facilities are severely in need of repair and maintenance, and are barely able to supply the basic needs of current residents. A substantial amount of infrastructure development would be required to accommodate any growth, much less a 10% increase all at once as would occur with a single development project of this scale and size, relative to the small size of our town. There is zero evaluation of how adding over 500 residents could possibly be accommodated by the current building plan. The plan naively states that the sewage would simply be diverted to existing sewer lines on Starr Avenue and Vineyard Valley. It is very disturbing to note that there is already something amiss with the sewage on Starr Avenue, where in the fall especially there is often a bad sewage smell on the corner of Starr Avenue and Hunt Avenue, clearly indicating an issue with capacity. The idea that we would simply add the sewage from over 500 additional residents to this already overwhelmed system is unsupportable.

4) Finally, it is important to note that **the Hunter parcel is very likely to be an important wildlife habitat area**. There are hundreds of waterfowl, including geese and ducks, that nest or stop off on that parcel every winter on their migratory route, a fact that is easily noted by anyone who regularly uses the walking path adjacent to the Hunter parcel for recreation in the winter time. According to the California Farm Bureau Federation as many as 60% of waterfowl in the Pacific Flyway, the main migratory route for water fowl on the West Coast, use California wetlands and grasslands for habitat in the winter months (https://www.cfbf.com/wp-content/uploads/2019/06/CommitmenttoConservation.pdf). **The draft EIR does not in any way address the impact of the proposed development project on the waterfowl that currently use this land in the winter months on their migratory route.**

121-31 Cont.

121-32

I request that the city planning commission address the concerns expressed above about the inadequacy of the draft EIR for the Hunter parcel.

Sincerely,

Angela M. Zivkovic

INTENTIONALLY LEFT BLANK

Response to Letter 121
Angela Zivkovic

121-1 The comment states an opinion the Draft EIR is inadequate and does not address environmental impacts due to climate change.

The comment does not identify any specific areas where the EIR or analysis is inadequate. However, please see Master Response 2 and Responses to Comments 3-1, 9-4 and 14-9 that address concerns associated with climate change.

121-2 The comment states an opinion that the Draft EIR used outdated and irrelevant data, including the 100-year flood plain approach no longer used by FEMA, based on assumptions that the climate would remain unchanged.

Please see Master Response 3 and Response to Comment 31-1.

121-3 The comment states an opinion that climate change will exacerbate natural disasters including fire, floods, and droughts.

The comment does not address the adequacy of the Draft EIR, but instead expresses the commentor's opinion about the project. The comment is noted and forwarded to the decision makers for their consideration.

121-4 The comment suggests that the flood analysis in the Draft EIR is inadequate and claims that the Project site is in a high-risk flood zone.

As detailed in the Draft EIR on page 3.9-7 in Section 3.9, Hydrology and Water Quality, the Project site is not located within a FEMA designated Special Flood Hazard Area as a result of construction of the levee. The newly constructed Napa River levee is designed to provide 200-year flood protection with additional flood protection provided by the additional freeboard. The Draft EIR includes a thorough description and analysis of the flood protection measures that the levee provides starting on page 3.9-7 through 3.9-13 as well as pages 3.9-44 and 3.9-45. See also Master Response 3 for further information on the levee.

121-5 The comment states an opinion that public safety and transportation during emergencies and natural disasters is not adequately addressed in the Draft EIR.

Please see Master Response 1.

121-6 The comment states an opinion that the threat to future water supply is not adequately addressed in the Draft EIR.

Please see Master Response 2.

121-7 The comment claims that the levee is not supported by federal funds and that the concept of a 100-year flood is outdated.

Please see Master Response 3 for a response to comments regarding the levee.

121-8 The comment claims that the Draft EIR ignores "the fact that this Project is in a high-risk flood zone" and is City managed and maintained rather than maintained by the US Army Corps of Engineers.

As described in Response to Comment 121-4, the Project site is not located in a Special Flood Hazard Area as a result of construction of the levee. The levee provides a 200-year level of flood protection, rather than the "100-year flood plain" referenced in the comments. The manner in which inspection and maintenance responsibilities for the existing levee are assigned are not environmental effects related to the Proposed Project. Furthermore, under CEQA, the effects of the environment upon the project are not "impacts." Rather, CEQA requires the lead agency to consider the ways in which the project effects the environment. The potential hydrological effects of the Project, including the potential to impede or redirect flood flows, are considered in Section 3.9 of the Draft EIR. See also Master Response 3 for further details regarding the levee, required certification, and maintenance responsibilities.

121-9 The comment claims the Project site is within a flood zone and the levee does not account for increased risks associated with climate change.

As detailed in the Draft EIR beginning on page 3.9-7, the Project site is not located within a FEMA designated Special Flood Hazard Area as a result of construction of the levee. In addition, the levee provides greater than the often standard 100-year flood protection with a 200-year flood design to account for other factors such as climate change. See also Master Response 3 for further details regarding the levee and Response to Comment 121-1 regarding climate change.

121-10 The comment states that levee failure would result in a financial burden on the City and its residents.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate, and CEQA does not require a discussion of financial impacts. Therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. However, please see Master Response 3 regarding the potential for levee failure.

121-11 The comment states that the recent atmospheric river event that flooded parts of the river bank was modest in comparison to impending catastrophic weather events.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 3 regarding the Napa River levee.

121-12 The comment states an opinion that wildfire incidents will increase due to climate change.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Responses to Comments 39-5, 76-9 and 82-14 that address wildfire issues.

121-13 The comment states an opinion that the Draft EIR does not account for the increased wildfire risk from climate change and the increase in evacuations.

Please see Master Response 1 and Responses to Comments 121-1 and 121-12 regarding climate change and wildfire concerns.

121-14 The comment states an opinion that increased wildfire incidents would result in more mudslides.

Please see Response to Comment 39-5.

121-15 The comment references the recent wildfires in Napa Valley and Sonoma Valley, and asserts that the wildfire season in California is increasing in length.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. The Draft EIR addresses if the Project would expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires under Impact 3.8-4 on page 3.8-21 of the Draft EIR.

121-16 The comment asserts that the two evacuation routes out of the City (Highway 29 and Silverado Trail) are inadequately sized.

Please see Master Response 1.

121-17 The comment states an opinion that the Project would endanger existing City residents by adding to the population.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

121-18 The comment expresses concern regarding emergency evacuation and claims the Proposed Project would reduce the ability for residents to safely evacuate the area during emergencies and requests additional mitigation measures.

Please also see Master Response 1, that provides more details related to emergency evacuation for both City residents and Project residents.

121-19 The comment states an opinion that emergency evacuation would be made more difficult due to the Proposed Project and that there are equity issues.

Please see Master Response 1.

121-20 The comment asserts that the Pope Street Bridge is not sufficient to facilitate emergency evacuation resulting in a reduction in access in the event of a wildfire evacuation.

Potential Project impacts along Pope Street and the Pope Street Bridge are analyzed in detail within Section 3.14, Transportation and Circulation of the Draft EIR and within Appendix K, Traffic Impact Study Please see Master Response 1.

121-21 The comment references a recent event in which a mudslide resulted in the closure of Silverado Trail.

Please see Response to Comment 39-5.

121-22 The comment states an opinion that, due to drought conditions and predictions for future droughts, the Project's water demands cannot be supported.

See Master Response 2 for further details regarding the City's water supplies and demands.

121-23 The comment asserts that climate change is decreasing snowpack and water supply.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Response to Comment 121-1.

121-24 The comment asks what the City's plan is for dealing with severe and sustained drought conditions due to climate change and providing adequate water supply for current and future residents.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. However, please see Master Response 2 regarding water supply.

121-25 The comment states an opinion that toilet retrofits are inadequate and that water supply will continue to be severely impacted by climate change. The comment states that the Draft EIR does not address these issues.

Please see Response to Comment 2 regarding water supply.

121-26 The comment states an opinion that the Project would irreversibly damage the aesthetics of the City by impacting views of the natural habitat restoration area and hills on either side of the valley.

Please see Responses to Comments 7-6 and 50-7.

121-27 The comment states an opinion that the Project would alter the aesthetics of the City's east side by increasing traffic and congestion.

The comment does not identify any specific areas where the EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Response to Comment 121-26.

121-28 The comment states an opinion that the increase in traffic generated by the Project would significantly impact air quality and surrounding areas including current residents as well as existing wildlife.

As discussed in Section 3.3, Air Quality, in developing thresholds of significance for air pollutants, the Bay Area Air Quality Management District (BAAQMD) considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be considered cumulatively considerable, resulting in a significant adverse air quality impact to the region's existing air quality conditions. Construction and operations of the Project be substantially lower than the BAAQMD significance thresholds as presented in Tables 3.3-8 and 3.3-9 (DEIR pp. 3.3-32 and 3.3-33). Thus, the Project would have a less-than-significant impact on air quality associated with construction and operation of the Project. The Project would not result in a significant degradation of the area's air quality that could adversely impact City residents and local wildlife.

121-29 The comment states an opinion that the Project would severely impact schools, recreation programs, water supply, sewer capacity, and garbage services.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Responses to Comments 89-2, 97-1 and 108-6 regarding schools; 70-7 and 79-3 regarding parks and Master Responses 2 and 4 that address water supply and wastewater. The Draft EIR addresses the Project's increase in solid waste in Section 3.13 Public Utilities. See Impact 3.13-4 starting on page 3.13-33.

121-30 The comment states an opinion that increased population from the Project would lower the quality of schools and asks where funds would come from in order to support rapid growth.

Please see Response to Comment 8-6.

121-31 The comment states an opinion that current water and sewage treatment facilities are in need of repair and that substantial infrastructure improvements would be required to accommodate growth. The comment asserts that there is no evaluation of how 500 new residents would be accommodated by the Project.

Please see Master Response 2 regarding water supply and Master Response 4 regarding wastewater. Additionally, the City uses a persons per household factor of 2.45 people per unit for medium/higher density residential land uses. Using this factor, the 87 units in the applicant's development proposal (including ADUs) would conservatively generate 213 residents, as explained on page 2-23 in Chapter 2, Project Description.

121-32 The comment asserts that that the Project site is used by various waterfowl species and contends that this use includes nesting.

The Draft EIR concluded that some birds may use the grassland for nesting when sufficient cover (i.e., tall vegetation) is present, but that it is unlikely that the approximately 9.7 acres of mowed annual grassland without a nearby open water area such as a pond or marsh represents critical foraging or nesting habitat for waterfowl species. The Draft EIR includes mitigation (BIO-2) to detect and avoid any nesting birds, including waterfowl that may nest within the Project site prior to commencing any construction activities.

Comment Letter 122

13 Jan 2022

Maya DeRosa Planning Director
City of Saint Helena

Comments RE Hunter EIR: (itemized outline of concerns/questions)

Believe in general there is a too consistent "readiness" or "swiftness" to jump into the LTS (less than significant Impact) category on a majority of topics. I find that to be counterproductive. I believe it would be more sincere to admit and embrace the reasonable conclusion that a project of this scope will have significant impacts in many areas. In my view that admission does not equate to reason to not proceed with an acceptable project that meets code. I am a firm believer in setting expectations based upon realities. Realities that include that this parcel has been designated by the the City of St Helena as MDR and as such should be afforded the expectations and right to pursue those outcomes as defined by applicable code. 122-1

On Alternatives:
General sense is that these are produced as mostly ineffective place fillers or easily dismissible fodder. Understand that is part of EIR format but again find little imagination or actual examination was undertaken to produce any powerful alternative options. I believe an actual consideration and some research into a more dense and more diverse (housing types and household types) solution would have been appropriate and ideally/possibly lead to more powerful and successful solutions. 122-2

3.9-3: 10.9 acres of additional impervious coverage (roads/roofs/walks etc…) (area that would require an engineered solution) out of a total site area of 16.9 acres is difficult to not consider that a substantial alteration of the existing drainage pattern. 122-3

3.12-1: Is there any data that shows the current capacity/state of the SH infrastructure (Water/ Sewer/wastewater) that demonstrates that this additional load would fit within existing capacity? Without that data I believe that jumping to a LTS impact condition is premature. 122-4

3.13-1: See above

3.13-2: Given current and expected ongoing water emergency situation "water supply" is a critical consideration. We are currently in a state that we do NOT have sufficient water supply to serve the existing built environment without taking measures/restrictions. I do not agree that it would in any way be appropriate to ignore that existing and ongoing condition. 122-5

3.13-3: Data on capacity of existing system and demonstration that added load would fit capacity in report? 122-6

3.13-6: I believe the added number of units to a stressed infrastructure system would be "considerable"…by considerable I believe that it should be shown that it was considered and demonstrations made that can show that capacity of the infrastructure can meet the added demand. 122-7

All of the above deal with increased demands on City water and sewer infrastructure systems which have been demonstrated to be under some stress with current demand. To conclude LTS impacts on any of these fronts in my view does not given these items adequate consideration…nor does it outline or generate possible solutions to mitigate or overcome these 122-8

added stressors to the somewhat fragile infrastructure systems. I believe we can and are obligated to service/maintain and upgrade those infrastructure systems that have been long neglected…but first we need to accept there is an issue. 122-8 Cont.

Alt 3- Park/Open Space: Generally find project ignores potentially powerful adjacency to an existing highly valued though under-maintained open space (river loop path). 122-9

2.3 Proposed project: I find it very difficult to support the concept of an incremental approval of a subdivision map that defers to a (to be approved later) housing agreement as the subdivision map itself essentially end runs/usurps/skips ahead a critical piece of our existing Inclusionary Housing Ordinance…setting in place a dynamic that accepts the condition without consideration the segregation of units of different types into sections. 122-10

See item 3.10 Land Use Inclusionary Housing 17.146.050(1)

3.9 H20: Very difficult to come to a LTS conclusion when adding 10.9 acres of impervious coverage to a 16.9 acre undeveloped site (64% of site). 122-11

3.12-2: Missing/ignoring consideration of impact to River loop path/open space adjacent to entire project site. In my view project concept also ignores the opportunity of this adjacency/ connectivity to a highly valued amenity. 122-12

Believe there is an inconsistency in EIR regarding the existing well that represents it as inoperable in one section and claims ignorance to if that well was used to water vineyard but later in appendix shows a high production value that is used to eliminate a large portion of water neutrality requirements. 122-13

On Water neutrality:

333 retrofits or an equivalent fee in lieu…? Experience tells me how difficult it is to find a single (or a handful) of Saint Helena households to retrofit and accomplish water neutrality. At some point as the inventory of retrofit opportunities naturally "evaporate" the mechanisms to achieve better water use need to be introduced into code or practice. In the least it would need to be demonstrated that 333 retrofit households exist. 122-14

In report there is some enticing info on the power of some alternate ways to actually achieve water neutrality (grey water systems etc…) but there is no attached commitment to pursuing any of those options. I believe it would be entirely appropriate for the City to introduce/induce or encourage some solutions that would accomplish water neutrality in a way that begins to service some of our greater critical infrastructure obligations/needs. 122-15

Call text or email with any questions.

Daniel Hale

1616 Madrona Avenue
Saint Helena CA 94574
707.227.4322

Response to Letter 122
Daniel Hale

122-1 The commenter is stating an opinion that there is a desire to conclude an impact is less than significant and that many impacts are significant.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

122-2 The comment states an opinion that the alternatives evaluated for the Project are not well thought out and that a more dense alternative with more housing diversity would be better for this Project.

Please see Response to Comment 89-2.

122-3 The comment references the amount of impervious surface area and states an opinion that the Project would contribute to a substantial alteration to the existing drainage pattern due to the increase in impervious surfaces.

The Draft EIR evaluates the increase in impervious surface area and changes to the existing drainage pattern under Impact 3.9-3 starting on page 3.9-44 in Section, 3.9, Hydrology and Water Quality. The Draft EIR concludes that Project would increase the amount of stormwater; however, increased runoff would be contained within the City's detention basin without the need to expand the basin. Therefore, impacts were determined to be less than significant.

122-4 The comment requests data for the current capacity and condition of the City's water and wastewater infrastructure.

The City has indicated the water and wastewater infrastructure is adequate and have not identified any concerns with the ability to serve the Project, as addressed in the Draft EIR starting on page 3.13-17. Please see also Master Response 4 that addresses the wastewater infrastructure.

122-5 The comment raises a concern regarding adequate water supplies to serve the Project.

Please see Master Response 2 that addresses water supply.

122-6 The comment requests information on the capacity of the City's existing wastewater system to serve the needs of the Project.

Please see Master Response 4 that addresses wastewater infrastructure.

122-7 The comment states an opinion that the Project would further stress the ability of the City's infrastructure to serve the additional load generated by the Project.

Please see Response to Comment 122-4 and Master Response 4 that addresses wastewater infrastructure.

122-8 The commenter disagrees with the finding that the City's water and wastewater infrastructure is adequate to serve and that the existing infrastructure is fragile and has been neglected.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Responses to Comments 122-4 through 122-7.

122-9 The comment states an opinion that the Project ignores the presence of the adjacent trail.

The Draft EIR recognizes the trail specifically in Chapter 2, Project Description and also in Section, 3.12, Public Services and Recreation. Please see also Response to Comment 114-11.This comment does not relate to the adequacy of the Draft EIR (which discusses the trail). The comment is forwarded to decision makers for their consideration. Please see Chapter 3, Changes to the Draft EIR for a figure showing the adjancent trails.

122-10 The comment states an opinion that it is difficult to support the incremental approval of a tentative map followed by other required approvals because the Project is not addressing compliance with the City's Inclusionary Housing Ordinance.

Please see Responses to Comments 19-1 and 84-3 that explain the approval process. There is no requirement that the Tentative Map have an Affordable Housing Agreement approved at the time of Map approval.

122-11 The commenter disagrees that increasing the amount of impervious surface area would result in a less-than-significant impact.

Please see Response to Comment 122-3.

122-12 The comment states an opinion that consideration of the adjacent trail and impacts to the trail are not addressed.

Please see Responses to Comments 84-9, 89-3, 89-5 and 114-11.

122-13 The comment asks if the Draft EIR accurately addresses the status of the onsite well.

The onsite irrigation well is addressed in detail in the Draft EIR in Section 3.9, Hydrology and Water Quality starting on page 3.9-40. The well is currently not operating as noted on page 3.9-43. The history of the well is unknown but it is assumed it was used at one time for irrigation of the onsite vineyard. Please also see Master Response 2 for more information specific to the onsite well.

122-14 The comment questions whether retrofitting homes to achieve water neutrality is practical.

Please see Master Response 2 that addresses this concern.

122-15 The comment asserts that there are alternate ways to achieve water neutrality and encourages the City to look at other solutions to offsetting an increase in water demand.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see also Master Response 2.

INTENTIONALLY LEFT BLANK

City of St. Helena Regular Planning Commission Meeting

November 2, 2021

CHAIR JOHN PONTE: Good evening. Thank you for coming to the St. Helena Planning Commission meeting of November 2nd, 2021.

There's a paragraph I need to read first before we get started.

This meeting will be conducted pursuant to the provisions of government code Section 54953 as amended by AB 361. It authorizes teleconference meetings under the Brown Act during certain proclaimed states of emergency. The governor of California proclaimed a state of emergency related to COVID-19 on March 4th, 2020.

This teleconference meeting is necessary so that the City can conduct essential businesses and, as permitted under government code Section 54953, in order to protect public health and safety of attendees.

Consistent with government code Section 54953, this Planning Commission meeting will be held via teleconference only and will not be physically open to the public.

Commission members and staff will be teleconferenced into the meeting by audio and/or video. The meeting will be conducted via Zoom webinar.

Ms. Gamero, do you have anything more for us?

SECRETARY XINIA GAMERO: Yes. Thank you, Chair Ponte. I will be sharing my screen here. Okay. Perfect.

Members of the public that wish to participate in public comments can do so by phone by dialing 669-900-6833. At the prompt, you may enter the meeting ID, 845 1730 1810. Press pound, and during public comment, press Star 9 to speak.

Additionally, tonight's meeting will have live Spanish interpretation. To access the interpretation, you will need to use the Zoom application from either your phone, tablet, or computer. Instructions on how to use the Zoom app are listed in English and Spanish on the agenda posted on the City's website.

Once you join the meeting from the Zoom application, you will see a small globe at the bottom or top of the screen. You can click the globe, and you will be able to access the live interpretation. We have Marci and Claudia who are the interpreters for this evening.

That will be all, Chair Ponte.

CHAIR JOHN PONTE: Thank you.

Vice Chair Hale, will you lead us in the pledge of allegiance, please?

VICE CHAIR DAN HALE: Surely.

I pledge allegiance to the flag of the United States of America, and to the republic for which it stands, one nation under God, indivisible, with liberty and justice for all.

CHAIR JOHN PONTE: Thank you. I'd like to call the meeting to order.

Secretary Gamero, will you take the roll please?

SECRETARY XINIA GAMERO: Yes. Commissioner Anderson?

COMMISSIONER AUTUMN ANDERSON: Here.

SECRETARY XINIA GAMERO: Commissioner Segura?

COMMISSIONER ROSAURA SEGURA: Here.

SECRETARY XINIA GAMERO: Commissioner Rothfeld?

COMMISSIONER MARIKA ROTHFELD: Here.

SECRETARY XINIA GAMERO: Vice Chair Hale?

VICE CHAIR DAN HALE: Here.

SECRETARY XINIA GAMERO: And Chair

Ponte?

CHAIR JOHN PONTE: Here. Thank you.

That takes us to Item 3, which is the public forum. This is an opportunity for the public to address the Commission on items of interest to the public that are not listed on the agenda.

Because of restrictions imposed by the Brown Act, the Commission may not engage in discussion nor take action on matters not described on the agenda. Please observe the time limit of four minutes.

Ms. Gamero, is there anybody who seems to wish to speak under public comment?

SECRETARY XINIA GAMERO: Yes, Chair Ponte. It looks like we have Nancy Dervin who would like to speak at the moment.

Nancy, will -- let me unmute you here. And I believe you're able to speak now.

NANCY DERVIN: Good evening. I would like to make a request. Since this is a public meeting, would you guys be so kind as to tell us how many people are logged in to view the meeting? So even though -- I mean, we don't know who they are, but it would be nice to know how

well attended the Zoom meetings are.

CHAIR JOHN PONTE: Is that even possible, Ms. Gamero?

SECRETARY XINIA GAMERO: I am able to see the number of attendees, and I believe there's -- I'm able to disclose that information. And it should be -- it's 25 attendees at the moment.

NANCY DERVIN: Thank you very much. It would be great if we could get updated if that number changes at some point, you know, if it goes up significant by like five or more, or people drop off, just to get a sense for how much involvement from the community there is.

Thank you very much, you guys.

CHAIR JOHN PONTE: Thank you.

Ms. Gamero, is there anyone else who wishes to speak under public comment? You're on mute.

SECRETARY XINIA GAMERO: I apologize. We have Angela -- I'm sorry -- Zivkovic, and you are unmuted now.

ANGELA ZIVKOVIC: Hi, good evening. My name is Angela Zivkovic, and I'm a resident of St. Helena.

I've been reading through the Hunter Project Develop EIR, and I realize that there's a public comment period that is open until November 8th. I'm wondering if it would be possible to advertise this more broadly because I don't feel like very many people are aware of this public comment period that's open.

And I would also like to express concern about the project in general, and --

CHAIR JOHN PONTE: Ms. Zivkovic?

ANGELA ZIVKOVIC: Yeah.

CHAIR JOHN PONTE: This item actually is on the agenda. This is for --

ANGELA ZIVKOVIC: Oh, it is.

CHAIR JOHN PONTE: This is for comments on items that are not on the agenda, so I need to ask you to hold your comment until we actually get down to the item of concern.

ANGELA ZIVKOVIC: Okay. Will do.

CHAIR JOHN PONTE: Thank you very much.

Anyone else, Ms. Gamero?

SECRETARY XINIA GAMERO: Yes. We have Tracy McBride has raised her hand. And you have been unmuted, Tracy.

TRACY MCBRIDE: Hi. Good evening,

commissioners. Thank you so much.

Could you please review the process for making a public comment? I have not made a public comment in a Zoom commission meeting before. You had the instructions for the phone public comment, but I'd like the instructions for the Zoom public comment.

And then just as a -- as a side note because I don't know all of you, just for future reference, it'd be really awesome if the commissioners could put "commissioner" in front of their names, and the city employees could state their roles on their names on the screen so that I can understand your roles.

Thank you so much.

CHAIR JOHN PONTE: We'll certainly take that into advisement for the future, ma'am, but I don't think we can backtrack at the present time.

TRACY MCBRIDE: Understood.

CHAIR JOHN PONTE: Yeah. Ms. Gamero, would you please direct her to where she could pick up the Zoom link on the city agenda?

SECRETARY XINIA GAMERO: She is logged in to the Zoom meeting.

CHAIR JOHN PONTE: Okay.

SECRETARY XINIA GAMERO: I'm not sure what her question is, but during public comments, during the item -- public hearing item, which is 5.1, Chair Ponte will open up the public hearing. And just like you did now, you'll be able to raise your hand, and I'll be going down the list and calling on your name, and that's how you can provide your public comment for the specific item.

TRACY MCBRIDE: Great.

SECRETARY XINIA GAMERO: Did that answer your question?

TRACY MCBRIDE: Great. Thank you so much. Yes.

CHAIR JOHN PONTE: Is there anyone else, Ms. Gamero?

SECRETARY XINIA GAMERO: Give me one second, Chair Ponte.

CHAIR JOHN PONTE: Thank you.

SECRETARY XINIA GAMERO: I do not see anybody else raising their hand at the moment.

CHAIR JOHN PONTE: All right. That takes us to Item 4, which is consent items. Members of the Commission or the public may ask that any items be considered individually for

purposes of considering alternative action, for extended discussion, or for public comment. Unless that is done, one motion may be used to adopt all recommended actions.

We only have one item tonight. That's the minutes of October 19th, 2021. Are there any members of the Commission that wish to pull that item for further consideration?

I do not see any. Secretary Gamero, is there anyone who -- online who wishes to have that item pulled for further discussion?

SECRETARY XINIA GAMERO: I do not see any raised hands, Chair Ponte.

CHAIR JOHN PONTE: Okay. Thank you. Then a motion from the Commission will be in order, if someone cares to make one.

Commissioner Anderson. You're on mute, Autumn. You're still on mute.

COMMISSIONER AUTUMN ANDERSON: I motion to approve the minutes.

CHAIR JOHN PONTE: Okay. Do I have a second?

COMMISSIONER ROSAURA SEGURA: I second.

CHAIR JOHN PONTE: Thank you, Commissioner Segura.

Ms. Gamero, will you tally the votes, please?

SECRETARY XINIA GAMERO: Commissioner Anderson? You're on mute.

COMMISSIONER AUTUMN ANDERSON: Yes.

SECRETARY XINIA GAMERO: Commissioner Segura?

COMMISSIONER ROSAURA SEGURA: Yes.

SECRETARY XINIA GAMERO: Commissioner Rothfeld?

COMMISSIONER MARIKA ROTHFELD: Yes.

SECRETARY XINIA GAMERO: Vice Chair Hale?

VICE CHAIR DAN HALE: Yes.

SECRETARY XINIA GAMERO: And Chair Ponte?

CHAIR JOHN PONTE: Yes. Thank you.

That takes us to the public hearing for this evening, 5.1, which is receiving comments on the Draft Environmental Impact Report for the Hunter Subdivision Project.

This may take us a while to get through, but I want to make it clear that that's all we're doing. We're not acting on the Environmental tonight. We're not acting on the

subdivision tonight. We're making no recommendations to the City Council on either one of those items. All we're doing is recording and listening to the comments from the public on the Draft Environmental Impact Report.

SECRETARY XINIA GAMERO: Additionally, Chair Ponte --

CHAIR JOHN PONTE: Director DeRosa --

SECRETARY XINIA GAMERO: I apologize. There's an announcement I'd like to make.

Any comment that was e-mailed, received after 3 p.m. this afternoon, will be added to the agenda tomorrow morning, so you will not see that on the Planning Commission agenda for tonight's meeting.

CHAIR JOHN PONTE: Thank you.

Director DeRosa, do you want to introduce this for us, please?

DIRECTOR MAYA DEROSA: Certainly. Thank you. We have the City's project manner, Eric Norris, here. We'll give a brief prestation and then open it up for public comment.

So Eric, you can go ahead and take it away.

ERIC NORRIS: Thank you, Maya. I'm

going to turn my camera off here briefly, and we'll get our show going.

Mr. Chair, members of the Commission, thank you very much for being here tonight.

I'm going to give a brief PowerPoint show, just a little bit of overview about the project itself. I think the chairman has already mentioned this is not an evening at which decisions will be made or recommendations made. It's also not a meeting where we will respond to comments. Tonight's meeting is all about getting comments from the public.

So let's talk a little bit about the project. So what we're talking about is a project called the Hunter Subdivision. It's a subdivision map, a tentative subdivision map at the end of Adams and -- Adams Street and Starr Avenue. Aerial photograph here shows where it is. Hunt Avenue also provides primary access to the site. It's about a 17-acre parcel, and they're proposing a total of 87 dwelling units on that land.

This is the -- what we call the tentative map. This is the kind of map that creates single-family lots that most of our homes

sit on, or larger lots that apartments sit on.

This is a very normal part of the development process when someone is planning to build a residential project, is to first of all subdivide the land into lots, and that's what they have proposed to do here. The map shows the arrangement of lots, the locations of streets, emergency access, some parcels on which houses won't be placed but other things will happen, and so on.

So again, just really briefly, the project is just under 17 acres. They're proposing 87 dwelling units. Now that's -- we've broken that down. It's 51 single-family homes, 25 multifamily homes on one of the larger parcels, and then 11 accessory dwelling units, and those are the second units or the granny flats that typically go on a lot with a single-family home.

The general plan density is -- or the general plan land use designation for the entire property is medium density residential, and I'll show you the general plan map in a moment.

The 2019 general plan recently adopted shows this density. The 1993 general plan which

predated it also showed that same density, so they're not requesting any change in land use policy, any change in zoning.

So the zoning matches the general plan. It's MDR, medium density residential. And within that density range that the general plan requires that the site build at, there's a floor and a ceiling on that, if you will. The minimum number of units that can be built on the site is 87, which is the number that they're coming in and proposing to build. Under the general plan, the site would support about three times more units, about up to 270. But they're not proposing that. They're coming in at 87.

So this is the general plan map. The site is outlined in red. It's adjacent to agriculture, high density residential, a lot of other MDR or medium density residential land as well.

So the applications currently, one of those is the Draft Environmental Impact Report, which is currently out for public review and which is the subject of tonight's meeting, and then the native subdivision map. That's the totality of what the city will be considering

early next year when this goes into public hearings at the Planning Commission and City Council.

Now, there are future applications that will need to be filed and considered before any development can take place. If this tentative map is approved, they won't be able to build any homes yet. There are several other steps. Those are listed on here.

There's an affordable housing agreement that will need to be approved by the City Council, and that's under the City's inclusionary housing ordinance, which generally requires that any new housing project include housing which is affordable to lower income households.

There is the design review of the proposed homes. They have not submitted any detailed designs for the homes yet. Again, all they're consider -- all they're pursuing at this point is the subdivision itself.

And then finally, there's a conditional use permit which is required under the City zoning code for the multifamily housing that they're proposing on the largest of the lots, Lot Number 52 on the subdivision.

The Draft EIR looks at a variety of topics. I'm not going to read all these off on the screen, but it's everything from aesthetics to energy. Some of the more important ones are probably transportation and circulation are certainly the ones that are going to receive a lot of attention. Utilities and service systems, which includes the issue of water service -- but basically a very complete range of topics for the Environmental Impact Report.

The document also looks at alternatives to the project and a number of other topics that are required to be examined under state law.

The Draft EIR, which is lengthy -- we understand that, but it's that way in an effort to make sure that all the information is out there -- concludes that all of the project's impacts, with one exception, can be reduced to a level of less than significant.

That one impact that can't be mitigated or can't be reduced to a level of less than significant is what we call vehicle miles travelled, or VMT. VMT or vehicle miles travelled is simple a measure of how far all the cars that basically live in this subdivision will

travel on an average day, and that's everything from driving from home to work, driving from home to school, driving home to shopping and back, and so on. It's a measure of how much vehicle travel is being generated by the project.

That's a new topic, actually, for CEQA that was imposed by state law just recently. What the state is trying to do is encourage cities to reduce the amount of vehicle travel as part of overall reductions in greenhouse gas emissions, which come partly from vehicles driving on the roadways.

But that's the one impact that can't be reduced to a less-than-significant level, and that is identified as significant, unavoidable.

Now, that doesn't mean that the EIR recommends adopting the project or approving it or not. The EIR doesn't do that. The EIR does not recommend anything about the project. It simply provides information. And in this case, it has identified that there's a significant impact, and there are methods provided in state law for the city to take action on a project even if it has significant impacts.

A little bit of history about the

project. Going back to 2010 was when the first application for this project came into the city. It was accepted as complete in 2011, so it's been around for a while. An earlier CEQA process started soon after that going between about 2011 and 2016. For various reasons, it was not completed.

This current process began about four years ago in 2017, which brings us up to September 23rd of this year, which was when the Draft Environmental Impact Report was released for public review for a minimum 45-day review period as required by state law. We're actually extending that because 45 days would've ended on a weekend, so we're extending that to the 8th of November.

Looking forward to next steps, once the comment period on the EIR closes on November the 8th, we will look at all those comments with the City's environmental consultant. If you're looking at your screen, you'll see someone named Christine Kronenberg. Christine is with the firm of Dudek. They are also working, as I am, for the City and on behalf of the City. They wrote the EIR, and they will be writing responses to

the comments that come in.

So that whole process of reviewing those comments, responding to them, and preparing a final EIR for consideration is going to happen through the winter. And then we're looking at the first quarter of next year for public hearings on the EIR and the tentative map.

Then, as I mentioned, there are future entitlements which can either happen next year or later. It's really up to the applicant on when they want to bring those in. Assuming that the subdivision map is approved, those being the affordable housing agreement, which goes to the City Council; the design review of the proposed homes; and the conditional use permit for multifamily housing, both of which would come back to this planning commission for approval.

So there are many opportunities throughout this entire process for public input, as we're showing on the screen here. The comment period that we're currently in is one of those, and this meeting is certainly an important part of that.

In addition to this, I mentioned there will be hearings next year, early in the year, in

the first quarter. Those will all be open to the public, and you'll be able to again come in front of the Planning Commission or the City Council, and express your concerns, ask questions, make comments about the project.

So once again, for tonight's meeting, we're trying to focus attention on comments on the Draft EIR. What we're looking for are your comments, your concerns that affect the adequacy of the environmental document that we're looking at tonight. Is there any information that's missing? Is there analysis that's not correct? Is there conclusions that you feel are incorrect? Are there typos in the document? We're looking for anything that -- any kind of comments like that.

So as the Chair mentioned, we're not looking tonight for comments on the project itself. There will be hearings at which time that is going to be a more appropriate topic of discussion.

I'll also mention that there are a number of different ways to comment. Well, first of all, the EIR is available on the City's website. I've put the web address up here. It's

also available, if you don't want to go online, in printed form at City Hall and at the St. Helena Public Library. The comment deadline is November 8th.

You can comment tonight. We certainly encourage you, if you have the ability to, to comment in writing either by U.S. mail or via e-mail. That way, we're sure that we get your exact comments in the record. We'll be taking notes tonight. As I mentioned, Ms. Kronenberg from Dudek is online, so she'll be just taking notes about the meeting tonight. But if you really want to be certain that your full comments exactly as you want to express them are in the record, we encourage you to do that in writing.

So Mr. Chair, staff's recommendation for tonight is that you finish receiving this presentation, open the public hearing, receive comments, close the public hearing, and then if there are any commissioner comments on the Draft EIR, we'd certainly welcome the commission members to provide those.

And with that, I will end my presentation, turn my camera back on, and again, thank you for the time.

CHAIR JOHN PONTE: Thank you very much, Mr. Norris.

With that, I will indeed open the public hearing. And this is actually -- right as we get started is the time for any commissioner who's had ex parte communications to place that on the table so we all know about it. Are there any commissioners who've had ex parte communications over this particular subject?

I see no hands going up, so Secretary Gamero, are there any members of the public who wish to speak on this item?

SECRETARY XINIA GAMERO: Yes. We have some hands, and I will start off with Angela Zivkovic. You are unmuted, Angela.

ANGELA ZIVKOVIC: Okay. Can you hear me all right?

SECRETARY XINIA GAMERO: Yes.

ANGELA ZIVKOVIC: Great. Thank you.

So I've read through the Draft Environmental Impact Report, and I'm surprised that so many of the issues that were covered were deemed as mitigated to a level of less than significant. I feel that there are quite a few issues that would, in fact, have significant

PC-1

impact, and I will go through the list as I see it.

I strongly support Alternative Number 1, which is no project, no build alternative for the following reasons.

One, the aesthetics of the east side of the town are inextricably linked with the vineyards, wetlands, and public outdoor space in the designated project area. Every day, hundreds of St. Helena residents access the areas around the site -- this site for recreation, as do visitors and tourists to the area.

If there were a large housing development erected on the site, it would irreversibly damage the aesthetics of this town as a small agricultural town with historic significance. We would not be able to walk on the walkway through the area, have a view of the hills on either side of the valley and the natural habitat restoration area.

The housing development would also permanently alter the aesthetics of Starr Avenue by drastically increasing traffic and congestion in this area.

As a direct result of the building work

PC-1 Cont.

PC-2

PC-3

PC-4

PC-5

itself and the subsequent increase in traffic and congestion to and from the development by hundreds of new residents, there would also be significant impact on the air quality, particularly when you look at it as microclimate on the east side of town, and to all of the current residents as well as wildlife that live in the protected wildlife habitat zone directly adjacent to the development.

The impacts on air quality from hundreds of additional vehicles driving to and from these residences and from the extension of Starr Avenue and Adams with the additional cutting over of vehicles from Main Street and Silverado Trail would have additional significant and cumulative negative impact on air quality.

The impacts of the development on water quality and hydrology have also not been adequately evaluated and mitigated in this report. The idea, it seems, is to simply use an agricultural well to supply the water needs of hundreds of residents, and I feel that this is naïve and inequality addressed.

We're living in a time of unprecedented water shortages with climate change projections

PC-5 Cont.

PC-6

PC-7

PC-8

PC-9

PC-10

predicting worsening in this regard over the next several decades. And with clear evidence that wells and underground water sources are simply running out all over California, it is completely irresponsible to propose that the water needs of potentially over 500 residents in this development could possibly be met with an agricultural well as the water source.

Next, with regard to land use, it is remarkable that the development in question does not take into account the fact that there is hardly any public open space available in town as it is, much less if the project were to go through.

Even chickens in the state of California have humane standards on the amount of minimum access to open space that they can have at about 60 square feet of space. At an equivalence of approximately 30 times body size for an average human, that would mean that every citizen of this community should have the right to a minimum of 1,800 square feet of open space.

Currently, the City of St. Helena has only a couple of parks, adding up to about 3 million square feet of open space. And with over

PC-10 Cont.

PC-11

PC-12

PC-13

6,000 residents, that means that each St. Helena resident has only about 500 square feet of open space, which is already less than the bare minimum requirement that even poultry has access to. We really can't afford to lose the last bit of open space that we have in this area.

Noise and vibration would also increase significantly with the development in the area, and this has not been adequately accounted for with regard to the residents of not just Starr Avenue and the adjacent neighborhoods but also the existing low-income housing development on Hunt Avenue, which would be severely impacted not just during construction but also once the development is finished, and there is significant traffic and congestion that's increasing in the area.

Finally, it's difficult to fathom how the development project could possibly fit in with the goals and aspirations of our community for public services, recreation, and public utilities. As it is, our community is barely able to meet the needs of current residents with regard to basic public services, recreation, and utilities.

PC-13 Cont.

PC-14

PC-15

PC-16

Everything from schools, water, sewage, garbage would be severely impacted by a construction project that would increase the population of St. Helena by 10 percent practically overnight. PC-17

It is difficult to understand how our schools could possibly continue to provide quality teaching to a student body that could grow by 10 percent from one year to the next. PC-18

And our current water and sewage treatment facilities are in need of repair and maintenance, and are barely able to supply the basic needs of current residents. A sustainable amount of -- PC-19

SECRETARY XINIA GAMERO: Ms. Angela Zivkovic, just a reminder that there's a time limit of four minutes per public comment. Your four minutes are up. If you'd like to wrap up your public comments, now would be a good time.

ANGELA ZIVKOVIC: Okay. I would like to just finish by saying that I think a major problem is sewage and water. The plan states that the sewage would simply by diverted to existing sewer lines on Starr Avenue and Vineyard Valley, and there's already some issues there. PC-20

We have a bad smell on the corner of Starr and Hunt in the fall on a regular basis, and we feel that this would be even more severely impacted by the development.

Thank you so much for giving me this opportunity to voice my opinion.

CHAIR JOHN PONTE: Thank you.

Ms. Gamero, is there a next person?

And I would like to remind everybody there is indeed a time limit of four minutes. We're trying to stick to that.

SECRETARY XINIA GAMERO: Yes. Chair Ponte, there is Greg Reynolds from Vineyard Valley who'd like to speak.

And Greg, you're more than welcome to speak now.

CHAIR JOHN PONTE: Mr. Reynolds, welcome.

GREG REYNOLDS: Thank you. Can you guys hear me?

CHAIR JOHN PONTE: Yes, we can.

GREG REYNOLDS: Okay. Good evening, I'm Greg Reynolds, 290 Pope Street, St. Helena. I'm the managing partner for Vineyard Valley Mobile Home Park. Thank you once again for an

PC-20 Cont.

opportunity to speak.

There is myriad of concerns we have about the Hunter Project. As our residents understand more about the project, topics of impact are significant and across the board. From levee access and levee maintenance to vista and privacy concerns, the electorate here in VV is not happy. PC-21

There are so many mitigating circumstances raised in today's current environment around water, fire safety, emergency response, traffic, to name a few, that your job as city planners and perhaps City Council members make it all the more critical that evidence doesn't get ignored. You have a tough job. You need to forecast where a project like this takes the citizens of Vineyard Valley and the greater city of St. Helena. PC-22

I'll focus on just three issues tonight, and we will follow up in writing next week as well.

My three issues are emergency evacuations; water, specific to sewer discharge; and traffic.

Vineyard Valley is a retirement

community 55 and older, approximately 218 homes when everyone is home. The park is home to 350 people. Many are retired seniors.

After the last five years and last year with the Glass fire, we've spent more time each year focused on fire suppression, readiness, and safety, this year primarily in neighborhood reach and resident evacuation in the event of an emergency.

After the devastating floods of '86 and '95, the park was transformed with a significant investment in the floodwall project. The design and building of that project attempted to mitigate the floodplain realities with the floodwall, the levee, and holding pond, and pumps.

The deployment of that significant investment did not include the construction referenced here. Hunter Project was not part of that plan and the safety they propose to deliver. We're very concerned that a safe evacuation and access through the back of the park will disappear with this project. We are concerned that the construction will undermine the levee and overwhelm the Army Corps strategy put in

PC-23

PC-24

place to protect our 350 residents and their homes.

We are concerned about water, as many have commented. As we all engage to participate in Phase 2, this concerns us greatly. We will comment in writing specifically about wastewater flows and what appears to be a plan to connect a portion of the Hunter Project to Vineyard Valley's wastewater discharge sewer. This is a city sewer that is documented to have significant issues when it does rain.

The majority of the Hunter Project single-family homes, 46 out of 51, will be connected to the VV sewer, Vineyard Valley sewer. We will be getting most of the sewer flow, taking into account the multifamily units as well as 75 percent of the total project discharge is directed our way. Our VV sewer is already overtaxed. This will clearly drown this infrastructure. As in other parts of the city, this is unacceptable and expensive, as the City spends and documents every cleanup situation.

The traffic data clearly demonstrates significant challenges for our senior contingent. In the DEIR, it is clear from the table, the

PC-24 Cont.

PC-25

PC-26

PC-27

proposed project transportation demand management, TDM, strategies would result in a project VMT to be 15.2 percent higher than the citywide VMT per capita.

The Draft EIR concludes and clearly states the proposal project has a significant and unavoidable impact. Then it is our opinion that the Council has an obligation to the citizens of St. Helena to protect their environment, environmental integrity, and vote to deny the acceptance of the Draft EIR.

Thank you so much.

CHAIR JOHN PONTE: Thank you very much, Mr. Reynolds.

Secretary Gamero, please.

SECRETARY XINIA GAMERO: Yes. One moment. We have Maria. Maria, you should be unmuted now. You can speak now.

MARIA VILLEGAS: Hi. Good evening, everyone, and thank you for taking my comment.

CHAIR JOHN PONTE: Good evening, ma'am. If you could give us your full name. You don't have to, but we would appreciate it.

MARIA VILLEGAS: Yes. This is Maria Villegas. I'm at 1166 Meadowcreek Circle.

PC-27 Cont.

PC-28

CHAIR JOHN PONTE: Thank you very much.

MARIA VILLEGAS: Sure. Well, on the surface for some, the proposed project appears to be advantageous to the community, but is it?

Though the project will increase the number of homes, including affordable housing, additional residents will increase the need for an electrical grid that can supply power for our extreme hot and cold seasons. PC-29

The Draft EIR states the (indiscernible) uses the 2016 state requirements. However, it is compliant with the updated 2019 version. There are increased power outages with our current population. Adding a new subdivision would stress an already struggling power system. PC-30

I was not able to find added evacuation routes in the event of a fire or flood. This leaves Adams and Starr as the only evacuation routes for the additional 87 units. The two streets would also be the evacuation routes for residents on Starr, Meadowcreek, Hunt, and spillover from Vineyard Valley. PC-31

As years have gone by, parked vehicles from surrounding neighborhoods have significantly increased on Hunt, Starr, and Meadowcreek. With PC-32

the current extreme fire danger and longer fire seasons, in the event of an emergency, evacuations will create a dangerous and potentially deadly situation.

If residents in surrounding neighborhoods are forced to park farther away from their homes, this would increase foot traffic and vehicle traffic during an emergency evacuation. As we all know, people panic, and the situation could become deadly. The Hunter Project would greatly impact -- increase traffic and a deadly situation more likely.

I was born and raised in St. Helena and have seen it grow from a sleepy town to a popular tourist destination. As a child, I remember residents never wanting to live on the east side of town, not because it was the wrong side of the tracks but because it flooded, and it was agricultural.

There were (indiscernible) trees and walnut trees, and yes, there were two wineries. It was (indiscernible) and Berringer.

And the early -- if the early settlers were standing before you today with the current proposed project, they would ask you, "Why would

PC-32 Cont.

PC-33

PC-34

you build in a flood zone?" And though there is currently a levee to project the proposed development, the elders would say, "Respect Mother Nature." When she decides to flood, there's no levee that would -- that's going to stop flooding. We need to respect nature and listen to what it's telling us. If the recent fires haven't taught us, we really need to reevaluate our understanding of climate change.

