulties, loss of prospective profits, neighboring violations, are not hardships justifying a variance.

**HINDS RESPONSE:** There is no hardship that is peculiar to this property. The facts are compelling. The Applicant is proposing to increase the number of students by 123 and at the same time is proposing to reduce the number of

parking places by 13. The Applicant is requesting a total of 72 parking spaces for 224 students. The code requires 175 spaces. The Applicant is seeking a variance that would enable them to have 103 spaces less than required by code. The Planning Commission should not allow a Variance that creates a building with insufficient parking. A building that houses 224 people clearly requires more than 72 parking places. The Applicant has chosen to fill property with buildings at the expense of providing for adequate parking and now seeks a variance. This variance should be denied.

B. The Variance is necessary for the preservation and enjoyment of substantial property rights of the Applicant which are possessed by other properties in the same district and in the same vicinity; and that a Variance, if granted, would not constitute a special privilege of the recipient not enjoyed by his or her neighbors.

**HINDS RESPONSE:** The requested Variance is not necessary for the preservation and enjoyment of substantial property rights of the Applicant which are possessed by other properties in the same district in the same vicinity. Currently, the Applicant has some very large buildings on the Property and has sufficient parking to meet those needs. Granting the Variance would constitute a special privilege to Applicant by allowing the Applicant to build out its property without providing sufficient parking. All of the surrounding properties have sufficient parking to meet the needs of their residents.

C. The authorization of the Variance will not be of substantial detriment to adjacent properties, and will not materially impair the purpose and intent of this Chapter or the public interest, nor adversely affect the General Plan.

**HINDS RESPONSE:** The authorization of the Variance will be of substantial detriment to the adjacent properties. The granting of this Variance will result in overflow parking along Pratt Ave. and along the frontage of neighboring homes which is detrimental to the agricultural/country feel of Pratt Ave. Based on letters submitted in response to this project, this has been a problem with the current parking.

D. The condition or situation of the specific piece of property for which the Variance is sought is not so general or recurrent in nature as to make reasonably practicable the formulation of a general regulation for such condition or situation

**HINDS RESPONSE:** The Variance requested by the Applicant is not the result of “the condition or situation of the specific property” in that the reason for the requested variance is that the Applicant is trying to place more buildings, and more people on the property than actually fit, to the detriment of providing adequate parking.

E. The Variance and any buildings or structures permitted by the Variance will not be detrimental to the public health, safety and welfare of the community.

**RESPONSE:** The Variance, if allowed, will result in buildings or structures that will be detrimental to the public health, safety and welfare of the community in that it will increase parking along Pratt Ave. and will detrimentally impact the safety along Pratt Ave. for pedestrians and cyclists.

#### **ACCESS ROAD:**

The proposed project has a 16' wide access road, as opposed to the 30' wide access road required by Section 17.124.070.B.2.e. Section 17.124.010 states "**access shall be in accordance with the requirements set forth in this chapter.**" The language of this provision is mandatory in nature, such that failure to meet the requirements can only be allowed by variance. Section 17.124.070 B. 1. provides that *"An access drive is a way located outside of the public right-of-way that provides vehicular access between the public street and the required parking for more than one lot, or for one lot if the length of the drive is greater than one hundred (100) feet."* The access drive in the Applicant's plans is greater than 100'. Section 17.124.070 B. 2. e. provides the following widths are the minimums that will allow for the safe passage of emergency vehicles. According to this Code Section, for residential developments having over 60 units, the minimum width (including two 2' shoulders) is 30'. Since the access roads for the proposed plans do not meet the minimum Code requirement for width, a variance is required. Width of access roads are provided as minimums for safety of residents and should be strictly enforced. A reduction in the size of the access roads, contrary to the Code provisions, could result in future liabilities for the City. A variance is also required for the access road in that it does not provide for two-way traffic. 17.124.070 B.2.e requires two-way access drives for residential housing over 60 units. The Planning Commission should find that a variance is required as it relates to the access road both for width and failure to provide for two-way traffic. Since Applicant has failed to file an Application for Variance as it relates to its access road, a Variance cannot be granted and the project must be denied.