This isn't rocket science. This is common sense. When a proposed project is being built in an area never meant for human habitat, it screams, "This proposed project should not move forward."

Lastly, the willingness to build a subdivision over a Native American burial site, the largest discovered in the Napa Valley, should give pause not only to the developer but all our elected officials. The site qualifies for both national and state registry as a historical site. 163 human remains were discovered along with trading beads believed to be from Spain. The DEIR recognized there is potential for more artifacts to be uncovered.

And under AB 52, the Native American

PC-34 Cont.

PC-35

PC-36

PC-37

tribe affiliated with the artifacts and/or human remains are to be notified. The Wappo tribal chairman was not listed in the DEIR as being notified. The artifacts discovered at the project site are part of St. Helena's history. It's part of us.

Thank you.

CHAIR JOHN PONTE: Thank you very much.

Ms. Gamero?

SECRETARY XINIA GAMERO: Yes. We have Patrick Band. Patrick, you should be able to speak now.

PATRICK BAND: Thank you very much.

Patrick Band, executive director of the Napa County Bicycle Coalition. I wanted to provide some general comments this evening in advance of a formal comment letter that we'll be submitting within the next week.

We would also like to request an extension of the EIR -- or DEIR comment deadline by an additional 30 to 45 days given the number of significant issues that we've identified as well as other community members are bringing up this evening.

Specific to the Bicycle Coalition, we

PC-37 Cont.

PC-38

PC-39

have pretty significant concerns regarding a lack of adequacy of the bicycle and pedestrian facilities that are proposed within this project.

Despite, as the consultant has referenced, the significant and unavoidable impacts primarily from VMT as a result of project buildout, notably the DEIR fails to acknowledge the city's own 2019 adopted bicycle plan, which would call for Class 1 multiuse facilities on Adams as well as Starr. Those facilities would provide a safe, separated opportunity for bicyclists and pedestrians to travel to and from the project location to a number of local destinations, including grocery stores, shopping, schools nearby, and that connectivity would only be leveraged further by the planned improvements for the Napa Valley Vine Trail, which is also likely to include a section of Adams.

Again, this project is very walkable and bikeable if those project facilities are included, which they are not currently.

We again will be providing a full comment letter, but suffice to say we are very disappointed that the DEIR is basing a number of their transportation assumptions on either

PC-39 Cont.

PC-40

PC-41

PC-42

outdated or faulty plans and would like to request an extension of the comment period by an additional 30 to 45 days.

Thank you very much.

CHAIR JOHN PONTE: Thank you.

I would like to say one thing here right now. The Commission is not empowered to make any sort of decision on extending the review time for this EIR. That's beyond our purview. That would come out of either senior City staff or the City Council itself. We have no power to do that. So if there's anyone else who is online waiting to request that, we are not the venue that can act on any such request.

Ms. Gamero, is there another person who wishes to speak?

SECRETARY XINIA GAMERO: Yes. We have Tracy McBride who would like to speak. And you have four minutes, Tracy.

TRACY MCBRIDE: Good evening, commissioners and staff. Thank you to those who have spoken, and thank you for this opportunity.

I want to say that I feel this is a design of the past, and I'm not quite understanding the City staff person who said

PC-42 Cont.

PC-43

tonight is about comments on the EIR but not on the project.

I do support more housing, more diversity in St. Helena, and property owner rights. But I strongly feel the proposal for 87 units needs to take into consideration energy efficiency, housing equity, working to achieve net zero impact on the environment, and resource consumption.

Constructing separate and unequal load to moderate-income housing will forever mark those units as affordable units, lesser quality, and be easily identified as the low-income section. The affordable housing should look and feel very similar to all the homes developed. I can accept they may be smaller and have smaller yards, but why do they need to look different?

I have an issue with the east side versus the west side of St. Helena. There are no similar big developments in the heart of the so-called west side or perimeter of the west side. You commissioners need to tip the scales to help the developers build homes that attract the next generation of residents to even the score between the east side and the west side.

PC-43 Cont.

PC-44

PC-45

I believe there should be public open space, mentioned in the EIR, of at least one acre. As commissioners, you know our per capita per public parks, and where do we stand? Just as the Signorelli development created Jacob Miely Park, which is much bigger than an acre, don't you feel creating public open space is the right thing to do for our community and the new residents who will live here? I believe this park should connect to a walking path to the Napa River. PC-46

This proposal should allow for owned, affordable housing, which should be regulated in the same way but not a rental. The affordable housing in St. Helena is only rentals. This eliminates home ownership, a very important component of our society. Owners will not be able to achieve the same appreciation as the free market, but they will be able to enjoy home ownership benefits. My opinion, at least 50 percent of the moderate and below-income housing should be owned. There are Bay Area cities that implement owned affordable housing. PC-47

The new construction should be fire retardant with underground utilities, even if PC-48

it's not in a high fire natural hazard zone. Anyone who's lived next to a fire knows it can sweep through any neighborhood. Has the City considered requesting the project be 100 percent electric, no natural gas for both environmental and fire hazard reasons?

This project absolutely has an impact on an evacuation plan with possibly hundreds more cars needing to evacuate. We absolutely need another connection to the Silverado Trail, other than Deer Park, the historic Pratt, or Pope bridges. Our stone bridges are not seismically sound. It's time to wake up to what we need to do for efficient, safe traffic flow. We are living on borrowed time with the old bridges, and we need to alleviate the weight of traffic on Hunt and Pope.

Then we get to the clincher. Would the proposed project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal dry and multiple dry years? "This is a less-than-significant impact." Come on. Really? Retrofitting toilets is something that was done 20 to 40 years ago. This will not make the

PC-48 Cont.

PC-49

PC-50

PC-51

project water neutral. The only thing that will make this project water neutral is investment in infrastructure to get more water for the whole city. The City can ask or incentivize the developer to do this.

In summary, I support development and property owner rights, but I do not support taking a step backwards to gain not enough. I'm talking about housing equity, forward thinking, balance east side and west side, build a new bridge, water, water, water, and I also think that the EIR comment period should be extended, and I'm making this comment out loud to the City staff.

Thank you so much.

CHAIR JOHN PONTE: Thank you.

Ms. Gamora?

SECRETARY XINIA GAMERO: Next we have Ms. Elizabeth Alderman. You can speak now.

ELIZABETH ALDERMAN: Hi. Hello. I guess in contrast to several people who have spoken tonight, we are actually very new to town. We moved here in February, and we are probably the most impacted by the potential construction, living at the corner of Hunt and Starr.

PC-51 Cont.

PC-52

There's a few things I would like to say. We have two small children who ride the bus every morning. We stand out, you know, at the corner of Hunt and Starr, and every single morning, I have to stand in the crosswalk of Hunt and Starr to prevent cars from driving past the bus and putting children in peril. The stop sign at our intersection is faded almost to not being recognizable. It has not been replaced. PC-53

So I think, you know, to sum up, I have no confidence that there is the ability to safely manage a new inflow of hundreds of cars for the children that ride that bus every single day. PC-54

The other thing I'd like to point out is there is a major parking issue in our neighborhood. I have been in contact with the manager of Hunt's Grove. My children are friends with kids in the community. You know, we live right next to them.

Those apartments right now have many more people living in them because of the affordable housing crisis, and it's trickling over into a parking situation. PC-55

What I have not seen is any plan from the City to accommodate the existing traffic PC-56

problems and parking problems we have right now as well as what we will do when there is an additional 80 units of housing.

I would also like to point out that from an equity perspective, I would much rather see another Hunt's Grove in the community where we give affordable housing to people who truly need it and who truly want to contribute and work in the community rather than potentially opening up multiple units of housing to second home owners who do not live here. There are too many people that need housing in this community to make that even a possible option that these would turn into Picasso homes or anything like that.

And echoing what other commenters have said, there's not enough time to react to this Environmental Impact Review. I know for a fact that many people in the Hunt's Grove community have not read it, and they are majorly impacted by this development, so I would like to also echo the sentiment as well.

CHAIR JOHN PONTE: Thank you, Ms. Alderman.

SECRETARY XINIA GAMERO: Yes, we have Nancy Dervin who would like to speak. You can

PC-56 Cont.

PC-57

PC-58

speak now.

NANCY DERVIN: Good evening again. Ditto to all the other speakers' concerns. I really thought a lot about this, and I don't know how it would be physically possible to undertake that type of a development in that particular location without serious degradation to the flora and fauna in the area. PC-59

It's adjacent to a conservation easement, agricultural lands, and publicly accessed property that the City owns, and I just don't see how you could go in there and do that kind of construction without devastating the habitat of wildlife, and plants, and shrubs, and other things that are trying to thrive and that we've been working towards trying to bring back, actually. PC-60

So there's an environmental effort underway now to try and restore habitat and preserve, and even enhance it, and this kind of a project just simply is not compatible. PC-61

And beyond the plants and animals and whatnot, I think as a society, if we don't take seriously what sacred ground actually means and honor it, we're going down a path that even if

fiscally a project is successful, there are other ramifications that aren't measured by dollars that are going to be very detrimental to our community, to the psyche of our community. So I think we need sometimes to think behind just the hard numbers, and the calculations, and whatnot.

And then lastly, I'd like to remind you guys -- I think you all know this, but possibly you don't -- that St. Helena Housing Coalition and our town, St. Helena, have some significant affordable housing projects that they're trying to bring forward. And at some point, if we're not already there, there just isn't enough water.

We're struggling with water now. We have hundreds of affordable housing units the government has asked us to provide. We have two nonprofit agencies working to that end. I think the priority should be for the developments to address mandated needs that are not just mandated but are demonstrated to us every single day with literally thousands of people commuting to jobs, many of them service workers or even City employees that cannot afford to live here.

So I don't even know if in this process it's possible for you guys to look at the bigger

PC-62

PC-63

picture and recognize at some point, we will have built out all that we can give our resources, and I don't think it's appropriate to bypass the affordable efforts that are being made in favor of something like this that would just be so irrevocably harmful on so many different levels.

Thank you for giving the opportunity to speak. I appreciate it. Goodnight.

CHAIR JOHN PONTE: Thank you, Ms. Dervin.

SECRETARY XINIA GAMERO: And at the moment, I do not see any more hands raised. I'll give it a few seconds to see if anybody raises their hand.

We have Marina Lava -- I'm sorry -- Lavagnino. I apologize if I messed that up. You can speak now.

MARINA LAVAGNINO: Great. Thank you. You did very well with that. Lavagnino. Marina Lavagnino.

I'm curious. I actually live in Vineyard Valley and look out on the side of this every day. My office looks out on the property, and I see so many people using this as a recreation area.

PC-63 Cont.

I am going through the DEIR carefully, and there's a lot of really interesting information there, so I would encourage people to read it carefully and not just briefly because there's a lot of detail.

But I'm wondering if there has been any survey of the people who use this -- the walking trail because they don't just stick to the (indiscernible). They do a loop around the property, and depending on the time of day and the fog in the area, or the sunshine, people use this area in many different ways. And it's certainly not just the Vineyard Valley residents or the people from Hunt's Grove.

I'd be curious -- and I think it's very relevant -- if there could be a survey of who uses the property and how fully. It would definitely be very different if they were walking along a set of homes rather than between a vineyard and field.

I think there's a recreational usage that people are experiencing right now that if we lose that, we don't have another place in St. Helena that provides that kind of access and usage. So I don't -- I know you can't answer

PC-64

this right now, but I think that that kind of survey would be really important.

Thank you.

CHAIR JOHN PONTE: Thank you very much.

SECRETARY XINIA GAMERO: Next, we have Ben Alderman. Go ahead, Ben.

BEN ALDERMAN: Oh, hi. Can you hear me okay?

CHAIR JOHN PONTE: Yes, we can, Mr. Alderman.

BEN ALDERMAN: Thank you. I was just wondering, taking into account recent weather events, the closing of throughways and how that's going to have an impact that we've seen already on the main streets. Once Starr is connected, that would then likely drive a lot of that traffic down Starr and over.

So when we're looking at traffic patterns, is there the opportunity to look at traffic patterns now? I don't remember the exact day -- I'm sorry -- the traffic patterns were taken, so we can look at the impact of the closing of Silverado Trail and what the likely impact to that would be on the thoroughfare through Starr. Because as we know, this

PC-65

PC-66

development has no access to Silverado from either side, if there was a closure. So all of that is then likely to be driven down not the main street but along Starr.

We know traffic is already an issue as part of the Environmental Impact Study. Recent events suggest to me it would actually be a much greater issue than what's been put into the study so far.

CHAIR JOHN PONTE: Thank you, Mr. Alderman.

Ms. Gamero?

SECRETARY XINIA GAMERO: I do not see any other hands raised at the moment, Chair Ponte.

CHAIR JOHN PONTE: All right. Well, let's close the public hearing for now, and we will check before we go on. But at this point, this would be the opportunity for planning commissioners to comment on the draft EIR if there are any comments from the Planning Commission. Any commissioner who wishes to throw their oar in the water on this subject this evening?

I do not see any hands, but I will

PC-66 Cont.

PC-67

remind -- oh. Vice Chair Hale, please.

VICE CHAIR DAN HALE: Yeah. I'm going to try to not get too deep in the weeds on my comments, but I would just encourage everybody out there to take the available time and the time it's going to take, actually, to read through some of this because there is a -- there's a mountain of data that's in this.

And I think what I would suggest that it's important to understand is what we're trying -- the comment process here about the EIR, the Draft EIR, is -- what we're trying to form is a more perfect tool to analyze this project. It's, I think, keeping your comments relevant to that -- to perfecting that tool will be really, really most useful.

And it's -- know it's a little -- it's dense, and it's difficult to kind of parse out the different pieces of this and the process of it. but I think if we can do that, this will be more productive, and it'll give us the most accurate kind of read on this, so I think if you can kind of push to perfect the data, you know, point out where pieces are missing, and if there's pieces that you feel are inaccurate, of

PC-68

course do that too. That would be the most productive thing. And I'll leave it there.

CHAIR JOHN PONTE: Any other commissioner care to comment on the Draft EIR at this point?

I do not see any hands raised. So with that, Ms. Gamero, has anyone come online the last couple of minutes?

SECRETARY XINIA GAMERO: I do not see any other hands raised, Chair Ponte.

CHAIR JOHN PONTE: Okay. In which case, I will --

ERIC NORRIS: Mr. Chair?

CHAIR JOHN PONTE: Yes, sir. Mr. Norris.

ERIC NORRIS: Perhaps the clerk could just mention the number of participants who are on the call at this time. It has gone up.

CHAIR JOHN PONTE: You're correct.

SECRETARY XINIA GAMERO: The number of participants is 32.

CHAIR JOHN PONTE: 32. Okay. We were at 25.

SECRETARY XINIA GAMERO: And I do see a hand that just raised.

PC-68 Cont.

CHAIR JOHN PONTE: Okay. Could you --

SECRETARY XINIA GAMERO: We have Mr. Hussong who would like to speak. Go ahead.

RANDY HUSSONG: That's correct. Great pronunciation, my last name. Thank you very much. Hunt Avenue resident.

I'm concerned about the water. I mean, everything else is going to be parsed out and mitigated. Traffic and so forth is going to be heavily impacted.

I can -- I read through the entire report. I cannot understand how retrofitting some toilets is going to make the water usage neutral, along with the sewer. We've got some serious, serious problems with the water in Bell Canyon. We're not doing anything to increase that to an adequate amount, and I beg any person in the town of St. Helena to say that 65 gallons a day, or a two-minute shower, is the luxury that you expect for the tax base that we're paying for.

So this is a significant impact, the water usage, that is not being addressed in the EIR. And I beg to differ that the -- it is not an impact and that the well is going to produce

PC-69

some portion of all the landscaping and that retrofitting 300 toilets is going to make this a water neutral situation when you can't provide enough water for the residents that are already paying for it. It's absurd.

So this needs to be addressed in a more significant way and more detailed. So thank you very much.

CHAIR JOHN PONTE: Thank you, Mr. Hussong.

SECRETARY XINIA GAMERO: We have Michael Mills next. You can speak now, Mr. Mills.

MICHAEL MILLS: Thank you. Commissioner Hale has pointed out that this document is -- I think his words were -- dense. And it seems to have encouraged us all to read it carefully.

And there was a request earlier from two people that the comment period, which is remarkably brief -- I think, per page, it's a really very minimal comment period. There was a suggestion that the comment period be extended. The Chair has said that the commission does not have the power to do that but suggested that the

PC-69 Cont.

PC-70

PC-71

staff has that power. Is that correct?

CHAIR JOHN PONTE: Not -- well, certain members of City staff have that power. But basically, it falls to the City Council to do so or to certain members of upper management of the City acting in their place.

MICHAEL MILLS: Then, Mr. Chairman, I would suggest that you identify specifically how we can submit that request. I think that would be fair to those who've made the request, that you give us the direction on how to do that.

CHAIR JOHN PONTE: You have made the request now. We just can't act on it. It's beyond our purview to act on it.

MICHAEL MILLS: Well, is the Commission then transmitting that request to the appropriate authorities on behalf of those who have asked?

CHAIR JOHN PONTE: We will be transmitting that request indeed.

MICHAEL MILLS: Thank you.

CHAIR JOHN PONTE: Anything else, Mr. Mills?

MICHAEL MILLS: No. Thank you very much.

CHAIR JOHN PONTE: Very good. Thank

PC-71 Cont.

PC-72

PC-73

you.

SECRETARY XINIA GAMERO: Next, we have -- excuse me -- Maureen 436. Maureen, if you could state your last name. You don't have to, but it would be great if you could do that for the record. You can speak now.

MAUREEN LEVANDOWSKI: Hi. I'm Maureen Levandowski. I live off of Fawn Park here in St. Helena, and I just feel like the most important thing of this whole scenario is definitely the water. I would have to agree with Randy Hussong that that is probably the biggest issue here. We are living in a time when there is an unprecedented amount of no water, and we need to be addressing that more than anything in this whole project.

And that's pretty much it. Thank you.

CHAIR JOHN PONTE: Thank you.

There are no other hands up at the moment, Chair Ponte.

CHAIR JOHN PONTE: No hands the moment. All right.

DIRECTOR MAYA DEROSA: Chair Ponte, if I may --

CHAIR JOHN PONTE: Yes.

PC-74

DIRECTOR MAYA DEROSA: -- respond and articulate for our public what the -- again, I know we spoke a little bit about what the process looks like going forward, and I did hear the request to extend the comment period.

The -- what I want the public to understand is that while the formal comment period on the EIR closes on the 8th so staff can prepared detailed responses through the final EIR, there actually will still remain an open period to still comment on the project and the EIR all the way up into the final hearing going to the City Council, which is still months away.

So -- and we had done a news release about this. So how we would endeavor to respond to those comments would be through the staff report at those respective public hearings.

So I want to, you know, not have a sense of alarm that just because they don't get their comments in by the 8th that they're going to be dismissed. That is not the intent at all.

CEQA is a public process. The purpose of the EIR is just to disclose what are the impacts, and there are statutory timeframes along that process of where we receive additional input

and feedback.

So I hope that helps clarify to the public that they're -- they are still welcome to submit comments on the EIR post the 8th, but there's just going to be -- it's just going to be a slightly different process of what it looks like of how those comments are addressed.

Thank you.

CHAIR JOHN PONTE: Thank you, Director DeRosa.

All right. Ms. Gamero, one last time, anybody who wishes to speak?

SECRETARY XINIA GAMERO: No additional hands are up, Chair Ponte.

CHAIR JOHN PONTE: All right. I'm going to, in which case, close the public hearing. And since we've already requested comments from the planning commissioners, unless there's anyone else on the Planning Commission who wishes to address this item -- I don't see any hands -- we will move on, which takes us to Item 6, new business. We have none.

Item 7, schedule matters. We have none.

Item 8, department reports. Director

DeRosa, do you have anything for us tonight?

DIRECTOR MAYA DEROSA: No formal report, but just to let you know that our next meeting will be cancelled in November, but we are looking to have a meeting, the first meeting in December on the 7th. So that would be our next scheduled meeting.

CHAIR JOHN PONTE: Thank you.

Agenda forecast, as always, it's on the City website, the list of current projects that are in process.

And this is also the opportunity for any commissioner to request an item on a future agenda. Is there any commissioner who'd like to bring an item forward for discussion or consideration on a future agenda?

Once again, seeing none, that brings us to what was (indiscernible) favorite item, adjournment.

We are adjourned. Thank you.

C E R T I F I C A T I O N

I, Sonya Ledanski Hyde, certify that the foregoing transcript is a true and accurate record of the proceedings.

Date: December 1, 2021

Sonya Ledanski Hyde

Responses to Planning Commission Meeting Commenters
November 2, 2021

PC-1 The comment states an opinion that many issues areas dismissed in the Draft EIR that would cause a significant environmental impact.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-2 The comment is in support of the No Project Alternative because the Project would irreversibly damage the aesthetics of the City.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-3 The comment asserts that residents would not be able to walk through the Project area to view the natural habitat restoration area and hills on either side of the valley.

The Project site is not publicly-owned and is therefore not a public open space. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-4 The comment states an opinion that the Project would alter the aesthetics of Starr Avenue by increasing traffic congestion.

The aesthetics due to an increase in traffic is not an issue evaluated because traffic is always changing and does not constitute a permanent physical change. The comment is noted and forwarded to the decision makers for their consideration.

PC-5 The commenter states an opinion that the increase in traffic generated by the Project would significantly impact air quality and surrounding areas including existing residents as well as wildlife.

Please see Response to Comment 61-2 regarding air quality concerns and Response to Comment 14-2 regarding wildlife.

PC-6 The comment states an opinion that the Project would impact the wildlife in the protected wildlife habitat zone adjacent to the Project site.

It is not clear from the commenter what habitat zone is adjacent to the Project site. The City has not identified the presence of any habitat zone. The comment does not

identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-7 The commenter states an opinion that the increase in vehicular traffic due to the Project would result in a significant impact to air quality.

Please see Response to Comment PC-5 that addresses this concern.

PC-8 The comment states an opinion that the Draft EIR does not adequately evaluate and mitigate water quality and hydrology impacts.

Please see Master Response 2 and the Response to Comments for Letter 32.

PC-9 The comment states an opinion that the idea to use an agricultural well to supply water to Project residents is naïve and inadequately addressed in the Draft EIR.

Please see Master Response 2 and Responses to Comments 88-2 and 88-3.

PC-10 The comment asserts that climate change is limiting water supply and that it is irresponsible to propose that 500 new residents be served by an agricultural well.

As stated in Chapter 2 of the Draft EIR, the Project is estimated to result in the addition of 213 new residents to the City and the City would provide water to serve future residents. The onsite well would only be used to provide water for irrigation. Please see Master Response 2 regarding water supply.

PC-11 The comment states an opinion that the Project does not consider the limited amount of public open space available in the City.

Public recreational spaces are discussed in Section 3.12 of the Draft EIR. Additionally, the Project site is not publicly-owned and is therefore not a public open space The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-12 The comment states an opinion that based on the minimum open space access requirement of 60 square feet for chickens in California, City residents should have a right to at least 1,800 square feet of open space.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-13 The comment states an opinion that each resident of the City only has access to about 500 square feet of open space which is less than the equivalent minimum requirement for chickens.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-14 The comment asserts that noise and vibration impacts to adjacent residents and the existing low-income housing development on Hunt Avenue have not been adequately addressed.

Noise and vibration impacts are discussed in Section 3.11 of the Draft EIR. See also Response to Comment 38-1. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-15 The comment asserts that the Project would increase traffic congestion in the area.

The Project's impact on transportation and circulation is addressed in Section 3.14, Transportation and Circulation. The analysis includes consideration of motorized vehicle traffic impacts on roadway capacity, vehicle-miles travelled (VMT), and potential impacts to transit, bicycle, and pedestrians. See also Responses to Comments 10-2 and 36-2. The comment does not identify any specific areas where the Draft analysis is inadequate; therefore, no further response is required.

PC-16 The comment asserts that the City already has difficulty serving current residents with regard to public services, recreation, and utilities.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Impacts to public services, recreation, and public utilities are discussed in Section 3.12 and Section 3.13 of the Draft EIR. Please see also Response to Comment 97-1 for additional information.

PC-17 The comment states an opinion that the Project would severely impact schools, water supply, sewer capacity, and garbage services.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decisionmakers for their consideration. Please see also Response to Comment 121-29.

PC-18 The comment asserts that local public schools would be unable to provide quality education to a growing student body.

Please see Response to Comment 108-6.

PC-19 The comment asserts that current water and sewage treatment facilities are in need of repair and are barely able to meet current needs of residents.

Please see Master Response 2 regarding water supply and Master Response 4 regarding wastewater. The City has not identified any issues with their water infrastructure or wastewater treatment plant to serve the Project.

PC-20 The comment asserts that there are already issues at the sewer lines on Starr Avenue and at Vineyard Valley that would be severely impacted by the Project.

Please see Master Response 4.

PC-21 The comment asserts that there are many concerns about the Project ranging from levee access and maintenance to scenic vistas and privacy concerns.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Master Responses 1 and 3 regarding emergency access and the Napa River levee and Responses to Comments 7-6 and 50-7 regarding visual issues. Privacy is not an issue required to be evaluated in an EIR and is not relevant to this Project.

PC-22 The commenter stated an opinion that there are many circumstances regarding the current environment that must not be ignored by City planners and City Council members.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-23 The comment asserts that the “Flood Wall project” did not include the Proposed Project and that there is concern that the Project would remove safe evacuation and access through the adjacent Vineyard Valley Mobile Home Park.

Please see Master Response 1 regarding emergency evacuation concerns and Master Response 3 regarding the Napa River levee.

PC-24 The comment states the commenter’s concern that the Project would undermine the levee and overwhelm the Army Corps of Engineers strategy to protect Vineyard Valley residents and their homes.

Please see Master Response 3.

PC-25 The comment asserts that Vineyard Valley residents are concerned about water.

Please see Master Response 2.

PC-26 The comment asserts that Vineyard Valley's wastewater discharge sewer is documented to have significant issues when it rains.

Please see Master Response 4.

PC-27 The comment states an opinion that, because the Project's VMT is estimated to be 15.2% higher than the City wide VMT per capita and has a significant and unavoidable impact which cannot be mitigated, that the Project and the EIR should be denied.

Please refer to Responses to Comments 93-8 and 111-2.

PC-28 The commenter asserts that the City Council has an obligation to citizens to protect the environment by denying the Draft EIR.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-29 The commenter is concerned that the Project would increase the need for power.

The Project's energy use and potential impacts to public utilities are described in Section 3.13, Utilities and Section 3.15, Energy. As documented in the Draft EIR adequate facilities and supplies are available to serve the Project and impacts are less than significant. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-30 The commenter states an opinion that the Project would result in an increase in power outages due to the City's struggling power system.

See Response to Comment PC-29.

PC-31 The comment asserts that Adams Street and Starr Avenue are the only evacuation routes for additional residents from the Project site as well as existing residents in the area.

Please see Master Response 1.

PC-32 The comment states an opinion that parking supply is an issue within the neighborhood and that wildfires that create emergency evacuations would be a problem.

The adequacy of parking supply is not an environmental impact under CEQA; therefore, the commenter's concern is noted for the decision makers and no further response is required. . For concerns regarding emergency evacuation, please see Master Response 1.

PC-33 The comment claims that a lack of parking would require future residents to panic during emergencies and that the Proposed Project would increase traffic congestion during emergency situations.

Please see Master Response 1.

PC-34 The comment suggests that nature should be respected by not building the Project in an area protected by a levee.

Please see Master Response 3.

PC-35 The comment asserts that it is "common sense" that the Project site is not meant for human habitat.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. The Project site is located within the City limits and has been designated and zoned for housing since the 1975 General Plan.

PC-36 The comment states that Project would be built over a Native American burial site that contains human remains and artifacts.

Please see Response to Comment 55-4. There is no evidence that the site is a Native American burial site.

PC-37 The comment asserts that the Wappo tribal chairman was not listed in the Draft EIR as being notified under AB 52.

Please see Response to Comment 55-4.

PC-38 The comment requests an extension of the Draft EIR comment deadline by an additional 30 to 45 days.

Based on requests from the public, the City extended the public comment period from the required 45-days to 67-days to provide more time for review and comment. During this review period, the Draft EIR for the Project was available at (1) the St. Helena Public Library, 1492 Library Lane, St. Helena, CA 94574; (2) St. Helena Planning Department, 1572 Railroad Avenue, St. Helena, CA 94574; and (3) on the City's website at www.CityofStHelena.org.

PC-39 The comment states the commenter's concerns regarding a lack of adequacy of the Project's proposed bicycle and pedestrian facilities.

Please see Response to Comment 1-2.

PC-40 The comment restates the opinion expressed by others that VMT impacts would be significant and unavoidable. The comment also states that the City's 2019 Bicycle Plan calls for Class I multi-use facilities along Adams Street and Starr Avenue, which would connect to other multimodal uses and to the Napa Valley Vine Trail.

Please see Response to Comment 1-2.

PC-41 The comment claims that the Project would be more walkable and bikeable if additional bicycle facilities were included.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The commenter's opinion is noted and forwarded to the decision makers for their consideration. Please see Response to Comment 1-2.

PC-42 The comment asserts that the Draft EIR uses outdated or faulty plans for transportation assumptions.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. The commenter's opinion is noted and forwarded to the decision makers for their consideration.

PC-43 The commenter states that there is confusion as to why the public meeting is about comments on the EIR rather than comments on the Project.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. The purpose of the hearings held to take comments on the Draft EIR is not to discuss the merits of the Project but rather the adequacy of the information provided in the Draft EIR. The Planning Commission hearing to review the Project will be an opportunity to provide input on the merits of the Project.

PC-44 The comment states an opinion that the Project should consider energy efficiency, housing equity, and resource consumption to achieve a net-zero impact on the environment.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see also Responses to Comments 82-15 and 107-7 regarding state required building code requirements.

PC-45 The comment states an opinion that the affordable housing units should look similar to market-rate units.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-46 The comment states an opinion that there should be at least 1 acre of public open space that connects to a walking path to the Napa River.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-47 The comment states an opinion that the Project should allow at least 50% of the moderate and lower income units to be owner-occupied rather than offered as rentals.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-48 The comment states an opinion that new construction should be fire-resistant with underground utilities.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The commenter's opinion is noted and forwarded to the decision makers for their consideration. The Project is required to comply with the California Building Code Standards and Fire Code as well as the City's development requirements which oversees undergrounding of any electrical lines.

PC-49 The comment asks whether the City has considered requesting the Project only be served by electric power.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. However, the City has not adopted an ordinance requiring all new construction be electric and it is not a requirement of the state building code.

PC-50 The comment states an opinion that the Project would affect emergency evacuation in the area and that another connection to Silverado Trail is needed to alleviate traffic congestion on Hunt Avenue and Pope Street.

For concerns regarding emergency evacuation, please see Master Response 1. The Project does not include the future expansion of Adams Street connecting to Silverado Trail. This is a separate City project and is not required for the Project.

PC-51 The comment states an opinion that retrofitting toilets would not make the project water neutral and that there needs to be more investment in infrastructure.

Please see Master Response 2.

PC-52 The comment states the commenter's opposition to the Project and requests the Draft EIR comment period be extended.

Based on requests from the public, the City extended the public comment period from the required 45-days to 67-days to provide more time for review and comment. During this review period, the Draft EIR for the Project was available at (1) the St. Helena Public Library, 1492 Library Lane, St. Helena, CA 94574; (2) St. Helena Planning Department, 1572 Railroad Avenue, St. Helena, CA 94574; and (3) on the City's website at www.CityofStHelena.org. The commenter's opposition to the Project is forwarded to the decision makers for their consideration.

PC-53 The comment states an opinion that the intersection of Hunt Avenue and Starr Avenue is unsafe for pedestrians and for people waiting for the bus. The commenter said that cars frequently do not stop fully, and the stop sign is faded.

Transit, pedestrian access, and collisions have been analyzed in detail within Section 3.14, Transportation and Circulation of the Draft EIR and within Appendix K, Traffic Impact Study and no safety impacts were identified. For additional information, please see Response to Comment 74-6.

PC-54 The comment states an opinion that additional traffic would make conditions even more unsafe for children that ride the bus.

Please see Response to Comment 74-6.

PC-55 The comment expresses concern regarding parking in the neighborhood.

The CEQA Guidelines do not require parking be evaluated in an EIR; therefore, the commenter's concern is noted for the decision makers and no further response is required.

PC-56 The comment states an opinion that existing traffic and parking problems have not been addressed by the City and that the Proposed Project would make matters worse.

Existing traffic conditions, along with the addition of the Proposed Project, and 2040 buildout of the City are analysis scenarios which have been analyzed in detail within Section 3.14, Transportation and Circulation of the Draft EIR and within Appendix K,

Traffic Impact Study. The comment does not raise does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required. Please see Response to Comment PC-55 that addresses parking concerns.

PC-57 The commenter states they would rather have an affordable housing development similar to Hunt's Grove rather than the potential for new homes to be owned by second homeowners.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-58 The comment states an opinion that there is not enough time to review the Draft EIR and requests that the comment period to be extended.

Please see Response to Comment PC-52.

PC-59 The comment states an opinion that it would not be possible to develop the Project without serious degradation of plant and wildlife species in the area.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see also Response to Comment 14-2 regarding wildlife concerns.

PC-60 The comment states an opinion that the Project would devastate wildlife and plant habitat at the adjacent conservation easement, agricultural lands, and public property.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Responses to Comments 14-2 and 36-3 regarding impacts to biological resources and the conservation easement noted in the comment,

PC-61 The comment states an opinion that the Project is not compatible with current habitat restoration efforts.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. It is unclear from the comment what habitat restoration efforts are ongoing within the Project site.

PC-62 The comment asserts that the City is struggling with water supply and expresses an opinion that the priority for new development should be to provide housing for employees that cannot to afford to live in the City.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 2 regarding water supply.

PC-63 The comment states an opinion that the Project is incompatible with available resources and current environmental efforts.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-64 The comment asks whether there has been a survey of people who use the walking trail at the Project site.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-65 The comment asserts that weather events which closed roadways in the City would cause more traffic congestion once Starr Avenue is connected to Adams Street.

Potential Project impacts, as well as impacts related to construction of the Project, along Starr Avenue and Adams Street, and the connection of both roadways to one another, are analyzed in detail within Section 3.14, Transportation and Circulation of the Draft EIR and within Appendix K, Traffic Impact Study. The comment describes that roadways in the area, such as Silverado Trail, were closed due to weather events; however, these closures are assumed to be temporary. Since the closure is not expected to be permanent and is not related to the Project, no further response is required.

PC-66 The comment asks for additional analysis of traffic patterns if Silverado Trail is closed and the effect the closure would have on Starr Avenue, especially during weather related closures.

Please see Response to Comment PC-65.

PC-67 The comment asserts that the traffic issues associated with the Proposed Project are greater than that those evaluated in the Draft EIR.

The comment does not raise does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required. The commenter’s opinion is noted and forwarded to the decision makers for their consideration.

PC-68 The comment states an opinion that retrofitting toilets would not make the Project water neutral and that water usage is not addressed in the Draft EIR.

The Project's increase in water demand was analyzed in the Draft EIR in Section 3.13, Public Utilities starting on page 3.13-24. Please see Master Response 2 for additional details regarding the Project's water usage and compliance with the City's water neutral requirements.

PC-69 The comment states an opinion that water supply problems should be addressed in more detail in the Draft EIR.

Please see Response to Comment PC-69 and Master Response 2.

PC-70 The comment states an opinion that the Draft EIR comment period is short and asks whether the City staff has the power to extend the comment period.

The comment was addressed during the public meeting and no further response is required. Please see also Response to Comment PC-52.

PC-71 The comment asserts that certain members of City staff have the power to extend the Draft EIR comment period.

Please see also Responses to Comments PC-52 and PC-71.

PC-72 The comment asks how to submit a request for extension of the Draft EIR comment period and if the appropriate authorities would be notified of the request.

The comment was addressed during the public meeting and no further response is required. Please see also Response to Comment PC-52.

PC-73 The comment states an opinion that water is the biggest issue of the Project.

Please see Master Response 2.

City of St. Helena

Special Planning Commission Meeting

November 30, 2021

SECRETARY XINIA GAMERO: And Chair Ponte, we are ready to begin the meeting when you are.

CHAIR JOHN PONTE: I will, as soon as Commissioner Anderson and Commissioner Rothfeld come on. Good evening. Welcome. Thank you for attending the Tuesday, November 30th, 2021 special meeting of the planning commission. There is a little bit of paperwork we need to do first and I'll start by reading this.

"This meeting will be conducted pursuant to the provisions of government code Section 54953 as amended by AB361 which authorizes teleconference meetings under the Brown Act during certain proclaimed states of emergency.

The Governor of California proclaimed a state of emergency related to COVID-19 on March 4th, 2020. This teleconference meeting is necessary so the City can conduct essential business and is permitted under Government Code 54-953 in order to protect public health and safety of attendees.

Consistent with Government Code Section 54953, this planning commission meeting will be

held via teleconference only and will not be physically open to the public. Commission members and staff will be teleconferenced into the meeting by audio and/or video. This meeting will be connected via Zoom Webinar."

Ms. Gamero, you have some additional information for us all?

SECRETARY XINIA GAMERO: Yes, I do. Thank you Chair Ponte. I will share my screen momentarily.

Members of the public who wish to participate in public comment by phone can do so by dialing (669) 900-6833. At the prompt, you will enter the meeting ID, 848 0893 5175. You will then press pound and during public comment you will press star-nine to speak.

Additionally, tonight's meeting will have live Spanish interpretation. To access the interpretation, you will need to use the Zoom application from either your cellphone, tablet, or computer.

Instructions on how to use the Zoom app are listed in English and Spanish on the agenda posted on the City's website.

Once you join the meeting from the Zoom

application, you will see a small globe at the bottom or top of the screen. You will click on the globe and you'll be able to access the live interpretation. We have Marci and Claudia who are our interpreters this evening.

And that concludes my presentation, Chair.

CHAIR JOHN PONTE: Thank you. That takes us to the pledge of allegiance. Commissioner Rothfeld, will you lead us all in the pledge of allegiance, please?

COMMISSIONER MARIKA ROTHFELD: Sure. I pledge allegiance to the flag of the United States of America and to the republic for which it stands, one nation, under God, indivisible, with liberty and justice for all.

CHAIR JOHN PONTE: Thank you very much. Like to call the meeting to order. Ms. Gamero, will you take the roll, please?

SECRETARY XINIA GAMERO: Thank you. Chair Ponte.

CHAIR JOHN PONTE: Here.

SECRETARY XINIA GAMERO: Commissioner Anderson.

COMMISSIONER AUTUMN ANDERSON: Here.

SECRETARY XINIA GAMERO: Commissioner Rothfeld.

COMMISSIONER MARIKA ROTHFELD: Here.

SECRETARY XINIA GAMERO: Commissioner Segura is absent this evening. And Vice Chair Hale.

VICE CHAIR DANIEL HALE: Here.

CHAIR JOHN PONTE: Thank you very much. That takes us to public forum. Under California law, public comments at special meetings are limited to subject on the agenda only; therefore, public comment will take place during consideration of the item. Each person's comments shall be limited to four minutes.

Consent items, we have none tonight, so that takes us to the public hearing for this evening; 5.1, continuing to receive comments on the draft environmental impact report for the Hunter Subdivision project.

I will open the public hearing and at this time, I will ask if any commissioner has any ex-parte communications they wish to bring to our attention.

Seeing none, Director DeRosa, staff report, please.

MAYA DeROSA: Thank you, Chair Ponte. Good evening, planning commission. It's our pleasure to host this special meeting, our second meeting to talk about the Hunter EIR and receive public comments. The public comment period does end today and we have posted all those comments on the agenda page.

As we did on the November 2nd meeting, I'm going to have the project manager, Eric Norris, provide a brief PowerPoint presentation to familiarize the public with what the project proposal is and then we can proceed with the rest of the meeting. And so I'll hand it over to Mr. Norris. Thank you.

ERIC NORRIS: Thank you, Maya. Get out slideshow going here. So yeah, I'll keep this brief, but just for those who weren't here at the first comment meeting, first of all, welcome to the second public comment meeting on the environmental impact report.

I'll give just a brief overview of the project so we all have a clear under -- at least a common understanding of what the project is. This is the location. It's at the end of Adams and -- Adams Street and Starr Avenue. It's

highlighted there in a tan color.

This is the application which we're all looking at currently. This is the only active application on the project site. There are others that will follow on. I'll talk about those in a minute. But at the moment, what the applicant is proposing is to create this subdivision. What this does is it creates lots on which single-family homes can get built and then one additional lot on which multi-family housing would be built.

But this is the only application currently being processed. Now, the environmental impact report looks at the effects of both this subdivision and the subsequent applications that would be needed in order to construct homes on the site.

Real briefly, we're looking at a site that's just a little under 17 acres, 16.9 acres. There are a total of 87 proposed housing units. That breaks down into 51 single-family homes, 25 multi-family homes, and then 11 accessory dwelling units that would be built with the single-family homes.

So of the 51 single-family homes, 11 of

them would have an accessory dwelling unit built with them from day one.

The general plan designation is medium density residential. It has been that way since at least the '90s and we believe probably back into the 1970s, so they're not requesting a change in either the general plan or the zoning. The zoning is also MDR, which matches that general plan designation.

Now, the general plan requires that you build at a number of units which falls between the two density numbers, 5.1 per acre and 16. For this site, that gets down to 87 to 270 dwelling units. They are coming in, therefore, at the very bottom end of the range. The general plan would allow them to build more units than they're proposing to build.

This is the current zoning on the site, so it is designated MDR, as I mentioned before. Variety of other kinds of zones around it, open space, agriculture, high density residential, and then getting further down as it goes sort of to the bottom of the picture, we're starting to get more into the commercial area over near Main Street.

So currently, what the planning commission will be looking at when this goes into a public hearing mode early next year are two things. One of those is the draft environmental impact report that we show as EIR here on the slide. The other is the tentative subdivision map.

Now, in the future, as I mentioned, there are other things that need to get approved. The tentative subdivision map does not give them the ability to build any homes. It simply creates lots.

They will need an affordable housing agreement which is something that's approved by the City council. They will need to have the design of the proposed homes reviewed by the planning commission. And for the multi-family housing, that requires a conditional use permit which is also reviewed an approved by the planning commission.

So those are all future actions which are not part of their current application package, but they will have to, assuming that they get through the first hurdle, getting the subdivision app approved, they'll have to come

back with additional applications.

The draft EIR looks at a variety of topics and I'm sure anyone who's looked online and opened up the document knows that it's very long and very comprehensive. I'm not going to go into all the topics here, but it is basically every topic that we could examine, is being looked at in the EIR, everything from aesthetics to energy and everything in between.

So taking all of those almost 700 pages in the EIR down to a paragraph, if I could, the draft EIR based on the technical studies that were conducted to provide the basis for the analysis concludes that the project's impacts can all be reduced to a total less than significant level which means it may have impacts but they're not significant. They don't rise to a threshold where the City becomes concerned that the impacts are negative, I guess if you want to say it that way, with one exception, and that's vehicle miles traveled.

That's something new that is part of CEQA analysis for just a few years now. It looks at the number of vehicle miles that people who live in this subdivision will drive on an average

day or in an average year. The state is trying to get cities to look at this in an effort to reduce overall vehicle traffic as a part of a strategy to reduce greenhouse gas emissions, improve energy efficiency, and so on.

So that one measure, vehicle miles traveled, is the one impact that is identified as significant and unavoidable, but everything else in the EIR can be mitigated to a level of less than significant, some of those, because there really are no impacts, others because there are mitigation measures which are in the environmental document that says, well, if we would have an impact, if you impose this mitigation measure, that impact is reduced or eliminated.

So a real quick timeline. The project goes back to 2010 when the first application for this subdivision was submitted to the City. Without going through the whole timeline here, suffice to say that in September of this year, September 23rd, we released the draft environmental impact report which is the subject of tonight's meeting. That initially went out for a 456-day review period. We had a public

comment meeting on November 2nd.

One of the inputs that came back out of that meeting was the public saying, we'd really like to have more time to review the EIR. So that now has been extended to today, which gets us to a total of 67 days of public review. Forty-five are required by state law, so the City has gone over and above what's required in order to give the public more time to look at the document.

Looking forward into the end of this year and into next year, we're going to spend the next probably month or so responding to the comments that came in. Those responses all get put into a response to comments or final environmental impact report document. So we'll say, we got thee comments. Here's how we responded to them. The public has an opportunity to review those responses to the comments before it goes into hearings.

We are looking in the first quarter of next year. We don't have a date yet to have actual public hearings on the project which would be then the EIR and the tentative map. And then either later in 2022 or really the time the

applicant chooses, again, those other three applications, the affordable housing agreement, the design review, and the use permit for multi-family housing would come back. Those would all be subject to their own individual public hearings but those are future items not on our calendar at all at this point.

And really briefly, again, just highlighting opportunities for public input. So we're now in the lefthand column which is the 67-day, the expanded public review and comment period. When it comes to the planning commission for the tentative subdivision map, there will be public hearings there. There'll be public hearings in the future at the City council for the affordable housing agreement, and again, additional comments at the -- or public hearings, rather, at the planning commission for the other two items.

So that gets us to tonight's meeting which is, again, an opportunity for the public to provide comments on the draft EIR. The focus of comments, really, should be on the adequacy of that document. It is a technical document. We're looking for information on whether there

was something perhaps analyzed incorrectly, information that we could have maybe updated information or corrected information. Those are the kinds of things we're looking for.

Tonight's meeting is really not the time to comment on must the pros and cons of the project itself. That comes in the public hearings next year.

So that completes my presentation. I will note real briefly the EIR has been available in -- online since the beginning of the public review period. It's also been in printed format the library and the City hall. And here, commission members, is staff's recommendation which is that you receive this presentation, open the hearing, receive comments, close the hearing, and then if any commissioner wants to comment on the EIR, tonight would be an appropriate time to do that.

I'll also mention that -- well, Maya, I guess if they submit an email comment by the end of this meeting, I guess we'll still accept that.

MAYA DeROSA: That's correct.

ERIC NORRIS: Yeah, and there will be opportunities during the public hearings to

comment on the environmental document, but the deadline to get comments in so they're responded to and included in the final EIR really is tonight. And I will end my presentation here and bring it back to the commission. Thank you.

CHAIR JOHN PONTE: Thank you, Mr. Norris. With that, I suppose we will start taking comments from the public, so at this time, we will open the public testimony portion of this hearing. Ms. Gamero, is there any member of the public who wishes to speak on the environmental document?

SECRETARY XINIA GAMERO: One second, Chair Ponte.

ERIC NORRIS: Mr. Chair, if I could, while we're waiting for the speaker to come on, one thing I forgot to mention, the recorded testimony from the first public comment meeting is being transcribed. That'll be part of the written record now.

We're also recording tonight's meeting. That recording will also be transcribed and the comments will be in the written record. So if you speak tonight, you can expect to see your words transcribed and in the final EIR.

CHAIR JOHN PONTE: Thank you very much, Mr. Norris. Ms. Gamero?

SECRETARY XINIA GAMERO: Chair Ponte, there are 13 members of the public at the moment. There are no hands raised.

CHAIR JOHN PONTE: Well --

SECRETARY XINIA GAMERO: Oh, I see Tracy McBride just raised her hand. I will allow you to speak here in a second.

CHAIR JOHN PONTE: Please, Ms. McBride. You're on mute. There you go. Thank you.

TRACY McBRIDE: Okay. Thank you. Good evening, commissioners. Thank you for having this meeting and doing extension and thank you Ms. DeRosa for answering questions that I had between this meeting and the last meeting. I just want to say that I found that the project's attorney's letter that was submitted was threatening.

I thought it was kind of a threatening letter stating that the time period to extend the public comments shouldn't have been granted and I just want to make the comment that we are still in a pandemic and people are struggling with their own jobs and working with the pandemic and

PC-75

PC-76

this is a very, very complicated project, and to understand it, and I want to say I appreciate the extra time given.

And I do hope you'll take some time to read my letter in the packet, but I do just want to super briefly highlight three items that it is a false equivalence and it's incorrect in this draft EIR to state that supplying the cost of water fixtures equates to the water usage for this project.

As many people also state, the safety and evacuation and circulation is not adequately addressed in this EIR project and I also feel that the multi-family, low-income housing is segregated and creating inequity issues for our town that just are not appropriate. So I just want to highlight those three topics.

I also would really encourage the City to continue outreach to the other members of the town through social media like Nextdoor, because I think a lot of people just don't really understand how to, you know, read the City documents, how to access them. They still don't know who to email. I see that question on Nextdoor. How do I email my comments in? Even

PC-76 Cont.

PC-77

PC-78

PC-79

PC-80

though you think this might be really available to al lot of people, I think people are having a hard time understanding, really, how to read it, access it, and to comment. So thank you very much.

CHAIR JOHN PONTE: Thank you very much. Ms. Gamero, anyone else?

SECRETARY XINIA GAMERO: Yes. We have Marina Lavagnino. You can go ahead and speak now.

MARINA LAVAGNINO: Okay, hello. Thank you. I agree that I greatly appreciate that the time was extended. I am one of those people who only found out about this in the last two weeks of the comment period and the documentation is very detailed, which is great, but -- and voluminous, and life is really crazy right now and it's been difficult to find the time, even with the extra month, to go through it carefully, but I have tried to do so.

Secondly, I wanted to say that having these Zoom meetings, while very convenient in some ways, makes it much more difficult to rally the troops to get together and attend the meeting. I think we'd have a greater response

PC-80 Cont.

PC-81

PC-82

and more public comment if we were doing this in person. So I hope that you don't think that any low turnout this evening is representative of a disinterest in the project. I think it's just very challenging for a number of people to get involved in the Zoom call.

My mother, for example, would not do this in a million years, but she might come with me to a public meeting. So hopefully in the spring, we have an opportunity to communicate in person. That would be really wonderful.

I did file -- my sister and I filed a document yesterday and I see that it's part of the agenda packet, so I know you received it, but I would like to read one portion of it that is -- what comes to me as the most important thing that's lacking from the draft EIR, and that related to the recreational aspect of this project.

So there's much to review within the section of public service and recreation; 2.45 persons per household for the purpose of calculating park and recreation facility demands is very different from the eight persons per four-bedroom home estimate used in the utility

PC-82 Cont.

PC-83

PC-84

section. Twelve elementary students among 87 residential units seems low. We would be interested in seeing what the numbers are at Hunt Street, so I'm curious as to whether or not some of the numerical things that look so easy to remedy if they're really going to be accurate.

I'm focusing here on recreation. In Section 3.12-16, it is stated that the City would have a ratio of 4.48 acres per thousand residents, which falls below the goal of 5 acres per thousand residents. So we would be short almost 5 acres of this goal. And interestingly, that's about 40 acres short of the nationally recommended standard mentioned, and don't we in St. Helena desire and deserve the higher standard?

What this section woefully ignores is the recreation usage that will be taken away by this development. Yes, there are parks in St. Helena. Table 3.12-2 lists 11 parks. Eight of these are mini-parks. None of these parks provides a connection to the grandeur of St. Helena's position in the Napa Valley. There is a reason why so many St. Helenans flock to the maintenance path and it is not to look at the

PC-84 Cont.

PC-85

PC-86

PC-87

gravel beneath our feet.

Walking along the berm provides a view of Mount St. Helena, both sides of the valley, beautiful vineyards, unique architecture with water towers and barns, a meadow, a habitat restoration area, and a river, all of which are home to numerous wildlife, and there's a tremendous view of the sky.

From glorious sunrise to inspiring sunset, people come to this area to experience nature. It is convenient to the center of town and the library. It is free and currently available to all. It is a natural resource that provides space that we need that isn't available in any of our 11 parks. This resource should be better understood if we are trying to document St. Helena's recreational facilities. It will be drastically diminished if homes are built up to the edge of the maintenance road. So I covered a few other --

SECRETARY XINIA GAMERO: (indiscernible), I would like to note that your four minutes are up, so if you would like to (indiscernible) your comment --

MARINA LAVAGNINO: Perfect.

PC-87 Cont.

PC-88

SECRETARY XINIA GAMERO: -- that would be good.

MARINA LAVAGNINO: That's all that I needed to say. Thank you very much.

CHAIR JOHN PONTE: Thank you. Ms. Gamero, next if we -- assuming we have one.

SECRETARY XINIA GAMERO: I'll give -- we have Matt Courtney who would like to speak. You may go ahead and speak now.

CHAIR JOHN PONTE: -- Courtney, please.

ANYA COURTNEY: Hello. My name is Anya Courtney. I am ten years old and I go to St. Helena Elementary School. I looked over the EIR and saw there was nothing said about climate change. I don't think it makes sense to build a ton of houses where there is a river that can flood, especially now during climate change when the floods are stronger and more unpredictable. PC-89

I am a skier and I notice every year there is less and less and less snow pack which means less and less water. This EIR completely ignores this reality. PC-90 I don't think this EIR does a good job of covering the impact of this project on air pollution. PC-91 I don't like the idea of hundreds more cars driving on my street every

day. I like living in our small town and breathing fresh air.

Also, I use that fun grassy area to play in the outside. All in all, in my opinion, the EIR does a terrible job of taking into account all of these issues that are important to me and our community. Thank you.

CHAIR JOHN PONTE: Thank you. Ms. Gamero?

SECRETARY XINIA GAMERO: Waiting here a couple of second, Chair. I do not see any more hands raised at the moment, Chair Ponte.

CHAIR JOHN PONTE: All right.

MAYA DeROSA: Chair Ponte, I did receive an email from somebody who's having trouble joining and I advised that they call in, so we might want to just give it another minute or so to give them an opportunity to dial in. Thank you.

CHAIR JOHN PONTE: Good.

SECRETARY XINIA GAMERO: I do see a hand raised, Chair Ponte.

CHAIR JOHN PONTE: Okay.

SECRETARY XINIA GAMERO: Greg Reynolds, Vineyard Valley. You can begin to speak now, Mr.

PC-91 Cont.

PC-92

Reynolds.

GREG REYNOLDS: Thank you. (indiscernible). Appreciate an opportunity to speak again. Appreciate you folks extending this experience. I just wanted to comment that I am the managing partner for Vineyard Valley. I had commented the first time around and a couple times online. The comments submitted yesterday by Vineyard Valley Mobile Home Park, I just wanted you guys to be -- realize that they included an additional 55 people who put their name on our comments.

PC-93

We have that documented in writing, et cetera, so that all of them felt comfortable with what we had put together as our response and I wanted to go on record to share that we have email support for all 55 names and a significant number of folks that would like to see this EIR evaluated in a different and more thoughtful way than what appears to be what's in front of us at this point.

PC-94

That's it. Thank you.

CHAIR JOHN PONTE: Thank you very much, Mr. Reynolds. Ms. Gamero?

SECRETARY XINIA GAMERO: There are no

additional hands raise at the moment, Chair Ponte.

CHAIR JOHN PONTE: Let's pull it back to the commission for a few seconds. Is there any commissioner that has questions or comments on the environmental document? This would be the time for that. I do not see any. So Ms. Gamero, Director DeRosa, have we gotten that phone call yet?

SECRETARY XINIA GAMERO: I do not see anybody that has -- any of the attendees that are attending this meeting via phone. Oh, I do see a phone number. Not sure if they will be raising --

MAYA DeROSA: Can you go over the instructions again on how to raise your hand when you're on the phone?

SECRETARY XINIA GAMERO: Yes. So during public comment, now, you can press star-nine and a hand will be raised so I can see it. There you go. Okay. Please state your name for the written record. Thank you.

I will ask you to unmute. Seems like you are muted as well. Can you -- I believe you (indiscernible) now.

JENNA LAVAGNINO: Hello.

CHAIR JOHN PONTE: Good evening.

JENNA LAVAGNINO: Hi. My name is Jenna Lavagnino and I live on Del Rio in Vineyard Valley. And one thing that -- I walk out on the berm once, sometimes twice a day. I've been enjoying it since I was a kid. One thing I've noticed that I don't think anyone's ever talked about is that as far as the recreation aspect of the area, I see people on a weekly basis.

I see fathers and mothers teaching their children how to ride a bicycle. I see elderly people walking with a cane, getting exercise. I see people who are stroke victims walking with their son -- I saw that yesterday -- as a way to spend time with each other as well as doing recreation as well as physical therapy.

The other thing I see, I see groups of people coming out and they bring their chairs and they fly model airplanes. I see families coming out and they bring cooler and they've got their sodas and their kids are riding bikes and they've got their little model airplanes and that type of thing. So I see this on a weekly basis and the space out here allows for that type of activity.

PC-95

The smaller parks, not as much. There's trees and wires and telephone, you know, wires and such.

And I just feel like there's a real family connection out there where you've got people spending time. They're not on their cellphones. They're not on their laptops. They're not playing video games. It's families out in nature, moving, talking, laughing, learning.

And I just think that that's a very important aspect and the space allows for that and I think in a time where everyone is trapped on their phones and their, you know, TVs and such, to have a space where families can go and congregate and work together and be together and learn together is hugs.

So that's just one aspect I really haven't heard about while researching this. So that's really it. That's my two cents. We need this space and if we don't have it, there's going to be a lot less activity of the such that I just talked about, so that's it I guess.

I hope that you will take this into consideration along with all the other -- I mean,

PC-95 Cont.

the water issues, sanitation issues, crime, fire, flood. I mean, those are all super, super important, but I think this is a really valuable thing to consider as well. So thank you so much.

CHAIR JOHN PONTE: Thank you very much. Do we have anyone else?

SECRETARY XINIA GAMERO: No hands raised, Chair Ponte.

CHAIR JOHN PONTE: No hands raised. All right. I will ask one more time if any commissioner has anything they'd care to say. I don't see anything. Well, unless there's anyone else out there who wishes to say something --

SECRETARY XINIA GAMERO: I do see a hand raised, Chair (indiscernible) and it's (indiscernible) a phone number, so if you could state your name for the written record I will give you permission to speak now.

I believe you are also muted. I will try to unmute you.

ANGELA ZIVKOVIC: -- hear me?

CHAIR JOHN PONTE: We can no. Thank you.

ANGELA ZIVKOVIC: Oh, wonderful. Hi. My name is Angela Zivkovic and I wrote in a

PC-96

letter with some comments and I just wanted to also state them at this meeting. I have some concerns about the adequacy of the environmental impact report with regard to the fact that most of the data that are being used to make evaluations about whether there's enough water and whether it makes sense to consider the impacts, like the impact on potentially the traffic flow and other issues.

None of these are actually taking into account the fact that there's a lot of changes that are taking place right now due to climate change. I think that we really have to, you know, be realistic about the fact that we practically ran out of water even just without this development this year in this town and that had it not been for that one big storm in October, we would be in a really dire situation right now a month later with water for this entire community.

And to put in even more housing which would need to accommodate hundreds more people's water needs, I think it actually not very well considered and it doesn't take into account the fact that we seem to be having a lot of drought

PC-97

PC-98

PC-99

issues and that that situation is going to be unpredictable going forward.

The other issues that I raised had to do with climate change impact on the likelihood that there be a catastrophic flood that will occur in the near future potentially. We do see bigger and bigger storms all the time because of climate change and even the Federal Emergency Management Agency has revised the way that they consider what is a flood zone.

The current environmental impact report does not take any of that into account and uses outdated flood scaling and assessment strategies. FEMA does not use the concept of the hundred-year flood zone anymore as of October of this year. That is now an outdated concept. In recognition of climate change, they of course are now actually considering that, you know, these algorithms have to change from year to year because we can no longer predict climate.

That's just the kind of phase we're in. It's an unfortunate and sobering fact, so the fact that this development is in a flood zone and we think that oh, well, it's okay, because there's a levee; levees fail and the likelihood

PC-99 Cont.

PC-100

PC-101

PC-102

that this one might fail under a catastrophic flood situation is very possible.

And then finally, I also brought up concerns regarding evacuation and safety with regard to having hundreds more individuals living in the area where we already have the highest density in town and we also have some of the most vulnerable populations in town, including low-income housing that's already right there, adjacent to this proposed development, as well as elderly housing and other high density housing areas that all are going to be needing to use the same emergency evacuation routes that are going to be highly impacted by having a higher number of people living here.

And because there's more and more fires every year, in emergency evacuations our -- a growing reality for us =, this is something that is not being accounted for correctly in the environmental impact report. So I encourage you to please read the full statement that I sent in and I thank you for your consideration.

CHAIR JOHN PONTE: Thank you very much. Do we have any further comments?

SECRETARY XINIA GAMERO: No further

PC-102 Cont.

PC-103

PC-104

hands raised, Chair.

CHAIR JOHN PONTE: I'm a little reluctant to halt the meeting after 40 minutes, but unless there's somebody else who wishes to come forward, I will do that. All right.

I will close the public hearing and that finishes this item and moves us on to Item 6 which is new business. Don't see any. And schedule matters, none.

Number eight, department reports. Director DeRosa, do we have anything for this evening?

MAYA DeROSA: Yes. Just want to let you know that we will be -- our next meeting will be December 9th instead of the 7th, so I think you all have your Zoom information for that, but just a friendly reminder and we'll see you at that meeting. Thank you.

CHAIR JOHN PONTE: Agenda forecast, as always, are available on the City website and this is also the time if any member of the commission wishes to see something added to a future agenda. Is there any member of the commission that has something -- I don't see any hands waiving around for that.

So that brings us to item ten, which is adjournment and we are adjourned. Thank you very much.

Responses to Planning Commission Meeting Commenters
November 30, 2021

PC-74 The comment states an opinion that the Project attorney's letter regarding extension of the Draft EIR comment period was threatening.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-75 The comment asserts that residents are still struggling through a pandemic and expresses the commenter's opinion that the extension of the comment period is appreciated.

Please see Response to Comment PC-52.

PC-76 The comment states an opinion that supplying the cost of water fixtures would not equate to the water usage of the Project.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see also Master Response 2.

PC-77 The comment states an opinion that safety and evacuation and circulation are not adequately addressed in the Draft EIR.

Safety, collisions, and overall circulation are all analyzed within Section 3.14, Transportation and Circulation of the Draft EIR and within Appendix K, Traffic Impact Study. For concerns regarding emergency evacuation, please see Master Response 1.

PC-78 The comment states an opinion that the multifamily housing is segregated from the rest of the Project and would create inequity issues in the City.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-79 The commenter encouraged City staff to continue outreach to the community through social media and educate residents on how to access the Draft EIR and provide comments.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-80 The commenter states that they appreciate the extension of the comment period but that it is still difficult to find the time to review the Draft EIR.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-81 The comment states an opinion that allowing attendance of the public meeting through Zoom results in low in-person turnout and fewer public comments.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. See also Response to Comment 30-6 regarding online public meetings.

PC-82 The commenter states that they would appreciate an opportunity during the spring to comment on the Project in person.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. The City will post a notice when the Project is scheduled for hearings before the Planning Commission as well as City Council.

PC-83 The comment states their opinion that the estimated persons per household for the purposes of calculating park demand is very different from the estimate used in the utility section. The commenter also asserted that the estimate of 12 elementary students from the Proposed Project seems low.

Please see Response to Comment 70-4.

PC-84 The commenters states their interest in the persons per household and number of elementary students that live along Hunt Street.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required.

PC-85 The comment states an opinion that the City's parks inventory does not meet park ratio goals and that residents of the City desire and deserve a higher standard.

Park ratio goals are discussed in Section 3.12 of the Draft EIR. Please see also Response to Comment 70-5.

PC-86 The comment states an opinion that the Draft EIR ignores the loss of the recreational value of the maintenance path.

Please see Responses to Comments 70-6 and 89-3.

PC-87 The comment states an opinion that the Project site is visited for recreation and to experience nature and that the Project would diminish a recreational resource.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. Please see Response to Comment 82-11.

PC-88 The comment states an opinion that the Draft EIR does not mention climate change and that it does not make sense to build houses where it can flood.

The Draft EIR addresses climate change in Section 3.7, Greenhouse Gas Emissions. Additionally, please see Master Response 3 which addresses climate change concerns.

PC-89 The comment asserts that there is less snowpack each year which results in less water availability and that this is not addressed in the Draft EIR.

Please see Master Response 2.

PC-90 The commenter states an opinion the increase in traffic generated by the Project would significantly impact air quality.

Please see Response to Comment PC-5.

PC-91 The commenter states that they play in the grassy areas of the Project site and opines that the Draft EIR does not account for issues important to the community.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Response to Comment 82-11.

PC-92 The commenter said that there are an additional 55 people that signed the comment letter representing the concerns of the Vineyard Valley Mobile Home Park.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

PC-93 The comment asserted that the residents of Vineyard Valley would like to see the Project evaluated more thoughtfully than what is provided in the Draft EIR.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The commenter's opinion is noted and forwarded to the decision makers for their consideration.

PC-94 The comment asserts that residents use the Project site as a recreational area and it should be preserved for recreational purposes.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The commenter's opinion is noted and forwarded to the decision makers for their consideration. Please see Response to Comment 82-11.

PC-95 The comment states an opinion that, in addition to loss of a recreational area, the Project would also result in effects on water, sanitation, crime, fire, and floods.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. Please see Master Responses 1, 2, 3 and 4 that address concerns associated with public safety, water supply, the Napa River levee, and wastewater. See also Responses to Comments 39-5 and 121-15 regarding wildfire.

PC-96 The comment states the commenter's concern about the adequacy of the Draft EIR due to data relied upon to evaluate water supply and traffic.

Please see Master Response 2 that addresses water supply and Responses to Comments 10-2 and 89-2 regarding traffic.

PC-97 The comment states an opinion that the Draft EIR does not account for changes occurring due to climate change, including less water availability.

Please see Master Responses 2 and 3 and Responses to Comments 14-9 through 14-17.

PC-98 The comment states an opinion that the Project does not consider drought issues and that new development would require more water to accommodate residents.

Please see Master Response 2.

PC-99 The comment states an opinion that climate change raises the likelihood of a catastrophic flood and that FEMA has revised what is considered a flood zone.

Please see Master Response 3.

PC-100 The comment states an opinion that the Draft EIR does not account for climate change and uses outdated flood data.

Please see Master Response 3.

PC-101 The comment states an opinion that it is a possibility that the levee would fail under a catastrophic flood situation.

Please see Master Response 3 regarding the potential for levee failure.

PC-102 The comment states an opinion that the Project would exacerbate problems with emergency evacuation.

Please see Master Response 1 regarding emergency evacuation.

PC-103 The comment states an opinion that fire incidents and emergency evacuation incidents are increasing and that this is not accounted for in the Draft EIR.

Please see Master Response 1 regarding emergency evacuation.

Hunter Subdivision Hydraulic Modeling Analysis

PROJECT MEMORANDUM

HUNTER SUBDIVISION HYDRAULIC MODELING ANALYSIS

Date: June 24, 2022

City of St. Helena

Prepared By:	Ryan Orgill, P.E. and Mike Wetterau
Reviewed By:	Tim Loper, P.E.
Subject:	Hunter Subdivision Hydraulic Modeling Analysis

Purpose

The City of St. Helena (City) contracted Carollo Engineers, Inc. (Carollo) to conduct a hydraulic analysis of the impact that the proposed Hunter Subdivision (Development) will have on the City's wastewater collection system.

Background

The City contracted Carollo to prepare their Integrated Utility Master Plan (Master Plan). As part of the Master Plan, Carolllo constructed a hydraulic model of the City's wastewater collection system using the InfoSWMM software package, developed by Innovyze, Inc. The hydraulic model was used to perform a capacity analysis to identify capacity deficiencies within the collection system under peak flow conditions.

The City has received a request from the developer to construct a new development within the City. The proposed development is located at the eastern end of Adams Steet in the northeastern portion of the City, as shown on Figure 1. The developer proposes to connect 51 single family residences (SFR), 25 multi-family residences (MFR), and 11 accessory dwelling units (ADUs) to the City's collection system. A summary of the proposed development is summarized in Table 1.

Table 1 Hunter Subdivision Summary

	Dwelling Units	Area (acres)
Single Family Residence	51	16.9
Multi-Family Residence	25	3.1
ADUs	11	--
Non-Developed	--	0.6

Notes:
(1) Source: Request for Proposals, Hunter Property Residential Subdivision Project (September 14, 2017).

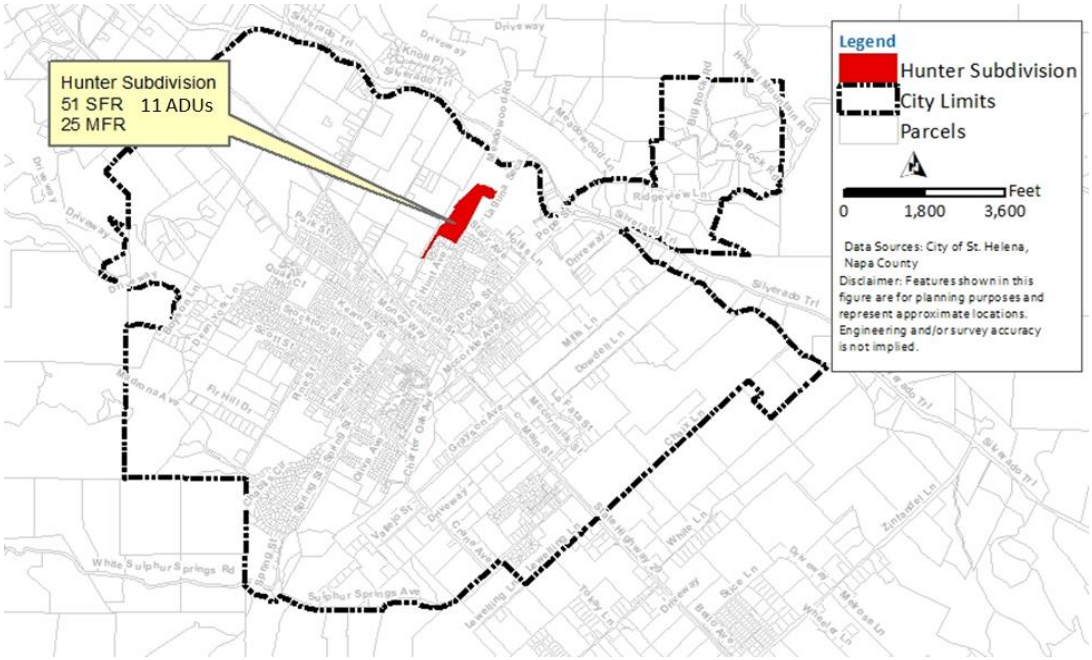

Figure 1 Hunter Subdivision

Flow Projections

The developer plans to develop approximately 20.6 acres (ac) with 51 SFR, and 25 MFR. Flow estimates were developed for the proposed development consistent with the City's Master Plan. Table 2 summarizes the ADWF estimates for the proposed development. The proposed development is estimated to increase the ADWF by approximately 12,289 gallons per day (gpd) or 0.01 million gallons per day (mgd). The peak rain derived inflow and infiltration (RDII) estimates for the proposed developments were developed based on a peak RDII rate of 500 gpd/ac, which is consistent with the Master Plan. With an area of 20.6 ac, the proposed development has a projected peak RDII contribution of 9,900 gpd (0.01 mgd). The estimated peak wet weather flow (PWWF) associated with the proposed development is 23,400 gpd (0.02 mgd).

Table 2 Hunter Subdivision Flow Projections

	ADWF (gpd)	Peak RDII (gpd)
Single Family Residence	8,200	8,300
Multi-Family Residence	4,000	1,600
ADUs	1,800	0
Non-Developed	0	30
Total	**14,000**	**9,900**

Notes:
(1) ADWF is calculated by multiplying the projected increase in residential units by the residential density of 2.45 persons per household and multiplying the result by the per capita flowrate of 66 gpcd.
(2) Planned developments within the existing service area were assigned a peak RDII rate of 500 gpd/ac.

Model Update

This section discusses the necessary model updates to properly evaluate the impacts that the proposed development has on the City's collection system. They hydraulic model was updated by adding the wastewater loads to the of point of connection at the intersection of Del Rio Court and Paseo Grand Drive.

Evaluation Criteria

The evaluation criteria used in this this study are consistent with the evaluation criteria used in Master Plan. The following summarizes the evaluation criteria used for this study:

- For existing sewers under PWWF condition, a minimum surcharge depth of three feet below the manhole rim.
- For new sewers under PWWF condition, a maximum flow depth to pipe diameter (d/D) ratio of 0.75.
- Under, Peak Dry Weather Flow (PDWF), no surcharging is allowed.

Hydraulic Analysis

The capacity evaluation identifies areas in the collection system where flow restrictions occur or where pipe capacity is insufficient to convey design flows. Sewers that lack sufficient capacity to convey design flows create bottlenecks in the collection system that can potentially cause sanitary sewer overflows (SSOs). This section discusses the impacts of the proposed development and verifies if the recommended improvement project sizing developed in the Master Plan are still adequate.

Under existing conditions, the Master Plan showed that there is sufficient capacity in the system under dry weather conditions, but under PWWF conditions, deficiencies upstream of the proposed development's point of connection were identified. After replacing a capacity limited (bottleneck) sewer this allowed for higher peak flows to be carried to downstream sewers. In some cases, this increase in peak flow overwhelms the downstream sewers, which creates additional deficiencies. This was the case for proposed project WWGM-6 from the Master Plan. Project WWGM-6 includes the replacement of approximately 450 feet of 15-inch, and 18-inch diameter pipeline along Del Campo Court, between Hunt Avenue and Paseo Grand Drive; and 910 feet of 18-inch diameter pipeline along Paseo Gran Drive, between Del Campo Court and Los Robles Court. The flow levels of the pipeline cause an SSO upstream under PWWF conditions. To mitigate the risk of SSO occurring during PWWF conditions, it is recommended that the existing pipeline be replaced with a 21-inch diameter pipeline. Project WWGM-6 alignment is shown in purple on Figure 2. This is the only project downstream of the proposed development's point of connection, which is shown on Figure 2.

Under dry weather conditions, the addition of the Hunter development did not trigger any capacity deficiencies. Under PWWF, the addition of the Hunter development did not identify any additional deficiencies downstream of the proposed development. The hydraulic model found that the existing system with improvements have sufficient to convey the projected build out flows identified in the Master Plan as well as the additional flow from the proposed development. The hydraulic analysis verified that the recommended improvement project sizing developed in the Master Plan are still valid.

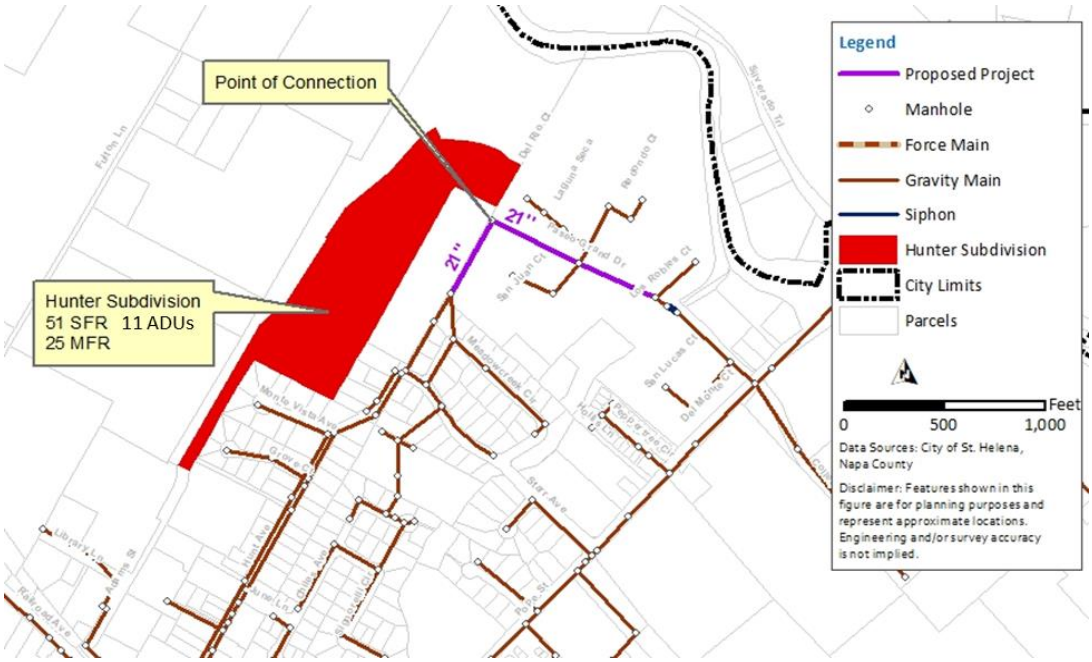

Figure 2 Downstream Recommended Improvements

Cost Share

This section discusses the project cost share that Hunter Subdivision is responsible for paying. Cost share is determined based on contribution of average dry weather flow (ADWF) as well as PWWF. The Hunter Subdivision is responsible for paying a proportion of Master Plan project WWGM-6 since, it is the only Master Plan project downstream of the point of connection and no additional deficiencies were identified. Table 3 summarizes the contributing flows from various users at Project WWGM-6 under buildout ADWF conditions and PWWF conditions. Based on this analysis Hunter Subdivision is responsible for paying six percent of $608,000 or $36,500 (ENR 20-City Average Construction Cost Index for April 2020 of 11,413) of proposed Master Plan project WWGM-6 based on the ADWF contribution.

Table 3 Hunter Subdivision Cost Share

User	ADWF (mgd)	Peak Wet Weather Flow with Master Plan Improvements (mgd)	Percent of ADWF	Percent of PWWF
Single Family Residence	0.14	4.15	93%	99.5%
Hunter Subdivision	0.01	0.02	6%	0.5%
Other Future Users	< 0.01	<0.01	1%	<0.1%

Conclusion

The updated hydraulic model was used to evaluate the impact that the proposed developments have on downstream collection system under various conditions. The hydraulic model verified that the recommended improvement project sizing developed in the Master Plan are still adequate. Based on the project cost share analysis, Hunter Subdivision is responsible for paying six percent or $36,500 (ENR 20-City Average Construction Cost Index for April 2020 of 11,413) of Master Plan project WWGM-6 based on their ADWF contribution to the system.

Segregation by Design

By Jessica Trounstine
University of California, Merced

Abstract:
Over the course of the 20th century the spatial scale of residential segregation along race and class lines increased. In the late 1800s, whites and people of color, renters and owners, poor and wealthy, were separated from each other in small clusters, so that residential segregation occurred block-to-block. By the middle of the 20th century segregation patterns had transformed; residents became segregated neighborhood-to-neighborhood. Throughout the post-war period, segregation between whole cities rose as the nation suburbanized. In recent decades, city-to-city segregation has remained remarkably persistent despite increasing neighborhood integration. Because political representation is geographically determined, these changing patterns have had profound political consequences – generating opportunities for exclusion and increasing polarization. I argue that local governments have been instrumental in driving and shaping these patterns; and they have done so largely in the name of protecting both property values and exclusive access to public goods for white property owners. When property values and public goods exclusivity were threatened, property owners changed their tactics – shifting the spatial of segregation higher. This process has always been Segregation by Design.

Conventional wisdom holds that segregation and the resulting deficit in services that the poor and people of color experience in American cities is driven by a combination of individual racial prejudices, market logic, and federal policy. This is an insufficient account because it ignores the institutional setting in which racism, economics, and federal law are embedded. Local politics structures the way in which *all* of these forces unfold.

Using qualitative historical evidence from large cities throughout the United States and quantitative data from hundreds of cities, I demonstrate that segregation and the unequal distribution of public goods accruing to individuals and neighborhoods are a function of local policies and political battles. Land-use planning, zoning, and redevelopment have been utilized by white homeowners and businesses seeking to enhance property values and monopolize public goods to generate segregation and inequality in access to benefits for over 100 years.

The changing spatial patterns of segregation have had important implications for political representation. Poor and minority residents have become more isolated and less able to secure political responsiveness and public benefits. In turn, segregation affects both local and national politics. In cities, segregated communities are more polarized and less willing to fund public goods. At the national level, neighborhoods that successfully resisted integration during the civil rights era are markedly more conservative today.

Instead of receding, segregation within cities and between cities and suburbs has grown over the past several decades, further antagonizing the imbalance of public benefits between the haves and the have-nots.

Introduction

"Segregated people in a nation that professes to be a democracy soon become a frustrated people. Those who segregate others soon become frightened, insecure people forced to accept and invent prejudice to justify their actions" Robert C. Weaver, *The Negro Ghetto*, 1948

City services sustain, prolong, and even save lives. In the latter half of the 19th century, urban American began a rapid ascent. City populations and economies were booming. But so too were their filth, their disease, and their divisions. By 1900, infectious and parasitic diseases killed nearly 8 in every 1,000 residents; accounting for more than 45% of all deaths (Tippett 2014) and more than 60% of deaths in children (Guyer et al 2000).[1] Between 1900 and 1940, the overall mortality rate in the United States declined by 35%[2] (Linder and Grove 1947) and the infectious disease mortality rate declined by 75% (CDC 1999).[3] In some cities in 1900, 30% of babies would not live to celebrate their first birthday (Meckel 1990). Estimates indicate that between one quarter and one half the decline in total mortality can be attributed to the development of public water and sewer systems. Local public works significantly reduced outbreaks of diseases like cholera, typhoid fever, diarrheal diseases, and malaria (Cutler and Miller 2006, Troesken 2004).[4] Over time, the growth of municipal fire and police forces, street cleaning and refuse disposal, childhood vaccination and physical examination programs, regulation of food supplies (e.g. requirements for milk pasteurization), and the implementation of

[1] Pediatrics. 2000 Dec;106(6):1307-17. Annual summary of vital statistics: trends in the health of Americans during the 20th century. Guyer B1, Freedman MA, Strobino DM, Sondik EJ.
[2] Total mortality declined from 17 per 1,000 persons to 11 per 1,000 persons.
[3] http://www.cdc.gov/mmwr/preview/mmwrhtml/mm4829a1.htm#fig1
[4] It is important to note that the dramatic improvement in mortality from water and sewer systems required the development of filtration and treatment techniques, which were not immediately available when the systems were first built.

building codes all worked to prolong life expectancy (Condran and Cheney 1982, Haines 2001, CDC 1999).

However, such benefits were neither inevitable nor universal. From the beginning poor and minority neighborhoods received fewer and lower quality services: they were less likely to be connected to sewers, have graded and paved streets, or benefit from disease mitigation programs.[5] Today, the quality of public goods in the United States remains highly variable. Some people have access to well-paved and plowed roads, sewers that never overflow, public parks with swing sets and restrooms, adequately staffed police and fire forces, and clean water. Others do not have access to these resources. The quality of such services is largely a function of the neighborhood, city, and state in which a person resides. The degree to which the poor and people of color have been concentrated into identifiable residential locations (e.g. segregation), varies from place and to place, and everywhere has changed dramatically over time.

Over the course of the 20th century the spatial scale of residential segregation along race and class lines increased (Logan et al 2015, Reardon et al 2009, Lee et al 2008). In the late 1800s, whites and people of color, renters and owners, poor and wealthy, were separated from each other in small clusters, so that residential segregation occurred block-to-block. By the middle of the 20th century segregation patterns had transformed; residents became segregated neighborhood-to-neighborhood. Throughout the post-war period, segregation between whole cities rose as the nation suburbanized. In recent decades, city-to-city segregation has remained remarkably persistent despite increasing neighborhood integration. Because political representation is geographically determined, these changing patterns have had profound political

[5] This book explores race and class divisions in local politics and residential locations. There are many ways one might go about defining these groups. As explained in more detail in Chapter 1, I focus on divisions between whites and nonwhites, and homeowners and renters. I use the terms minority and nonwhite interchangeably. I also use the terms black and African American interchangeably.

consequences – generating opportunities for exclusion and increasing polarization. I argue that local governments have been instrumental in driving and shaping these patterns; and they have done so largely in the name of protecting both property values and exclusive access to public goods for white property owners. When property values and public goods exclusivity were threatened, property owners changed their tactics – shifting the spatial of segregation higher. This process has always been Segregation by Design.

An example from Southern New Jersey is illustrative. Camden and Cherry Hill, New Jersey are similarly sized cities, just across the Delaware River from Philadelphia. Camden is home to two superfund (toxic waste) sites; Cherry Hill is home to none.[6] In Camden only 1.7% of state roads had good pavement in 2004[7] compared to 35% in Cherry Hill.[8] Camden has 22 combined sewer overflow outfalls (where raw sewage and storm water may be released to the surface during wet weather), while Cherry Hill has zero. Camden offers no e-waste recycling and no yard waste collection; Cherry Hill provides both. In 2012, Camden's water supply ran so low that residents were required to boil water for consumption and were prohibited from watering their gardens.[9] In contrast, Cherry Hill has a clean, plentiful water supply. The Cherry Hill Public Library has more than 400,000 circulating materials, more than 300 adult programs and classes, and 67 public computers.[10] In 2011, Camden shuttered the doors of its main library and handed control of the remaining two small branches to the county.[11] Cherry Hill offers 63 recreational facilities (parks, art centers, tennis courts, etc.) for its residents and supports 13

different swim clubs.[12] Camden has 25 parks and 8 community centers.[13] Between 2007 and 2012, Camden's city budget declined by about $245 per resident, while Cherry Hill's increased by about $12 per capita. Clearly, living in Camden is unlike living in Cherry Hill. So, how did Cherry Hill and Camden get to be so different?

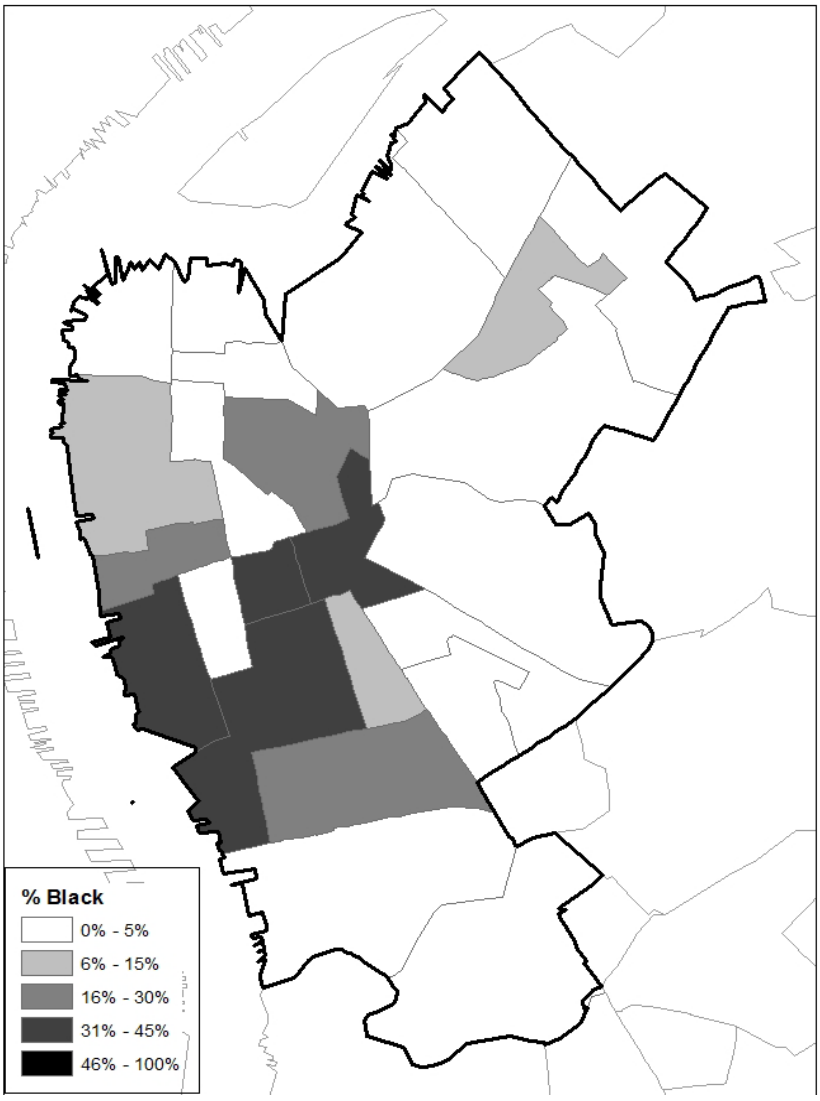
The story begins with a focus on Camden at the turn of the century. Although Cherry Hill was incorporated as a municipality in 1844, it remained a small, undeveloped agricultural community in the first few decades of the 20th century. In 1900, Camden had a population of nearly 76,000 residents. The city boasted 55 miles of sewers, 79 miles of water mains, and about 38% of the city's streets were paved; figures that suggest that Camden's development was right in-line with national averages. Also similar to other cities, were Camden's level of race and class segregation. By the turn of the century, Camden was home to two well-established free black communities named Fettersville and Kaighnsville (Garwood 1999). Established in the 1830s (Fettersville) and 1840s (Kaighnsville), these communities were comprised of small lots affordable to people of modest incomes, many of whom were African American (Garwood 1999). One of Fettersville's neighborhood churches, the Macedonia African Methodist Episcopal Church, was believed to be a stop on the Underground Railroad (Garwood 1999). While the majority of Camden's black residents lived in Fettersville and Kaighnsville, both neighborhoods were predominately populated with white, working-class residents.

According to the 1900 Census, the wards representing Fettersville and Kaighnsville were about a quarter African American. For a city in which African Americans only comprised 8% of the total population, clearly, blacks were not evenly spread across the city. But, the extent and scale of black segregation would increase dramatically by 1940. By 1940, the share of black

[12] http://www.cherryhill-nj.com/Facilities
[13] http://ecode360.com/8508679

residents had increased to 11%, but this growth in the black population was concentrated geographically in the central and southern parts of town. Figure 1 shows that by 1940, the black concentration in parts of Camden exceeded 50%.

Figure 1: Segregation in Camden, 1940



The creation of Camden's segregated neighborhoods echoed the creation of segregated neighborhoods throughout the United States. Camden city government used zoning laws, the placement of segregated schools, and public housing to create and enforce residential segregation between whites and Africans Americans, as well as between renters and homeowners. New Jersey's zoning enabling statute specified that regulations "must be made with reasonable

consideration, among other things…with a view of conserving the value of property," (Cunningham 1965). Camden first authorized zoning in 1928 and like other early zoning adopters, moved quickly to ensure that land use policy was used strategically to protect the interests of white home-owning residents.

By 1930, Camden was a bustling central city. It had more than 118,000 residents and spent nearly $950 (in 2012 dollars) per capita on municipal expenditures – well above the national median. But the stress of the Great Depression left Camden with an enormous burden of vacant and uninhabitable properties (Housing in Camden, 1942)[14]. And, so it was one of the earliest recipients of federal slum clearance and public housing funding in the 1930s (Pommer 1978). In 1938, two buildings were erected – one for whites and one for blacks. When the program was expanded in the 1940s two more projects were built; also segregated. Unsurprisingly, the neighborhoods around each project increasingly came to reflect the race of public housing occupants (Williams 1966a[15]). Later, when Interstate 95 was run through the city, "an attempt [was] made to eliminate the Negro and Puerto Rican ghetto areas" (New Jersey State Attorney General report, quoted in Rose and Mohl 2012, p108).

Overtime, neighborhood segregation in Camden rose; climbing more than 50% in the first half of the 20th Century. As would be the case in cities throughout the United States, Camden's city government underprovided services to its black neighborhoods (Helzner 1968[16], Silvotti 1968[17])

Starting around the time of the Second World War, the city faced desegregation pressures on a number of different fronts. In 1881, the state of New Jersey passed a law prohibiting the segregation of schools by race (Wright 1953). But, as of 1944, no black children attended white elementary schools (Jensen 1948). When the NAACP sued the district, officials responded that black parents had simply not requested attendance at their neighborhood schools. So, the NAACP took out ads in the Camden Courier Post to convince parents to do just that. In 1947, hundreds of black children enrolled in previously all-white schools (Wright 1953).

School desegregation was just one of the first of many signs of racial transition in Camden. In 1951, the city witnessed its first biracial contest for city council when Dr. Ulysses S. Wiggins, the president of the Camden NAACP Branch, was nominated on the Republican ticket (Chicago Defender April 21, 1951). He lost, but in 1961, Elijah Perry became the city's first African American city council member (Riordan 1996[18]). In 1954, the New Jersey Supreme Court ordered public housing to be desegregated and the first black families moved into white buildings in 1966 (Williams 1966a, Williams 1966b[19]). And in 1969 and 1971, the city erupted in violent race riots, touched off by police brutality against black and Latino residents.

In 1940, the little hamlet of Cherry Hill had a population just under 6,000 residents; they were 91% white and 9% black.[20] Not only small, the city was economically weak, having defaulted on its bond obligations been placed in receivership by the state government during the Depression (Shay v Delaware 122 N.J.L. 313, 316 (N.J. 1939), Cammarota 2001). But after the war, while housing and schools in Camden were integrating, Cherry Hill's population and economy exploded, as was true of suburbs throughout the nation.