#### **IMPACTS OF INSUFFICIENT PARKING COMBINED WITH INSUFFICIENT ACCESS ROAD:**

The Planning Commission should deny the requested parking variance and the project since the access road does not meet the 30' widths required by the zoning code. The combination of inadequate parking and an access road that is not wide enough will result in compounded impacts due to the design of the parking being along the access road. There are many situations when the parking will clearly not be sufficient to meet demand. Here are some examples:

1. Move-in and move-out days: For any of you parents who have taken your college students to dormitories, move-in and move-out days result in extremely high demands on parking spaces (even for colleges with ample parking) . These students will not be using rental cars or bicycles to move in and out. The majority of students (who are not allowed to bring their own cars) will have parents/friends bringing them in cars full of their personal belongings, bedding, clothing and

other items that they will want to have in their dorm rooms. The requested variance does not provide for this and other similar situations.

2. Visitors: These students are not comparable to residents of an elderly care facility. They are college students. These are young, healthy, **social** people who will be coming and going from the project at all hours of the day and late night. Bicycles will not provide for transportation at night or for social events outside St. Helena. Only 69 students will be allowed to have cars (including 4 spaces for disabled parking). Since 155 students will not be allowed to have cars, and since there will only be three rental cars available for the 155 cars to share, it is likely that many of these students will rely on friends outside the dorms to pick them up for social outings, work, etc. They may also have friends come to visit. They may call Uber drivers. They may have dates picking them up. The parking places are designed along the access road such that the cars have to back out into the access road to pull out of their parking places. This is a recipe for disaster. The visiting cars will show up and if the student is not outside waiting or is running late, there will be no place to park. While parking on the access road will likely be prohibited, the failure to provide for adequate parking will not leave many options for the visiting vehicles and will likely result in a pattern of illegal access road parking. The natural tendency will be to wait in the access road for the students to come out. There may be situations where students park temporarily in the access road as they make a “quick trip” to drop off an item for a friend or to see something in their dorm. The point here is that insufficient parking could foreseeable result in situations where students illegally park on the access road. Since the access road is not sufficiently wide, this creates safety concerns for emergency situations when a fire truck or ambulance is necessary at one of the buildings and is not able to go around cars parked illegally in the access road. Due to the large size of the buildings and the fact that they will be housing 224 people, access roads are required to be 30’ wide, at a minimum.

3. Students in Outside Housing. There will still be 29 students remaining in outside housing (conflicting numbers in submittals by Applicant). The majority (85%, TIR) of these students have cars. Some of these students currently park at Vineyard Lodge and shuttle to the Greystone campus. Where will these students park under the proposed project? The students, who reside in outside housing, will very likely be socializing with the students living in the dorms. They will be visiting the students at the dorms and will be giving them rides. Again, this will compound the issues discussed in the prior paragraph.

## **GROWTH MANAGEMENT**

The Staff Report dated February 21, 2017 discussed Growth Management on Page 23. The report states: *The category of “dormitories” is not explicitly referenced in the GMS and given that the dormitory use is not a residential development with units available to the open market and the proposed rooms are only available to students attending the*

*CIA culinary program, it is determined that the GMS does not apply to the proposed project. Further, the dormitories serve as temporary student housing and would not be expected to induce growth of permanent residents.*

**HINDS RESPONSE.** The GMS clearly applies to this project. The Code is sufficiently clear and, therefore, does not lend itself to the interpretation set forth above. Section 17.152.020 states: *No building permit for a new resident shall be issued except in conformance with this chapter.* This provides for a broad application of the provision that applies to all residential projects. The provision then clearly sets forth specific development categories that are exempt from the provision in Section 17.152.040, as follows:

**17.152.040 Exempted and regulated development categories.**

A. Exempted Development Categories. This chapter shall not apply to the issuance of building permits for the following projects:

1. Industrial;
2. Commercial;
3. Commercial/residential (daily rental);
4. Replacement housing (on the same site as a preexisting unit which has been removed, demolished or burned within the immediately preceding two years) but not in conjunction with subsection (A)(5) of this section;
5. Relocation of units already existing in the city;
6. Additions, renovations and refurbishment of existing dwelling units;
7. Accessory buildings of any type (except dwelling units);
8. Guest cottages (detached bedroom(s) without kitchen facilities);
9. Second units as defined in Section 17.04.160 and regulated by Section 17.116.030;
10. Affordable Housing. Affordable units are those dwelling units which are required to be rented at affordable rents or purchased at an affordable sales price, consistent with Chapter 17.146. The number of affordable housing units constructed shall be determined by the city council at the time of review of the development agreement authorizing the units. The agreement shall contain guarantees that the dwelling units would continue to be affordable to persons of very low, low, or moderate income for an agreed upon period of time.

The proposed dormitory buildings clearly do not fall into any of the exempted categories listed above. If Applicant wants to be exempted from this project, it should be required to state which exemption from Section 17.152.040 applies to their project. The argument that the GMS does not apply to this project since the dormitories serve as temporary student housing is faulty. If the Code was not intended to apply to situations of “temporary housing”, then it would not have specifically provided for exemption 3., which exempts commercial/residential (daily rental). The proposed dormitories will, in fact, add 100 additional residents to our community. While the students may be temporary (in that they will likely leave St. Helena upon graduation), the increase in population will remain the

same as the graduating students are continuously replaced by new students. In effect, this project is adding 100 additional people to the community of St. Helena who will be using City water, sewer, streets, parks, library and other finite resources. Since the GMS applies to this project, the Applicant must seek a variance from the GMS. Applicant has failed apply for this variance, as required by Section 17.172.030 and therefore, a Variance to the GMS cannot be granted.

#### **COMPOUNDING EFFECTS OF MULTIPLE PROJECTS ON PRATT AVE./MAIN ST.:**

Multiple projects have been approved or proposed in close proximity of the proposed project that will result in impacts of increased traffic, noise, and use of water/sewer and other finite resources. The following projects include:

1. Los Alcobas Hotel at the intersection of Pratt/Main;
2. Proposed use permit modification by Beringer located at 1000 Pratt Ave. between the proposed project and the intersection of Pratt/Main;
3. Recent expansion of the Wine Train services to include wine tasting cars that cross Pratt Ave. at the west boundary of the proposed project (near the access road where cars will be exiting the property);
4. Vine Trail bicycle path that is proposed to follow the Wine Train railroad from the south side of Pratt Ave and then turn onto Pratt Ave. at the western edge of the dorm property and proceed west on Pratt Ave.

The Impact Study failed to address how the impacts of all of these projects, combined together, will result in even greater impacts on this area than each given project alone. The intersection of Pratt Ave. and Main St. is already rated "F" and is below acceptable standards. This intersection is a main artery in and out of our City. A worsening of the condition of this intersection could have serious detrimental impacts on every resident of our City by causing continuous back up of traffic down our vital Main Street commercial district. It could also result in backing up traffic coming into St. Helena from the north. The consequence of this foreseeable traffic condition will result in making St. Helena a less desirable City for both its residents and tourists. Any proposed project that could potentially impact this intersection should be looked at with increased scrutiny from an environmental impact standpoint. This project should not be approved without the requirement of a full Environmental Impact Report.

#### **CONCLUSION:**

The proposed project requires the following variances:

1. Pratt Ave. Setback from 36' (required) to 20' (requested)
2. Parking Variance from 175 (required) to 72 (requested)
3. Access Road Variance from 30' (required) to 16' (requested)
4. Access Road Variance from being a two-way drive to being a one way drive.
5. Growth Management System

The Variances requested for front setback and parking should be denied due to the inability of the Planning Commission to make the findings required by Section 17.172.050. The Planning Commission should deny the project since the Access Road fails to meet the requirements of Section 17.124.070 B.2.e both in required width and two-way traffic, and a variance was not requested. The GMS applies to this project and since the Applicant has failed to request a variance to this provision, the project should be denied.