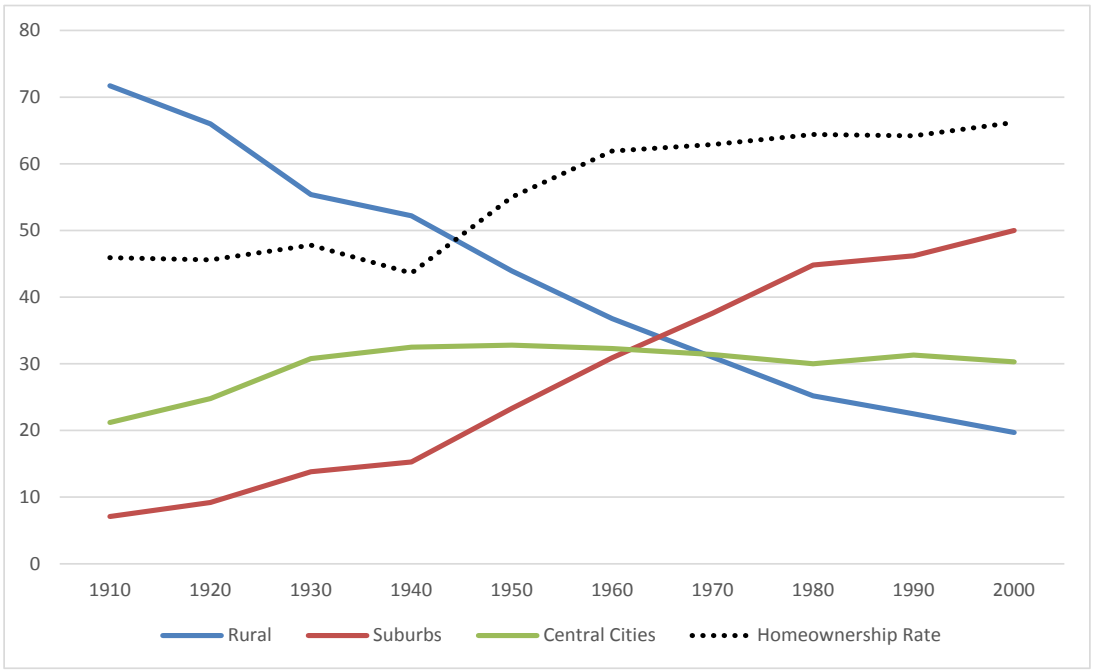
Drawn to places like Cherry Hill by the attractiveness of low-cost federally insured mortgages, the development of new homes and new employment opportunities in outlying communities, and easy commuting along newly built federal highways, the nation suburbanized and white homebuyers moved to the periphery (Jackson 1985). After the war, Cherry Hill witnessed a tenfold increase in 30 years. During the same period, Camden lost 13% of its residents.

Figure 2 shows the share of the total population living in rural areas, central cities, and suburbs over the 20th century. The graph reveals that the pace of suburbanization increased sharply during the postwar period so that by 1970, a plurality of the population lived in suburbs.[21] The homeownership rate increased at the same time. This latter fact is important because it helps to explain the driving force behind exclusionary zoning adopted by suburban communities.

[21] Rural here refers to population outside of any metropolitan area. A suburb is an area inside of a metropolitan area, but outside of the central city. City refers to the central cities of metro areas. https://www.census.gov/prod/2002pubs/censr-4.pdf p33; https://www.census.gov/hhes/www/housing/census/historic/owner.html

Figure 2: Share of Total U.S. Population Living in Different Types of Places



As Camden rushed to utilize more than $30 million in federal redevelopment funds to revitalize its flagging urban center, Cherry Hill was busy implementing zoning restrictions that effectively prohibited the development of low-or even moderate-income housing (Cammarota 2001). In 1975, black residents of Mount Laurel, New Jersey (a suburb close to Cherry Hill both geographically and demographically) along with several local chapters of the National Association for the Advancement of Colored People (NAACP), won a class action lawsuit challenging Cherry Hill's type of exclusionary zoning. As a direct result of this decision, Cherry Hill was required by the state to zone for thousands of low-income housing units. The city declined to do so. As of 2015, Cherry Hill continued to face litigation for its failure to zone for

affordable housing.[22] As is true in many places throughout the United States, exclusionary economic zoning cannot be disentangled from race. One activist argued "many residents carried racist feelings about affordable housing, fearing it would attract poor blacks and Hispanics."[23]

Figures 3 and 4 reveal how segregation between Camden and Cherry Hill changed between 1970 and 2010.

Figure 3: Segregation in Camden and Cherry Hill, 1970

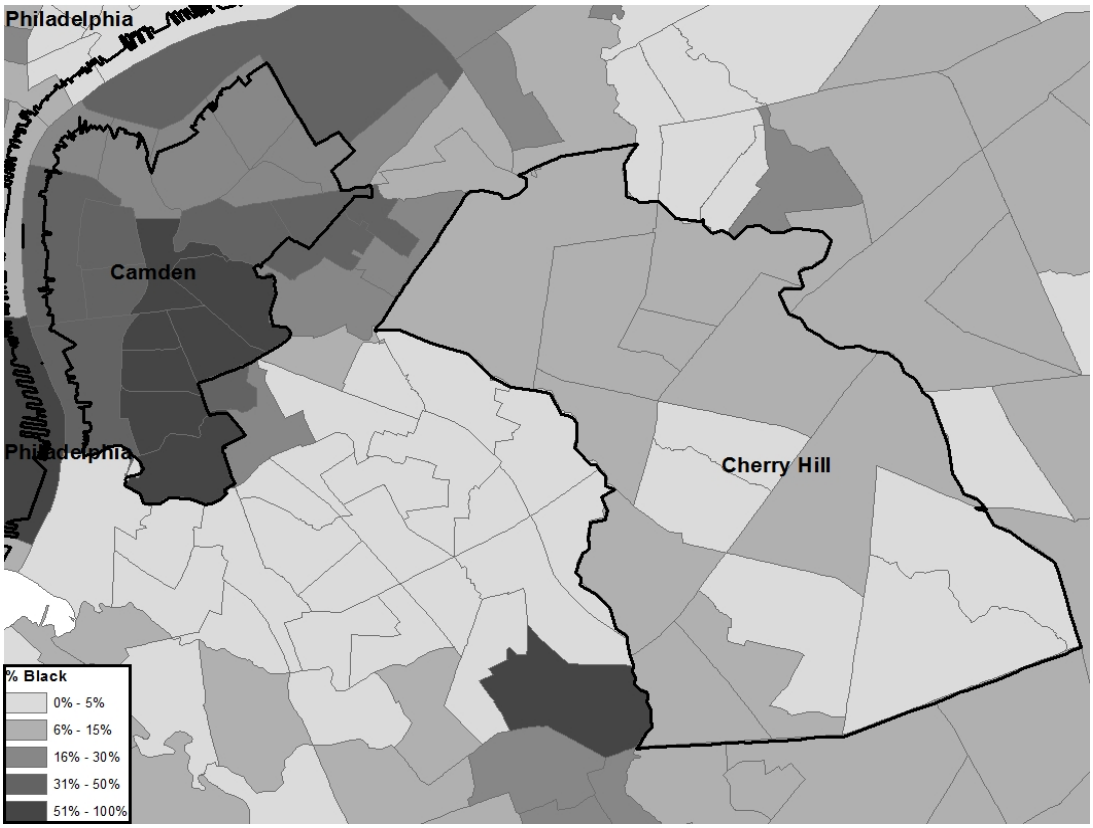
Figure 4: Segregation in Camden and Cherry Hill, 2010



In 1960 Camden was 76% white; and the maps show that in 1970, although home to many more people of color than was true in 1940, Camden still had several exclusive white neighborhoods. These white neighborhoods had all completely disappeared by 2010. So, even though Cherry Hill diversified to a limited extent, a greater share of segregation occurs between these cities than within them.

Those who left Camden during the postwar period and those who moved to Cherry Hill were largely white, middle-and upper-class. As of 2014, about 39% of Camden's population owned their homes, 5% were white, and the annual median household income was $26,000. In Cherry Hill, 80% owned their homes, 75% were white, and the median household income was

$89,500.[24] In 2012, per capita taxes in Cherry Hill were double Camden's. Camden simply cannot afford to offer the services that Cherry Hill provides. The segregation along race and class lines between these two cities, and the resulting inequality in access to public goods was produced by public policy. It is a pattern that was replicated many times over throughout the United States; a postwar version of similar patterns that had developed at the turn of the 20th century.

A Theory of Segregation by Design

In the late 1800s as industrialization brought thousands of migrants and immigrants into cities, people of color and the poor were spatially isolated, not by ward or census tract, but by building and street (Logan et al 2015). What this means is that although blacks, Latinos, and Chinese residents were unlikely to live next door to white homeowners, they *were* quite likely to live down the street. By 1940, segregation shifted up to the neighborhood level (Cutler et al, Massey and Denton), so that large swaths of many cities had become predominately black or white, and both poor and wealthy residents became increasingly clustered in most places. By the onset of the Second World War, every large city in America had parts of town where people of color lived, and parts of town where the poor lived. Sometimes, but not always, these neighborhoods overlapped. Race and class segregation both increased by more than 50% between 1900 and 1940. These concentrating trends continued at a slower pace throughout the postwar period until 1970, when both race and class neighborhood segregation peaked. Neighborhood segregation by race has declined since 1970, but segregation by class has

[24] http://www.census.gov/quickfacts/table/PST045215/3410000,3400712280,00

increased.[25] During the post-war period segregation between cities increased and has remained stable since that time (Massey and Hajnal 1995, Farrell 2008, Fischer et al 2004).

Two classic economic models of individual choice appear to predict these different patterns of segregation. Thomas Schelling (1971) argued that extreme racial segregation could result from individual decisions about where to live, given even mild preferences for having neighbors of the same race. Only a small number of racially intolerant white residents can cause a neighborhood to rapidly transition because as each intolerant white resident is replaced with a black neighbor, whites with lower and lower levels of intolerance choose to leave, creating neighborhood-to-neighborhood segregation. The second individual choice model predicts city-to-city segregation. Charles Tiebout (1956) proposed that residents with similar preferences for taxation and public goods provision should sort themselves into cities with like-minded neighbors. To the extent that heterogenous preferences for tax and spending levels (or ability to pay) overlap with heterogenous demographics, they will also generate segregation.[26]

The trouble is that both theories are subject to instability in the absence of collective enforcement mechanisms (Oates 1969, Oates 1981, Fischel 1992). That is, for an individual to ensure that her neighborhood remains white and has access to a nice public park, she needs the cooperation of her neighbors. But, neighbors may have individual incentives that undermine the achievement of other residents' collective goals. For instance, it can be extremely lucrative for a white homeowner to sell her home to a black buyer. This is especially likely to be the case when black housing options are restricted and when the black population is expanding. As Hamilton

[25] The precise pattern of class segregation depends on the measures used to indicate class. Income segregation has increased significantly since the 1970s (although remains lower than racial segregation), while homeowner/renter segregation has increased by a smaller amount.

[26] Banzhaf and Walsh combine Schelling and Tiebout's insights into a single model that establishes that preferences over public goods and demographics are mutually reinforcing in the generation of segregation (2010).

(1975) explained, individual incentives can also undermine the Tiebout model. It also makes fiscal sense for a resident who prefers high quality public goods, but is unable to afford high tax rates, to locate the smallest, least expensive home in a wealthy city. The taxes this resident pays do not support the share of the public goods she utilizes, but she benefits from them nonetheless. In Hamilton's tale, this behavior could lead to wealthy residents chasing each other around to try and maintain exclusivity. In the first instance, the collective goal of maintaining the white neighborhood is undermined by sellers seeking the highest sale price. In the second instance, the provision of public goods is undermined by residents who do not pay the full cost.

Governments can promote collective action by generating enforcement of collective goals; and here it is *local* governments that play the starring role, because they alone regulate land-use. By invoking their powers of control over land-use and making choices about service provision, local governments can affect the aggregate demographic makeup of communities and the spatial distribution of residents and services, thereby generating and enforcing segregation. The goal of these policy choices is stability (or enhancement) of property values and the protection of public goods quality.

As North (1990) explains, the relative bargaining strength of different interests in any community will dictate the structure of its rules. Such rules, he tells us, are frequently devised in to promote private rather than public interests (p48). The history of local land-use planning and service provision fits squarely within this theoretical perspective. Property owners (and those who derive their livelihood from property, like realtors and lenders)[27], seek both property value appreciation and protection from losses in value. Because tax levels, service quality, and

[27] Developers, while also obviously earning their livelihood through property only sometimes have goals that are aligned with homeowners'. In some settings, developers prefer fewer regulations on development (allowing them to build smaller homes on smaller lots or denser multifamily structures, for example), but in others they are strong proponents of restrictive mechanisms like large lot zoning and racial covenants.

neighborhood demographics are capitalized in property values (see Hilber 2011 for a review), property owners invest considerable energy into dictating local policy (Fischel 2001, Stone 1989; Logan and Molotch 1978).

In the United States, property owners have always been disproportionately white; and property value has been tied to the race of occupants and neighbors (Hayward 2013, Freund 2007). Furthermore, as Bradford, Malt, and Oates (1969) argued, the quality of many public goods, like education and public safety, is predominantly affected by the characteristics of the residents themselves rather than inputs from the government. Together these circumstances have given property owners a powerful incentive to regulate who lives where since the very earliest years of urbanization. In particular, white property owners have long been concerned with excluding certain types of people from their communities.

From the earliest years of city development, white, native-born Americans had a racialized, classist understanding of property value and deservingness of public benefits. In particular, it was widely accepted that poor and minority neighbors negatively impacted property values and were less deserving of benefits than property owners and whites. Local policies like zoning and redevelopment serve these ends, and the result has been segregation along race and class lines.

The very first laws generating segregation were adopted in the first decade of the 20th century, to protect both property values and public goods exclusivity. Over the course of the next 100 years, when property owners were stymied in their attempts to create exclusivity by demographic shifts, loss of political control, or meddlesome higher levels of government seeking to promote equality, they adopted new strategies to achieve segregation, often increasing the spatial scale of exclusivity to achieve their goals. For instance, when first industrialization and

then the explosion of war time economies pulled great numbers of working class people of color to cities, many black and Latino neighborhoods swelled, threatening to spill into white, home-owner communities. City governments were called upon to use policy levers like land use regulations, zoning, the placement of thoroughfares and public housing to consolidate, and then circumscribe minority communities. When state and federal courts ordered desegregation of communal spaces like parks, golf courses, and swimming pools, local governments again used control over land use to alter the residential map. In the post-war period, big city governments became unreliable allies in this pursuit. When the federal court ordered desegregation of schools and when white owners saw threats to their political power in central cities, they ensured that suburban governments protected their interests.

The Geography of Inequality

Political geography is comprised of nested units: neighborhoods within wards, wards within cities, cities within states, and states within the nation. When residential segregation maps onto political geography, political divisions become fused with race and class divisions. This has two important consequences. First, segregation generates inequalities between race and class groups because in a world of scarce resources, the politically powerful deny public goods to those who are politically weak. Segregation within cities and suburbanization across city lines has meant that the benefits experienced by racial and ethnic minorities and low-income individuals are inferior to the benefits experienced by whites and the wealthy. Second, segregation generates political polarization between race and class groups and ultimately, inhibits cooperation.

Segregation generates inequalities because it allows political elites to target public goods toward supporters. At one time, public goods were segregated directly, through laws which

dictated that whites and blacks (and often Native Americans, Latinos, and Asians) could not attend the same schools, sit in the same area on public transportation, utilize the same parks, pools, libraries, or hospitals, be incarcerated in the same facility, or be buried in the same public cemeteries.[28] The legal segregation of public goods allowed city, county, and state governments to provide unequal funding for black and white schools, black and white hospitals, and black and white playgrounds (thereby generating unequal quality). This meant that compared to whites, blacks received inferior public goods than whites regardless of where they lived. But by the middle of the 20th century, public goods inequalities had largely come to be determined by residential segregation instead of directly. [29]

This transformation occurred in part as a response to the 1896 decision *Plessy v. Ferguson* which dictated equality in separate facilities. It was cumbersome and expensive to develop separate and equal services in diverse communities. The duplication of schools, parks, hospitals and cemeteries for black (Asian, Latino, and Native American) and white residents meant higher expenses (CQ Researcher 1947).[30] Such costs arose not only from the establishment of facilities that would not have been needed if the facilities were integrated, but also from the loss of efficiency that the replication of equipment and personnel entailed.[31] Obviously, these costs were minimized when nonwhite facilities were severely underfunded

---

[28] Jim Crow laws demanded or permitted segregation in settings far beyond the reach of public goods including everything from seating in theaters and circuses, to marriage and sex, to the playing of checkers or dominos in private homes (Woodward 1955). Furthermore, laws mandating segregation were but one way in which the rights of racial and ethnic minorities were violated during this period. For instance, various laws barred minority individuals from testifying on juries against white defendants, denied them citizenship status, prohibited their access to certain professions, excluded them from owning land, and of course, prevented them from voting.

[29] The choice between segregating public goods directly and segregating public goods via residential segregation was not confined to the South. Leon Litwack (1961) writes of the antebellum north "legal and extralegal discrimination restricted Northern Negroes in virtually every phase of existence," (p64). More details on Jim Crow segregation in the north are provided in Chapter 3.

[30] http://library.cqpress.com/cqresearcher/document.php?id=cqresrre1947110700

[31] One study of St Louis's segregated school system found that 75% of the city's transportation costs in 1951-52 were spent transporting Negro school children who lived in outlying areas to colored schools in the center of the city (Russell 1954).

(Myrdal 1944, p342), but in the wake of *Plessy v. Ferguson* and successive lawsuits urging cities toward equal (albeit separate) facilities, residential segregation became an attractive alternative. After the many midcentury court decisions striking down any separate facilities (e.g. Brown v. Board of Education), residential segregation became the only remaining option (CQ Researcher 1947, Kruse 2005). In addition to being constitutional, residential segregation was also an efficient mechanism for producing inequalities across multiple public goods at once.

A similar transformation occurred in the post-war period, as neighborhood level segregation was traded for city level segregation. In 1948, when the Supreme Court ruled restrictive covenants unenforceable in *Shelley v. Kraemer*, white neighborhoods lost one of their most effective means of defense against integration. The 1968 Fair Housing Act further limited white collective action. As technological changes enhanced suburban service delivery and commute possibilities, and as the federal government subsidized homeownership outside of the central city, segregation across city lines rose. Moving outside of city boundaries allowed suburbanites to provide high levels of public goods for their residents without having to pay for services for nonresidents. For the privileged, suburbanization was an even more efficient mechanism of segregation than choosing separate neighborhoods within the city. As Hayward (2009) has argued, suburbs offered the opportunity to, "engage in exclusionary zoning practices…to opt out of supporting public housing…and even opt out of supporting public transportation within the boundaries of their municipalities," all while allowing suburbanites to, "pool their tax monies…to provide schooling and other public services." (p149). In addition to offering efficiency, suburbanization also freed residents from having to fight for control of the city government. Indeed, suburban flight was encouraged by a loss of political power in the central city.

In many ways, these inequalities in access to public goods are precisely the goal of segregation's promoters. But, a second consequence of increasing correspondence between political geography and demographic division, is an increase in political polarization. Within cities, segregation generates stark divides between racial groups, leading segregated cities to underprovide public goods. But, even beyond city borders, segregation is consequential. The process of building and defending white homeowner neighborhoods created new ideological commitments to a meritocratic discourse that depicted inequalities as being the result of the free-market, and choices made by black and poor residents, rather than the result of actions taken by government or white homeowners. The new ideology that was bred in defended white homeowner neighborhoods took root, growing into a modern conservatism that prioritized protection of property, self-reliance, and individual achievement (Self 2003, Lassiter 2006, Kruse 2005). Over the years, this conservatism has persisted, inculcating new neighbors with the same perspective.

Empirical Expectations

The preceding argument generates several broad predictions which I test in various ways throughout the coming chapters. First, I predict that some communities will be more likely to desire segregation than others: these are places that have a taste for segregation and/or have significant resources to protect. These places will be most likely to implement local policies like zoning, urban renewal, and restrictive land use regulations. When communities seeking segregation are thwarted in their ability to generate exclusivity, they'll seek to change the spatial scale of segregation – moving to exclusive neighborhoods and exclusive cities. Second, I predict that these local policies work to generate segregation along race and class lines. Third, I predict that residential segregation generates inequalities in access to public goods. Finally, I propose

that residential segregation will cause political polarization in both local and national politics. No chapter or time period contains tests of all of these predictions; but together they tell a compelling story. For more than 100 years property owners (and those who derive their livelihood from property) have urged local governments to enact policies that institutionalize segregation along race and class lines to protect their property values and control the distribution of public goods; and I show that they have been incredibly successful.

I find that segregation along both race and class lines has been promoted by white homeowners and land oriented businesses for more than 100 years. Where these interests dominated city government, segregation grew more rapidly. I also find that as segregation increased, service investment in white homeowner neighborhoods increased. As whites lost control over the distribution of benefits, they moved to the suburbs and continued to expand service delivery. Today, a greater share of public dollars is spent by suburbs than by central cities. Finally, I reveal that in more segregated places political polarization is greater and poor and minority residents have access to lower quality public goods.

Important Caveats

Schools (or lack thereof)

This is a book about segregation, and only rarely do I engage a discussion of schools. This will seem a glaring omission to many readers, especially because many pieces of my argument overlap with accounts offered by education scholars. The literature exploring inequality of educational opportunities is extremely dense and well developed (see Reardon and Owens 2014 for an overview). As Stephen Macedo writes, "Local control, when combined with local funding, and district-based assignment of pupils to schools, has created a geography marked by stark inequalities centered on class and race: a new form of separate and unequal"

(Macedo 2003, p743 in "School Reform and Equal Opportunity in America's Geography of Inequality"). The arguments that I advance here compliment and underscore much of this research. One might view this book as an extension of these arguments to the provision of *all non-school local public goods*.

My focus here is on the various policies that local governments use to generate segregation; and the consequences of segregation for local and national politics. The vast majority of the governments that I study do not play a direct role in the governance of schools or the provision of public education. That is, most cities in the United States do not spend money on educational services; and most public school students (about 85%) attend schools that are governed by school districts not municipalities. One could approach school district politics as I have done for municipalities – analyzing decisions about the drawing of catchment zones, policies on bussing, and the allocation of resources across schools in the same district. But, this would require vastly different data than what I have gathered.

That said, school enrollment and quality plays a major role in individual decisions about where to live. So while I do not analyze the politics of school districts, my argument attempts to take school dynamics into account when analyzing the impetus for segregation. For instance, I use federal desegregation orders to study how segregation changed in the post-war period.

Data Hurdles

The data that I use to reveal the patterns described above differs in important ways from previous research. Most scholars who analyze the determinants of segregation focus either on metropolitan level segregation (e.g. Dreier et al 2004, Jackson 1985) or neighborhood segregation (e.g. Massey and Denton 1993)[32]; and on racial segregation (e.g. Charles 2003) or

[32] M.J. Fischer (2008), Reardon, Yun and Eitle (2000), C.S. Fischer et al (2004), and Rhode and Strumpf (2003) are notable exceptions. However, none of these authors analyze the political causes or consequences of segregation.

class segregation (e.g. Bischoff and Reardon 2013) – but these types of sorting are intricately linked. Class segregation and racial segregation are correlated, but they are not identical. Determining both the causes and consequences of segregation requires taking these linkages into account. The data that I have collected measure segregation both within and across cities, they account for both race and class divisions, and cover city expenditures on a wide range of services during the entire 20th century. This required the encoding of archival data, the generation of new spatial data using GIS, and the compilation of thousands of digitized observations from the United States Census. The comprehensiveness of the data allows for a more complete picture of the patterns of segregation over time and allows for an analysis of the factors that give rise to this variation.

I find generally, that I am better able to explain the causes and consequences of racial segregation. In part this is because the data for measuring racial segregation are available for a longer time series and at a finer grain of detail than the data for measuring class segregation. But, the historical record is also clear that exclusion of other races has been a more powerful driver of these processes than exclusion of the poor. This is evidenced by the fact that many neighborhoods contain a mixture of homeowners and renters, as well as varied income levels, even when they are dominated by a single racial group. As a result, racial segregation has always been higher than class segregation. However, today, local policies that generate class based exclusion are generally upheld by courts, while race based exclusion is not. Additionally, income inequality has increased in recent decades. As a result, class segregation has risen and will likely continue to rise, even while racial segregation declines.

Throughout my empirical analyses I face profound causal challenges. In some cases my analysis is plagued by reverse causality: do white residents move to the suburbs because the

central city elected a black mayor, or did the moving of white residents make it possible for a black mayor to get elected? In other cases, my analysis suffers from an inability to disentangle selection from treatment: does living in a homogenous white neighborhood make people more conservative or do people with conservative views move to homogenous neighborhoods? In still other cases, my argument would be aided by evidence of strategy on the part of local elites, but none exists: zoning generates greater segregation, but could this have been an unintended consequence?

In each chapter I describe the hurdles presented by the (lack of) data and my strategies for overcoming them. Generally, I seek to build a case for my argument using both detailed qualitative evidence and quantitative evidence from hundreds or even thousands of places. I often draw on the timing of events for evidence of causality and, where I am able I utilize instrumental variables to underscore my findings.

Contributions to Existing Literature

This book contributes to a number of dense literatures including work focused on segregation, public goods, attitudes toward outgroups, and political inequality. Although a great deal has been written on each of these topics, very little research engages more than one of these areas. For instance, Tiebout's (1956) seminal article arguing that consumer-voters pick communities which best satisfy their preferences for public goods ignores the role of race, segregation, and inequality in these choices and is silent about the ways in which public goods packages are developed. Other scholars (Alesina et al 1998) show that diversity drives down collective investment in public goods, but do not consider the ways that geo-spatial arrangements might affect this relationship. Still others have shown that whites' desire for homogeneity has played a role in generating racial segregation between cities and school districts (Reber 2005,

Baum-Snow and Lutz 2011, Boustan 2010). However, these works largely ignore the political mechanisms by which such preferences are realized (e.g. the development of zoning policies).[33]

Outside of (excellent) case studies focused on one to two metropolitan areas at a time (Danielson 1976, Hirsch 1983, Sugrue 1996, Kruse 2005, Lassiter 2006, Kraus 2000), to date most of the research analyzing the relationship between segregation and public policy has focused on national level programs like the Federal Housing Administration underwriting guidelines (Jackson 1985) or the Home Owners Loan Corporation neighborhood investment ratings (Hillier 2005).[34] With such far reaching effects, the focus on these programs has been well placed, but has tended to obscure considerable subnational variation; and while the case studies offer invaluable historical detail, they are unable to provide evidence of broader patterns of the effect of local policies on segregation. In short, while scholars have documented changing patterns in racial and class segregation, they have not demonstrated the ongoing role of city politics and local service policy in creating segregation and growing inequality. I show how patterns of local service delivery, zoning laws, and other local policies not only mirrored patterns of segregation but also very much drove them – not only in the pre-civil rights era, but also in recent decades.

Although many scholars have suggested that segregation across neighborhoods or between cities and suburbs fosters inequalities in access to public goods (Massey and Denton

[33] Baum-Snow and Lutz analyze the effect of school district desegregation orders on suburbanization. So, while they focus on the effect of a public policy, they are not concerned with policies that intentionally aided segregationist preferences.

[34] Important exceptions include Rothwell (2011) who analyzes the effect of low density zoning on metropolitan area racial segregation and Dreier et al (2004) who suggest (although they do not provide direct evidence) that zoning and redevelopment affect economic segregation across cities. Cutler, Glaeser, and Vigdor (1999) find support for a theory of "collective action racism" prior to 1970. They show that housing prices for equivalent quality housing were higher for blacks than for whites implying that whites acted collectively to limit black housing choices. However, the authors do not provide any analysis of the types of collective action in which whites engaged beyond speculating that restrictive covenants and racial zoning may have played a role. Importantly, Cutler et al do not distinguish between collective actions that occur in the public versus private realm.

1993, Burns 1994, Dreier et al 2004), very little research offers systematic evidence of this intuition.[35] Other scholars have carefully documented the pernicious effects of segregation on individual level outcomes (Ananat 2011, Cutler and Glaeser 1997), but have not offered a direct link between these outcomes and allocation of public goods. I offer quantitative and qualitative data showing that segregation across both neighborhoods and cities allows governments to disinvest in poor and minority communities and this produces unequal access to public goods. These results help to explain why social mobility is tied to place, as scholars like Sharkey (2013) and Sampson (2012) find, and demonstrate the consequences of public policy and segregation for larger patterns of inequality.

Much of the work investigating the determinants of segregation (both within cities across neighborhoods, and within regions across cities and suburbs) argues or assumes that the important driver of racial segregation is prejudice – that is, attitudinal predispositions toward racial and ethnic minority groups. This is an insufficient account. It is insufficient first because racial segregation has not declined as precipitously as one would predict given dramatic changes in overt expressions of racism. I argue that the institutionalization of prejudice through local public policy makes segregation more rigid. Second, pure prejudice does little to explain the rise of class segregation. I argue that if we understand segregation as a mechanism to protect public goods and property values, increasing class segregation is predictable. Finally, a pure prejudice account leaves unexplored the basis for these predispositions. I argue that beliefs about the acceptability of different demographic groups as neighbors (e.g. what we might take to be pure

[35] An important exception is Troesken (2001) who provides direct evidence of the relationship between segregation and public goods inequalities. He shows that cities with racial segregation were more likely to generate unequal access to municipal water and sewer connections in the late 19th and early 20th centuries.

prejudice) were influenced by the distributions of public goods and battles over those distributions decades ago.

Contrary to some scholars' conclusion that the core problems of segregation have been alleviated, I show that segregation persists, that segregation has grown across cities, and that government policies continue to play a central role in perpetuating segregation.[36] White, wealthy Americans are still trying to segregate themselves. And local governments still tend to invest more toward whites and the wealthy. I build this argument through seven substantive chapters and a conclusion that considers omissions from the book and forecasts the path forward.

Chapter Summaries

In order to orient the study, in Chapter 1, I provide descriptive information regarding changes in segregation and public goods spending over the course of the 20th century. I offer an overview of patterns that will be linked through the chapters that follow. I begin by providing a broad overview of spending between 1900 and 1940. It reveals that cities increased expenditures on street paving and lighting, refuse collection, sewers, libraries, health, education, public safety, and recreation, and increased revenue from taxes. During this early period, cities became modern service providers.

Next, I explore early patterns of race and class segregation. I show that racial segregation increased dramatically between 1890 and 1940 while class segregation increased marginally. It was in the cities with the largest budgets that segregation increased the most. Then, I turn to analyzing fiscal and segregation patterns between 1970 and 2011. I argue that during this period, white property owners turned to suburbanization as their primary mechanism for protecting

[36] Several recent headlines make this claim "Glimpses of a Ghetto-Free Future," "Segregation Continues to Decline in Most U.S. Cities, Census Figures Show," "The End of the Segregated Century: Racial Separation in America's Neighborhoods, 1890-2010."

property values. After 1970 the dominant trend in both race and class segregation was increasing differentiation between cities. During this period, suburban governments grew more intensely than central cities so that by 2011, central cities accounted for a smaller share of total metro area spending than they had in 1970.

In Chapter 2, I provide the first piece of evidence directly linking the patterns described in Chapter 1 by showing that public goods considerations drove efforts to segregate in the early decades of the 20th century. Acting in response to white homeowners and land-oriented businesses, local government policy explicitly sought to exclude people of color from white neighborhoods and poor individuals from wealthy neighborhoods. In empirical analyses I analyze the factors that encouraged the adoption of zoning laws and the role that zoning laws played in the development of race and class segregation. I find that exclusion was most adamantly pursued in cities that had become significant providers of public goods, where property taxes were high (and so, raising property values was attractive), and where political support for Progressive reform was strongest. I supplement this analysis with qualitative evidence that reveals the many factors local governments utilized to promote segregation, including strategies like the siting of segregated public goods such as parks and schools. Finally, this chapter reveals that zoning laws had their intended effect: early zoning adopters segregated more rapidly over the next several decades compared to cities without similar ordinances and zoned cities witnessed greater inequalities in housing values.

Chapter 3 documents the unequal provision of public goods that early segregation allowed. Using historical case study evidence, I show that poor and minority neighborhoods consistently received worse public amenities like road paving, and health clinics. I draw on detailed ward level data from Baltimore, Boston, Chicago, and Philadelphia to show that sewer

extensions were less likely to be built in neighborhoods with higher proportions of African American and renting residents. As a result, inequality in water and sewer access was greater in more segregated places. I show that these inequalities persisted. Using data on all tracts in all cities in the United States, I provide evidence that whites and minorities, and renters and homeowners had differential rates of access to public sewers in more segregated places in 1970, 1980, and 1990. I argue that these inequalities in service provision affected the ways in which white and wealthy residents would come to view poor and minority neighbors. Daria Roithmayr (2014) points out, "we see the strongest evidence of continuing discrimination in housing markets" (p18). This is because the roots of this bias are whites' conscious and subconscious beliefs about the effect of nonwhite and renter neighbors on property values and the quality of public goods – beliefs that were fostered by government choices at the turn of the 20th century.

Chapter 4 provides evidence of municipal policy effects on segregation in the middle of the 20th Century. By 1940, segregation was entrenched, as were the unequal allocations of public goods. But patterns would change in the post war period. In some places segregation along racial lines increased, while in others it had already begun to decline (as it would everywhere after 1970). Class segregation began a slow ascent and then leveled off. As was the case in the first time period analyzed, local public policy played a role in these patterns. I provide evidence that cities that more vigorously implemented urban renewal programs grew more segregated along both race and class lines. I also show that during the 1960s and 70s, in many cities white homeowners lost the political power needed to police the borders of their neighborhoods and control the distribution of public goods. I argue that such changes made suburban living a more attractive option than living in homogenous neighborhoods within cities.

Between 1970 and 2000, the major change in segregation patterns occurred between cities. That is, neighborhoods became more racially integrated within cities, but whole cities became more racially homogenous. Class segregation across cities also increased during this period. Chapter 5 offers an analysis of the role of local political control in generating these changes. Using demographic and finance data from all metropolitan areas in the United States between 1980 and 2000, I show that larger budgets, higher spending on policing, and minority mayoral victories are associated with more segregation across city lines. Where whites maintained control they were less likely to move to the suburbs. Throughout the postwar period cities and suburbs alike moved away from explicitly racial strategies toward class based tactics, such as large lot zoning and limiting multi-family developments, to ensure segregation. I show that more restrictive zoning by suburban cities increased both race and class segregation. As a result, suburban communities made decisions that profoundly affected non-suburban residents while preventing them from participating in the decision making process. In this context, representative government, policy responsiveness, and political equality became hollow concepts.

In Chapters 6 and 7, I focus on the consequences of segregation for modern politics. In Chapter 6, I analyze the consequences of segregation within cities. Quite ironically given early claims that segregation was the best solution to racial discord, I show that segregation is associated with deep race and class divisions that dominate city politics today. Polarization makes cooperation difficult and, I show that segregated cities have smaller city budgets and spend less on individual categories of expenditure such as roads, policing, parks, and sewers. Underinvestment means that city services do not operate well. Focusing on one measurable area

of public goods provision, I demonstrate that sewer overflows are more frequent in segregated cities.

In Chapter 7, I focus on the effects of segregation for national level politics. I draw on case study and large-n evidence to show that the integration of public spaces and residential areas encouraged whites and the wealthy to move to the suburbs during the postwar period, which allowed for more control over political decisions and the distribution of public goods. Then, I draw on restricted-access General Social Survey data geo-coded to 1970 Census tracts to show that residents who live in neighborhoods that were whiter than the metropolitan area as a whole in 1970 are much more conservative than those who live in more integrated places. I argue that this conservatism is rooted in the battles over integration that occurred in earlier decades.

In the conclusion of the book, I pull the many pieces of evidence presented previously into a single framework and discuss what the future holds. I reiterate my main claim: local governments pursue segregation at the behest of politically powerful interests. This allows politicians to target public goods towards some residents and away from others, resulting in differential access to public goods. Segregation generates unequal political outcomes which in turn, reinforces segregation. By linking neighborhood level segregation to suburbanization, I suggest that preferences for separation have changed in form, but not intent over time. Going forward we can expect additional change. Rather than seeking residential segregation, some individuals will choose to leave the public realm altogether – relying more heavily on private provision of services like education, policing, and park space. We have some evidence that privatization has increased even as many cities have become more integrated. The drive to protect property values, ensure good schools for children, and safe streets for families has

remained a powerful force. In the final section of this concluding chapter I consider some potential policy solutions to these seemingly intractable problems. I suggest that the most promising path forward is to utilize lessons from school finance reform (e.g. Lafortune, Rothstein, and Schanzenbach 2015) to guide state governments' approach to producing more equal access to a range of local public goods.

Chapter 1: Segregation and Public Goods over the 20th century

At the turn of the 20th Century, cities in the United States experienced intense demographic change. The first waves of African American migrants left the South for Northern communities, and immigrants from Europe streamed across the borders until the onset of World War I and the implementation of restrictive immigration laws. By the middle of the Century, the spatial distribution of residents was markedly different than it had been 50 years prior; and patterns would change again over the ensuing 50 years. Until the onset of the Great Depression, expenditures by local governments also grew rapidly. It was during this period that the foundation for modern urban politics was laid across the nation. This growth in municipal spending continued unabated for the next 100 years, but it was uneven, favoring suburbs at the expense of cities. This chapter charts and links changes in both demographics and service provision in metropolitan America.

I begin with a presentation of data on the growth of expenditures during the first four decades of the 20th century. I analyze demographic correlates of this growth, showing that homeownership, wealth, diversity, and density were all associated with expanding municipal governments. This, I argue, explains why white homeowners and land-oriented businesses pursued residential segregation: to protect property values and capture public goods. Next, I present the changing patterns of race and class segregation for these early decades. I show that cities with greater spending became more segregated. I then turn to an analysis of spending and segregation between 1970 and 2010, concentrating on the effects of suburbanization. I provide evidence showing that the level at which segregation occurred shifted during this time. While neighborhoods within cities became less segregated, cities started to look increasingly different

from one another. As the next several chapters will reveal, the changing level of segregation has had significant implications for the allocation of resources.

The Rise of Urban America

In the year 1800, only 5% of the population of the United States lived in cities and approximately 90% of the workforce was tied to agriculture. For the next half century, this figure inched modestly upwards, so that by 1850, 15% of population lived in urban areas.[37] After the end of the Civil War, the pace of urbanization (and industrialization) increased dramatically. By 1900, the nation was 40% urban and in 1920, the Census reported a majority urban nation for the first time. This trend continued; today the nation is approximately 80% urban.

As industrialization advanced, massive demographic shifts accompanied the economic changes. Cities began to fill with migrants and immigrants seeking work in the new factories and service sectors. During this period, most workers commuted to their jobs by foot, limiting the distance residential neighborhoods could be located from places of employment. The result was massive overcrowding – in some cities as early as the first decades of the 1800s. Housing and sanitary capacities became overextended; epidemics and conflagrations were rampant. O'Connor (1984) offers a vivid description of early 19th century Boston:

> Within the heart of the old city…things had deteriorated badly over the years…Its meandering streets…were hedged in by four and five-story houses that blocked out the sunlight. Pedestrians were in constant danger of being knocked down by stagecoaches, or bowled over by droves of pigs being hustled to market….[An] abominable stench rose above it all. Not merely the oily fish smells from the docks, the briny tang of salt water, or the sickish odor of the mudflats at low tide. This was the repulsive reek of

[37] The Census determines whether a particular geographical area is urban based on population size and density. Rural territory is any area that is not urban. Starting in 1900, the Census has defined urban areas as all places with at least 2,500 residents. From 1910-1950, urban areas only included incorporated places (e.g. cities) that met the size threshold. In more recent decades, the determination has been a combination of size and density; urban areas contain at least 2,500 people have a density threshold of at least 1,000 people per square mile.

> uncontrolled street refuse and untended garbage. To make matters worse, the city's sewerage system emptied out into the Town Dock… (p80).

Despite the clear benefits of moving away from the center of town, the nature of transportation and the needs of industry meant that even while they grew larger and more diverse, cities in the 1800s experienced low levels of segregation along race and class lines. At this time, the population of urban blacks was heavily concentrated in Southern cities. My dataset includes demographics for 296 cities from the 1900 Census of Population and Housing. These cities housed about 1.2 million black residents; approximately 64% of whom lived in the South. In an early analysis of *The Negro Ghetto* (1948) Robert Weaver explained, "in the cities of the Old South, like Charleston and New Orleans…most of the dwellings occupied by Negroes were either servants' quarters in the rear of the better houses or shacks on streets where low-income groups of whites also lived," (p8). In the north, Weaver says blacks "usually lived in clusters in racially mixed neighborhoods," (p9-10). However, detailed research on New York and Chicago by Logan et al (2015) reveals that although northern blacks did not live in "*predominately* black neighborhoods", they did live in "*disproportionately* black…neighborhoods," (p1062). What this means, is that while neighborhoods were mixed in the aggregate (thereby generating low measures of segregation), the housing available to blacks and other racial minorities in urban areas, was nonetheless heavily restricted from the start. Yet, because political representation is frequently defined at the neighborhood level, with low levels of neighborhood segregation, blacks and other minorities were likely to benefit from public goods provided to white homeowners.

Until about 1930, "state and local governments were *the* governments of most Americans" (McDonald and Ward 1984, p14). This was especially true with respect to fiscal

affairs. To the extent that *any* government would have addressed the negative externalities associated with rapid urbanization, it would have been viewed as the responsibility of the city (and their parent states). Yet, throughout the first half of the 19th century, city governments were fairly limited in scope. The economies of early cities were largely commercial, and a dedication to privatism and the market generally dictated political affairs (Monkkonen 1988, Warner 1968, McDonald 1986). A large and meddlesome government was something to be suspicious of and few cities provided extensive public services. Government was run by (and services were often partially funded by) the wealthy – typically merchants. As Bridges (1984) explains of New York City in 1830s, "it is impossible to determine where government began and noblesse oblige (and the church) ended" (p72).

In most instances, services were handled by volunteers (e.g. fire brigades) or part-time, municipally funded workers (e.g. night watchmen); and while city budgets provided contributions toward these services, city responsibilities were largely focused on regulating access to urban activities (like city markets). But by the end of the 19th century, city governments began to adopt a new orientation toward public goods provision and city leadership began to shift away from wealthy merchants and toward career politicians. As a result, services came to be increasingly funded by city budgets, not charitable contributions. Monkkonen (1988) argues that city goals had been broadened by the 1890s to include:

> Protecting private property (firefighting); suppressing crime; controlling behavior in public areas; building and maintaining streets and sewerage systems; aiding the poor, schooling children and sometimes adults; funding public libraries; providing recreation and entertainment; supporting a minimal level of health; temporarily assisting all persons incapable of caring for themselves…; enforcing public morality; expending direct financial aid to private capital…; and constructing not-for-profit public buildings in which to house these activities (p218).

Historians do not agree on what caused the transition from the regulatory approach of antebellum governments to what Monkkonen calls the "service city" by the late 1800s. Yet, with one exception (Brown and Halaby 1984), scholars have not analyzed this development quantitatively in more than a handful of cities. Simply put, we lack systematic, quantitative knowledge of the factors that affected the development and expansion of city government at the turn of the 20th century when significant variation was present. In 1902, for example, the median per capita expenditure of local governments in cities over the size of 25,000 (n=160) was about $11, but the standard deviation was more than a third of that amount ($4). Some cities spent very little providing services for residents, others, a great deal. If city governments were once limited and weak, why did some choose to begin providing services for residents while others lagged behind?

The dominant paradigm is to understand the growth of city government as the necessary response to the negative externalities of increased population growth and density such as pollution, congestion, conflagration, crime, and disease (see for example Griffith 1927, Still 1948, Glaab and Brown 1967, Chudacoff 1975, Anderson 1977, Troesken 2004). Scholars have generally recognized that the capacity to fund such developments through taxation and debt varied widely across cities (Dilworth 2005, Cutler and Miller 2006, Monkkonen 1988).[38]

Some scholars argue that managing racial and ethnic diversity in growing, compact cities was an essential driver of the development of municipal government. In an analysis of city relief spending in 1929, Cybelle Fox (2012) argues that native-born Americans and social welfare workers sought to Americanize foreign-born populations by drawing them into the reach of government. Tebeau (2003) shows that the development and expansion of fire services was an

[38] Research indicates that prior to the advent of the municipal bond market, cities were largely unable to invest in large infrastructural development.

attempt to confiscate power from ethnic fire brigades, ensuring that firemen would be loyal to the city and not to their group. Similarly, Monkkonen (1988) argues that spending was a mechanism to manage conflict. As cities grew, he says, the bureaucracy of municipal government was invoked to manage conflict and Americanize newcomers as a substitute for small town interactions. In support of this thesis, Brown and Halaby (1984) find a substantial, positive relationship between expenditures and percent foreign born. But contrary to these arguments, Goldin and Katz (2008) show that community *homogeneity* was key in the expansion of free public schooling. A large literature linking diversity and limited public goods provision underscores this finding (Alesina et al. 1999, Poterba 1997, Vigdor 2004, Hopkins 2009, Habyarimana et al. 2007, 2009, Miguel and Gugerty 2005, Miguel 2004, Algan et al. 2011, Fearon and Laitin 1996). This leaves no clear prediction regarding the direction of the relationship between diversity and spending.

Several accounts emphasize demands made by emerging middle-class residents (Yearly 1970), as views regarding what it was the duty of government to provide evolved (Myrdal 1944). McDonald (1986) suggests that property owners in particular wanted good public services which led to high spending through debt. Others highlight the demands of newly minted professionals engaged in the private provision of services, who would benefit from public funding. Teachers pushed for public education; fire fighters pushed for fire forces (Katznelson and Weir 1985, Tebeau 2003). Along these same lines, Monkennen (1988) highlights the growing role of planners, real estate developers, and professional bureaucrats who helped to build the Progressive reform movement (see also Hays 1964, Bridges 1997, Tretter 2012 on Progressivism and growth).

City Spending Data

To provide a description of historical expenditure patterns, I use a new dataset built from a number of government sources that includes data from the turn of the century to the Second World War. Starting from 1902, the Bureau of the Census has been responsible for collecting data on the finances of local governments. With a few exceptions, the data have been collected annually for cities that meet a particular population threshold (which has varied over time). The Federal Reserve Archive (http://fraser.stlouisfed.org/) has digitized copies of the paper Census reports up until the year 1941, and I encoded a series of relevant variables from these digital reports at five year intervals.[39] Thus, I have fiscal data from 1902, 1907, 1912, 1917, 1923,[40] 1927, 1932, and 1937, as well as other governmental data from a number of early special Census reports.[41] I encoded socioeconomic data from the Census of Population and Housing in 1900, 1910, 1920, 1930, and 1940. In order to be able to analyze the diversity of the population, I gathered data on the country of origin for all of the foreign born residents in each city. Details on the coding of foreign born groups are included in the appendix. Linear interpolation was used to create intercensal estimates for all of the socioeconomic variables. In my largest sample, I have a total of 1,397 city-year observations, which includes data from 262 cities.