The fact that the proposed project requires so many variances speaks to the feasibility of this project. The Applicant is simply trying to put too many people and too many buildings on a piece of property that is not sufficient in size to accommodate their desire to increase their student count by 100.

Grace,  
I've heard squabbling about the expanded CIA housing project proposed on Pratt Avenue. One of the concerns has been that the city's current wastewater lines to that area are currently inadequate to handle the existing sewage, let alone added discharge. Can you enlighten me about this rumor? It would seem reasonable if the CIA wants to add more discharge to an already taxed sewer line, then the CIA should have to pay for an upgrade to the system to accommodate their added burden.

Thank you for you feedback,  
Tom B.

St. Helena Planning Commission

1480 Main Street

St Helena CA 94574

Dear Chair Kistner and Commissioners:

I have been a St. Helena resident for 18 years and the owner of Heaven and Earth for more than 7 years.

The CIA has become an increasingly more important part of our fantastic community.

The people that attend there are investing in themselves, doing an art that they are passionate about, making the world a better place.

What's more is that they live like local consumers while here. They enjoy movies at the Cameo, meals about town, shopping and having services at Heaven and Earth among other shops on Main Street which they walk to, preserving parking for others and reducing traffic.

The CIA has produced countless events that benefit our community over the years and have included gift certificates, donations of products, equipment, volunteering, food, and event support for non profits in our Valley.

This world class school has been an important partner and economic driver in our town for a long time now.

Please allow them to build more student housing on Pratt. They have shown that they are willing to work with the city and community to soften the profile of the project to make it work for everyone.

Thank you,

Sara

830 Pratt Avenue

**File:** PL16-042; PL16-043

# Project Description

## **GREYSTONE – 2555 Main Street:**

### **Design Review and Use Permit**

- Restructure/expand the educational facilities at the Greystone Campus
- Expand student enrollment from 200 to 300 students,
- New 4,468 sf underground storage cave,
- Three modular storage units

## **VINEYARD LODGE- 830 Pratt Avenue:**

### **Demolition Permit, Design Review, Use Permit, Variances**

- Expand Vineyard Lodge Housing by 123 net new dorm rooms to accommodate a total of 224 residents.

**Front Setback: 20 feet**

**Side Setback (Vineyard Rd): 13 feet**

**Rear Setback (RR): 54 feet**

- Will operate as student dormitories for CIA students only
- No individual kitchen facilities

## Shuttle Service

Will continue to operate every 15 minutes between the hours of approx. 6am and 9pm.

# **ANALYSIS GREYSTONE CAMPUS**

# Analysis: Greystone

## GENERAL PLAN

**2.6.30** Protect historic resources in the commercial areas and encourage their rehabilitation and re-use

**3.4.3** Give preference to visitor serving uses whose orientation is toward a more discriminating upscale market consistent with the Valley's reputation as a producer of world class wines, and discourage the introduction of uses that are dependent upon a mass tourist market, while not increasing the total number of tourists.

**4.8.1** Preserve historic buildings and landscapes throughout the City of St. Helena as an important component of the City's heritage

**4.8.2** Where feasible adapt historic structures to modern uses to ensure their economic viability and to protect against possible loss.

# Analysis: Greystone

**GP LAND USE:** Public Quasi Public

**ZONING:** W: Winery; PD: Planned Development overlay; and HP: Historic Preservation Overlay.

## HP Overlay

1. That the alteration is compatible with the architectural style of the existing structures;
2. ...does not eliminate elements that are required to maintain the essential form and character of the structure;
3. ...is compatible with adjoining structures and the use of such structures.