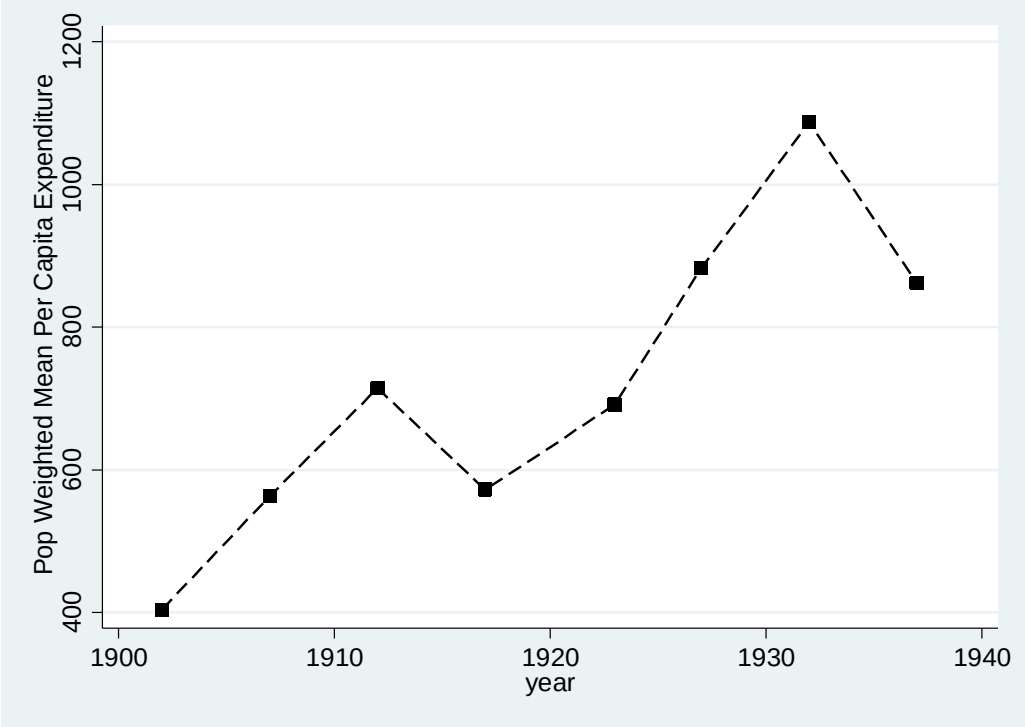
[39] The five year interval was selected to match the interval that the Census of Government used starting in 1952. From 1902-1903, the report was entitled "Statistics of Cities Having a Population of over 25,000." From 1904-1908, it was entitled "Statistics of Cities Having a Population of over 30,000." From 1909-1931, it was entitled "Financial Statistics of Cities Having a Population of over 30,000." From 1932-1941, it was entitled "Financial Statistics of Cities Having a Population of over 100,000." Collection of data on local governments was spotty between 1942 and 1952. The Census resumed regular collection of data at five year intervals starting in 1952.

[40] The report produced in 1922 was limited to very basic data and lacked many of the variables of interest. The 1923 report was used instead.

[41] These include the General Statistics of Cities: 1909: Including Statistics of Sewers and Sewage Disposal, Refuse Collection and Disposal, Street Cleaning, Dust Prevention, Highways, and the General Highway Service of Cities Having a Population of Over 30,000; Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems: 1912; General Statistics of Cities: 1915: Including Statistics of Governmental Organizations, Police Departments, Liquor Traffic, and Municipally Owned Water Supply Systems, in Cities Having a Population of Over 30,000; General Statistics of Cities: 1916: Including Statistics of Parks, Playgrounds, Museums and Art Galleries, Zoological Collections, Music and Entertainments, Swimming Pools and Bathing Beaches, and Other Features of the Recreation Service.

I begin with an analysis of total *Per Capita City Expenditure* as the dependent variable.[42] All data are shown in real (2012) dollars to make comparison to the modern period more straightforward. As Figure 1.1 shows, development of municipal budgets was rapid over this time period. The graph displays the population-weighted mean of per capita total expenditure, plotted against time for all cities that had more than 30,000 residents in 1902. Tables 1.1 and 1.2 show inflation adjusted (but unweighted) mean per capita spending and revenue on various categories over the same time period.

Figure 1.1: Municipal Expenditures Per Capita
In 2012 dollars



[42] This measure includes all general expenses, expenditures on interest, and outlays for the municipal corporation.

Table 1.1: Municipal Budgets in the Early 20th Century
Per capita expenditures in 2012 dollars

year	Expenditure	General Expenditure	Outlays	Revenue	Taxes	Subventions
1902	$313.0		$ 114.2	$425.5	$269.3	$20.6
1907	$409.7	$279.2	$174.0	$418.6	$285.6	$24.4
1912	$562.0	$323.0	$207.9	$541.7	$364.9	$27.3
1917	$456.7	$274.7	$168.0	$408.8	$314.6	$22.1
1923	$587.0	$393.9	$205.2	$491.5	$431.2	$29.2
1927	$700.7	$460.9	$247.3	$586.7	$521.9	$32.2
1932	$868.7	$700.3	$173.3	$807.4	$710.8	$65.0
1937	$670.9	$682.2	$115.5	$704.0	$643.9	$126.9

Table 1.2: Municipal Spending in the Early 20th Century
Per capita expenditures in 2012 dollars

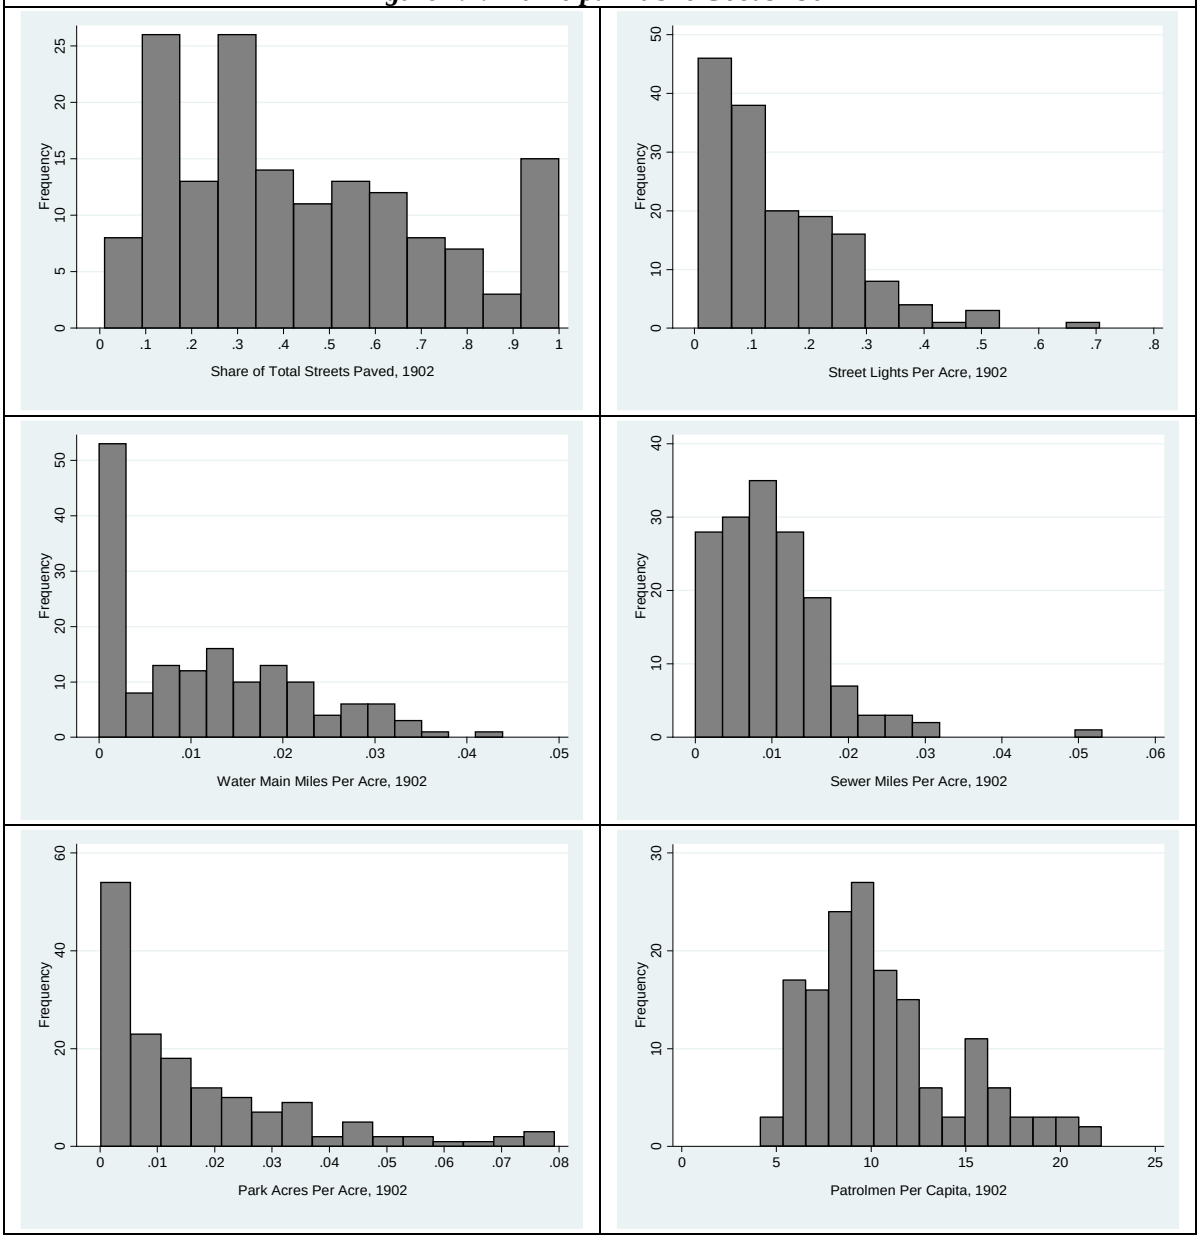
Year	Inspections	Refuse Collection	Sewers	Libraries	Police	Fire	Health	Highways	Recreation	Schools
1902	$1.3	$4.6	$3.7	$3.0	$28.9	$31.1	$4.8	$43.2	$6.5	$84.4
1907	$1.4	$6.7	$4.6	$4.4	$31.4	$35.4	$4.6	$38.7	$7.3	$96.0
1912	$2.2	$19.6	$5.0	$5.1	$33.3	$37.9	$6.2	$42.2	$10.1	$107.7
1917	$1.9	$16.1	$3.8	$4.0	$27.0	$29.2	$6.3	$32.6	$8.9	$97.5
1923	$2.4	$11.9	$5.1	$5.6	$36.1	$39.8	$9.0	$39.0	$11.9	$161.8
1927	$3.0	$14.1	$5.9	$6.7	$43.6	$45.2	$11.2	$43.4	$13.1	$202.3
1932	$3.9	$18.7	$7.7	$10.7	$63.2	$57.2	$17.7	$51.6	$22.3	$257.5
1937	$3.4	$16.1	$7.9	$10.7	$60.3	$53.5	$11.5	$43.4	$21.2	$233.0

The figure and tables reveal that during this period, city expenditures grew across the board. In every category, from sanitation to safety, from health to highways, American cities became modern service providers. Spending slid back during the time of the First World War and the Great Depression, but otherwise followed a steep upward trajectory. Over the next 70 years, growth continued. In 2012, per capita spending was literally 10 times what it had been in 1902. Yet, even at the start of the period, growth was uneven.

Figure 1.2 shows histograms of a number of different public goods that were provided by cities in 1902, including the share of total street miles that were paved, the number of street lights per acre, water main miles per acre, sewer miles per acre, park acres per acre, and

patrolmen per capita. All of the distributions are widely spread. Clearly, significant variation existed.

Figure 1.2: Municipal Public Goods 1902



To analyze the correlates of expenditure, I regress the natural log of inflation adjusted *Expenditures Per Capita* on several variables intended to capture explanations offered in the historical literature. Many scholars have argued that cities responded to pressing needs as they arose. For instance, Glaab and Brown (1967) argue that industrialization and population growth generated demands that were fulfilled by city government. While my dependent variable is measured as per capita spending, it is still possible that large and/or dense cities may have required higher levels of spending (if, for example, fires or diseases were more likely to spread in such places). Monkkonen (1988) argues that the need for social control through bureaucratization was greatest in large cities. Alternatively, large cities may have benefitted from returns to scale, and therefore may have been able to provide services for a lower cost. To test for these possibilities, I include a measure of the *Total Population* (logged) and *Density* (total population divided by total acres).

The analyses also include two different measures of diversity. The first is the share of all residents that were classified as *Nonwhite* by the Census of Population and Housing. During this period, racial categorization was in flux (Roediger 2005) and the determination of race was made by Census takers (Nobles 2000). However, generally speaking, the *Nonwhite* category included Blacks, Asians and Asian Americans, Native Americans, and sometimes Mexican/Latin Americans. Persons of mixed race were typically identified as nonwhite.

The second measure of diversity is a Herfindahl Index:

$$Diversity = 1 - \sum_{f=1}^{F} \pi_f^2$$

where, π_f is the population share of the foreign-born group *f* and F is the total number of foreign-born groups. There were 52 different foreign-born groups recorded by the Census during this

period (listed in the appendix), and the resulting diversity index ranges from a low of 0.23 to 0.94, with a mean of 0.84.[43] This illustrates that the foreign-born population in the United States was extremely diverse.

As explained above, property owners were among the most supportive of investing in new services (McDonald 1986). However, scholars also report a general tendency among the populace to rail against high taxes and profligate spending of city governments in the late 19th and early 20th centuries (Bridges 1984). According to Monkkonen (1988), this belief was particularly pronounced among property owners. To investigate the role of support for spending among owners, I include the proportion of housing units occupied by *Home Owners*. To measure the wealth of the community I include the *Assessed Value* of all property in the city. McDonald (1986) provides compelling evidence that this measure accurately captures the level of economic development in the city – which should correlate positively with ability to fund city services.[44] Finally, to capture the argument that the development of city services was driven by the emerging professional class (including land developers and planners), I add the share of adults employed as *Professionals*.[45] Because I have missing data on a number of variables, I begin with a presentation of the results using only density and population as independent variables. I then add the remaining variables iteratively. Summary statistics for all variables are in appendix Table A1.1.

[43] Making these categories comparable across censuses required some recoding. For instance, in 1930 and 1940, Irish immigrants were separated by Northern and Southern Ireland. I combined these categories to make the data comparable to the 1900, 1910, and 1920 censuses, which included only one category for Ireland.
[44] However, McDonald (1986) finds that when assessed value rose in San Francisco, politicians tended to lower tax rates, perhaps resulting in little difference in expenditure.
[45] The other occupational categories coded by the Census during this period were trade, manufacturing, domestic work, and agriculture. In 1900, the category professionals included actors, architects, artists, clergymen, dentists, electricians, engineers and surveyors, journalists, lawyers, literary and scientific persons, musicians, government officials, physicians, teachers, and other professionals.

These variables are admittedly insufficient to capture all of the important differences across cities during this period. So, rather than attempt to explain variation across cities, I pursue a more modest goal – to describe variation within cities over time. To do so requires that I use a city fixed effects model for the analysis. This strategy overwhelms much of the variation present in the data, but it allows for a more precise estimate of the effect of each of these contextual variables on spending. Table 1.3 presents the results.

Table 1.3: Factors Affecting City Wide Expenditure

	Logged Per Capita Expenditure								
	β	Std. Err	P>|t|	β	Std. Err	P>|t|	β	Std. Err	P>|t|

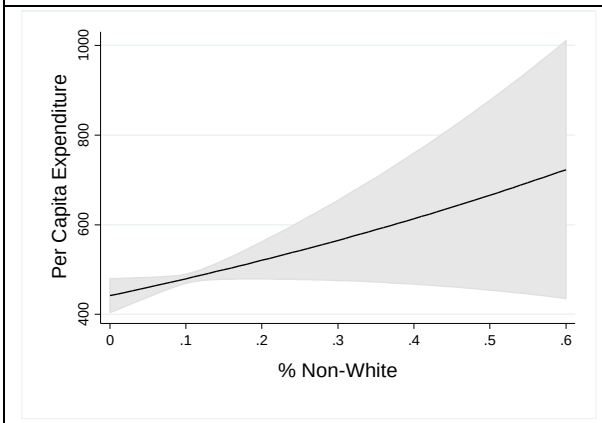
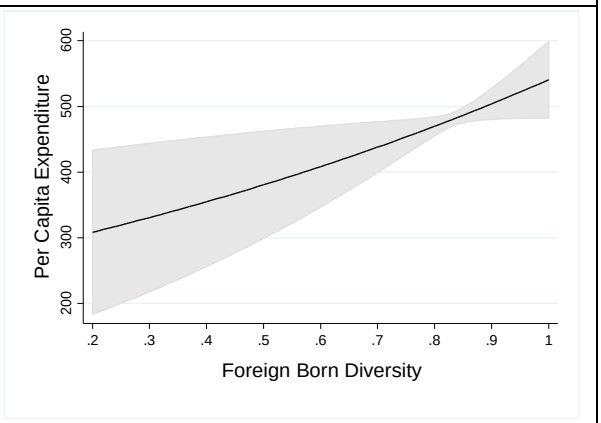
ρ	0.681			0.606			0.567		

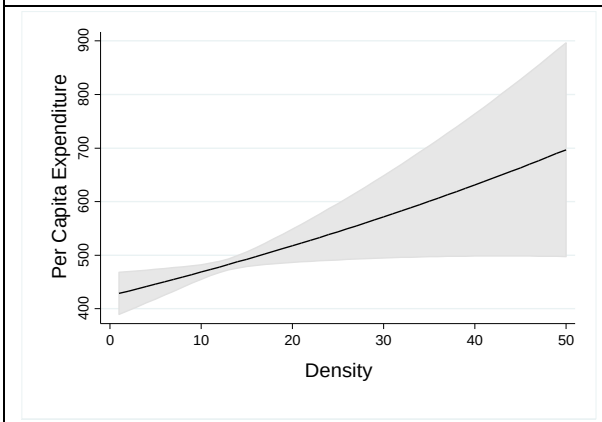
Note: Fixed effect for cities included, but not presented

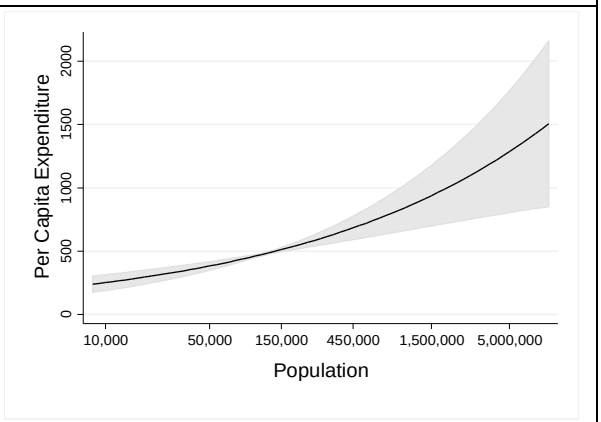
The regression reveals that the factors identified by historical research *do* correlate with expenditures. Cities that were more diverse (either having more nonwhite residents or a diverse foreign-born population from many different places) spent more money. Those places with large, dense populations witnessed higher spending per resident. In an alternate analysis, I add the number of fires per capita that the city experienced in 1902 and 1907. This variable is powerful. Increasing from the 25th to the 75th percentile (from 3 to 5 fires per 1000 people each year), increased spending by $50 per resident. Cities were clearly responding to the negative externalities associated with urbanization. Finally, cities with more capacity and demand (higher property values, more homeowners, and more professionals) also had larger budgets. These results are shown graphically in Figure 1.4. Figures show the marginal effect of each independent variable, holding all other variables at their mean value.

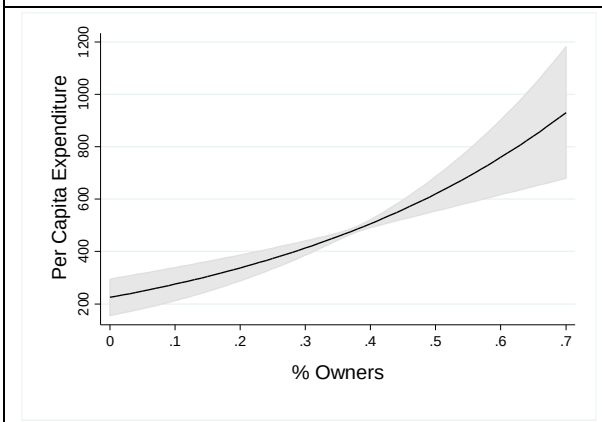
Figure 1.4: Factors Related to Expenditure in Cities, 1902-1937

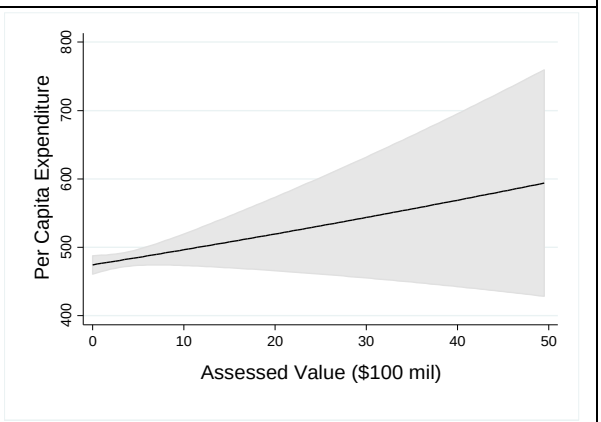


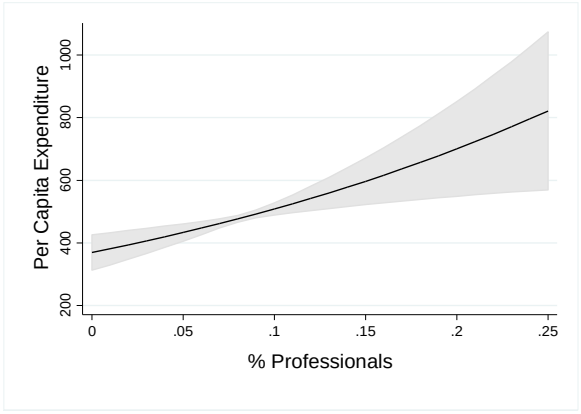












In this book, I argue that white, homeowners sought to institutionalize the residential segregation of poor and minority residents in order to protect their property values and control the distribution of public goods. They were supported in this pursuit by land-oriented businesses. The pattern of relationships presented in Table 1.1 and Figure 1.4 begin to explain this impetus – particularly the positive correlation between property ownership, assessed value, percent professionals, and municipal expenditures. Holding all other variables at their means, a city that was in the 25th percentile of home-owning, assessed value, and professionals (30% owners, $43 million in assessed value, 6% professionals) spent about $378 per resident. A city in the 75th percentile of all three measures (45% owners, $218 million in assessed value, 10% professionals) spent about $588 per person.

These relationships were circular. Local service provision was understood to increase the value of property. It was for this reason that the property tax was thought to be the most appropriate avenue for supporting local expenditures, as owners would be able to "recoup at least part of the levies in the form of higher real property worth" (Benson and O'Halloran 1987). Thus, property owners sought high levels of municipal services, which were expected to bring both direct benefits (from having access to clean water, paved streets, reliable fire-fighting, etc.)

and indirect benefits through increases in property values. In turn, cities expected owners to fund public goods. Yet, even in the early 20th century, owners were prone to believing that city governments were wasteful and they often opposed increases in taxes. Residents wanted high quality services, but were loath to pay for them.

Property owners' orientation toward both government and services was related to the emerging understanding of *who* should benefit from publicly-funded improvements (Myrdal 1944). The cities with the fastest growing service provision were also cities with high levels of racial and ethnic diversity. As Tretter (2012) explains, growth in municipal service provision operated "within a framework of white supremacy" (p10). Controlling who accessed the new benefits was of utmost importance. During this period, the vast majority of blacks, Asians, and Latinos lived in places where they lacked the right to vote; and everywhere, foreign-born residents had to be naturalized before participating (Keyssar 2000). Thus, the preferences of these groups hardly played a direct role in formation municipal policy. A white voter living in Birmingham in 1902 could be certain that no matter how much money the local government raised in taxes, black residents would have little say in how that money was spent. The same was true for a San Franciscan thinking about his Chinese neighbors and for an El Paso resident concerned with Mexicans in his city (Myrdal 1944, Chen 2000, Fox 2012). However, most public goods provided by cities were not targetable to individuals.[46]

When municipal governments provide streetlights and sewers, even those ineligible to vote benefit from these services. But, residential segregation could limit equality of access. Segregation made targeting services – at least to groups, if not individuals – easier. As will be

[46] Municipal jobs, particularly when distributed as patronage, are an exception to this statement. However, despite early accounts to the contrary, the presence of political machines actually depressed spending (Trounstine 2008, Fox 2010, Brown and Halaby 1984). Thus, it appears to be the case that growth in municipal governments has never really been driven by the logic of patronage.

shown in detail in the chapters to come, segregation allowed city governments to collect taxes from poor and minority residents, but underprovide services to them – thereby holding down the total tax bill. Oates (1981) explains that for many important local services such as education and public safety, the characteristics of residents are more important in determining the quality of the public good output than budgetary contributions. Thus, the generation of race and class segregation via policy enacted by local governments (such as zoning or urban renewal), was, in and of itself, a mechanism to improve municipal service provision. Segregation also ensured that the presence of poor and minority neighbors would not threaten property values. As the chapters ahead will show, it was in those places where city spending was high that segregation was institutionalized through local public policy; such institutionalization was pursued most adamantly by white owners and developers of property.

Explaining and Measuring Segregation

The high level of residential segregation in America has been tremendously well-documented (see Charles 2003, Ross 2008, and Boustan 2012 for extensive literature reviews). A smaller, though still well-developed, body of literature is focused on class segregation (see Bischoff and Reardon 2013 and Jargowsky 1996 for reviews). The debate over the fundamental causes of segregation is extensive and nuanced. Scholars have focused on two primary explanations: individual preferences for same race/income neighbors (particularly among whites and the wealthy) and market explanations (e.g. differences in the socioeconomic status of different racial groups and the ability to pay for quality housing/transportation among the poor).

Research on racial segregation largely concludes that the driving force behind residential separation is white preferences for same race neighbors (Cutler et al. 1999, Bayer, Ferreira, and

McMillian 2007, Charles 2006).[47] Boustan (2010) finds that in northern metropolitan areas, between 1940 and 1970, every black arrival from the South was associated with 2.7 white departures to the suburbs. Several scholars show that differences in socioeconomic characteristics such as education, income, wealth, and family structure cannot fully account for segregated living patterns for blacks, but *does* explain a fair amount of the segregation of Latinos and Asians (Bayer et al. 2004, Erbe 1975, Massey and Denton 1987 and 1993, Iceland and Wilkes 2006). Logan summarizes by explaining that racial segregation for blacks is due to the inability to "translate higher income…into residential mobility" (Logan 2011 p15).

Several scholars find that income inequality is an important driver of economic segregation (Bischoff and Reardon 2013, Watson 2009). Others concentrate on selection. Alesina et al. (2004) show that people are willing to give up economies of scale in order to avoid being in a jurisdiction with significant income heterogeneity and Bayer, Ferreira, and McMillian (2007) reveal that households self-segregate on the basis of education.

The links between race and class segregation also form a considerable literature. Some scholars like Denton and Massey (1991), Krysan et al. (2008), and Emerson, Chai, and Yancey (2001) find that whites avoid black neighbors *because* they are black, while others like Ellen (2000), Yinger (1997), Taub et al. (1984), and Harris (1999) argue that whites use black neighbors as a proxy for neighborhood quality. That is, whites do not avoid black neighbors per se, but rather choose what they perceive to be better neighborhood amenities or neighbor characteristics like wealth.

With only a handful of exceptions (e.g. Rothwell 2011, Pendall 2000), quantitative research on the causes of segregation ignores the political context in which it occurs. Local

[47] A small amount of scholarship shows that black preferences for same race neighbors contributes to segregation (Bayer, Ferreira, and McMillan 2007, Fossett 2006)

policies and political battles are crucial for understanding *how* white/wealthy preferences for homogeneity and socioeconomic inequalities are translated into residential patterns. To be sure, scholars have extensively documented the *private* mechanisms by which these factors affect segregation (e.g. via racial steering, mortgage discrimination, and willingness to pay for homogenous neighborhoods). But even private mechanisms may be shaped by local policies and political concerns. For example, I argue that white beliefs about available amenities in poor and minority neighborhoods are, in part, the product of under provision of public goods early in the 20th century. Cutler et al. (1999) find that these beliefs contribute to whites' willingness to pay higher housing prices in whiter neighborhoods. In the next section, I provide the first piece of evidence for this argument. Segregation is correlated with city expenditures – places that provide more services are also more segregated.

There are many different ways to measure segregation (e.g. the degree to which groups are disproportionately distributed across geographic space). Indices of segregation are typically correlated with each other, but capture different theoretical dimensions of separation and so, measure different things (Massey and Denton 1988). The two most commonly used measures are the index of dissimilarity and the index of isolation which can be intuitively interpreted respectively as the proportion of a racial group that would need to move neighborhoods in order to generate an even racial distribution given the racial makeup of the larger community, and the racial makeup of the neighborhood in which the typical member of the racial group lives. While these are obviously meaningful dimensions of segregation, neither measure includes the most relevant information from a political perspective. In politics, what matters is not just how individuals from different racial groups are distributed across neighborhoods, but also how large each racial group is relative to others and how big of an impact each neighborhood might have

on the vote. That is, we need a measure that weights diversity by group size and weights evenness by population size. The *H* index developed by Theil (1972) meets these criteria.

Theil's *H* Index measures the difference between the diversity of the city and the weighted average diversity of individual neighborhoods. Diversity scores for each neighborhood and the city as a whole are influenced by the relative size of racial groups, while the overall index is influenced by the relative size of each neighborhood, giving more weight to larger than to smaller places. Both types of weighting are key to understanding the political implications of segregation. We should expect the effect of segregation to be most pronounced when minority groups are unevenly dispersed across geographic units *and* represent a substantial share of the population.

Theil's *H* has a number of other useful qualities. Importantly, for understanding city politics, Theil's *H* can be calculated for more than two groups at a time (unlike either the dissimilarity or isolation indices). Additionally, it is the only index that obeys the principle of transfers in the multi-group case - the index declines when a minority resident (theoretically) moves to a neighborhood with fewer minority residents (Reardon and Firebaugh 2002). Finally, as will be discussed in the next section, Thiel's *H* is additive and can also be aggregated to higher levels or decomposed into its constituent parts.

Theil's *H* Index is built from Theil's entropy score which is a measure of diversity itself

$$E = \sum_{r=1}^{R} (\pi_r) \ln \frac{1}{\pi_r}$$

where π_r represents the proportion of the population in racial group r (or class group r if the index is measuring class segregation). The higher the entropy score, the more diverse an area

is.[48] The score ranges between 0 and the natural log of the total number of groups *R*. It is maximized when individuals are evenly distributed among the different racial groups (e.g. when

$$\pi_r = \frac{1}{R} \text{ for all } r$$

).[49] Entropy is calculated for each neighborhood individually and for the city as a whole.

The *H* Index measures the degree to which the diversity in each neighborhood differs from the diversity of the city as a whole, expressed as a fraction of the city's total diversity and weighted by the neighborhood's share of the total population.

$$H = \sum_{n=1}^{N} \frac{P_n}{P_c}\left(\frac{E_c - E_n}{E_c}\right)$$

Where *P* represents total population of neighborhood *n* or city *c* and E is the entropy of *n* or *c*. *H* varies between 0, where all neighborhoods have the same composition as the entire city, and 1 where all neighborhoods contain only one group.[50] This *H* Index serves as a key outcome to be explained throughout the book.

The dataset that I constructed to measure segregation is built from a number of different sources. The calculation of the *H* Index requires data on population characteristics at the sub-city level. Cutler et al. (1999) digitized sub-city demographics on race and immigration for 178 different cities from the 1890- 1950 Censuses. To this, I add available data that I encoded on homeownership from the 1900 Census and data from the Elizabeth Mullen Bogue files (1975) on

[48] Where any group's share of the population is 0, the natural log is set to zero, as is the convention in the literature (Iceland 2004).
[49] A scatterplot relating a white/nonwhite calculation of E to percent white is included in appendix Figure A1.1.
[50] In all analyses, neighborhoods are represented by Census tracts, which are relatively stable, contiguous geographic areas containing approximately 4,000 people. Most studies of segregation (e.g. Massey and Denton 1993) use Census tracts as a proxy for neighborhood (although this is not without debate, see for instance Logan et al. 2015).

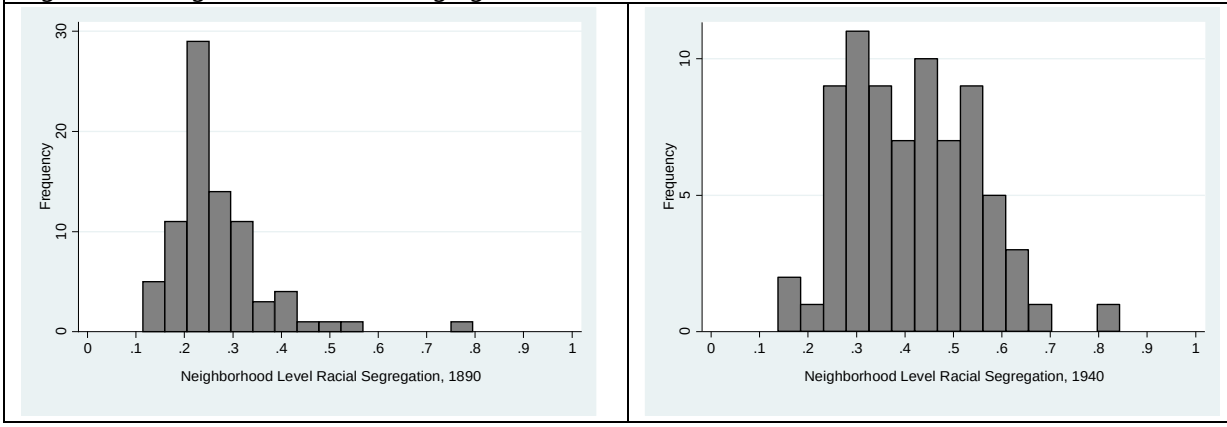
homeownership from the 1940 census.[51] For the 1970-2000 Censuses, I rely on a product developed by GeoLytics called the Neighborhood Change Database (NCDB). The NCDB matches and normalizes Census tract boundaries for each Census year, allowing for direct comparison in demographic changes across time. Finally, I add data from the 2007-2011 American Community Survey. These data allow me to create a panel dataset measuring segregation at the Census-tract level for cities and metropolitan areas for more than 100 years.

Figure 1.4 plots the distribution of racial segregation scores in 1890 and 1940, using data for the 80 cities with populations of at least 25,000 and with at least 1,000 blacks as of the 1890 Census.[52] In 1890, racial segregation patterns were similar from place to place, and generally fairly moderate – although higher than some historical analyses indicate (Cutler et al. 1999). Both features had changed substantially by 1940.

[51] The data from 1900-1940 are collected at the ward level (political units for electing city council members). Starting in 1940, the Census published tract-level data for some cities. Wards tend to be larger in area than tracts and therefore, suggest a smaller value of the segregation index without actually representing a lower level of segregation. To account for this, I adjust all ward-level estimates by a correction factor calculated using a set of 47 cities that reported both ward and tract-level data in 1940.

[52] For all figures presented in this chapter, the two groups used to calculate the *H* index are whites and all others for years 1890-1970. For 1980-2011, the groups are non-Hispanic whites and all others. Throughout the book, I calculate the *H* Index by tract-city-county-msa (Metropolitan Statistical Area). This means that cities which cross county lines end up with multiple observations. This is necessary because Census tracts are nested within counties – not cities. When presenting any analysis at the city level, I use the observation representing the largest share of the city population.

Figure 1.4: Neighborhood Racial Segregation in 1890 and 1940



Note: The white/nonwhite *H* index for 1890 is calculated using wards as the base population unit with an additional correction factor to make the data comparable to tract-level estimates. The *H* Index for 1940 is calculated at the tract level where available and at the ward level otherwise. Data provided by Cutler et al. (1999) and Bogue (1975).

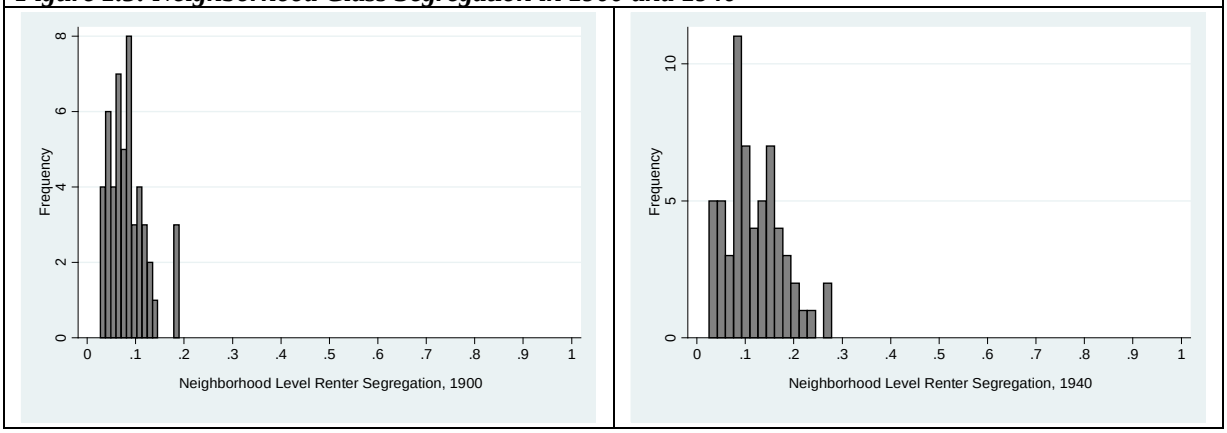
In all but a handful of cases, neighborhood-level racial segregation rose between 1890 and 1940 – on average rising 0.15, a change of about 65%. But the standard deviation is large at 0.13; some cities segregated much more intensely than others. There are many ways to consider measuring class segregation. Throughout the book I use two measures – the distribution of renters versus homeowners, and the concentration of households in the top income threshold.[53] The correlation between owner and wealth segregation is about 0.60. I rely primarily on the former measure for two reasons. First, it is available for the entire time period. More importantly, the existing scholarship indicates that it is property ownership – not wealth – which is the more important driver of local political participation and preferences (Fischel 2000, Oliver and Ha 2007). The downside of this measure is that, at an aggregate level, it is very resistant to

[53] The Census reports income categorically, not continuously; wealthy refers to the number of families in each Census tract with incomes above particular thresholds for each Census year. I use family as opposed to household income because the NCDB does not report household income at the tract level. The thresholds were determined by calculating the average family income for all Census tracts in the United States for each Census year. The wealthy threshold represents the income bin with a starting point closest to the 90th percentile of this distribution. The thresholds for each census year are: $35,000 for 1980, $75,000 for 1990, $100,000 for 2000, and $150,000 for 2011. All families with this amount of income or more are categorized as wealthy. Census tracts range from 0 to 100% wealthy, with a mean of 18%, a median of 13%, and a standard deviation of 16%.

change as the housing stock changes more slowly than demographics. Wealth segregation is a more straightforward measure of the residential divisions along socioeconomic lines, but it is only available starting with the 1970 Census and is less directly affected by city policy.

To demonstrate change over time, Figure 1.5 presents data on the renter/homeowner distribution within cities. This figure reveals that class segregation started off much lower and was more consistent from city to city as compared to racial segregation, and increased a small amount (0.037) between 1900 and 1940.

Figure 1.5: Neighborhood Class Segregation in 1900 and 1940



To determine how segregation correlates with expenditure in the pre-war period, I add to the segregation dataset the measure of *Logged Expenditures Per Capita* described in the previous section. Because segregation data are measured every decade, and expenditures in years ending in 2 and 7, I interpolate spending data. I then lag spending by five years under the assumption that demographic sorting takes time to respond to budgets. I regress *Racial Segregation* and *Renter Segregation* on the lagged *Expenditures* variable. As in the previous section, I add fixed effects for cities. This fixed effect model analyzes the relationship between lagged expenditures and racial segregation over time within cities. This accounts for variation across cities on all other dimensions that might affect segregation and spending.

Table 1.4: Correlations Between Spending and Segregation

	Racial Segregation			Renter Segregation		
	β	Std. Err	P>|t|	β	Std. Err	P>|t|
Expend. Per Capita, 5 year lag (logged)	0.100	0.010	0.000	0.026	0.003	0.000
Constant	-0.238	0.059	0.000	-0.052	0.018	0.005
N	368			179		
Number of Cities	118			56		
R^2 within	0.292			0.383		
R^2 between	0.020			0.010		
ρ	0.802			0.931		

Note: Fixed effect for cities included, but not presented.

The results, presented in Table 1.4, indicate a positive correlation between spending and segregation. The R^2 suggests that about 30 to 40% of the variation in city segregation levels can be explained by variation in the budget. Places with larger budgets were more segregated five years later compared to cities with smaller budgets up until the Second World War. For a host of reasons, this relationship would change going forward.

Suburbanization – Another Form of Segregation

Teaford (1979) argues that two conflicting forces animated city development in the late 19th and early 20th century. On the one hand, socioeconomic diversity generated an impetus for separation. As early as the mid-1800s, "the urban population was resolving itself into separate geographic spheres – factory zones, ethnic neighborhoods, upper-middle-class retreats, race track havens – and each zone sought local self-government as a means of protecting its own particular interests" (Teaford 1979, p23). This separation, Teaford shows, led to the explosion of newly incorporated municipalities. But, over the course of the next 50 years, many of these tiny new cities consolidated and/or were annexed into larger central cities for one primary reason: the provision of city services. Prior to 1900, suburban governments were simply unable to provide the quality of sewers, clean water, paved streets, uniformed police forces, and fire-fighting that

was available in the central city. As a result, as cities became more diverse, the forces of separation pulled people into different neighborhoods, but not into different cities.

However, in the period following the Second World War, America began to suburbanize rapidly (Rappaport 2005). Scholars have detailed the role that automobile accessibility (Glaeser, Kahn, and Rappaport 2008), highway construction (Nall forthcoming), federal programs encouraging home ownership (Jackson 1985), changes in the building industry, and rising incomes (Margo 1992) played in the growth of suburbs. The vast majority of people who arrived in the bucolic, grassy, neighborhoods filled with single-family homes were whites with incomes slightly (although not dramatically) higher than the median income of the central city (Cutler et al. 1999, Winsberg 1989). By about 1940, many larger suburbs were able to compete with central city service provision, thus increasing the attractiveness among residents, industry, and business to move away from the center. As Teaford (1979) explains, "while the forces encouraging unity were weakening, the forces of separatism and disunion remained powerful" (p84). Thus, in the middle of the century, central cities stopped growing politically and suburbs arose as powerful actors in the metropolitan universe (Teaford 1979, Danielson 1976, Miller 1981, Burns 1994). In 1970, more than half of all metropolitan area populations lived outside of the central city; a figure that would grow to two-thirds over the next 30 years. The rise of suburbs decoupled residential spaces from job spaces, and encouraged suburban residents to prioritize neighborhood amenities and property values in political decision making (Teaford 1979, Fischel 2004).

As they moved outside of the central city, suburbanites sought to protect their investments (high quality public goods and property values) in much the same way as their predecessors had – by institutionalizing segregation through public policies like land use

planning and zoning. Thus, the impetus toward separation in the latter half of the 20th century played out across, rather than within, city lines. The level of segregation is of crucial importance to politics. When cities are not segregated by neighborhood, district representation ensures that all residents within a particular location are likely to be provided similar services. When a district councilor wins a public park for his neighborhood all those who live nearby benefit. As the level of segregation shifts from blocks to neighborhoods, residents are more likely to lose representation. Still though, when segregation occurs across neighborhoods within cities, it is possible for residents of segregated neighborhoods to affect the delivery of municipal services through the political process. If a heavily minority neighborhood lacks a public park, residents from this neighborhood might mobilize to try to elect a mayor or city council member who is responsive to their demands. But when segregation occurs across cities, heavily minority cities have no ability to affect the distribution of public goods from neighboring white towns.

To understand how segregation patterns have changed over time, I compiled a measure of segregation that accounts for segregation both within cities and across them. In order to do this, I build on the measure of segregation presented in the previous section – Thiel's *H* Index. Theil's *H* is suited to this purpose because it is perfectly additive for nested geographies (Reardon and Firebaugh 2002, C.S. Fischer et al. 2004). In my case, census tracts are nested within cities, and cities are nested within metropolitan areas. Residents can be segregated in two ways – across neighborhoods within cities, or across cities within metropolitan areas. My measure combines these two types of segregation.

As explained above, the *H* Index measures the degree to which the diversity (*E*) of subunits differs from the diversity of a larger unit. For each Census year, I calculate *H* Indices at the two levels that are of interest – within cities and across cities. Respectively, these measure

the extent to which Census tract diversity differs from city diversity (H_{c_t}) and the extent to which city diversity differs from metropolitan area diversity (H_{m_c}). [54]

$$H_{c_t} = \sum_{t=1}^{T} \frac{P_t}{P_c}\left(\frac{E_c - E_t}{E_c}\right)$$

$$H_{m_c} = \sum_{c=1}^{C} \frac{P_c}{P_m}\left(\frac{E_m - E_c}{E_m}\right)$$

Where *P* represents total population of the tract *t*, city *c*, or metropolitan area *m*, and *E* represents the entropy of the geography ($E = \sum_{r=1}^{R}(\pi_r)\ln\frac{1}{\pi_r}$).

I combine the two indices to produce a total *H* Index for the metro area calculated at the tract level, H_{m_t}.

$$H_{m_t} = \sum_{t=1}^{T} \frac{P_t}{P_m}\left(\frac{E_m - E_t}{E_m}\right) = H_{m_c} + \sum_{c=1}^{C}\left(\frac{P_c}{P_m}\right)\left(\frac{E_c}{E_m}\right)H_{c_t}$$

To illustrate the two levels of segregation, Figure 1.6 provides images from a map of the population developed by Dustin Cable for the Weldon Cooper Center for Public Service at the University of Virginia. The map includes one dot for each person in the United States as of the 2010 Census, color coded by race (blue for white, green for African American, red for Asian, and orange for Latinos). [55]

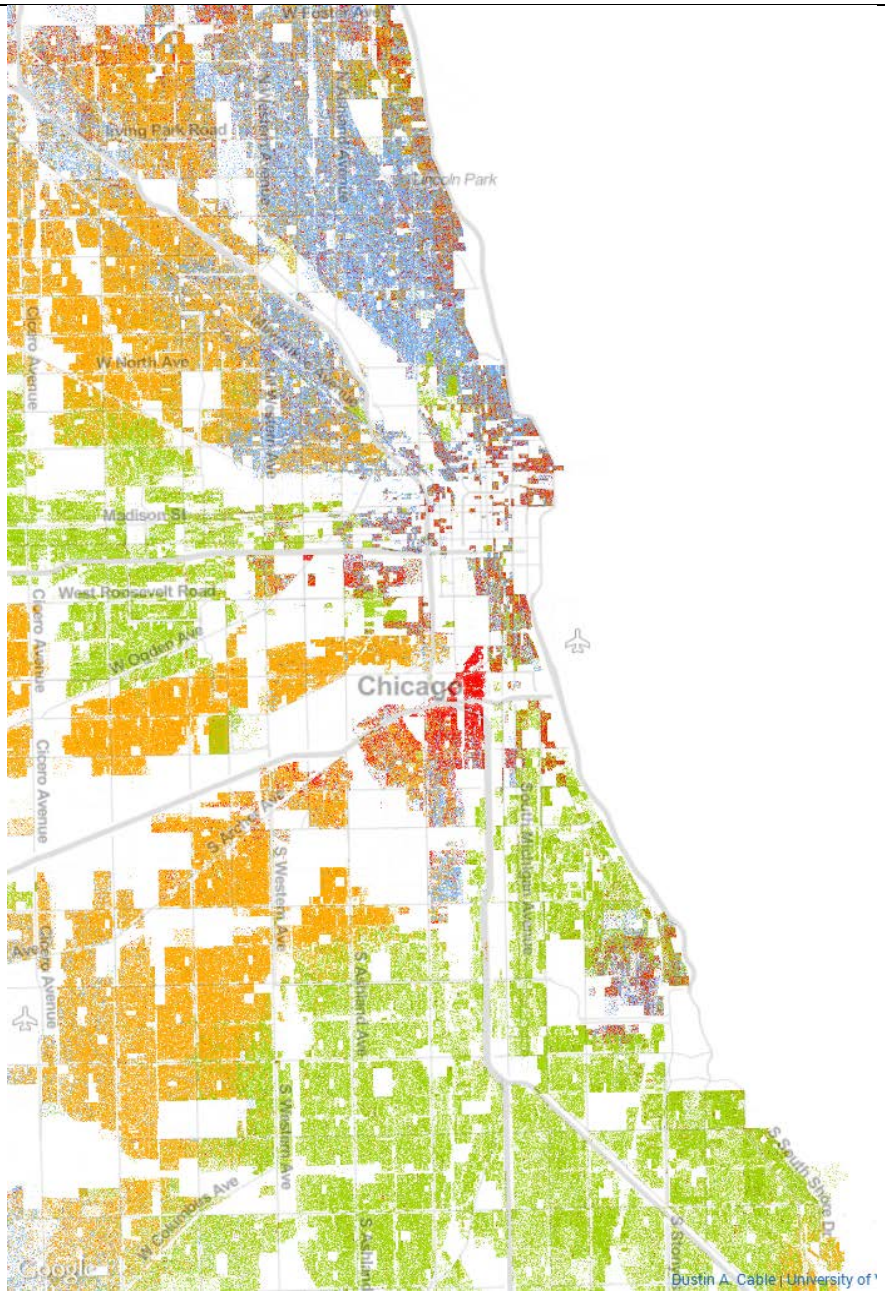
[54] Census tracts are perfectly nested within states and counties. However, in some cases, tracts cross city lines. In these cases, GeoLytics assigned the tract to the city containing the largest share of the tract population. In 2011, tracts are weighted by the share of population contained in each city. Observations are unique when defined by year, tract, city, county, and metropolitan area. Tracts located in unincorporated areas within a metropolitan area (even if they are denoted as places by the Census) are combined as a single unincorporated unit. Tracts outside of metropolitan areas are not included in the analysis. I use Metropolitan Statistical Areas and where possible, Primary Metropolitan Statistical Areas, as the highest level of aggregation (not Consolidated Metropolitan Statistical Areas which are much larger).

[55] Available at http://demographics.coopercenter.org/DotMap/index.html.

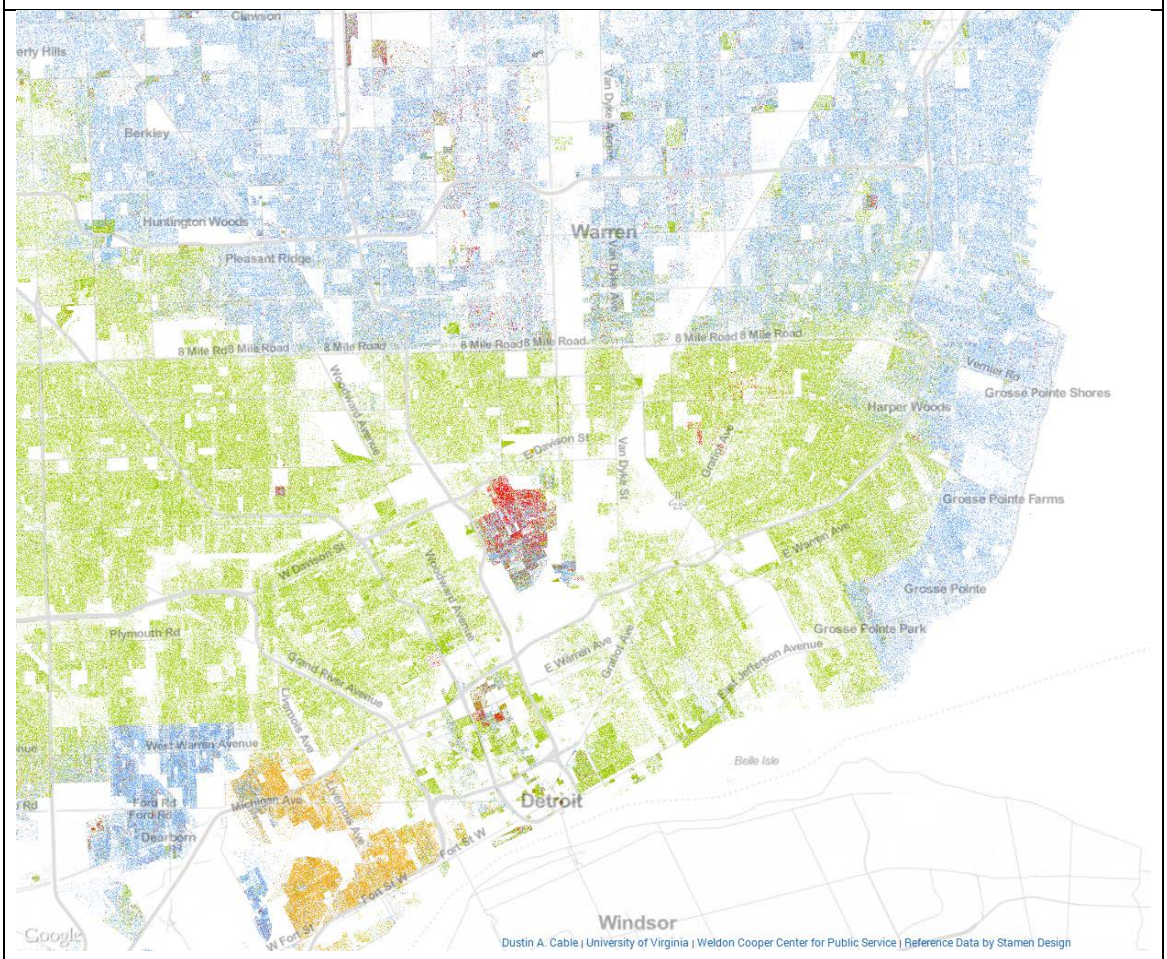
The upper panel shows Chicago, Illinois – a city in which whites are segregated from nonwhites in different neighborhoods (indicating a high amount of segregation across tracts within the city, H_{c_t}). The bottom panel shows a section of the Detroit, Michigan metropolitan area where racial sorting is much more prevalent *across* city lines as opposed to within them (indicating a high value of H_{m_c}).

Figure 1.6: Segregation Within City vs. Across Cities, 2010

Chicago, Illinois: Segregation within a City



Detroit, Michigan: Segregation Across City Lines



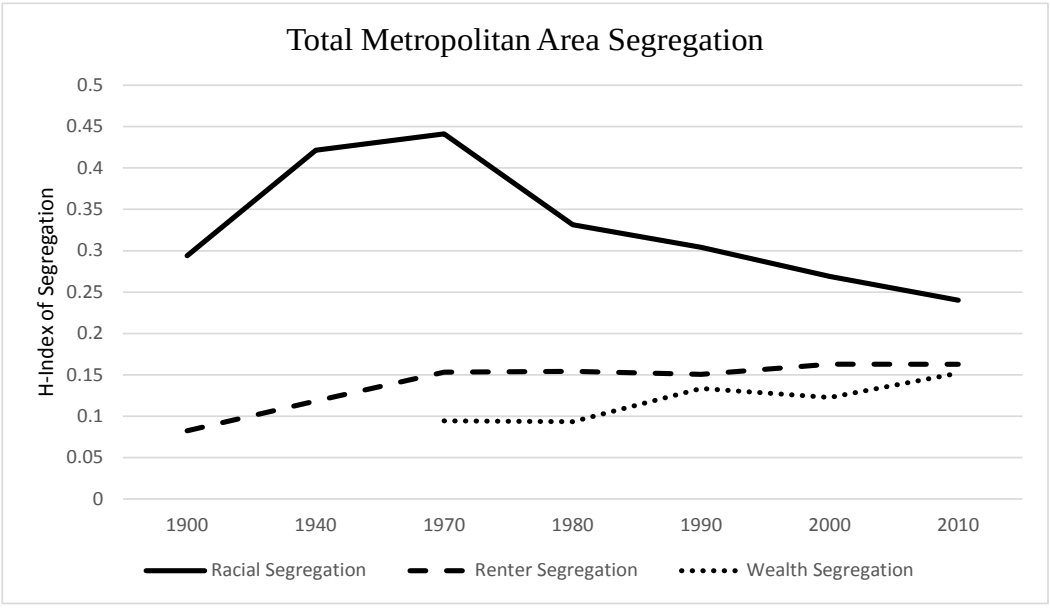
The maps make it clear that white and nonwhite residents of Chicago live in homogenous neighborhoods. Overall, the city is very segregated. The value of H_{c_t} in 2011 for Chicago was 0.379; the value of H_{m_c} (total segregation across cities) for the Chicago metropolitan area was 0.192. In the bottom panel, the neighborhoods within the cities of the Detroit metropolitan area are much more homogenous. The stark horizontal divider between the blue and green dots is 8

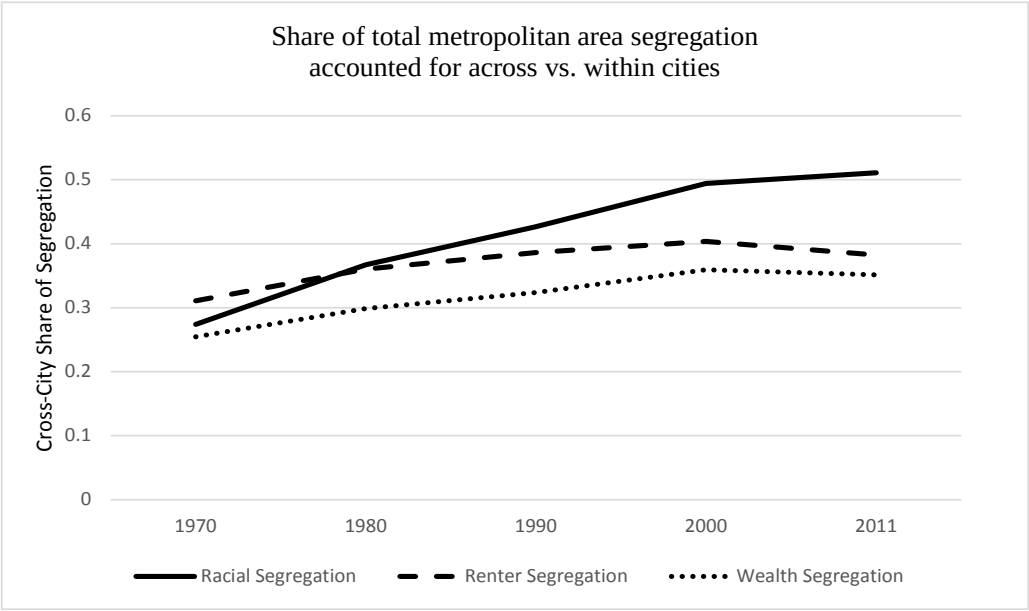
Mile Road which marks the boundary between Detroit and the neighboring ***city*** of Warren. A similar vertical division can be found on the right hand side of the picture, noting the boundary between Detroit and the cities of Grosse Pointe, Grosse Pointe Park, Grosse Pointe Farms, and Grosse Pointe Shores.[56] The value of H_{c_t} (within city segregation) in 2011 for Detroit was 0.220, while the value of H_{m_c} for the metropolitan area was 0.395.

How has metropolitan area segregation changed over time? The top panel of Figure 1.7 shows total metropolitan segregation measured at the tract level (H_{m_t}) since 1900, while the bottom panel shows the share of that segregation that was accounted for across cities rather than within them ($\frac{H_{m_c}}{H_{m_t}}$) from 1970-2011.

[56] The maps are shaded based on population density, hence the darker colors in Chicago.

Figure 1.7: Changing Metropolitan Segregation Patterns





These figures reveal that by 1970, racial segregation had peaked and begun to decline, while class segregation began a slow ascent. Between 1970 and 2011, in nearly every

metropolitan area in the United States, neighborhood segregation was exchanged for city level segregation along both race and class lines. The figures also show that historically, class segregation was much lower than racial segregation, but by 2011, the indices had converged substantially. The relationship between race and class segregation also increased over time. In 1990 (the earliest date for which I have data on all 330 metropolitan areas), the correlation between race and renter segregation was 0.19. It rose to 0.32 in 2011. The correlation between race and wealth segregation increased from 0.46 to 0.51 over this same period. The link between race and wealth segregation across city lines is even stronger; it was 0.70 in 2011. This tightening link between race and class is driven by changes in both race and class segregation, both within and across cities. However, these remain distinct demographic patterns.

Chapter 2: Local Government Action Contributes to Segregation 1900-1940.

Segregation along both race and class lines grew in tandem with the growth of cities (Meyer 2000). Race, ethnic, and class enclaves developed as urbanization brought white migrants, African Americans, and immigrants to cities (Teaford 1979). At the turn of the century, the predominant pattern of segregation occurred building by building, block by block, and sometimes several blocks by several blocks, but typically not by neighborhoods (Logan et al. 2015, Meyer 2000). Many cities featured multiple racial, ethnic, and class enclaves (Kellogg 1982, Rabinowitz 1978). In Philadelphia, for instance, about 40% of the black population lived in central city wards (4th, 5th, 7th, and 8th); but there were significant clusters of black homes in the 14th, 15th, 20th, 22nd, 26th, 27th, 29th, 30th, and 37th wards too (DuBois 1899). In Atlanta blacks lived in "Shermantown, Mechanicsville, Hell's Half Acre, Bone Alley, and Pigtail Alley," as well as "Darktown….Peasville…and Jenningstown," (Rabinowitz 1978, p106). By 1940 neighborhoods had become much more homogenous. So, while the residential location of people of color and the poor was nearly always restricted, the pattern of segregation changed during the years leading up to the Second World War. In this chapter I argue that local governments played a role in producing this change. Governments adopted zoning and other policies that created or reinforced segregation in service to business elites and white, property-owning constituents who were demanding a larger, more active city government.

In the very large social science literature on the causes and maintenance of race and class segregation, the contributions of local government are given limited attention.[57] Boustan (2012) concludes, "the most important [factor in the generation of residential segregation] appears to be individual choices of white households" (p318). Hayward (2013) agrees, arguing that restrictive

[57] The contributions of the federal government, on the other hand, are well covered (Jackson 1985, Massey and Denton 1993).

covenants were, "a more significant mechanism of racial segregation," than local government activities (p59).[58] Other scholars combine private and public actions into a single theoretical construct. For example, Cutler et al. (1999) provide evidence of "collective action racism" which involves, "specific policy instruments such as racial zoning or restrictive covenants prohibiting sales to blacks, or organized activities such as threatened lynchings or fire bombings that discourage blacks from moving into neighborhoods" (p476). Similarly, Dreier et al. (2004) associate racial zoning laws with biased real estate codes of ethics, racial steering, insurance redlining, and white violence concluding that, "racial segregation thus stems from the routine practices of the private real estate industry" and the spontaneous choices of urban residents "as well as from government policy" (p 120).

The role of government was important. For one thing, using the state to engage in promote restrictive collective action is qualitatively different than arranging segregation privately. Marshalling the power of city government institutionalizes prejudicial behavior and denies victims recourse. As Abrams (1955) explains, "passions and prejudices…unsanctioned by government…exhausted themselves" (p206). But when democratically elected local governments developed policies promoting segregation they became, "instruments of oppression against minorities" (p207).

Furthermore, while prejudicial attitudes and behavior were widespread during this period, government action was more variable. Understanding where and when local governments worked to create segregation along both race and class lines helps to clarify where segregation was likely to become entrenched and where it was more fluid, as well as provide insight into the factors that generate consequential local policy decisions.

[58] Of course, restrictive covenants required government action for enforcement. However, they could be generated without government involvement.

In this chapter, I explore the factors that contributed to the adoption of zoning laws. I argue that zoning was enacted by political elites seeking to manage the distribution of public goods to their core supporters. To present that argument, I first offer a historical narrative detailing the adoption of zoning laws by municipal governments. Then, I present a quantitative analysis of these adoptions. I find that cities with higher property taxes and larger budgets (where more was at stake), where Republicans (who led the municipal reform movement) had greater support, and where political participation was low (and thus more likely to be heavily skewed toward middle-upper class, native, white voters), zoning ordinances were more likely to be adopted. Finally, I analyze the effect of zoning adoption on future levels of segregation. I show that cities that were early adopters of zoning went on to become more segregated along both race and class lines than similarly situated cities without early zoning plans.

The dawn of the 20th century was an exciting time for local government. Populations exploded as the industrial revolution took hold. In this environment, the limited, caretaker approach to city governance became suddenly and profoundly insufficient for maintaining health, order, and property. Monkonnen (1988) explains, "cities could have chosen to ignore sewage, crime, unschooled children, and slow transportation by simply tolerating higher disease rates, offense rates, illiteracy rates, and traffic tangles" (p4). City governments did not take that path. Instead city governments worked aggressively to shape their social and economic environments. As Chapter 1 revealed, between 1890 and 1940, cities became modern – providing services like clean water, fire protection, police patrol, and road paving. It was in this environment that cities also began to seek control over space and residents' use of space through zoning and city planning. The end goal of this control, as was true of most Progressive Era reforms, was to improve the lives and opportunities for businesses and residents – more

specifically, US born Anglo residents (Tretter 2012, Woodward 1955, Toll 1969, Brownwell 1975).

As Monkonnen indicates, it was far from obvious that cities would assert control over their environments, but the rapid spread of slums, worries about skyscrapers blocking natural light, fears of conflagration, and concern about public health threats provided early inspiration for cities to invoke their policy power of regulation over nuisances (Toll 1969).[59] Reformers debated the correct policy solutions for these ills, recommending for example, density restrictions (Woodbury 1929), stricter building codes (Power 1983), the removal of alley dwellings (Silver 1997), or policies, including increased public transportation, that would encourage suburban homeownership for the working class (Baar 1996). In many cases, typically at the urging of local chambers of commerce, city councils chose to pursue zoning – regulating the use, height, and area of buildings and land (Brownwell 1975). Zoning was sometimes, but often not, combined with general development plans for the city. While zoning became wildly popular, planning did not. This decoupling of zoning from planning was viewed negatively by some leaders of the early planning movement who thought the creation of homogenous neighborhoods would be likely to reinforce social divisions and inequality (Toll 1969). Of course, this was often precisely the goal of zoning supporters.

The rise of social Darwinism contributed to the attraction of zoning as a solution for burgeoning problems. Social Darwinists argued that the evolution of humanity would follow a process of natural selection in which the environment played a defining role. As a result, controlling the environment was of utmost importance (Toll 1969). A related body of literature

[59] A number of important court battles ensured that zoning would be constitutionally allowed for the promotion of health, safety, welfare, and morals and did NOT constitute the deprivation of life, liberty, or property (see Hayward 2013 and Toll 1969 for overviews).

came to understand race and the differences between racial and ethnic groups as biologically rooted, hence, immutable (Hayward 2013). According to this doctrine, the inherent inferiority of blacks and other people of color (Native Americans, Chinese, Japanese, Mexicans), the preservation of "race purity" demanded, "segregation and discrimination in recreation, in religious service, in education, before the law, in politics, in housing, in stores, and in breadwinning" (Myrdal 1944, p58). Additionally, scientific and medical experts as well as politicians believed that the unsanitary habits and homes of the poor and people of color spread epidemic disease (Shah 2001, p6). In combination, these new theories offered a convincing rationale for the creation of special districts to quarantine offending groups. By 1930, about half of all large cities in the US had adopted comprehensive zoning plans.

Political leaders often used threats to public safety as a rationale for legislating segregation. New York's 1916 zoning law, the first comprehensive zoning ordinance in the nation, sought to limit the health threat posed by skyscrapers which blocked natural light and so, contributed to the spread of tuberculosis (Toll 1969, p154). Because immigrants and Blacks were viewed as disease carriers, segregating them was a typical goal of zoning. In San Francisco, the first city to segregate explicitly on the basis of race, whites had grown increasingly paranoid that Chinese residents were spreading diseases like smallpox and tuberculosis and in 1890, enacted an ordinance that required all Chinese residents and their businesses to move, within 60 days, to the section of town which had been set aside for, "slaughterhouses, tallow factories, hog factories, and other businesses thought to be prejudicial to the public health or comfort" (McClain 1996, p224). In Baltimore, segregationists agreed that, "blacks should be quarantined in isolated slums in order to reduce the incidents of civil

disturbance, to prevent the spread of communicable disease into nearby white neighborhoods, and to protect property values among the white majority" (Power 1983, p301).

The belief that zoning would create stability in property values was widely held and generated strong support from land owners, commercial organizations, bankers, realtors, and developers (Abrams 1955, Brownell 1975, Weiss 1987). Boston's first height restriction was passed in 1892 at the behest of downtown property owners who feared that the new skyscrapers would lead to an oversupply of office space and drive down property values (Kennedy 1992). In some places, this view had to be cultivated. In Los Angeles, for example, some developers were opposed to the city's 1908 zoning law because they worried it would inhibit growth (Weiss 1987). To combat such reservations, early supporters of zoning made sure to argue that their proposals would, "enhance, not detract from property values," (Toll 1969, p150). Zoning could easily have been invoked to improve the quality and health of working and lower class neighborhoods and limit land speculation (as some of the early reformers argued it should); however, "political pressures from those less inclined toward broad civic improvement" won out (Silver 1997, p24).

As zoning practices spread through the 1920s, emphasis on the enhancement of property values became the dominant argument; almost universally, it was believed that the wrong sorts of people residing or sometimes even working in an area could negatively impact property values. Abrams (1955) quotes an early real estate text which argued that, "…property values have been sadly depreciated by having a single colored family settle down on a street occupied by white residents," and another that claimed a similar effect of "unassimilated aliens." Both prescribed "rigid segregation" as a solution, "no matter how unpleasant or objectionable the thought may be to colored residents" (p159).

Aside from adding wealth to property-owning and voting residents, city governments had an even more powerful reason to protect and enhance property values – taxes (Lees 1994). An advertisement run by 5th Avenue merchants in the March 5th and 6th, 1916 editions of the New York Times argued that failure to support the city's new zoning plan would lead to "vacant or depreciated property," which would lead to "reduced taxes, leaving a deficit made up by extra assessment on other sections" (p5). Rising property values allowed municipal governments to grow without increasing tax rates. When some property values actually declined, municipal officials faced the unwelcome task of raising tax rates or cutting the budget.

As municipal governments began to spend vast sums on improving the lives and environments of residents, ensuring that the right (white/wealthy) residents benefited from the new city services became of utmost importance. This goal was clear to observers at the time. Booker T. Washington explained that, "the negro objects to being segregated because it usually means that he will receive inferior accommodations in return of the taxes he pays." Such objection stemmed from the belief that segregation would ensure that, "the sewerage in his part of the city will be inferior; that the streets and sidewalks will be neglected, that the street lighting will be poor; that his section of the city will not be kept in order by the police and other authorities, and that the 'undesirables' of other races will be placed near him." Thus, Washington concluded, "when a negro seeks to buy a house in a reputable street he does it not only to get police protection, lights and accommodations, but to remove his children to a locality in which vice is not paraded" (Washington 1915, p113-114). Frequently, white elites made arguments that taxing whites to pay for black public goods (like schooling) was "an indignity." One delegate to the Louisiana Constitutional Debate in 1864, incredulous at the proposition asked, "Shall we tear the slave away from his master and then force the master to educate him?"

(Louisiana Constitutional Debate, quoted at length in Bond 1934, p16-17). As a result, in many cities (see Chapter 3), black areas lacked municipal services such as, "paving, water, sewerage, lighting and garbage removal," (Knight 1927, p53; also Myrdal 1944).

Given that zoning was viewed as a way to both increase property values and maintain exclusivity in the distribution of public goods, it is unsurprising that Southern cities made early use of zoning to hem in expanding black neighborhoods and create clear dividing lines between white and black residential areas. Of course, the development of racial zoning in the South was part of a much larger process of reconfiguring race relations after the Civil War. During the period of Reconstruction and Redemption, whites subordinated, exploited, and killed blacks, but even in this context, the legal segregation of the races was not a foregone conclusion (Woodward 1955). [60] In fact, although Jim Crow laws were widespread, most Southern cities did not legislate residential segregation directly.[61]

Blacks being able and willing to live in white neighborhoods was a necessary (although not sufficient) condition for the enactment of legislation. Baltimore passed the first racial zoning law directed at blacks in 1910 following the violent response of white residents as black migrants moved into previously all white areas. Baltimore's ordinance prohibited whites and blacks from moving into city blocks occupied by a majority of members of the other race. Quite aware of the requirements of the 14th amendment, the Baltimore council argued (and the Maryland Supreme Court agreed), that because the ordinance placed the same limitations on both racial groups it

[60] One vivid example of the ways in which Jim Crow changed existing practice comes from New Bern, North Carolina. In 1913, the city aldermen passed an ordinance which required that all "colored bodies" buried in the public cemetery be dug up and moved to a segregated location.
http://www.newbernsj.com/article/20140209/Opinion/302099914

[61] Rabinowitz (1978) argues that the picture was different with respect to schooling. Here, segregation was immediate and unchanging after the end of the war.

was not discriminatory (Virginia Law Review 1916).[62] The vote of the city council fell along party lines with all of the Democrats in support and all of the Republicans opposed.[63] Republicans were joined in their opposition by the entire community of black residents, some real estate brokers, and white homeowners who lived in integrated neighborhoods (Power 1983). Democrats were not just responding to their white voters in their promotion of segregation. Limiting black residential location also bolstered Democratic political power by ensuring that blacks would be packed into certain wards; thereby reserving the rest of the city for Democratic control (Rabinowitz 1976).

In some places, black political power slowed or inhibited the enactment of segregation ordinances (Rice 1968). In St. Louis, an effort to pass a segregation ordinance failed because it was opposed by a significant number of city elites (including most of the city's leading Republicans, labor interests, religious leaders, and newspapers). The National Association for the Advancement of Colored People (NAACP) and the Knights of Pythias lobbied the St. Louis city government tirelessly and ultimately convinced 21 of the 28 aldermen and the mayor to vote against it. In 1912, the city went so far as to station five police officers at the house of a black family to protect them from, "possible attack by whites who resent what they term a 'Negro invasion' in their residential district" (*The Crisis* 1912 Vol 4, No 6, p272). In a low turnout election in 1916, supporters of the segregation ordinance won a city referendum and the city immediately began mapping the race of each city block. (Meyer 2000 19-21). In Kansas City, Missouri, blacks had a modest amount of political power due to their ties to the (Democratic)

---

[62] Although the Court agreed with the city's reasoning about the 14th amendment, it ultimately declared the ordinance unconstitutional because its provisions were retroactive thereby representing a taking by the government. (*State v. Gurry* 121 Md. 534 (1913))

[63] Republicans were generally (tepidly) supportive of black rights in Baltimore and between 1890 and 1931, six black Republicans served on the Baltimore City Council (Greene 1979). Over the course of their careers, these councilors led the city council to provide significant contributions to Baltimore's black community; but none were able to defeat the segregated housing legislation.

Pendergast machine. Despite support from a significant segment of the city's white population, a racial zoning ordinance never made it past the lower chamber of the city council (Meyer 2000).

Bacote (1955) reports that throughout the late 1800s in Atlanta, black support was frequently courted by white factions. For instance, in the 1891 election, black candidates were nominated for council positions in the 1st, 4th, and 6th wards on the Citizens' ticket (an anti-prohibitionist faction of the Democratic Party). White factions did this when they were in danger of losing the election – in 1891 the anti-prohibition Democrats were worried about a Populist victory. To prevent white factions from seeking black support in the future, the Democratic Party adopted the white primary in 1892, and the state of Georgia enacted a new constitution in 1908 which included a character requirement, a literacy test, and made property ownership a condition for registration (Bayor 1996). These changes severely restricted black participation, ensuring that white factions would only rely on white votes. The evisceration of the black electorate and black representation opened the way to the city's enactment of segregation ordinances (Key 1949, Kousser 1974, Woodward 1955).

Atlanta enacted a racial zoning ordinance on the heels of a violent race riot in 1906. The riot erupted after local newspapers reported four alleged (but never substantiated) assaults upon white women by black men. According to Garrett (1969), the riot was ignited by the sight of black passengers riding next to whites on street cars. A white mob killed and beat dozens of black Atlantans over the course of three days. A concerted organizing effort among the city's African American population followed. White elites and politicians denounced the riot, and a public/private relief fund was even established for families of the murdered victims (Garrett 1969). However, the riot also led many whites to conclude that, "separation of the races is the only radical solution of the negro problem in this country" (Charleston News and Courier,

quoted in the New York Times, September 30, 1906). Following the passage of the ordinance in 1913, all blocks in the city were assigned racial designations based on the race of the majority of current residents (Silver 1997).

Fighting racial zoning was one of the early nationwide causes to be adopted by the NAACP (Rice 1968, Meyer 2000) and due to the organization's work, in 1917, the Supreme Court ruled racial zoning unconstitutional in *Buchanan v. Warley*. In the *Buchanan* decision the justices did not seek to protect the rights of black property buyers or to prohibit "amalgamation of the races," but rather to protect the right of white owners to, "sell or lease their lands and houses to whomsoever they pleased" (Virginia Law Review 1928, p531).[64] Nonetheless, the Chicago Defender declared that the, "hydra-headed monster of segregation…was killed by the Supreme Court," and argued that the, "decision [was] a direct slap in the face to white southern oligarchy." (November 10, 1917). According to Rice (1968), it was also a, "victory for moderate whites and Republicans" (p197).

Following *Buchanan*, many cities sought to enact constitutionally defensible racial zoning plans by turning to comprehensive city plans (Silver 1997).[65] In 1914, a racial zoning ordinance was proposed in Birmingham while the *Buchanan* case was already moving through the court. A group of black attorneys convinced the Birmingham city council that they could face a costly legal battle if the Court ruled against Louisville's ordinance. In order to prevent this, and to appease white demands for segregation, the council chose instead to adopt a

[64] The Court found that the ordinance improperly restricted the rights of property owners to dispose of property. It did not challenge the separate-but-equal doctrine that was in place as a result of the 1896 *Plessy v. Ferguson* decision.

[65] San Francisco was the first city to utilize a form of use zoning for a racial purpose. In 1885, the city enacted a set of regulations for laundries operating in residential areas in an attempt to keep Chinese residents (who owned nearly all of the laundries and typically lived above them) from white neighborhoods. The law was invalidated by the Supreme Court in the 1886 case *Yick Wo v. Hopkins* in which the Court found that a law which is race neutral on its face may still violate the 14th amendment if administered in a prejudicial manner.

comprehensive zoning plan in 1926 that included racial designations for different city zones (Connerly 2005). Atlanta's 1922 revision of the zoning ordinance combined zoning categories of land use and building regulations with racial designations. For instance, the city's master zone map noted that, "unless otherwise designated on this map, all areas designated as dwelling house districts are also class H1 height districts and white race districts." Other areas were designated as "colored district and an apartment house district" or "colored district and dwelling house district."[66] In 1929, the zoning code was again revised, this time including a prohibition on occupying a home on a street where the majority of residences were occupied by persons whom the resident was forbidden to marry by law (Meyer 2000). Eventually, the court ruled against these ordinances and by the 1930s segregationists had dropped the racial designations in favor of comprehensive zoning.

As the court struck down plans that endorsed outright racial segregation, the case for other forms of zoning had been building. A series of judicial decisions established the bounds of permissible approaches to regulating the uses and size of buildings. For instance, the court determined that exercise of police power (e.g. the authority to regulate behavior and enforce order), "must be reasonably adapted to the purpose of protecting some interest of the community," (C.C.S. 1925 p417) and that nuisance regulation and other use restrictions, "must bear a substantial relation to the public health, safety, morals or general welfare" (Monchow 1928, p323). Zoning ordinances spread rapidly throughout the 1920s, particularly after the Supreme Court determined that comprehensive zoning would not require cities to compensate owners for losses in prospective land values in the 1926 case *Euclid v. Ambler Realty Company*.

[66] https://cityloci.files.wordpress.com/2014/07/6-atlanta-19291954.pdf

Zoning adoption was also propelled by the Republican-led federal government. In 1922, under the direction of Secretary Herbert Hoover, the Department of Commerce issued a template for state enabling laws in the Standard State Zoning Enabling Act. The Act was published in 1924 and a revised edition was released in 1926. Thus, while Republicans tended to oppose zoning in the South, they were frequently the drivers elsewhere. In Boston, Republicans were shut out of city government by the powerful Democratic organization, leaving them to pursue zoning laws through the Massachusetts state legislature instead (Kennedy 1992, p113).

The arguments surrounding the adoption of comprehensive zoning were broad but imbued with municipal Progressivism's race and class prejudices (Bridges 1997, Trounstine 2008). Comprehensive zoning supporters highlighted benefits such as the "adequate provision of light and air," "stabilization [sic] and protection of property values," "protection and maintenance of the home and home environment," "to apply the most up-to-date methods of sanitation and hygiene, "simplifying the problems of street traffic regulations," and the prevention of congestion (A.C. Holliday 1922, p217). By separating industrial, commercial, and residential uses into separate districts each with standard regulations regarding the use, height, and area of buildings, zoning would make, "every town, city or village a more orderly, convenient, economic and attractive place in which to live and work," (A.C. Holliday 1922, p218,). One key to ensuring high property values and orderly living arrangements was the ability for zoning ordinances to prevent noxious uses from polluting residential neighborhoods (Fischel 2001). Apartment buildings constituted one such noxious use.

In *Euclid v. Ambler*, Justice Sutherland explained that the apartment house is often a, "mere parasite, constructed to take advantage of the open spaces and attractive surroundings... interfering by their height and build with the free circulation of air and monopolizing the rays of

the sun…depriving children of the privilege of quiet and open spaces for play enjoyed by those in more favored localities…until, finally, the residential character of the neighborhood and its desirability as a place of detached residences are utterly destroyed. Under these circumstances, apartment houses, which in a different environment would be not only entirely unobjectionable but highly desirable, come very near to being nuisances." (p394-395).

In allowing the protection of single-family home neighborhoods, *Euclid* laid the groundwork for the long-term shift from a country segregated by race to one that became increasingly segregated by income. In the early 20th century, race and income were so strongly overlapping that denying apartment buildings in a neighborhood of single-family homes would also largely prohibit blacks and many immigrants from residency. Making this point, Bruno Lasker, editor of Survey Magazine asked:

> "Why, in this country of democracy, is a city government, representative of all classes of the community, taking upon itself to legislate a majority of citizens – those who cannot afford to occupy a detached house of their own – out of the best located parts of the city area, practically always the part with the best aspect, best parks and streets, best supplied with municipal services and best cared for in every way? Why does it deliberately 'segregate' the foreign-born who have not yet become sufficiently prosperous to buy or rent a home under building regulations which preclude the possibility of inexpensive development and construction?" ("Unwalled Towns," *The Survey*, Volume 43, 1920, p677).

Lasker suggested that the answer to his question was the dominance of politics by wealthy property owners who sought to employ, "public power for the purpose of protecting sectional interests" ("The Issue Restated," The Survey, Volume 44, 1920, p278). Segregation enforced via zoning was a means to accomplish this end. In cities like Chicago, Kansas City, and Los Angeles, some of the most powerful voices in support of zoning were homebuilders and real estate boards who stood to gain monetarily from segregation (Gotham 2000).

With such wide-ranging positive effects for powerful interests, it is easy to see why zoning became so popular. Yet, by the close of the 1920s, many cities had not yet adopted zoning plans. I have argued that zoning was a tool that enables elected officials to make it easier to limit the distribution of public goods to certain constituents and to ensure high property taxes, and that it was successfully implemented where zoning supporters had political power. In order to provide more systematic evidence of this argument, I collected data on all of the cities that enacted *zoning ordinances* between 1900 and 1930. I gathered racial zoning information from several reports including Rice (1968), Connerly (2005), Silver (1997), and numerous issues of the NAACP's *Crisis Magazine*. To encode general zoning plans, I drew on an article published in *The American City* by Norman Knauss in 1929, which listed the years that zoning ordinances were enacted. Knauss reports having sent a survey to all municipalities with the authority to enact zoning. His list includes 768 municipalities that reported having an ordinance. I coded the city year in which zoning was enacted as a 1 and years leading up to that date as a 0. Cities exit the analysis once they enact zoning. Cities that were included in the Census but had no zoning law by 1929 are coded 0 for the entire time period. Zoning is my dependent variable. To these data, I merged city spending and demographic data culled from the Census (which are described in Chapter 1).

My primary independent variables are per capita total *Expenditure* and *Property Taxes*. I log the total expenditure variable because the data have a strong rightward skew. I expect both of these variables to be positively correlated with zoning. Where spending and property taxes were higher, local officials would have a greater incentive to protect the existing distribution of public goods and the total tax revenue. I include two additional political variables – the county-level *Republican presidential vote share* (linearly interpolated for non-election years) and county

level *Turnout* of age-eligible voters.[67] Republican vote share is a rough proxy for the degree of support for regulatory policy, of which zoning was an example. I expect that greater Republican support will be associated with a higher likelihood of implementing zoning – except in the South. A range of voting restrictions were in place throughout the time period under consideration (Keyssar 2000) and I include the turnout of the age-eligible population to capture the permissiveness of the electoral environment. This measure is preferable to including state level laws like the poll tax or literacy test because it allows for sub-state variation in the electoral setting. Generally, higher turnout is associated with greater participation of the poor and people of color (Hajnal 2010); populations that both tended to be opposed to zoning plans and stood to lose from their implementation. Thus, I expect that where turnout was higher, the likelihood of enacting zoning was lower.

A wide range of alternative explanations for the adoption of zoning were proposed by contemporary observers and later analysts of the movement, many of which are correlated with the political factors I seek to test. Writing about racial segregation laws, Woodward (1955) argues that the economic depression at the end of the 1890s led to "aggression against the minority race" (p81). To account for this possibility, I include a measure of the share of the total population that was *Unemployed*, linearly interpolated from the Census of Population and Housing. Fischel (2004) claims that zoning adoption followed the invention of trucks and busses, which made it feasible for businesses and apartment buildings to be built in residential and suburban areas, away from rail lines. I include per capita spending on *Roads*, which include street paving, street cleaning, and street lighting to capture differences in vehicular accessibility. In the "History of Zoning," Gordon Whitnall explains that, "the practice of zoning began…when

[67] This denominator includes men over the age of 21 until 1919 and both women and men over the age of 21 in 1920 and later elections.

the concentration of population in cities began to be pronounced" (1931, p2). The "urge for zoning" he goes on to say, "has arisen from the desire and the necessity to bring some order out of the chaos that has resulted from the anarchistic development of our cities." I include the *10 year rate of change* in total population and population *Density* (persons per acre) to capture urbanization. To measure threats of disease and conflagration, I include per capita spending on *Health care* and *Fire-fighting*.

As described above, contemporary supporters of segregation ordinances often asserted the protection of white, single-family neighborhoods as the primary goal. To measure the social threat of black and foreign populations, I include the share of the population that is *Black*, *Foreign Born White*, and *Foreign Born Non White*. To measure the threat of lower-income (apartment dwelling) populations I include the share of the population *Renting* their homes. To capture the presence of noxious industry that might be better contained in a zoned city, I include the share of the employed population working in *Manufacturing*. This variable also captures an argument presented by Connerly (2005): that industrialists preferred to maintain segregated cities in order to dampen the threat of union organizing across racial lines.

Many scholars (e.g. Woodward 1955, Myrdal 1944, Blumer 1958) understand segregation as a mechanism to bolster hierarchical racial control, as social distance may preserve the relative status advantage of whites. For instance, Wade (1967) argues that segregation was, "rooted in the white's need for discipline and deference," and that it, "provided public control to replace dwindling private supervision of the master over his slave" (p278). If this is the case, we should expect that cities with existing patterns of segregation would be most likely to institutionalize the practice. It is also possible, however, that cities with high levels of segregation would have had no need for legislation (see Silver 1997 on Roanoke). To adjudicate

between these two possibilities, I include a dummy variable coded 1 if the city had *Segregated Schools*. This variable is encoded from Johnson (2015) who characterizes states as requiring segregation, permitting segregation, prohibiting segregation, or with no segregation statutes. My variable is coded one for states that require segregation, .5 for states permitting segregation, and 0 for all others. Bobo, Kluegel, and Smith (1997) argue that the political institutionalization of Jim Crow ideology was driven by the needs of the Southern economy, particularly the exploitation of black agricultural labor. On the other hand, Godsil (2006) suggests that whites with a significant stake in retaining a large black laboring class may have opposed racial zoning, as such ordinances might lead black workers to leave the city. To account for either possibility, I include for the share of the workforce employed in the *agricultural sector*. If Bobo et al.'s theory applies to zoning, we would expect a positive relationship between agricultural dominance and zoning. We'd expect the inverse if Godsil is correct.

My observations represent 4293 city-years from 240 cities. All spending data are inflation adjusted and linearly interpolated. Census data are linearly interpolated as well. I run logistic regressions with errors clustered by city. I include fixed effects for region, which means that these comparisons are all within the same area of the country. That is, the regressions analyze the effect of city expenditures on the adoption of zoning in each of four regions – West, North, Midwest, and South. Column 1 shows the base model with no controls. Column 2 includes all of the above-described controls. In Column 3, I change the dependent variable to focus on racial and comprehensive zoning. Here, the dependent variable is coded 1 when the city adopts either race zoning or comprehensive zoning and is coded zero otherwise. In this analysis, I present an interaction between Republican vote share and region to show how party

politics differed in the South. These results are presented in Table 2.1 and summary statistics are shown in appendix Table A2.1

Table 2.1: Effect of Local Political Factors on Zoning Implementation

	Column 1		Column 2		Column 3 Race and Comprehensive Zoning Only

Note: Logistic regressions; Robust Standard Errors clustered by city

Table 2.1 offers strong support for my claim that cities with greater public goods expenditures and more property tax revenues were more likely to implement zoning ordinances. With all else equal, shifting from the minimum per capita expenditure (about $4) to the maximum (about $476), changes the probability of adopting a zoning ordinance from 0.004 to 0.15. Similarly, cities with the lowest property taxes per capita (about $2) rarely adopted zoning ordinances, while those with the highest taxes ($67 per person) had around an 18% chance of implementing zoning. Where turnout of the voting age population was higher, zoning was less likely to be adopted. This result supports Toll's (1969) claim that, "the demand neither for zoning nor for planning had grown out of any widespread outcry in the cities of the United States" (p199). Zoning adoption appears to have been led by the Republican Party, except in the South, where Republican voting strength limited the likelihood of adoption of comprehensive and racial zoning ordinances.[68] These data fit the historical narrative presented above well.

In addition, many of the control variables suggest interesting patterns. For instance, there is no evidence that larger racial and ethnic minority populations drove zoning adoption. Nor did greater threats to public health or conflagration increase the likelihood of zoning. Contrary to Fischel's prediction, zoning was not more common in cities with more spending on roads. Economic factors appear to have played a more important role. Zoning adoption was more likely in cities with higher unemployment and with greater shares of the workforce employed in manufacturing and agriculture. It was also more likely in cities with more renters (particularly in the case of comprehensive and racial zoning). This conclusion is bolstered by a secondary analysis in which I add a measure of renter segregation in 1900 for 42 cities. Where renters were

[68] Cities with reformed institutional structures were not more likely to adopt zoning. In fact, nonpartisan cities were somewhat less likely to adopt. This effect is largely driven by cities in the South where nonpartisan laws may have advantaged Republicans.

more segregated from homeowners, zoning was much more likely to be implemented. This finding suggests that homeowners were more supportive of zoning measures when they lived in more defined neighborhoods to protect. It is also clear that zoning ordinances were much more likely to be enacted in places that had a preference for segregation. Where segregated schools were the law, cities were more likely to adopt zoning. In additional analyses I find that cities with marked segregation at the turn of the Century, particularly in the South, were also more likely to adopt zoning. These results support the contention that zoning was a mechanism used to reinforce existing racial hierarchies. In the next section I provide evidence that this was precisely its effect.

Zoning Generates Segregation

As Chapter 1 revealed, race and class segregation existed prior to the introduction of public policy measures that would separate residents and land uses. The history of private mechanisms producing segregation is well understood (e.g. Jones-Correa 2000, Meyer 2000, Burgess 1994, Myrdal 1944). Blacks, immigrants, and the poor tended to live in areas that were removed from native white middle class residents for a variety of reasons. Rabinowitz (1974) explains, "some of the housing segregation was voluntary: Negroes sought proximity to their jobs, welcomed the freedom from white surveillance, and enjoyed the company of other blacks" (p98). More important was "black poverty, which limited housing options" and "white pressures to keep blacks out of their neighborhoods" (p98). Restrictive covenants, clauses written into property deeds specifying restrictions on the use of the property, were widely used to bar undesirable neighbors from occupying properties starting in the late 1880s (Fogelson 2005). Mortgage discrimination and real estate steering were institutionalized in the early 1900s (Helper 1969). However, Hayward (2013) explains that the problem with relying on black poverty or

restrictive covenants to maintain segregation was that the market was susceptible to encroachment, requiring coordination and constant vigilance against potential violators (Brooks 2002, McAdams 2008). Marshaling the power of municipal governments to restrict land use offered developers and property owners the promise of a protected investment.