# Analysis: Greystone

## DESIGN REVIEW

# Analysis: Greystone

## USE PERMIT

### **Existing** Use Permit Authorizes:

- Enrollment of 200 students
- 35 seat bakery/café
- 190 seat WSGR
- 3100 SF retail store
- Special Events

### **New** Use Permit to authorize:

- Enrollment of 300 students
- 35 seat bakery/café
- 58 seat restaurant
- 3100 SF retail store
- Special events

# **ANALYSIS VINEYARD LODGE**

# Analysis: Vineyard Lodge

## GENERAL PLAN/ZONING

**4.3.4** Strengthen community identity by appropriate building design, size, and site landscaping.

**2.6.2** New development should be required to occur in a logical and orderly manner within well-defined boundaries, and be consistent with the ability to provide urban services.

**2.6.4** Permit infill development and higher densities within currently developed areas wherever possible to minimize and postpone the need for expansion of the Urban Service Area.

**2.6.5** Encourage the continuation of agricultural and low-intensity uses adjacent to the Urban Limit Line.

**HE1.5** Encourage innovative housing types and designs.

**HE2.1** Encourage higher density development where appropriate.

**HE2.2** Ensure that higher density housing opportunity sites are not lost to lower density uses.

**HE2.6** Promote a balance of types of housing throughout the whole community

# Analysis: Vineyard Lodge

## GENERAL PLAN/ZONING

### ZONING: Public Quasi Public

It is the purpose of the PQP public and quasi-public district to provide for government-owned facilities, public and private schools and quasi-public uses such as churches and cemeteries. Due to the wide variety of possible public and quasi-public uses and legal relationships involved it is not possible to fully implement a traditional list of uses with fixed development standards. As such, all uses within the PQP Zoning District are subject to a use permit approval with the determination of appropriate development standards (e.g. setbacks, height, etc.,) being deferred to the Planning Commission.

# Analysis: Vineyard Lodge

## VARIANCES

1. Reduced number of parking spaces at the Vineyard Lodge Housing Site.
2. Reduced setback along Pratt Avenue.

# Analysis: Vineyard Lodge

## VARIANCES

### FINDINGS REQUIRED:

- (a) A hardship peculiar to the property, not created by any act of the owner, exists.
- (b) The Variance is necessary for the preservation and enjoyment of substantial property
- (c) The authorization of the Variance will not be of substantial detriment to adjacent properties, and will not materially impair the purpose and intent of this Chapter or the public interest, nor adversely affect the General Plan.
- (d) The condition or situation of the specific piece of property for which the Variance is sought is not so general or recurrent in nature as to make reasonably practicable the formulation of a general regulation for such condition or situation
- (e) The Variance and any buildings or structures permitted by the Variance will not be detrimental to the public health, safety and welfare of the community.

# Public Comment

## KEY CONCERNS

# Recommendation

Adopt the Mitigated Negative Declaration and Mitigation Monitoring and Reporting Program, and approve the requested Use Permit and Design Review for 2555 Main Street and approve the Demolition Permit, Design Review, Use Permit, and Variances for 830 Pratt Avenue.

# Questions?

**THE CULINARY INSTITUTE OF AMERICA**  
Presentation to the City of St.  
Helena  
Planning Commission

February 2017

# Executive Summary

- The Culinary Institute of America is a world-class culinary college.
- The CIA has been an important community partner and economic driver in St. Helena.
- Our Master Plan is critical to the future of the college and the CIA's long-term presence in St. Helena.

# THE CIA'S ROLE IN THE ST. HELENA COMMUNITY

©The Culinary Institute of America.All rights reserved.

# The CIA: An ECONOMIC DRIVER

- The CIA's annual impact on the St. Helena economy is conservatively estimated to be in excess of \$2,000,000 annually through a diverse set of channels including sponsored events, enthusiast programs, weddings, industry conferences, and visitors to historic Greystone.
- The CIA is the magnet for over 200 students and staff who are regular consumers in St. Helena.
- The CIA makes meaningful economic contributions through gifts & donations, sales tax, and TOT tax.
- The CIA invests +\$3,000,000 annually in the continued maintenance and upkeep of the Greystone building.