Evidence indicates that zoning adopted in the early 1900s followed patterns created by private actors (Burgess 1994, Tretter 2012). Writing in 1929, M. T. Van Hecke explained, "zoning programs are frequently influenced by restrictions in deeds. Where a very substantial area has been set aside for a high type use through the medium of deed restrictions, and that area is sufficiently large and geographically distinctive, zoning officials ordinarily recognize the character of the development and classify that section accordingly, so that the objectives of the statutory and deed restrictions are the same" (p420). Both supporters and opponents of zoning argued that the new laws would simply reinforce patterns produced by the market. Supporters, like Robert Whitten, creator of Atlanta's post-*Buchanan* comprehensive zoning plan, claimed that zoning would serve to lessen racial antagonism and economic loss by making the future of development more predictable as it enforced existing segregation patterns (Toll 1969 p262). Opponents suggested that zoning would add unnecessary (and some argued, unconstitutional) regulation when restrictive covenants were perfectly suited to the job of preserving neighborhoods and property (Virginia Law Review 1928, Ellickson 1973, Hayward 2013 pp118-119, Denzau and Weingast 1982, Berry 2001).

Aside from freezing private decisions in public policy, zoning also had the potential to generate race and class segregation through implementation. Ostensibly, zoning is undertaken in the interest of the city as a whole, but this, "depends entirely upon the way in which the work is done" (Van Hecke 1929, p414). This is because zoning, as an administrative task, requires

innumerable small decisions by municipal officers who may, consciously or unconsciously, bias outcomes toward some groups and away from others. E.T. Hartman (1925) explains, "chief among the problems are the granting or refusal of permits in accordance with the law, the decisions of the board of appeals in appealed cases, and appeals from either or both by interested parties" (p162-163). As is true of any regulation, zoning serves political purposes (Denzau and Weingast 1982). The discretion inherent in applying zoning laws meant that local officials could deny permits to builders who sought to house nonwhite or poor families and/or make exceptions for developers serving white and upper class residents (Bayor 1996, Meyer 2000). Abrams (1955) explains, "those who build for whites can get a modification pro forma. But the moment an unwelcome group appears, the officials stand firm" (p210). Until 1949, the Federal Housing Administration officially encouraged the use of zoning to generate race and class segregation (Stearns 1962). Valuators were instructed that, "the best artificial means of providing protection from adverse influences is through the medium of appropriate and well-drawn zoning ordinances" (Federal Housing Administration 1936, *Underwriting Manual*, Part II paragraph 227). Zoning was understood to protect locations "against declines in value or desirability" (section 306(2)) by preventing the, "infiltration of business and industrial uses, lower class occupancy, and inharmonious racial groups" (paragraph 229).

As Berry (2001) notes, providing evidence of the effects of zoning on segregation has proved challenging because zoning is ubiquitous today.[69] But as the first section of this chapter revealed, in the first decades of the 20th century, zoning adoption was variable. I argue that this variation shows that early zoning adopters became more segregated cities – even accounting for the degree of segregation that existed when zoning laws were adopted. My dependent variables

[69] Berry (2001) takes advantage of the lack of zoning laws in Houston and their presence in Dallas to show that private controls – particularly covenants – produce the same outcomes as zoning laws.

in these analyses are *Change* in the level of *Race* and *Class segregation* between about 1900 and 1970. More specifically, I subtract the level of segregation at the earliest point in my dataset from the 1970 of segregation of non-Hispanic whites and renters. The earliest measures for racial segregation are from 1890, 1900, or 1910. For renter segregation, the earliest measure is 1900 for most cities.[70] As explained in Chapter 1, the segregation of renters is an imperfect measure of class segregation – but it is the only measure that allows me to capture change over time.

My primary independent variables are drawn from the data described for Table 2.1. I expect that racial segregation will be most closely linked to racial zoning and comprehensive zoning (as the historical discussion indicated), while class segregation will be tied to all forms of zoning. In the analysis of racial segregation, my independent variable is a dummy variable noting whether a city adopted either a race based or comprehensive zoning ordinance in the period 1900 and 1930. These *Early Zoning Adopters* are coded 1, and cities that did not adopt racial or comprehensive zoning are coded 0. In the analysis of renter segregation, cities are coded 1 if they adopted any type of zoning ordinance between 1900 and 1930 and zero otherwise. I control for the *Change in City Population* between the earliest point of measurement for each city and 1970. Table 2.2 presents these results.

[70] I have data in 1900 for 49 cities. To increase the number of usable observations, I include the level of renter segregation in 1940 for 14 additional cities. The correlation between renter segregation in 1900 and 1940 is .8676. The results are nearly identical (though less precise) using only the data from 1900.

Table 2.2: Zoning's Effect on Race and Class Segregation

	Change in Racial Segregation 1900-1970		Change in Renter Segregation 1900-1970	
	β	P>|z|	β	P>|z|
Early Zoning Adopter	0.133	0.001	0.036	0.061
Change in City Population	0.000	0.002	0.000	0.000
Constant	0.057	0.103	0.026	0.181
N	88		63	
R^2	0.198		0.222	

Note: OLS Regressions

The results in Table 2.2 are striking – cities that were early adopters of zoning ordinances grew more segregated over the next 50 years compared to cities that were not early adopters. Around 1900, cities that adopted zoning had very similar racial segregation rates to non-adopting cities (0.265 for adopters and 0.287 for non-adopters). By 1970, cities that adopted early zoning ordinances had segregation levels about 10 points higher on average (0.489 compared to 0.390). Zoning also exacerbated renter segregation. Cities that were not early adopters saw about a 4 percentage point increase in renter segregation between 1900 and 1970 compared to an 8 percentage point increase in cities with zoning.

Furthermore, zoning had significant consequences for property value inequality (as its promoters had hoped). To measure property value inequality, I created a *Property Value Gini Index* built from median home values at the census tract level in 1970. Cities in which all census tracts have very similar 1970median home values have a low score on this measure, while cities that witness inequality in property values from neighborhood to neighborhood have a high score. Regressing the property gini on the dummy variable for early zoning adoption, including state fixed effects produces a coefficient of 0.09 (SE=0.003). Cities without early zoning had an average 1970 property gini of 0.04, compared to 0.13 among early zoning adopters. This difference is greater than a standard deviation on the gini index.

Of course, zoning was not the only mechanism available to local governments to promote race and class segregation. One of the most successful strategies of directing residential locations without force was the placement of segregated amenities. Austin, Texas was a pioneer in this practice. The city's 1928 comprehensive zoning plan found that, "the Negroes are present in small numbers, in practically all sections of the city, excepting the area just east of East Avenue and south of the City Cemetery. This area seems to be all Negro population" (page number). So, the plan recommended that, "all facilities and conveniences be provided the negroes in this district, as an incentive to draw the negro population to this area." This strategy would, "eliminate the necessity of duplication of white and black schools, white and black parks, and other duplicate facilities for this area" (Koch and Fowler 1928, p57). Soon after the adoption of the plan, Austin's city council pursued this approach, providing a park, school, and sewer connections for African Americans only in this one section of the city. The council went on to duplicate the strategy for Latinos (Tretter 2012). In the 1940s and 50s (as I discuss in Chapter 4), the siting of segregated public housing followed a similar pattern.

Another tactic cities used to shape minority residential patterns was the use of eminent domain and the placement of public improvements. Abrams (1955) reports, "Sites abutting Negro developments have been acquired for railroad stations, incinerator dumps, urban redevelopment, public housing projects, roads, and similar improvements. These improvements sometimes tend to cut off the minority area from the rest of the city and stem the expansion of its living space" (p212). Such decisions became increasingly frequent as the federal government provided funds for redevelopment. As I show in Chapter 4, cities that spent more urban renewal dollars also became more segregated.

Cities also engaged in several strategies that enhanced/protected private decisions generating segregation. Chief among these was the refusal to deploy police forces to protect blacks from white violence when they sought to buy or rent homes in white neighborhoods. In many places, police routinely prevented the poor and people of color from setting foot in wealthy white areas at all (Meyer 2000, Myrdal 1944).[71] In some places, city governments took actions to aid the effectiveness of private deed restrictions (Hirsch 1983). For example, the mayor of Baltimore established a special Committee on Segregation to help coordinate deed restrictions in white neighborhoods. The committee included the city's building inspector, representatives from the health department, real estate agents, and neighborhood improvement association members (Meyer 2000).

Conclusion

This chapter has provided the first piece of quantitative evidence along with qualitative historical references that suggest that local governments influenced patterns of segregation by taking into consideration public goods provision as well as the wishes of wealthy business elites and white property-owning constituents. Local governments institutionalized prejudicial behavior and promoted segregation through the use of zoning ordinances.

Political elites enacted zoning ordinances in order to control the distribution of public goods in the city. They justified their zoning and segregation legislation with the argument that the poor and minorities had habits that were harmful to public health. One of the main goals of zoning ordinances was to create property values that were stable; this was highly supported by influential groups including home and landowners who did not want "others" settling in their

[71] As was the case with zoning, the use of police to support segregationists was variable. For instance, Meyer (2000) reports several examples of police providing support for black residents in New York City, St Louis, and Baltimore.

areas and decreasing the value of their investments. Local governments had no objections to keeping the property values high and stable, as this allowed them to refrain from raising taxes.

One major consequence that resulted from enacting zoning ordinances was that cities that adopted them early became more segregated in terms of both race and class lines. When cities restricted land use and the location of specific buildings, this created areas that were homogenous, leading to the reinforcement of inequality and social divisions.

In 1917, the Supreme Court ruled that zoning ordinances were indeed unconstitutional. This led many cities to turn their attention to comprehensive city plans and other forms of zoning that did not make outright segregation obvious. New comprehensive city plans were fueled by continuing race and class prejudice, and influenced the long-term shift from racial segregation to segregation by income level.

The historical references presented in this chapter support the argument that local government politicians used zoning as a mechanism to control the distribution of public goods towards their supporters and away from others, as well as create and maintain high property values in their cities. Zoning was an implemented effectively in areas where those in favor of zoning had political power to turn racial and class prejudice into legislation. Cities that were early adopters of zoning ordinances grew to be ten percent more segregated over the following fifty years than did cities that were not early adopters. The results also illustrate that zoning ordinances doubled the amount of renter segregation. In these early adoption cities, property values would also become more unequal by 1970.

Local governments used zoning ordinances as a mechanism to solidify, through institutionalization, existing racial hierarchies and prejudice, and this practice has had long-lasting effects. When cities could have used zoning to enhance the life of all residents, local

government officials catered to the private interests of their supporters and utilized policy tools including the placement of segregated amenities, public improvements, eminent domain, and redevelopment funds to protect and increase property values. The consequence of these practices was the generation of long-standing race and class segregation and prejudice.

Chapter 3: Inequality in Public Goods Provision, 1900-1940

Throughout the first decades of the 20th century, neighborhoods became increasingly homogenous along both race and class lines. By 1940, white/nonwhite segregation had increased by an average of 63%, while renter segregation increased by 54%.[72] Chapter 2 provided evidence that cities pursued race and class segregation in an effort to ensure the protected delivery of public goods to constituents with political power – namely land owners, realtors, developers, and white homeowners. Segregation served this goal because both local public goods and local political representation have a spatial component. While it is difficult to deny particular households access to sewer lines or a local public park, it is much easier to deny particular neighborhoods. Thus, as segregation geography shifted, so too did public goods inequalities.

Nothing about the existence of residential segregation necessitates inequality in service provision; it only makes it easier to produce if it is what city officials prefer to do. In fact, early planning advocates often argued that taking race into account when developing city plans was the key to *protecting* black communities and ensuring that they received, "all necessary municipal services – paving, city water, sewers, electricity, fire, and police protection…" (Knight 1927, p137).[73] While it was clear that public facilities would be separate, some planners insisted that there would be, "equal opportunities and facilities" (Virginia Law Review, 1928, p526). In most places though, inequality was the norm as, "housing segregation…permit[ted] any prejudice on the part of public officials to be freely vented on Negroes without hurting whites" (Myrdal 1944, p618).

[72] As described in detail in Chapter 1, renter segregation remained at lower levels than race segregation throughout this period.
[73] Knight, Charles. 1927. Negro Housing in Certain Virginia Cities, Publications of the University of Virginia Phelps-Stokes Fellowship Papers, Number 8

As Abrams (1955) explains, "though often merged into a single neighborhood, the ghetto was not always a slum nor the slum always a ghetto….the slum-ghetto was created when those of a single ethnic minority group lived not only in a ghetto but also in bad housing" (p76). Local governments contributed to the development of slum-ghettos by providing worse city services to neighborhoods populated predominantly by certain groups. Myrdal (1944) explains that the argument offered in support of these unequal allocations was the (erroneous) belief that whites paid all of the taxes, and so were therefore entitled to all of the benefits. It followed that, "whatever [Negroes] get is a charitable gift for which they should be grateful" (p336).

Over the long run, this pattern of government behavior contributed to the development of negative stereotypes about the people who lived in the slum-ghetto (e.g. that racial minorities or the poor, "*cause[d]* the deterioration of the places in which they live[d]" Hayward 2013, p64, emphasis in original). This is what Glenn Loury (2002) refers to as a "politically consequential cognitive distortion" because the disadvantage observed among a group of people is assumed to be, "intrinsic to that group when, in fact, that disadvantage is the product of a system of social interactions," which then leads observers to be opposed to policy solutions or systemic reform (p26). It was in the early part of the 20th century that the foundation for continuing inequality in the 21st century was laid. By building inequality into the physical landscape, cities added, "unprecedented durability and rigidity to previously fragile and fluid [social] arrangements" (Torres-Rouff 2013, p257).

In Chapter 2, I provided evidence that political power in the hands of opponents could slow or inhibit the enactment of such policies. A similar pattern existed with respect to the distribution of benefits. In many cities, political participation of lower socio-economic status groups and racial minorities limited the degree to which public goods were allocated unequally.

When these groups were able to assert political power through voting strength or in official positions, they received more benefits from municipal governments.

In this chapter, I show that between 1900 and 1940, neighborhoods that were identifiably poor or inhabited by minorities were allocated lower quality services including road paving, public health efforts, and sewer extensions. I draw on detailed data from Atlanta, Birmingham, Baltimore, Boston, Chicago, and Philadelphia to provide this evidence. Where relevant, I discuss mobilization efforts on the part of underserved groups that limited the extent of unequal allocation. I also show that in the case of sewer connections, this inequality persisted into the latter half of the century. Using data from all places included in the Census in 1970, 1980, and 1990, I provide evidence that where minorities and renters were more concentrated (e.g. in more segregated cities) they were less likely to be connected to public sewers.

A common argument promoted in the literature, as early as the 1930s, was that class, not race, was the more important determinant of inequality. A 1932 report commissioned by President Hoover stated, "These conditions of Negro housing in our cities are not the result of any willful inhumanity on the part of our society. On the contrary, they merely emphasize the present shortcomings of our individualistic theory of housing…The Negro's housing problem is part of the general problem of providing enough housing of acceptable standards for the low-income groups in our society" (Johnson 1932, p.viii). Myrdal (1944) also argued that, "in the North there is little, if any, direct discrimination…What inequality there is in the Negro's consumption of public services in the North is due mostly to poverty, lack of education, and other disabilities which he shares with other lower class persons in the region" (p335). Thus, the belief that blacks endured worse conditions than whites solely because of their lower socio-economic status, was widespread. As will be shown throughout this book, this was not true in

either the historical or modern period, regardless of the measures used or the region studied. Race and class exert powerful, independent effects on distributional outcomes.

Jim Crow and Public Goods Inequalities

Until the mid-1950s (and in some places long after), many Southern (and some Northern) cities generated inequalities in public goods by segregating access directly and then underfunding nonwhite services. Of all of the public goods residents sought to secure, none was as important as schooling. As of 1947, all southern states, along with Arizona, Indiana, Kansas, and New Mexico required or allowed segregation of schools (CQ Researcher 1947). Until the mid-1930's, about 75% of public school revenues were completely locally derived (Snyder 1993).[74] In the post-war period state and then later, federal government contributions rose. According to the data described in Chapter 1, localities spent an average of $103 (in 2012 dollars) per capita on schooling in 1902, representing about 35% of total expenditures. Per capita spending rose dramatically over the next 25 years (to $203 in 1927), but not as quickly as other expenditures. In 1927, schooling represented about 31% of local budgets. Until (and in some places even long after) *Brown v. Board of Education* was decided in 1954, racial segregation in schools was generated directly – that is, *residential* segregation was not needed to

[74] Technically, most schools in the United States are governed by approximately 13,000 independent, single purpose governments called school districts, rather than by cities. Not only are the governments that provide schooling and garbage service different entities, with separate budgets and separately elected officials, they do not often share the same boundaries. Today, only about one quarter of cities over 50,000 people have boundaries that are coterminous with a single school district (Fischel 2007). However, the 1902 Census Statistics of Cities reports that, "In most cities [included in the report] the schools are under the control of the city government, or of a school district, practically coterminous with the city" (p21). In his study of modern district boundaries, Fischel (2007) confirms that older cities are much more likely to have coterminous boundaries. It is for this reason that I include a discussion of schooling in this section. The figures cited in this paragraph combine revenue and expenditure for the municipality and the district as reported by the Census. However, it is not proper, even during this early period, to think of expenditures on schooling as being exchangeable with expenditures on other types of services. That is, increasing school spending did not directly impact funds available for policing, although one might imagine a theoretical budget constraint that the voters could impose on all governments. Due to a lack of clarity both theoretically and statistically, for the most part, I do not consider school district revenue and expenditure as part of the municipal budget in the remainder of this book.

ensure that whites and Blacks attended different schools. This was true in both the North and South. As one observer explained, "contrary to the general impression, this doctrine [of segregated schools] is of Northern and not of Southern origin. It originated in fact in the Quaker state of Pennsylvania and the abolitionist state of Massachusetts, and; although it repudiates any implication of a superior and an inferior race and insists on equal opportunities and facilities…" (Virginia Law Review 1928, p526). Litwack (1961) found that, "by the 1830s, statute or custom placed Negro children in separate schools in nearly every northern community" (p115).

In 1912, the Census reported expenditure data on schools separated by race in 40 communities. Unsurprisingly, white schools were better funded than black schools. I estimate that these cities spent about $4 per white resident and about $2.6 per black resident (in 1912 dollars).[75] However, the ratio of spending in black to white schools differed by region. While Northern black schools were not, as the Virginia Law Review implied, equally funded – it was the case that the disparities were greater in the South. For cities in the Midwest, the ratio was 0.846, compared to 0.685 in the Northeast, and 0.573 in the South.[76] School enrollments were also lower among black children. For the 1902-1903 school year, about 56% of black children were enrolled in school in Southern states, compared to 72% of white children (DuBois and Dill 1911, p24).[77] In some places with substantial black populations, no black schools were provided

[75] This is an estimate because I used linear interpolation to estimate the total white and Negro population in each city in 1912. The figure represents the total amount of funding for white and Negro schools reported by the Census divided by my population estimates.

[76] It is important to note that these data only represent a fraction of the communities with black schools or significant numbers of black school aged children (see discussion on page 122 in Financial Statistics of Cities Having a Population of Over 30,000: 1912). The 40 communities included in this special Census report spent less overall on schooling compared to other communities (about $3.6 per capita vs. $4.8 per capita). Compared to data reported in DuBois and Dill (1911), these figures appear to understate the discrepancy in funding between black and white schools.

[77] W.E. Burghardt DuBois, PhD and Augustus Granville Dill A.M., editors, The Common School and the Negro American: Report of a Social Study Made Under the Direction of Atlanta University, No. 16.

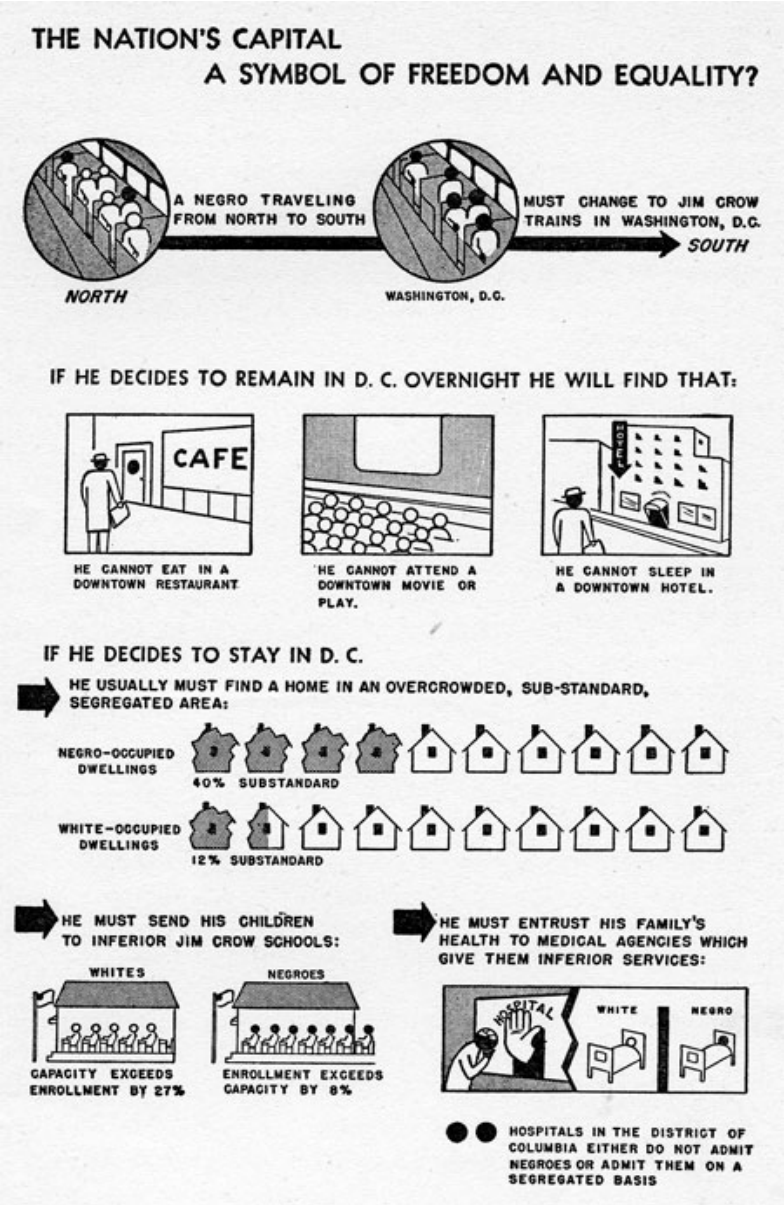
at all (Dubois and Dill 1911). Indeed, as Rabinowitz (1978) has argued, segregated schools actually represented an improvement in many communities because the alternative was complete exclusion – not integration.

Black schools had fewer teachers per child, shorter school years, and inferior physical infrastructure (DuBois and Dill 1911, Myrdal 1944). Teacher pay also differed substantially. For instance, in 1908 Georgia, the average teacher salary for whites was $45.47 compared to $26.37 for blacks (DuBois and Dill 1911). Despite similarly sized populations of white and black school children, Atlanta provided only 15 black grammar schools in 1920 compared to more than 40 grammar schools for white children. But not all white schools were treated equally. Schools serving poor whites (largely immigrants) were also, "older, less well equipped and often more overcrowded" (Myrdal 1944, p338).

Everywhere, blacks paid property taxes that were used to support white schools. Myrdal (1944) explains, "whenever the proportion of Negroes in the population is high, and the standard of Negro schools is kept well below that of white schools, the white educational system can derive substantial gains from segregation. Segregation makes discrimination possible; discrimination means lower expenditures for Negro schools, and the white population thus gets a vested interest in separation" (p341). In 1917, the Negro-at-Large series sought to catalogue reasons for the increasing Northern migration among Southern Blacks. The results of the organization's survey were printed in the Atlanta Independent. The third most important reason (after unhappiness with Jim Crow laws and disenfranchisement) dealt with inequality in school funding. The survey stated, "At present Negroes pay their proportion of taxes directly and a big portion in-directly through their rents, yet Negro schools receive in some cases less than 30 per cent of their just desserts" (reported in West 1976, p14).

However, the extent of inequality differed from place to place. DuBois and Dill (1911) report that in Washington D.C., where blacks sat on the Board of Education and held an assistant superintendent position, "there is no discrimination in the pay of teachers or in the requirements for teachers or in the course of study laid down" (p32). St. Louis and Baltimore both offered black high schools during this period. A 1954 study of inequality in education funding in St. Louis found that black schools were underfunded given their enrollment, but the difference was only about 5% and teacher pay was nearly identical (Russell 1954). In Atlanta, an active chapter of the NAACP sought to mobilize black voting power to improve public services in general and schooling in particular. In spite of a series of restrictions on voting (e.g. the white primary, poll taxes, etc.), the organization was able to register enough blacks to vote to sway some elections (Bacote 1955). In 1919, black Atlantans organized to defeat a bond package that would have solely funded white schools. So, in 1921 sponsors of the referendum sought black support in exchange for a black high school (West 1976).

Schools were not the only public good that was segregated directly during this period. Recreational facilities like parks, swimming pools, bath houses, and golf courses were also designated for white use only in many Southern cities. In Atlanta, blacks had three recreational sites compared to 22 for whites (Kruse 2005, p75). In 1954, The Atlanta Urban League calculated that whites had access to one acre of park land for every 155 residents compared to one acre of park land per every 1020 black residents. As a result, black parks witnessed severe overcrowding and much more rapid degradation (Kruse 2005). Myrdal (1944) writes, "virtually the whole range of…publicly administered facilities…are much poorer for Negroes than for whites" (p335). A graphic from President Truman's Report of the President's Committee on Civil Rights (Wilson 1947) makes the point visibly:



Although Jim Crow legislation was efficient at producing racial inequality, it was not perfect. As the Truman Report explained, "Following the *Plessy* decision, the Supreme Court for many years enforced with a degree of leniency the rule that segregated facilities must be equal. Gradually, however, the Court became stricter about requiring a show of equality"

(Wilson 1947, p82). Separate-but-equal facilities increased costs dramatically (Myrdal 1944). Additionally, some public goods could not be segregated directly. Troesken (2004) argues that, "because most cities and towns installed their water and sewer systems before 1920, during an era of relatively low residential segregation, it was difficult to construct systems that underserved African Americans without also underserving whites" (p91). As a result, he finds that the delivery of clean water and sewage disposal had a dramatic effect on lowering black mortality in the South. Furthermore, in some places, white public opinion had already begun to develop in opposition to overt racial prejudice and blacks were able to make headway in pursuing integration. Boston desegregated its schools in 1855 after sustained protest by blacks and abolitionist whites (Mabee 1968). By 1947, eighteen states had enacted antidiscrimination legislation prohibiting direct segregation (Konvitz 1947). Even some Southern cities (e.g. Atlanta) witnessed a significant local voice in opposition to Jim Crow (Kruse 2005). As direct segregation became untenable and the black population of these cities expanded, residential segregation became the obvious solution. Furthermore, unlike Jim Crow legislation, residential segregation permitted the separation of poor residents from wealthy residents in addition to the separation of residents of color.

Inequalities Generated Through Residential Segregation

When the nonwhite or poor community was segregated residentially, systematic denial of services was possible. A mid-century analysis of "American Negro, Puerto Rican, and Mexican" housing in large cities found that,

> "Garbage collections, building inspections, street maintenance, and other city services are less satisfactory than in other areas. The abnormal number of rat bites in Harlem, for example, may be ascribed not only to proper upkeep but to the ready supply of uncollected garbage in the streets. Southern cities and some in the North omit street paving and sidewalks in Negro sections. In hills sections the residents try to fill gullies in

> the streets with broken masonry, worn-out linoleum, and other trash" (Abrams 1955, p74-75).

In Birmingham, a committee of Black professionals protested the city's 1923 segregation ordinance saying that while blacks "would prefer to live to themselves," black neighborhoods, "are without the necessary sanitary arrangements, street improvements, lights, police protections, and the necessary comforts given other people in the municipality" (Connerly 2005, p44).

Among the most ambitious and expensive public goods that cities developed in the first decades of the 20th century were the delivery of clean water and removal of waste through sewer systems. Sewer and water mains were built along major roads, and homes located along these lines would have had the opportunity to be connected to the system. Troesken (2004) suggests, in a detailed analysis of Savannah and Memphis, that it appears that segregation, "facilitated efforts to underprovide African Americans with sewer and water systems" (p91). I build on Troesken's case studies by analyzing sewer and water extensions over time in four cities: Baltimore, Boston, Chicago, and Philadelphia. These cities all witnessed increases in racial and renter segregation between 1900 and 1940 and had data available on sewer construction.

To measure segregation, I calculated the *H* Index (as described in Chapter 1) for Baltimore, Boston, Chicago, and Philadelphia using ward-level demographic data from the 1900, 1910, 1920, 1930, and 1940 Censuses of Population and Housing.[78] For racial segregation, I use whites and nonwhites as the groups in the calculation of the measure. For class segregation, I use renters and homeowners. Table 3.1 shows each city's *H* index in 1900 and 1940 measuring white/nonwhite segregation and renter/homeowner segregation.

[78] In order to make these scores comparable to modern data, I adjust the scores using a correction factor to make the ward-level estimates similar to the tract-level estimates used in later decades.

Table 3.1: Segregation Increased in the early 20th C					
	Race			Class	
	1900	1940		1900	1940
Baltimore	0.43	0.60		0.07	0.12
Boston	0.33	0.52		0.09	0.11
Chicago	0.46	0.84		0.09	0.15
Philadelphia	0.29	0.44		0.04	0.09

If the argument that I have presented is correct, it should be the case that nonwhite and renter households should have been less likely to have access to water and sewer connections in more segregated cities. Unfortunately, I do not have the individual-level data to test this hypothesis. However, there are also aggregate implications of my theory. If elected officials were taking demographics into account when making decisions about where to build sewer extensions, we should we witness an interactive effect between segregation and the demographics of a neighborhood. As segregation increases, it should be the case that the share of residents who are nonwhite or renters should have a more powerful negative effect on new sewer extensions.

The data I use for this analysis were provided by the Center for Population Economics at the University of Chicago in the Historical Urban Ecological dataset (which is really a collection of many different datasets and maps). The dataset (Costa and Fogel 2015) includes ward boundaries for the four cities listed above between 1900 and 1930 and also includes a map of each city's sewer system. The sewer map includes the year different segments of the system were built. Using ArcGIS, I created counts of sewer segments in each decade for each ward and combined these counts with ward-level data from the Census of Population and Housing.

Observations are arranged by ward-census year. That is, each observation represents one ward in a city in a single year. The dependent variable in the analysis is the *Total New Segments*

built in each ward before the next census. The key independent variables are the share of each ward's total population that is *Black* and the share of occupied housing units that were *Rented* (as opposed to owned). These demographic variables are interacted with each city's *H index of segregation* (for race and class respectively) in a given Census year.

I control for the *Total New Segments* built in the city in each decade to account for the slackening pace of sewer development over time. I include the *Total Segments* built in the ward at the completion of the sewer system to account for the variation in sewer needs across wards. I also control for the proportion of those total segments that were built at the beginning of each decade in the variable *Percent Built*. Finally, I account for the share of the ward population that is *Foreign Born* to account for the possibility that city governments were providing fewer benefits to immigrant neighborhoods (which would have correlated with renter neighborhoods).

An important alternative (and undoubtedly true) explanation to rule out is that black and renting residents chose housing that lacked public services because it was less expensive. I do this by taking advantage of time. I explore the pattern of sewer line extensions in each decade between 1900 and 1940 given the racial makeup of each ward at the beginning of the decade. For instance, the total number of extensions built between 1900 and 1910 is regressed on the share of the ward that was black and the share that were renters in 1900. Because the dependent variable is a count of sewer segments, I fit a Poisson regression.

I was able to obtain data at the ward-level detailing racial makeup for every decade between 1900 and 1940, but data on renters is only available for 1900 and 1940. Because ward boundaries changed dramatically in some cities between these years, interpolation is not possible. Additionally, the Census did not tabulate data on renters in 1940 for the city of Chicago. As a result, adding the proportion of renters to the models significantly decreases the

number of observations. For this reason, I present the model without the inclusion of renters in the first model, and with the proportion of renters in the second.

The results, presented in Table 3.2, reveal a powerful negative relationship between the share of the ward that was black or renting and new sewer extensions in more segregated cities.

Table 3.2: Segregation Decreased Access to Sewers for Blacks & Renters

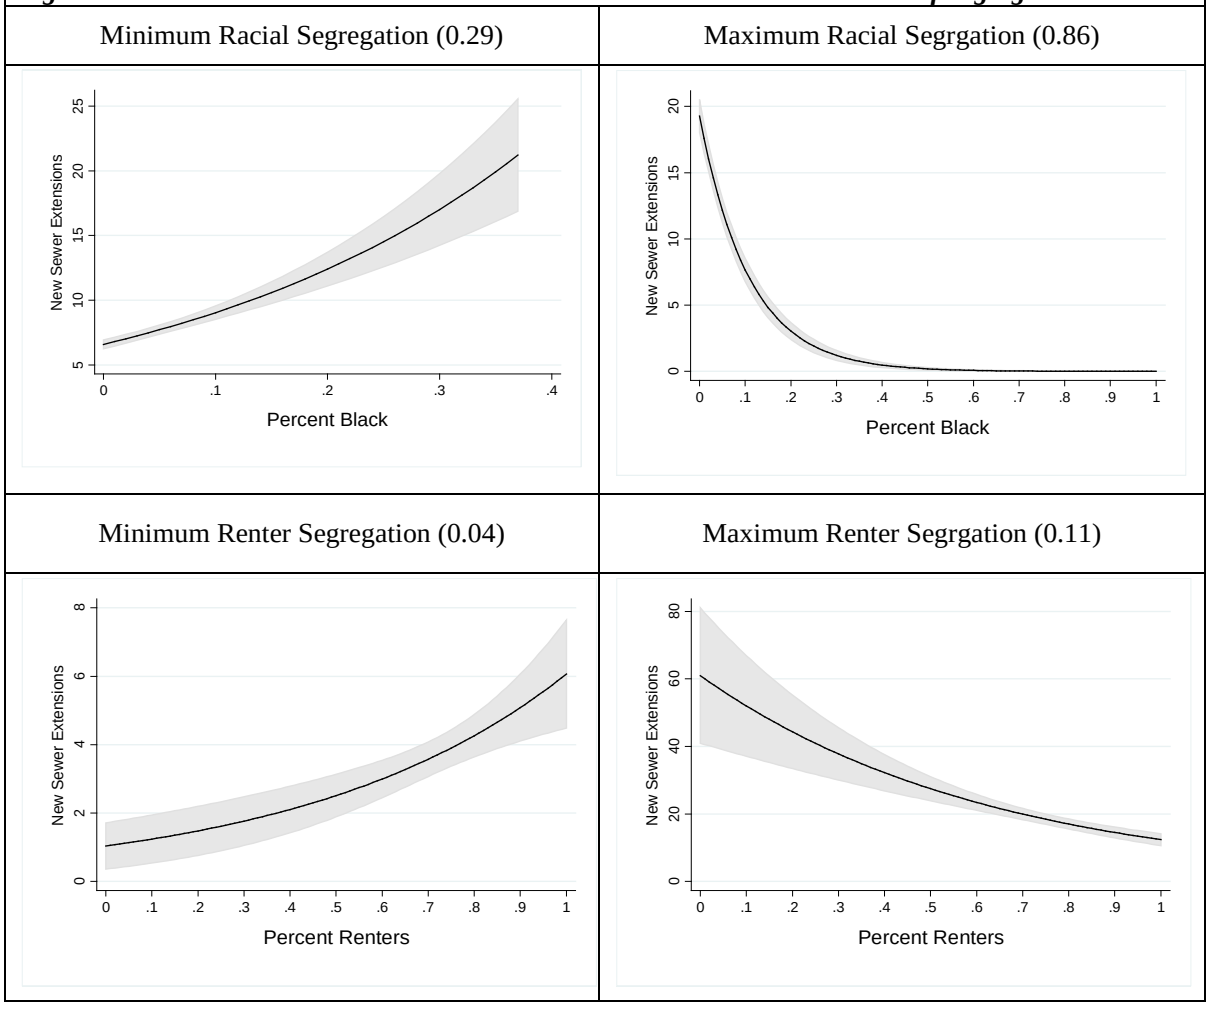
The data indicate that in more segregated cities, heavily black and renter wards were unlikely to receive new sewer lines. Figure 3.2 plots the predicted number of new sewer segments across the full range of black and renter population shares for the least and most segregated city-years in the dataset. The graph in the top right makes clear that majority black wards see no additional investment in their sewer systems. A similar pattern exists for wards with increasingly large renter populations in cities that were segregated by class.

Figure 3.2: Predicted Sewer Extensions at the Minimum and Maximum Level of Segregation



In integrated cities however, the reverse is true: larger black and renting populations increase sewer line extensions. This may seem puzzling at first glance – but it is not. Troesken (2004) explains that the reason for this apparent generosity was self-preservation. He says:

> …discrimination in this arena was costly to white politicians and voters in at least three ways. First, given the networked structure of these systems it was difficult to deny service to African-American households and neighborhoods without also denying service to white households and neighborhoods…. Second, in a world where blacks and whites lived in close proximity, 'sewers for everyone' was an aesthetically sound strategy. Third, failing to install water and sewer mains in black neighborhoods increased the risk of diseases spreading from black neighborhoods to white ones (p9-10).

As a result, to the extent that sewer systems were built prior to rising segregation, variation in sewer system service did not disproportionately affect any demographic group. In Richmond, Virginia, neighborhood segregation actually declined between 1890 and 1930, and one contemporary observer wrote, "With the completion of the 1925 program practically the whole of Richmond was sewered and supplied with city water" (Knight 1927, p51).

In other cities, organized political action on the part of nonwhites and the poor mitigated inequalities. Bond passage in Atlanta required approval of two-thirds of votes cast and the two-thirds majority had to constitute a majority of registered voters – so by simply registering and not turning out, African Americans could ensure defeat at the polls (West 1976, Bayor 1996). In 1919, Black voters defeated a one-million-dollar bond package that was to provide, "for improvement of waterworks, a motorized fire department, erection of a museum at cyclorama, and the construction of a crematory with electricity generating facilities," after being told that, "blacks would receive no benefits from the measures" (West 1976, p13). When a new package was submitted to voters in 1921, it included $2,850,000 for water works and $750,000 for the viaduct (Atlanta Independent, February 24, 1921, p4). The mayor promised to appoint a special commission of colored citizens to advise the Bond Commission regarding the distribution of the

funds (Atlanta Independent, February 24, 1921, p4). On election day, Atlanta's "colored citizens…voted for every improvement named on the ballot" (Atlanta Independent, March 10, 1921, p4).

In some cities, sewers were built at the behest of property owners and developers. This was the situation in Birmingham and Los Angeles. In cities with this type of process, land-owners played a crucial role in the eventual sewer map. Because very few land owners were people of color, blacks in Birmingham and Mexicans and Chinese residents in Los Angeles lacked the opportunity to request sewer extensions or connections. While it might seem reasonable to explain inequality in access as the result of these economic differences, cities had other means by which to compel development. In Birmingham, sanitation and building codes were ignored in black neighborhoods (Connerly 2005), and in Los Angeles the city council ordered sewers to be built at the, "cost and expense of the several parties owning property along its route." However, they declined to compel sewer building in Sonoratown or Chinatown (Torres-Rouff 2013, p224; quoting Los Angeles City Council minutes, April 4, 1873). Because most Mexican and Chinese residents were renters, this refusal was a significant benefit extended to their landlords. As a result, in both cities, the absence of sewer and water service was concentrated in minority neighborhoods.

In this next section, I ask whether this unequal pattern of sewer development continued to affect minority and renting residents in the latter half of the 20th century. In order to investigate this question, I draw on the GeoLytics Neighborhood Change Database which matches and normalizes Census tract boundaries between 1970 and 1990. This normalization allows for direct comparison of tract attributes across time. I use this database to construct the race and

renter *H* index (as described in the previous section) for 4,566 incorporated municipalities and 800 unincorporated county areas.

The dependent variable in my analysis is the share of housing units in a given census tract that is connected to *Public Sewers*. My primary independent variables, similar to the previous analysis, are the share of the tract population that is *Nonwhite*, and the share of households that are *Renters*. These variables are interacted with each city's *H* index *of segregation* (for race and renters respectively) in each year. I control for the proportion of *Wealthy Families* in the tract (those earning incomes above the 90th percentile for a given Census year: $15,000 in 1970, $35,000 in 1980, $75,000 in 1990), the total *City Population*, and the total number of families connected to *Public Sewers* in the city. I include fixed effects for region and cluster the errors by city. The results are presented in Table 3.3 (summary statistics are in table A3.2).

Table 3.3: Nonwhite and Renter Sewer Access in Segregated Cities

R^2	0.327		

As was the case in the early period, between 1970 and 1990 renters and nonwhite residents continued to have inferior sewer access in more segregated cities. Of course today, overall sewer

access is high; the median census tract has 97% of homes connected to public sewers. The point demonstrated by this analysis is that both in the past and today, lack of access to public sewers is disproportionately concentrated among minority and renting residents.

Delivery of other public goods followed a similar pattern to sewer development and clean water provision. In 1900, 8,000 automobiles were registered in the United States; by 1940 the figure was 27.5 million (Federal Highway Administration 1997). But during this same period, actual spending on roads increased very little and dropped as a share of total budgets.[79] This meant that road paving distribution was an intensely political decision and different areas of the city were treated differently. One study of four Virginia cities reported, "a general lack of paving in the Negro residential areas" (Knight 1927, p53). In Los Angeles, Torres-Rouff (2013) explains, "many paved streets ran through the Anglo residential neighborhoods and commercial center but abruptly yielded to dirt as soon as they crossed into Sonoratown and Chinatown" (p226). A 1958 study of Birmingham analyzed white and black blocks in a single working class neighborhood and found that about a third of the black blocks had unpaved streets on three or four sides compared to only 6% of white blocks (Connerly 2005, p31).

As described in the introduction, mortality rates in cities during this time period, particularly the early years, were high. A budding public health movement sought to utilize government funds to address disease contraction and death. Cities created new public health departments, passed regulations regarding the storage and transport of milk, sent inspectors to stores and dairies, and engaged in large scale fumigation efforts. In all of these activities, white and homeowner neighborhoods were treated more protectively than neighborhoods inhabited by

[79] In a sample of 84 cities for which I was able to obtain data between 1902 and 1937, mean per capita road spending was $44 in 1902 (in 1912 dollars) and $43 in 1937. It reached a high of $51 in 1932. Road spending represented about 13% of city budgets in 1902 and about 8% in 1937.

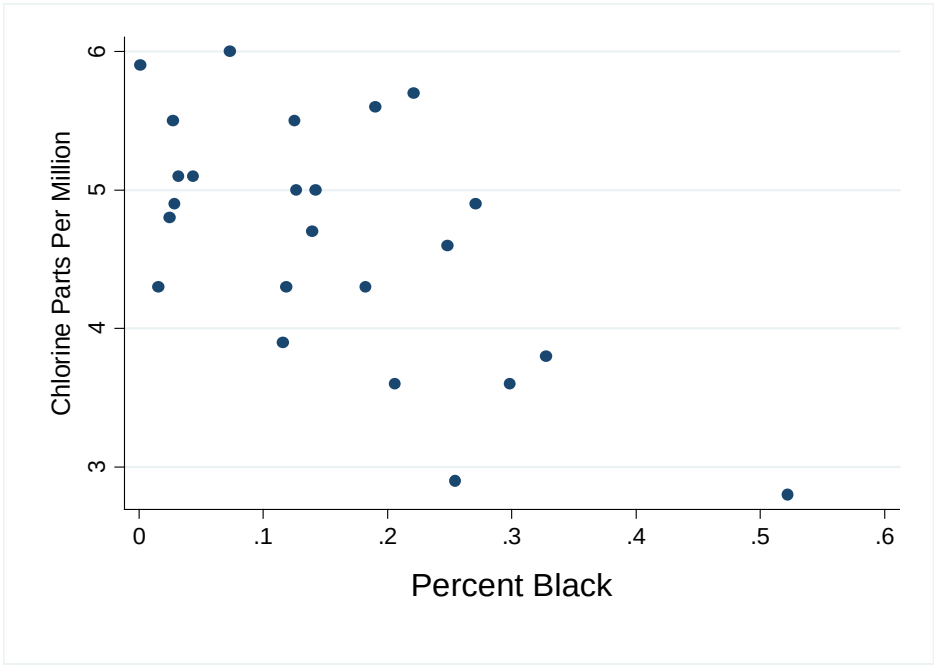
renters and minorities. In 1915, the nationwide infant mortality rate was 57% higher among nonwhites than whites. One study of 4 southern cities determined that nearly 1 of every 2 black babies died (Meckel 1990 p.142). Even still, black infants were "almost entirely" excluded from the "early part of the infant welfare campaign," (Meckel 1990, p142).

A 1914 analysis of Baltimore's Public Health department by the United States Surgeon General found that regulations were not enforced in the poorer parts of town. The report explained:

> An inspection was made by me of the stores selling milk in two of the districts of the city. One was located on the outskirts of the city in a good neighborhood…In every store the milk was sold in unbroken packages, was kept in a separate compartment of a large refrigerator and the conditions were as good as could be expected…The other district visited was of a different type altogether. It was located in the slums, among the foreign population. Here all the milk was sold in bulk under the most insanitary conditions. To make regulations here is practically hopeless. There are but three things to be done – stop the sale of milk in such places, establish a municipally controlled dairy within the district, or prohibit the sale of anything but bottled milk in original packages… (Fox 1914, p37).

In 1901, the Baltimore Health Department (reported in HUE dataset by Costa and Fogel 2015) reported an assessment of water quality in each ward. Only one ward had water that was classified as "Very Muddy" (as opposed to clear, fairly clear, cloudy, or muddy). That one ward was 52% black. The same ward also had the lowest level of chlorination in the entire city. In fact, there was a powerful negative relationship between chlorine parts per million and the share of black residents in a ward. Figure 3.3 provides a scatter plot of the data.

Figure 3.3: Chlorination of Water in Baltimore Wards, 1901



Not only were services provided differentially, but many cities engaged in a practice Rabin (1990) calls expulsive zoning: the placing of negative uses in minority neighborhoods. Kruse (2005) explains that as neighborhoods transitioned from white to black, city officials would assume that property values would fall and the area would become a slum. "Accordingly, planners and zoning committees lowered their standards for the region and began approving projects they would have routinely rejected if the residents were still white" (Kruse 2005, p74). A 1932 analysis of housing in one New Orleans neighborhood reported that, "The superintendent of the public school system used to live in this area but the white residents began to move out and then the city built a garbage incinerator over here, and all of the best whites moved out and the Negroes moved in with the poor whites," (Johnson 1932, p19). In Birmingham, city planners zoned black neighborhoods in flood plains and in industrial areas (Connerly 2005). Myrdal

(1944) reports that it was common to ignore criminal activity in black areas. As Muhammad (2010) explains, municipal authorities allowed crime to flourish in black neighborhoods as a service to white politicians and constituents. Doing so allowed whites access to prostitution, gambling, illicit alcohol and drugs while protecting white neighborhoods from the criminality. Because such operations were, "mostly owned, partially operated, and unofficially regulated by a largely white power structure" (Muhammad 2010 p.227), the benefits were captured by whites, while the negative externalities of vice were borne nearly exclusively by blacks. These strategies created conditions that lead later generations of planners to denote black areas as blighted slums, thus enabling the expulsion of blacks from these neighborhoods in redevelopment projects.