# Data Summarizing Economic Impact

- Sales Tax - +\$67,200 direct to St Helena in 2016 (+\$420,000 is sales tax collected. 16 cents per dollar to St Helena)
- Hotel room nights - +4,000 annually +\$900,000 annual impact at ADR of \$226
- TOT tax revenue to St Helena in 2016 = +\$146,720\*
- Other gifts + Donations – \$50,000 - \$75,000 annually to the Napa Valley Community
- Weddings, Corporate Events, Enthusiast Programs visitors spending time and money in St Helena businesses
- Economic Impact in St. Helena from Students & Employees
- Built in workforce of students to meet local business need and reduce traffic from out of town workers

\* Average TOT of \$262 Average Daily Rate with 14% TOT = \$36.68.

©The Culinary Institute of America.All rights reserved.

# The CIA: A Global Gateway to St. Helena

- CIA-sponsored events draw corporate executives, hospitality industry titans, and thought leaders from around the world to St. Helena every year.
- Many of these individuals are cultured and affluent, making them ideal clientele for St. Helena's many hospitality and retail businesses.

# 2016 Conferences

# THE CIA'S MASTER PLAN

©The Culinary Institute of America.All rights reserved.

## Master Plan

- The CIA's Master Plan has two components which are inextricably linked:
  - Improvements on the Greystone Campus.
  - Incremental student housing on Pratt Avenue.

# Master Plan

- Improvements on the Greystone Campus:
  - Reconfigure various interior spaces at Greystone.
  - Improve water / wastewater efficiency.
  - Construct 4,500-square-foot underground storage cave.
  - Install three storage structures behind the building.

# Greystone – First floor (proposed)

© The Culinary Institute of America. All rights reserved.

# Greystone – Second floor (proposed)

# Greystone – Third floor (proposed)

© The Culinary Institute of America. All rights reserved.

## Master Plan

- Incremental student housing on Pratt Avenue:
  - Replace the inefficient, “tired” former convalescent home with attractive, purpose-built student housing.
  - Accommodate the measured growth contemplated by the Master Plan.
  - Design housing that is sensitive to the concerns voiced by the community.

## Master Plan

- If the Master Plan is not approved in its entirety, the CIA's ability to succeed in St. Helena will be limited.
  - Vital for institutional growth and utilization of resources.
  - Critical to attracting top students and faculty.

# INCREMENTAL PRATT AVENUE STUDENT HOUSING

©The Culinary Institute of America.All rights reserved.

# Incremental Student Housing on Pratt Avenue

- Replacing a portion of the student housing on Pratt Avenue is a key element of the CIA's Master Plan and is vital to the college's continued success in St. Helena.
- The CIA is currently undersupplied with student housing and a significant portion of its existing housing stock is aged and inefficient.
- Site constraints preclude development of any material housing units on Greystone.

## Community Benefits to St. Helena & Pratt Avenue

- Increases the supply of affordable housing in St. Helena by reducing occupancy by CIA students.
- Reduces vehicle traffic downtown on Main Street from students commuting to campus.
- Catalyzes road improvements on Pratt Avenue.
- Preserves the CIA's economic presence in St. Helena.

## Minimal Impact on City Infrastructure

- The proposed student housing has little to no impact, as outlined clearly in CEQA documentation:
  - Water: No increase in water use beyond what's already allowed under CIA Water Agreements for both Greystone and Pratt Avenue
  - Sewer: Immaterial net impact at Pratt Avenue and no impact at Greystone (processed through a private facility and not through a City system).
  - Noise: No significant impacts
  - Traffic: Overall reduction in impacts

© The Culinary Institute of America. All rights reserved.

## Select Financial Benefits to St. Helena

- Development impact fees
- \$130,000 payment for a new bike path
- Continued sales tax revenue on +\$4,000,000 in retail and hospitality sales
- Continued TOT revenue in St Helena on +4,000 room nights annually.

## Existing Conditions

- 830 Pratt Avenue was acquired by the CIA in 2004 with the purpose of utilization for student housing.
- Vineyard Lodge I: Developed in the 1960s as the Marlinda Convalescent Home.
- Vineyard Lodge II: Developed by the CIA in 2008-09.

## Existing Conditions

- The site currently contains:
  - Approximately 27,600 total square feet of student housing
  - Approximately 85 parking spots, only 31% of which have been granted permits for on-site parking
- The triangular site is challenging and has limited space.

# Existing Conditions

©The Culinary Institute of America.All rights reserved.

# Existing Conditions

©The Culinary Institute of America.All rights reserved.

# Existing Conditions

©The Culinary Institute of America.All rights reserved.

# Existing Conditions

©The Culinary Institute of America.All rights reserved.

# Existing Conditions

©The Culinary Institute of America.All rights reserved.

# Proposed Student Housing

- Project Summary:
  - Remove existing Vineyard Lodge I.
  - Retain existing Vineyard Lodge II.
  - Add 123 net new, purpose-built student housing beds.
- Total Beds on Pratt Avenue:
  - Current: 101.
  - Pro Forma: 224.

# Proposed Student Housing

- The incremental impact from the proposed housing is minimal and the project has been revised multiple times in response to feedback from the community:
  - Initially presented at the Neighborhood Meeting on April 20, 2016
  - Revised design submitted to the Planning Department on June 21, 2016
  - Further revised design submitted to the Planning Department on September 2, 2016

© The Culinary Institute of America. All rights reserved.

# Primary Design Revisions

- Key areas of re-design based on community feedback are as follows:
  - Massing Along Pratt Avenue
  - Building Setback
  - Building Height
  - Tree Preservation

## Massing Along Pratt Avenue

- In response to community feedback, the buildings along Pratt Avenue were reduced from 3 stories to 2 stories.
- The CIA has significantly revamped its unit mix and floor plans in order to constructively respond to the community's concerns while still satisfying its programmatic needs.

# Massing Along Pratt Avenue

- April 20: The original design comprised 3-story buildings exclusively

©The Culinary Institute of America.All rights reserved.

# Massing Along Pratt Avenue

- June 21<sup>st</sup> & September 2<sup>nd</sup>: Only 2-story buildings front Pratt Avenue.

©The Culinary Institute of America.All rights reserved.

## Building Setback

- In response to feedback received from the city following a review of the initial design, the CIA increased the setback of the project from the Pratt Avenue Right of Way.
- The initial setback was 26', but it has been increased by nearly 60% to 41' in the current design.

# Building Setback

- April 20: 26' setback from the road

©The Culinary Institute of America.All rights reserved.

# Building Setback

- June 21 & September 2: 41' setback from the road

©The Culinary Institute of America.All rights reserved.

## Building Height & Tree Preservation

- Feedback related to the extensive preservation of trees along Pratt Avenue and the Vineyard Road has been incorporated more strongly into the final program.
- The height of the 3-story buildings located within the site has been reduced by 7'8", in order to soften the profile of the project even further.

# Building Height & Tree Preservation

- April 20: All 3-story buildings with partial tree cover

©The Culinary Institute of America.All rights reserved.

# Building Height & Tree Preservation

- June 21: 2- & 3-story buildings with partial tree cover

©The Culinary Institute of America.All rights reserved.

# Building Height & Tree Preservation

- September 2: 2- & 3-story buildings with more extensive tree cover, with the height of 3-story building reduced by an additional 7'8" relative to the June design

©The Culinary Institute of America.All rights reserved.

©The Culinary Institute of America.All rights reserved.

©The Culinary Institute of America.All rights reserved.

## Summary of Design Changes

- Reduced bed count by 12 beds
- Reduced overall Building Heights:
  - Removed one story along Pratt Avenue
  - Lowered interior 3-story buildings by 7'8"
- Increased the Building Setback by 15'
- Preserved trees along Pratt Avenue and the vineyard road
- Completely removed the planned “Commons” building

## Conclusion

- The CIA is an important citizen of St. Helena that contributes meaningfully to this community.
- Approval of the CIA's Master Plan is beneficial to St. Helena and is critical to our success in the city.
- The CIA has been responsible, attentive, and flexible over the last 10 months in adapting to the needs of the community while fulfilling our institutional mission with the project.

# ADMINISTRATIVE DETERMINATION

**DATE:** February 17, 2017

**TO:** Greg and Christin Fowler

**FROM:** Noah Housh, Planning and Community Improvement Director

**RE:** Administrative Determination that discretionary Design Review approval to re-develop the property at 2600 Sulphur Springs Road will not require dedication of 30-feet of right-of-way to the City of St Helena for future public street improvements.

## PROJECT DESCRIPTION

The applicants have requested a formal determination regarding any dedication of right-of-way across their property that would be required as a condition of a discretionary Design Review approval of a proposal to demolish the existing structures and construct a new single family home and associated residential structures on the property at 2600 Sulphur Springs. One additional consideration of this request is to determine the appropriate setback from the right-of-way in order to allow the design of the proposed development to occur.

2600 Sulphur Springs is currently encumbered with a "right-of-way 20-feet in width" along the southeasterly property line "for private road purposes and all uses and purposes usually incidental thereto". The existing Vallejo Street right-of-way adjacent to this easement is 30-feet in width and portions of both the public and private right-of-way are currently developed as a dirt road connecting the paved portion of Vallejo Street to Sulphur Springs, open and utilized as public access. In addition, the 1993 City of St Helena General Plan Land Use Map identifies Vallejo Street right-of-way connecting to Sulphur Springs across 2600 Sulphur Springs (the subject property).

It is the determination of the Planning and Community Improvement Director that a discretionary Design Review entitlement required to redevelop the property does not provide the nexus for the City to require the dedication of right-of-way required for this street extension. However, any design to redevelop the property must maintain the ability of the City to construct the future road extension, as identified in the General Plan. Therefore a minimum of a 30-foot setback from the south-eastern property line must be maintained in order for the project to be found consistent with the General Plan. Other discretionary applications (beyond Design Review) triggered by the proposed design redevelopment of the property may modify this Determination.

The justification for the requirement that the project maintain a minimum of a 30-foot setback (the existing 20-foot private right-of-way, plus an additional 10-foot) is based on Design Review Design Criteria enumerated in Municipal Code Section 17.164.030, A. 1. and 11. which state that the Planning Commission shall consider "Consistency and compatibility with the applicable elements of the General Plan" and "Whether access to the property and circulation systems are safe and convenient for pedestrians, cyclists and vehicles", in order to grant approval of a discretionary Design Review application.

In summary, it is the formal staff determination that discretionary Design Review approvals to redevelop the property at 2600 Sulphur Springs Avenue would not require the dedication of a 30-foot right-of-way (the existing 20-foot private right-of way plus an additional 10-feet to satisfy

*Administrative Determination  
2600 Sulphur Springs Road  
February 17, 2017*

the future street design and construction). However a 30-foot setback from the south-eastern property line must be maintained for the reasons listed above.

**APPEALS**

This determination is subject to a 14-day appeal period. Anyone interested in appealing this Determination shall file an appeal with the Planning Director within 14-days of the date of this letter. The letter of appeal must state: (1) the specific action objected to; (2) the action appellant requests the city council to take; (3) the reason for the appeal; and (4) the name, address, and telephone number of the appellant or contact person if there are multiple appellants and be accompanied by the appropriate fee.

Notice of this Determination will be provided to the Planning Commission at their next regularly scheduled meeting (March 7, 2017).

Thank you for your attention to this matter.

Noah Housh  
Planning and Community Improvement Director  
City of St Helena.