The historical record indicates that lower levels of segregation and more political power in the hands of blacks and the poor could mitigate such inequalities. Throughout the late 1880s, blacks held significant bargaining power in Atlanta city politics. Blacks were appointed to the nominating committees for city elected offices, and black votes were courted with promises of a black fire company, schools for black children, and street paving (Bacote 1955). After the white primary was struck down in 1946, blacks gained even more leverage in Atlanta politics. Black leaders had been pressing the city government for years to hire black police officers, "hoping to solve the problems caused by both the absence and the presence of white policemen" (Kruse 2005, p33), but their requests were ignored until they could marshal votes in city elections. In 1948, eight black patrolmen were hired (although they were only allowed to patrol black neighborhoods and could not arrest whites).

In Birmingham, many black neighborhoods formed active, dues-paying, civic leagues to lobby the city government for improved services. While they won a few small victories (the first city-owned park for blacks, some street paving and lighting, fire hydrant installation, sewer

extensions, and gas lines), they were mostly met with staunch resistance from the all-white government. One organization, the Harriman Park Civic League waited for four months to get an appointment with the public safety commissioner, Bull Connor. When the meeting finally occurred, Connor literally turned his back on the presentation (Connerly 2005, p221). In the late 1960s and early 1970s, as political power began to shift toward black residents, many of the requests brought by the civic leagues were finally addressed.

In Boston, Progressive Reformers attracted public support and won a series of institutional reforms between 1903 and 1913. Nonpartisan neighborhood organizations arose as powerful voices in municipal politics. The result was the consolidation of political power in the hands of middle-class homeowners (Connolly 2009) at the expense of working-class white ethnic immigrant constituencies like the Irish. However, the city was fairly integrated residentially along both ethnic and class lines during these years – and so, while political power shifted hands and the agenda changed, when neighborhoods won improvements like street cleaning and repair, playgrounds, libraries, or improved police protection, they benefitted all residents in the community, not just those with political power.[80]

Between 1914 and 1950, Boston was governed (on and off) by a staunch advocate of the poor and working classes – James Michael Curley. Curley was a machine-style politician, who was never able to consolidate a dominant citywide organization (Erie 1988). Many histories of this period note Curley's lavish attention to the city's, "working-class, ethnic neighborhoods" (Connolly 2009, p146). But the Census data from the period reveal that even the most heavily ethnic wards were actually fairly mixed. In 1930 for instance, wards ranged from 21% foreign

[80] Connolly (2009) argues that this shift in political power altered the agenda of city politics toward neighborhood improvement and away from issues that the working class prioritized like union protections and wage and pension increases (see pages 115-120) and also decreased participation among working-class voters.

born to 42%, and no ward housed more than 11% of the total foreign born population. So when Curley "ordered loans to clean and pave local streets, build a playground and bathhouse, and improve sewer and water serves" (Connolly 2009, p166) in the North End in order to woo Italian votes, non-Italian residents also benefitted.[81]

Yet, in many cities, even when residents and activists mobilized to lessen inequalities, "segregation [became] the cornerstone of the elaborate structure of discrimination against some American citizens," (Wilson 1947). Hayward (2013) explains that the, "black ghetto [was] subjected to systematic disinvestment, while collective investments in new residential and commercial structures, and in 'public amenities', such as parks and athletic facilities and well-built and well-equipped schools, disproportionately [were] channeled to places that were, first legally, then practically, restricted to those constructed as white" (p63). These inequalities contributed to a growing collective sense of whiteness and homeowner identity on the one hand (Sugrue 1996, Hayward 2013), and on the other hand, the hardening of stereotypes about the suitability of poor and nonwhite residents as neighbors. White homeowners believed that individuals who shared demographic characteristics with those who lived in disinvested neighborhoods would bring slum conditions with them wherever they lived. In 1951 and 1953, Rose Helper conducted 40 interviews with real estate agents in New York City and Chicago to learn about the, "reasons for excluding Negroes from white residential areas" (Helper 1969 p18). She reported that the agents believed that, "[white people] fear that their neighborhood will deteriorate if Negroes come because of their manner of living in other areas: they associate Negroes with the undesirable slum (dirt, noise, squalor, stealing, vice), something to be avoided

[81] One scholar (Puleo 1994) estimates that in 1920, 95% of the North End population was Italian (p116). Without detailed data regarding the exact location of Curley's benefits, it is impossible to know the degree to which they served other populations.

if possible" (p79). In response, white homeowners sought continued governmental protection of their neighborhoods. Over the next several decades they succeeded in this fight.

Conclusion

Between 1900 and 1940, America's cities became increasingly segregated along race and class lines. While renters and homeowners both became more concentrated, the most dramatic changes in segregation occurred between blacks and whites. These changes in residential living patterns changed the distribution of public goods. As cities became modern service providers, the allocation of public goods was intensely political. In the earliest years when no neighborhoods benefitted from paved streets or clean water, health and cleanliness did not differ dramatically from place to place. But as streets became sewered, paved, and lit, and as inspectors enforced building, sanitation, and health codes, some neighborhoods reaped the benefits while others, "continued to contend with dirt roads and open cesspools" (Torres-Rouff 2013, p227). As Torres-Rouff (2013) explains, "these decisions produced a city that physically imposed inequality on its citizens" (p227). Such choices would be consequential for the future as inhabitants of these neighborhoods came to be associated with poor living conditions. Today, evidence indicates that segregation is maintained by white homeowners' willingness and ability to pay a premium to live among white, educated neighbors (Cutler, Glaeser, and Vigdor 1999).

Chapter 4: City policy maintains/deepens segregation, 1940-1970

By 1940, segregation patterns in cities were well-established. The boundaries of minority neighborhoods were clearly defined and white prejudice against nonwhite neighbors was entrenched. As one Chicago realtor explained, our "firm has a policy where they won't sell to a Negro in an area where Negroes are not resident…the general public…is not willing to accept the Negro as a neighbor. That's the basis for our not selling to Negroes in this type of an area unless one Negro family is already in the block. You can't be censured then. A silly idea but that's life" (Helper 1969, p41).

The maintenance of property values was the typical explanation offered for these practices; a belief that had been cultivated by policies enacted by local governments and which quickly became a self-fulfilling prophecy. Blacks were seen as undesirable *neighbors* because the features of their *neighborhoods* became associated with individual members of the racial group. Whites came to similar conclusions about Chinese residents in San Francisco (Shah 2001, McWilliams 1964) and Latinos throughout the Southwest (Abrams 1955, Torres-Rouff 2013, McWilliams 1964). This was the case despite the fact that minorities and renters experienced poor neighborhood quality because of paltry municipal services, neglectful landlords, and the overcrowding that resulted from segregation, not from their own doing.

During the build-up of the war effort in the early 1940s, massive demographic changes rippled through the nation. African Americans moved to the North and West, and the war and agricultural industries attracted Latinos to cities and farms in the Southwest (Weaver 1948, McWilliams 1964). In the post-war period, city governments utilized policy instruments like urban renewal and the placement of public housing to prevent minority and poor neighborhoods from expanding into white areas, and to protect property values for white homeowners. At the

same time, tumultuous battles over racial integration (of neighborhoods, schools, busses, lunch counters, unions, etc.), the rising Civil Rights movement, and the passage of the Voting Rights Act, threatened to undermine white homeowners' control of the political system, distribution of city services, and ability to police the borders of their neighborhoods (Sugrue 1996, Kruse 2005, Self 2003).

A great deal of insightful, detailed historical research studying the Civil Rights movement, segregation, and suburbanization has been written about the postwar period and this chapter does not attempt to retell what we already know. Instead, here and also in Chapter 5, I focus on the role of city policy in the generation of neighborhood segregation and suburbanization. An important contribution of these chapters is to explore why, if the drivers of segregation and suburbanization are similar, do white homeowners choose one avenue of separation over another? I argue that policy control plays an essential role. When white homeowners lost the power to adequately guard their neighborhoods and dictate municipal policy and public goods distribution, suburbanization became attractive. First, I show that urban renewal was linked to increased race and class segregation in the postwar period. Then, I demonstrate that whites in racially segregated cities witnessed increasing threats to their political power, both electorally and more specifically, with regard to housing policy.

Urban Renewal and Segregation

In 1932, more than 80% of local revenues came from property taxes (Census of Governments Finance File). By the end of that year, nearly 750 homes were foreclosed every day (Gotham 2000). City government revenue plummeted. Mayors sought relief from Congress; organizing as the National Conference of Mayors and testifying in hearing after hearing about the dire need for federal subsidy (Ogorzalek, forthcoming). As part of its

response, Congress enacted housing legislation. With its first foray into this area, the 1934 Housing Act and establishment of the Federal Housing Administration (FHA), Congress had multiple goals –the reemployment of the construction industry, the shoring up of the financial sector, and the stimulation of home ownership. But these policies were *also* spurred by a commitment to residential segregation. As Gotham (2000) details, the major authors of the proposals under consideration were, "leading officials in the real estate and lending industries" (p303), most of whom, by this time, had come to view race and class segregation as a stabilizer of property values and therefore, made them a conscious goal of these policies. Thus, it should not be surprising that the FHA played a major role in the institutionalization of suburban segregation (Gelfand 1975, Jackson 1985, Massey and Denton 1993).

However, the next piece of housing legislation, enacted in 1937 as the Wagner-Steagall Housing Act, was a conscious turn *away* from these forces. The Wagner Act sought to, "provide financial assistance to the States and political subdivisions thereof for the elimination of unsafe and insanitary housing conditions, for the eradication of slums, for the provision of decent, safe, and sanitary dwellings for families of low income, and for the reduction of unemployment and the stimulation of business activity" (Wagner-Steagall Act 1937). To achieve these goals, the act established the United States Housing Authority (USHA) to, "make grants and loans to local public housing authorities, to enable them to build, own, and operate housing projects for families of low income," and importantly, to clear slums (Robbins 1937, p4). As such, the Wagner Act served as the first Congressional effort to assist in what is now commonly referred to as "urban renewal" – local efforts to address the ravages of time, revitalizing the "urban built environment" (Avila and Rose 2009, p339).

Whereas the establishment of the FHA and passage of the 1934 Housing Act were aimed at assisting those who *could* afford housing in the private market, the Wagner-Stegall Act sought to, "provide decent, safe and sanitary housing for that large group of our population who [could not] afford to pay enough to cause private capital to supply their housing needs" (Brabner-Smith 1937, p681). In addition to focusing on low-income residents, the Wagner Act also understood that, "any realistic approach to clearing slums and rehousing low income families would necessarily include a large number of Negroes as tenants" (Weaver 1940, p150). Thus, the USHA included an Office of Race Relations directed by an African American, Harvard-trained economist, Dr. Robert C. Weaver (Meyer 2000).[82] Weaver's office was charged with reviewing applications for federal funds to ensure that, "sound racial policy may be reflected in all projects" (Weaver 1940, p155). In a 1968 interview, Weaver recalled:

> The Public Housing Program was perhaps one of the outstanding examples of equity of treatment as between white and black Americans….In public housing we not only got approximately a third, as I recall, at one time of the units available to nonwhites--most of them were Negroes--we also got Negro managers, which was unheard of in places like Atlanta and Memphis and Jacksonville and in Miami. We were able in the North to get projects which were open to both Negroes and whites. This required some doing as early as 1937 to '38. These were the exceptions rather than the rules but they did occur. (Weaver Oral History 1968, p9)[83]

Reviewing Dr. Weaver's tenure, *The Crisis* (the official publication of the NAACP) reported, "As a result of his efforts and the support of USHA officials, a more fair and equitable racial policy now exists in USHA than in any other branch of the Federal Government. On the basis of need, Negroes are enjoying equitable benefits from public housing…" (October 1940, p319).

[82] Dr. Weaver was the first African American to earn an Economics PhD at Harvard. He went on to serve as the first black cabinet member as the Secretary of Housing and Urban Development.
[83] Available at http://transition.lbjlibrary.org/files/original/6404ca478ed6c3848eedaaf380acdb45.pdf

However, despite the fact that, "The United States Housing Authority…tried to set…desirable precedents in the field of practical racial relations" (Weaver 1940, p155), the seeds of segregation were embedded in the design of urban renewal; planted by the coalition that brought it to fruition.

The first of these seeds was local control. J. W. Brabner-Smith, Counsel for the Federal Housing Administration explained in 1937 that the, "problem is essentially local and should be decentralized as far as possible" (p.681). Allowing local governments to decide which land would be cleared and where new housing would be built virtually guaranteed the continuation and exacerbation of race and class segregation because white homeowners and land-oriented businesses controlled city governments and opposed residential integration along either race or class lines. Further, these interests quickly moved to ensure control of the new housing and renewal authorities created to direct and manage the process (Hirsch 1983, Sugrue 1996, Gotham 2001). Sugrue (1996) explains, "local governments had the final say over the expenditure of federal funds, the location of projects, and the type constructed" (p60).

In Chapter 3, I provided evidence that city governments underprovided city services and practiced expulsive zoning – the placement of negative uses (like garbage incinerators) in poor and minority neighborhoods. The land values in these areas were low; the environment was degraded. As a result, they were considered blighted. In the early 1930s, local realtors and bankers assisted the federal Home Owners' Loan Corporation (HOLC) in mapping property values of every block of every city in the nation (Gotham 2000). The HOLC's low appraisal of neighborhoods of color and large numbers of renters is well known (Jackson 1985, Weaver 1948). These areas too, were considered slums. In San Antonio, 82,000 Mexican Americans populated a 4-square mile neighborhood west of downtown. Many of the homes were wooden

shacks or converted horse stalls. Tellingly, the neighborhood lacked paved and lit streets, parks, and sufficient sewer capacity (obviously the doing of the local government). Annual flooding created a breeding ground for mosquitos (Fairbanks 2000). Neighborhoods like this *barrio* – predominately populated with people of color and renters – particularly those close to downtowns or homogenous white neighborhoods, were the first to be cleared (Hirsch 1983, Sugrue 1996).

At the same time, in order to preserve property values and access to FHA loans (which required racial homogeneity), white homeowners vigorously blocked the building of low-income and multi-unit housing in their neighborhoods (Weaver 1948, Sugrue 1996, Hirsch 1983). Weaver (1948) reports that even whites living miles away from proposed projects objected to their development on the grounds that their property values would be threatened. Nearly all new housing was provided on a segregated basis – that is, whites and nonwhites were not to live in the same projects (Weaver 1946). In order to provide enough units for racial minorities, and given the few sites that were available for building, many of the public housing projects were constructed as high-rise buildings – which, even at the time, were understood to be less desirable for the successful integration of people in need (Weaver 1946). Thus, as neighborhoods with large populations of renters and people of color were razed, these residents were displaced into even more densely segregated communities. In both the decisions regarding clearance and the decisions regarding the building of replacement housing, local control generated increased segregation.

The second important feature linking urban renewal to segregation was underfunding. Basil Stockbridge, Executive Assistant to the United States Building and Loan League, complained that, “it can readily be seen that the Authority’s activities will hardly scratch the

surface of the real needs of the country in eliminating urban slums and blighted areas" (Stockbridge 1938, p329). The Act required that the development of any new housing be accompanied by the razing of unsafe or insanitary dwellings, "substantially equal in number to the newly constructed dwellings provided by the project" (Wagner-Steagall Act, 1937, p5). But the new housing did not need to be located where the old housing had stood. Additionally, it was possible to raze more housing than was actually built. The lack of adequate funds meant first, that many slums remained, and second, that the number of new, affordable units was generally lower than the number cleared. Because of this, overcrowding in existing poor and minority neighborhoods worsened.

Furthermore, the receipt of federal funds required the local community to contribute funds for construction, typically in the form of land donation and property tax exemption, as well as funds for ongoing operation of the project (Levine 1941). Many cities eagerly accepted the federal dollars, but budgeted vastly insufficient amounts for the maintenance of public housing. So, even though by the 1950s most housing authorities stopped the explicit segregation of public housing tenants, and in some cases promoted peaceful race relations (Weaver 1946, 1956, Collins 2004), the degradation of the units meant that they had already become housing of last resort. Those who could avoid public housing did and preexisting segregation meant that it was whites who could most easily find housing in the private market.

As is true of all large government endeavors, the coalition in support of the Wagner Act and its later revisions was a collection of diverse, conflictual interests. These interests can be roughly categorized as those who emphasized slum clearance versus those who sought "public low-rent" housing (Ickes 1935, p109).[84] The former included business interests who held

[84] Although of course, there was diversity within these broad groups, see Marcuse 1995.

property in and/or relied on a healthy economic market in the downtown of cities, real estate elites, urban planners, homeowners, and local politicians hoping to increase the tax base (Zipp 2012, Ringelstein 2015, Avila and Rose 2009, Gotham 2001, Sugrue 1996). As one journalist representing this set of interests explained, "the housing problem is not merely one of replacing insanitary or unhealthful dwellings for large numbers of our people. More importantly, it involves the whole problem of progressive neighborhood decay, which for years has been eating like a cancer at the heart of every great city in America. The victims of this cancer are not only slum dwellers. In greater number these victims are taxpaying, home-owning families in neighborhoods from humble to well-to-do in all parts of the country" (Lewis 1937, p189).

On the other side were those concerned about the extreme housing shortages among lower-income residents, severe overcrowding plaguing minority neighborhoods, and the influence of slums on lax moral standards and community disorder (Dean 1949, Zipp 2012, Meyer 2000, Hirsch 1983). This group included many low-income and working class residents, people of color, organizations like the NAACP, institutions like the Chicago Defender, unions, and social workers (Meyer 2000, Gotham 2001, Compass 1936).

From the outset, slum clearance supporters, like the National Association of Real Estate Boards, were opposed to direct government provision of housing (Gotham 2001). However, much of the land that local elites viewed as blighted and sought to redevelop was residential, and the areas were often physically quite large. Razing the houses and assembling parcels required eminent domain, which required a clear public purpose. Public housing offered this justification, but only when *local* authorities engaged in the taking – thus necessitating local control.[85] Public

[85] In *United States v. Certain Lands in the City of Louisville* (1935) the 6th Circuit Court ruled that the condemnation of land for slum clearance by the *federal* government was unconstitutional because it did not constitute a use necessary to carry out the powers delegated to Congress. The Housing Act of 1937 thus moved to decentralize

housing advocates worried that local control over site selection and construction would exacerbate segregation (Meyer 2000), but without support from the slum clearance interests, public housing would have collapsed nearly as soon as it started for lack of funding (Marcuse 1995).

When the Wagner-Stegall Housing Act was revised and expanded in 1949 and 1954, power shifted toward the interests favoring slum clearance and segregation. Because the crisis of the Great Depression had abated, slum clearance was much more popular with voters and elites than was public housing (Fairbanks 2000, Zipp 2012).[86] As Gotham (2001) explains, these revisions, "represented the culmination of real estate industry lobbying efforts to curtail the production of public housing, create local redevelopment authorities with broad powers of eminent domain, and provide generous public subsidies for private redevelopment" (p297). By the time the last funds were allocated to local governments in 1974, the program had operated for more than 25 years as a mechanism to maintain and deepen segregation; it was termed the, "successor-weapon to the restrictive covenant and the racial zoning ordinance" (Abrams 1950). According to Collins and Shester (2013), urban renewal cumulatively resulted in the clearance of 400,000 housing units and 57,000 total acres; 300,000 families were displaced, about 54% of whom were nonwhite.[87] But, as we saw with racial zoning in Chapter 2, there was great variation in the local pursuit of urban renewal funds, and thus its effect on segregation.

To provide evidence of the relationship between urban renewal and segregation, I rely on a dataset gathered by Collins and Shester (2013). In their article, Collins and Shester (2013)

housing administration – requiring local housing authorities to be established to receive loans and grants from the federal government and engage in slum clearance and public housing construction (Freedenberg 1941).

[86] The Housing Acts were not the only mechanism cities used to engage in urban renewal, but patterns were similar with regard to other programs. For instance, Barrett and Rose (1999) provide evidence that local business, politicians, and real estate interests utilized highway construction to produce similar outcomes.

[87] Collins and Shester (2013) provide significant evidence that these measures accurately capture urban renewal activity undertaken by cities.

show that slum clearance and urban development programs had quantifiable *positive* benefits on city-level measures of income, property values, employment, and poverty rates. I seek to determine whether or not the program also increased race and class segregation. Collins and Shester's data represent all funds approved and disbursed under Title 1 of the 1949 Housing Act between 1950 and 1974. The data were gathered from the Department of Housing and Urban Development's Urban Renewal Directory. Cities applied for federal grants for particular urban renewal projects, and the directory listed the value of total approved and disbursed grants as of the date of publication. I add to these data each city's level of white/nonwhite and renter/owner segregation in 1980, measured using the *H* Index described in Chapter 1:

$$H = \sum_{n=1}^{N} \frac{P_n}{P_c}\left(\frac{E_c - E_n}{E_c}\right)$$

Where *P* represents total population of neighborhood *n* or city *c* and E is the entropy (diversity) of *n* or *c*. *H* varies between 0, where all neighborhoods have the same composition as the entire city (no segregation), and 1 where all neighborhoods contain only one group (high segregation).

First, I regress *Total Approved Urban Renewal Funds* (in hundreds of millions of dollars) as of 1974, on the *H* Index of *Segregation in 1950*. We should expect that cities with a strong preexisting propensity for segregation should have been the most eager applicants for federal funds. I add a series of city characteristics also measured in 1950 to account for the many demographic and environmental conditions that might have both led cities to seek urban renewal funding and be correlated with segregation. These controls include the proportion of housing units that were *Owner* occupied, *Median Home Value*, the share of housing units that were *Dilapidated*, the share that were *Built Prior to 1920*, and the share that lacked *Indoor Plumbing*. I include *Total Population*, the share of the population that was *Nonwhite*, median *Educational Attainment* of the population over age 24, the log of *Median Family Income*, the *Employment*

Rate, the share employed in *Manufacturing*, and the percentage of families with *Income Below $2,000* in 1949. These variables were all provided by Collins and Shester (2013). I add fixed effects for region, and report robust standard errors clustered by state. Collins and Shester provide data for all cities with more than 25,000 residents in 1950 and 1980 (482 in total), but I only have segregation measures for 172 observations. Tables 4.1 presents the results (summary statistics are in appendix Table A4.1).

Table 4.1: Relationship between Preexisting Racial Segregation and Approved Urban Renewal Funds

	Model 1			Model 2

R^2	0.227			0.679		

Note: OLS regression including fixed effects for region, robust standard errors clustered by state presented.

Table 4.1 reveals that the application for urban renewal funds is strongly correlated with preexisting segregation. Those places that had a propensity for segregation were the most likely to apply for federal funding – even accounting for all of the physical factors that would have generated such applications. Topeka, Kansas, with a segregation index of 0.26 in 1950, applied for about $17.5 million in urban renewal funds over the course of the program. Kansas City, Kansas, where the segregation index was 0.54, applied for nearly $53 million. Atlanta, Georgia, with a segregation index of 0.67, applied for more than $100 million. In Richamond, VA, where

the segregation index was 0.51, city leaders only asked for $37 million. Salt Lake City, Utah with a segregation index of 0.18 applied for less than $5 million compared to Denver, Colorado's application of $83 million with a segregation index of 0.49.

Next, I analyze the effect of urban renewal funding on future levels of *Segregation* (*H* Index measured in 1980), conditional on preexisting segregation (*H* Index measured in 1950). The independent variable in these analyses is *Total Disbursed Urban Renewal Funding* (in hundreds of millions of dollars) as of 1974. I do not have data on renter segregation in 1950, so these analyses use the 1950 level of racial segregation as the control. Again, I present the models with and without demographic and environmental controls measured in 1950. Table 4.2 shows the results for racial segregation and 4.3 shows renter segregation.

Table 4.2: Relationship between Dispersed Urban Renewal Funds and Future Racial Segregation

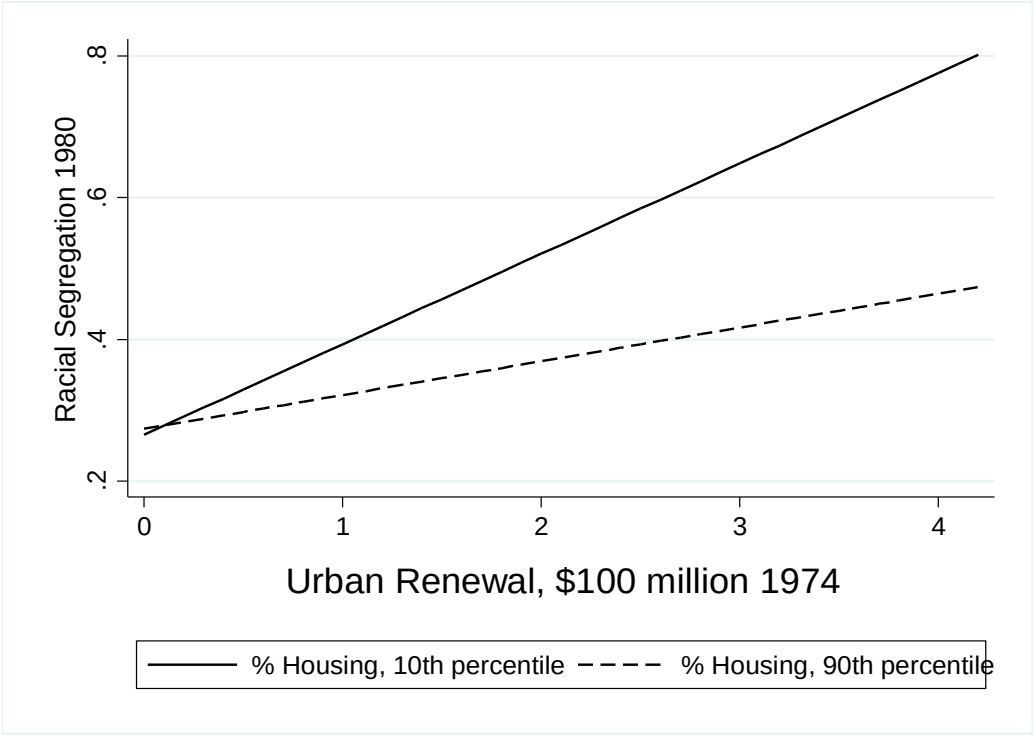
Tables 4.2 and 4.3 reveal that the vigorousness with which a city pursued urban renewal affected the level of segregation after the completion of the program (conditional on starting levels of segregation). The results are much more powerful for racial segregation than for renter segregation. Every additional $100 million in urban renewal funds is associated with a 7% increase in racial segregation, compared to a 2% increase in renter segregation.[88] As was the case for the effects of zoning shown in Chapter 2, local policy implementation is more tightly linked to racial housing patterns than class housing patterns.

This historical evidence indicates that cities varied not only with respect to their participation in the urban renewal program, but also in their investment in the ongoing maintenance of public housing. To investigate this possibility, I add to the data a measure of the

[88] Collins and Shester (2013) use an instrumental variable approach in their analysis. They estimate urban renewal funds with the number of years the city had access to the program as a result of state enabling legislation. Even more powerful results are evident when I replicate their strategy.

share of total expenditures each city spent on *Housing and Community Development Operations*[89] in 1972. I interact this variable with the measure of *Total Urban Renewal Funding* in Model 2 from Table 4.2 above.[90] I also add a control for the number of *Public Housing Units Per Capita* built under the Housing Act (from Collins and Shester) to account for differences in the need for maintenance spending.[91] Figure 4.1 reveals how urban renewal funding operated differently when cities invested in ongoing maintenance and when they did not.

Figure 4.1: Urban Renewal Interacted with Housing Operations



[89] This variable was constructed using the finance data described in Chapter 1. It is calculated as the total dollar amount spent on housing and community development minus housing and community development capital outlays, divided by total expenditure.

[90] Adding the interaction to Model 2, Table 4.3 (analyzing renter segregation) produces a similar effect that is smaller in size than the effect on racial segregation.

[91] Interestingly, the coefficient on this variable is negative – meaning that cities that had more public housing overall were less segregated. However, interacting the number of public housing units with urban renewal funding results in a positive coefficient. This indicates that slum clearance and public housing were both factors in the increase in segregation that urban renewal produced.

In cities that accepted urban renewal funds, but budgeted nothing for operations in 1972, urban renewal had a steep positive effect on racial segregation. In places that provided municipal funds for the maintenance of renewal sites, increasingly vigorous renewal expenditures had a much smaller effect on segregation. Of course, this analysis does not offer causal leverage. It is entirely plausible that the cities that were inclined to invest in maintenance had a social/political culture that led to a smaller increase in residential segregation for other reasons. Whatever the underlying cause was – cities that accepted federal funds without ongoing budget provision for housing operations segregated the most rapidly. This variation aside, generally speaking, where slums were cleared and public housing was built, segregation increased.

Yet, even while urban renewal was largely carried out to the benefit of white homeowners and land-oriented businesses, their control over public policy was not absolute; the rising Civil Rights movement threatened it significantly. As of 1960, not a single large city in the United States had elected a black mayor. By 2010, more than a third had (Vogl 2014). Changes to voter eligibility brought by the 24th amendment and the 1965 Voting Rights Act increased turnout of racial minorities and the poor during this period as well (Filer, Kenny, and Morton 1991).

I use data collected by Vogl (2014) to investigate the relationship between levels of segregation and interracial electoral competition. Vogl (2014) analyzes mayoral election returns between 1965 and 2010 for all cities that had 1960 populations that were at least 50,000 and 4% black (194 cities). His data record the race of the top two candidates (either black or not black) and their vote totals. I add segregation measures to Vogl's data resulting in complete data for

122 cities.[92] During the 1960s, only 13 black candidates sought the mayor's seat in Vogl's dataset; this number rose to 57 in the 1970s, and 84 in the 1980s. Interracial electoral competition was much more likely in more segregated cities. To show this, I regress a dummy variable coded 1 if the election was *Interracial* (e.g. featured a black candidate running against a non-black candidate) on the city's *H* Index of *Segregation* for the election year (interpolated between Censuses). I add the share of the city's residents that were *White* and the share *Renting* their homes, as well as the natural log of total *Population*, and a trend variable for the *Year* as controls. I use a random-effects logit model with errors clustered by city. I restrict the analysis to elections that occurred between 1965 and 1990 in order to focus on the post-war period. The regression includes 731 elections from 117 cities. Figure 4.2 shows the marginal effect of segregation on the probability of witnessing an interracial election, holding all other variables at their mean values.

[92] I am missing pre-1970 segregation measures for 20 cities in Vogl's dataset. I use 1970 segregation for the 36 elections between 1965 and 1970 for these places. Results are robust to the exclusion of these observations.

Figure 4.2: Segregated Cities Saw More Interracial Elections in the Post-War Period

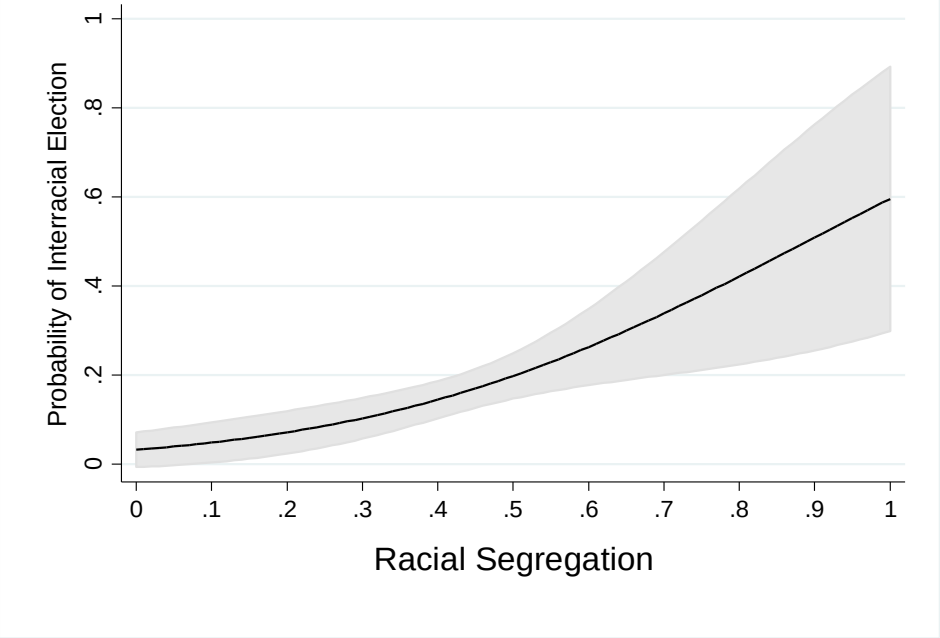


Figure 4.2 makes clear that racially segregated cities were much more likely to experience interracial elections – even controlling for the share of the population that was nonwhite. As will be shown in Chapters 6 and 7, segregated cities are also more likely to have racially divisive politics. Although the dividing lines were in place long before the 1960s, they became much more visible in electoral politics during the postwar period. Elections featuring black candidates (and white contenders) were contentious – driving up turnout among both blacks and whites, and decreasing margins of victory (Vogl 2014, Lublin and Tate 1995, Washington 2006). However, the vast majority of elections were still won by whites. Blacks only won 13% of the 731 contests reflected in Figure 4.2; moreover, these wins were concentrated in places with majority black populations. Although whites maintained power in

most cities throughout the 1960s and 70s, their hold was tenuous. This weakness became increasingly clear through the successes of the open housing movement.

In 1942, only 36% of whites said that they would not be bothered if a black person with their same income and education moved into their block (Schuman and Bobo 1988); the majority of whites, "expect[ed] a vigilant government to protect their segregated neighborhoods" (Sugrue 1996, p63). These beliefs were intimately intertwined with opposition to public housing, which was viewed as "Socialist housing" (Los Angeles Times, March 23, 1952 p E1); specifically, public housing was viewed as, "a taxpayer-subsidized handout for the feckless" (Sugrue 1996, p63). Although a majority of the poor in central cities were white, racial minorities were disproportionately poor and poorly housed.[93] Many whites opposed public housing because they feared, "a change in the racial character of the neighborhood" (New York Times, April 13, 1952, p28). Efforts to locate low-income housing in home-owner neighborhoods and/or integrate white areas was viewed as a government assault on owners', "right to protect one's own property" (Thomas, William P., Letter to the Editor, Washington Post, February 27, 1949).

In order to prevent integration in housing, white homeowners organized neighborhood associations, encouraged vigilant city inspectors to fine overcrowded minority homes, sent hundreds of letters to city governments, turned out in droves at public hearings, and engaged in violent assaults on black residents (Sugrue 1996, Hirsch 1983). But defending white, home-owner neighborhoods was a zero-sum game. For every area that successfully halted integration or low-income housing, another had to absorb (or block) it. This led to a lack of unity among segregationist forces. At the same time, support for scientific racial categorization plummeted

[93] About 62% of persons below the poverty line in central cities were white in 1959. Approximately 14% of whites were poor compared to 41% of blacks (https://www2.census.gov/prod2/popscan/p60-068a.pdf, p7).

(Hayward 2013), and outright, public expressions of racism were, "placed on the defensive" (Hirsch 1983, p175, Schuman et al. 1985).

Advocates of open housing began to win concessions from the government. By 1945, in more than 200 cities, municipal authorities dedicated to maintaining peaceful race relations, established interracial commissions, committees, or agencies that advocated for civil rights reform (Hirsch 1983, p42). These often appeared in the wake of violent riots (Meyer 2000). The racial restrictive covenant, long used by real estate developers and homeowners' organizations to keep minorities out of white neighborhoods, became unenforceable with a Supreme Court decision in 1948 (Abrams 1955). Even before this decision, some municipal judges were refusing to enforce covenants (Hirsch 1983).

Because the government owned and operated public housing, it was an obvious target for constitutional claims of unequal treatment. As early as 1944, New York City enacted an ordinance prohibiting tax-exempt status for housing projects that denied access to tenants on the basis of race. The ordinance had been spearheaded by the city's interracial relations commission. In other places, civil rights organizations pressured municipal housing authorities to integrate public housing; the NAACP brought this matter before the court (Meyer 2000, Sugrue 1996). In 1953, the California Court of Appeals ruled in *Banks* v. *Housing Authority of San Francisco* that San Francisco's Housing Authority must assign residents to public housing without regard to race or color. When the Supreme Court declined to hear the appeal (thereby allowing California's ruling to stand), the case became precedent-setting. By 1954, 21 cities had passed some form of anti-discrimination law (Meyer 2000) and in 1962, President Kennedy signed an executive order,

> directing Federal departments and agencies to take every proper and legal action to prevent discrimination in the sale or lease of housing facilities owned or operated by the

> Federal Government; housing constructed or sold as a result of loans or grants to be made by the Federal Government; and housing to be available through the development or redevelopment of property under Federal slum clearance or urban renewal programs (Papers of Burke Marshall, Assistant Attorney General for Civil Rights).

Not only did cities and states pass anti-discrimination laws covering public housing, some also enacted open housing legislation that sought to prevent discrimination in the private housing market. The leader of the movement was again New York City, passing an ordinance prohibiting, "race, creed or national origin" discrimination in rental housing in 1957 (Bennett 1957b, p9). The ordinance was, "bitterly fought by property owners and real estate representatives" (Bennett 1957a, p7) and explicitly exempted room rentals in single-family homes or duplexes unless they were located in large housing developments (Bennett 1957b). Still, the passage of open housing laws represented clear policy change, largely emerging from the bottom-up. By 1968, 22 states had enacted fair housing laws that covered nearly all sales and rentals (Collins 2006). Such laws were passed in response to vocal, mobilized advocates in black and liberal white communities (Collins 2006). The 1968 Federal Fair Housing Act extended this coverage nationwide.

Despite such policy progress, even as of 1973, the General Social Survey found 64% of white respondents believed that a homeowner should be able to, "decide for himself whom to sell his house to, even if he prefers not to sell to Negroes" (GSS 1973), and a homeowners' rights movement arose in response to the open housing laws. In Detroit, a collection of neighborhood organizations gathered more than 44,000 signatures in support of a homeowners' right initiative (Chicago Tribune, July 13, 1963). The ordinance passed but was declared unconstitutional by the Wayne County Circuit Court in a suit brought by the NAACP (Chicago Defender, December 23, 1964, Sugrue 1996).

In California, after the state legislature passed a fair housing law known as the Rumford Act in 1963, a statewide campaign for its repeal was led by the California Real Estate Association and the California Apartment Owners Association who combined to form the Committee for Home Protection (Self 2003, Duscha 1964, Turner 1964). Proposition 14, confusingly referred to as "The California Fair Housing Initiative," prohibited the state from, "denying, limiting, or abridging the right of any person to decline to sell, lease, or rent residential real property to any person as he chooses."[94] In an analysis of the campaign for Proposition 14, Self (2003) and Brilliant (2010) show that supporters rarely invoked race in their arguments, focusing instead on freedom and property rights. Reporting on the initiative battle, the Washington Post quoted a pamphlet issued by the Committee for Home Protection that stated, "Those who stand for the preservation of individual property rights today are in direct line of descent from the patriots who endured the hardships of the long winter at Valley Forge with George Washington" (Duscha 1964, pA2). Prominent Democrats including Governor Edmund Brown opposed the initiative, and a number of "right-wing Republicans" including Ronald Reagan and Barry Goldwater were "extremely active" in support of the initiative (Duscha 1964, pA2). In the end, the initiative passed with more than 65 percent of the vote, even as Johnson won the presidential race decisively (Greenberg 1964, p1).

Scholars have identified varying patterns of opposition to open housing in different places. For instance, Sugrue (1996) shows that in Detroit, the staunchest integration resisters were working-class white ethnics who owned modest, single-family homes (see pp236-237). In Oakland, Self (2003) finds that it was *not* solely, "an anti-liberal white working class engaged in direct struggle with African American," but rather middle and upper-class whites who,

[94] SALES AND RENTALS OF RESIDENTIAL REAL PROPERTY California Proposition 14 (1964). http://repository.uchastings.edu/ca_ballot_props/672

"understood property rights as sacrosanct expressions of their personal freedom" (p168). Collins (2004) shows that states with higher union membership rates were more likely to pass fair housing legislation and Self (2003) provides evidence that the UAW campaigned against Proposition 14, although Brilliant (2010) argues that rank and file union members were staunchly opposed.

To better understand the individual correlates of opposition to open housing, I gathered data from the 1964 Field Poll in California.[95] Carried out in seven waves between January and October, the poll asked respondents about their support for the Rumford Act and Proposition 14. I recoded these questions to into a variable coded 1 if the respondent *Opposed Open Housing*.[96] I use logistic regression to regress this variable on several demographics including whether or not the respondent *Owns* (vs. rents) her home, her *Race* (coded 1 for white and 0 for nonwhite or other), her *Age*, her level of *Education*, whether or not the respondent or her spouse belongs to a *Union*, and her *Economic Level* (with higher values representing lower classes).[97] In addition, I include a measure indicating whether or not the respondent planned to vote for the *Democratic*

[95] Ideally, I would have analyzed the relationship between community segregation and public opinion on open housing. Unfortunately, the Field Poll recorded no geographic identifiers other than the very broad categories of Northern and Southern California.

[96] For waves 2, 3, and 5, I used the question about the Rumford Act. In waves 1 and 7, no Rumford Act question was asked, so I used a question about Proposition 14 instead. Waves 4 and 6 did not include open housing questions. The text of the questions are as follows: (Rumford Act) Well, as you know the Rumford Act is a Law which makes it illegal for apartment house owners, owners of publicly assisted housing, and real estate brokers to discriminate against anyone because of race, color, religion, national origin or ancestry in the renting or selling of housing accommodations. From what you know of it, do you approve or disapprove of the Rumford Act?" (Proposition 14) "If you were voting today, would you approve or disapprove of this addition to the state constitution? (the amendment reads as follows – prohibits state, subdivision, or agency thereof from denying, limiting, or abridging right of any person to decline to sell, lease, or rent residential real property to any person as he chooses. Prohibition not applicable to property owned by state or its subdivisions, property acquired by eminent domain, or transient lodging accommodations by hotels, motels, and similar public places." Where possible, I use the question about the Rumford Act instead of Proposition 14, because the waves included very different wording of the Proposition question (adding more and less detail about the content).

[97] The coding of this variable is obscure. The codebook suggests that 10 categories were used and lists the following labels "upper," "upper middle," "upper middle," "middle," "middle," "middle," "lower middle," "lower middle," "lower," and "lower." One can only assume that the coders were instructed in some way to make distinctions across categories.

Presidential ticket (Johnson/Humphrey). I cluster the standard errors by poll wave. The results, presented in Table 4.4 paint a clear picture confirming and undermining various aspects of the historical accounts. Summary statistics are presented in Table A4.2.

Note: Logistic regression with errors clustered by poll wave.

White homeowners were clearly in opposition to open housing, as were less educated respondents, Republicans, and union members. After controlling for these characteristics, economic status and age played no role in the determination of political opinions on open housing. Since the earliest years of the century, the most consistent opponents of integration have been white homeowners who came to view the protection of their neighborhoods as a right to be protected by government. These residents understood the "very essence" of Proposition 14 to be the avoidance of, "state involvement in private decisions in the sale of rental of privately owned residential property" (Blake 1964, pK1).

In 1966, the California Supreme Court declared Proposition 14 in violation of the Constitution, and the Rumford Act was allowed to stand. However, the lack of support for open housing among whites and owners would prove to be a formidable barrier for integrationists. Collins (2004) reveals that fair housing policy had little effect on black housing market outcomes

and did nothing to affect levels of segregation. The changes local communities experienced during post-war period would have other long lasting effects. When California voters overwhelmingly supported Proposition 14, they also overwhelmingly supported Johnson (over Goldwater) for president. Many contemporaries and scholars would explain this apparent inconsistency as Mark Brilliant (2010) does:

> Californians who voted *for* Prop 14 but *against* Goldwater were not so much signaling a wholesale rejection of civil rights…They were, however, hoisting a 'no trespassing' sign. They drew a line that cordoned off a more public sphere where the state could and should protect against discrimination from a more private sphere where no such state laws could tread (p206).

As Kruse (2005) so forcefully demonstrates, and I quantify in Chapter 7, this turn toward understanding neighborhood protection as a right (rather than a racist act), did not, in fact, represent an expression of newly discovered profound principles. It was, rather, a means to a segregationist end, and would serve as the rhetorical foundation for a rising conservative movement. More immediately, the rise of black candidacies, the advancements of the Black Power and Civil Rights movements, and the changes to public policy encompassed in the Voting Rights and Fair Housing Acts all threatened white control over central cities. At the same time, numerous federal and local policies made suburban living an attractive option – one that would offer white homeowners more complete control over the political arena. The next chapters offer evidence of these patterns.

Chapter 5: The Rise of Suburban Segregation, 1970-2011

In 2012, the Manhattan Institute issued a report entitled "The End of the Segregated Century," declaring that, "all-white neighborhoods are effectively extinct," (Glaeser and Vigdor 2012). Though not all demographers shared the optimism of Glaeser and Vigdor, many trumpeted the decline of neighborhood segregation in America following the release of the 2010 Census (Frey 2014). While segregation *between neighborhoods* has declined, another type of segregation has remained remarkably stable, even rising in the post-war period. Segregation *between cities* is persistent along both race and economic lines (Fischer et al 2004, Massey and Hajnal 1995). This means that while integration within cities has increased, cities as a whole have become less racially and economically diverse over time. As a result, a greater share of total segregation in metropolitan areas is now accounted for across cities rather than within them (see Chapter 1). This is what is commonly understood as the process of suburbanization.

While we have substantial evidence on the role federal policies have played in generating suburbanization (Jackson 1985, Massey and Denton 1993, Hayward 2013), our understanding of the ways in which local politics affects suburbanization has been limited. In previous chapters, I argued that segregation was pursued by local governments in order to enhance property values and make it possible to target local public goods towards white homeowners and land-oriented businesses. Such strategies, combined with political control of city councils and mayors' offices, ensured that local governments operated to protect the homogeneity of white homeowner neighborhoods and provide them with disproportionate benefits. In the post-war period, this control was threatened by increasing minority electoral participation and policy achievements. Here, I demonstrate that these changes contributed to suburbanization.

The analyses in this chapter rely on a measure of segregation that incorporates patterns of sorting both within cities and between cities and suburbs. This strategy offers an advancement over previous scholarship because it allows for a consideration of residential sorting at multiple geographic levels at the same time. Most scholars focus either on metropolitan level segregation (e.g. Dreier et al. 2004, Jackson 1985) or neighborhood segregation (e.g. Massey and Denton 1993) – but these types of sorting are intricately linked. By drawing on a nested measure of segregation for all metropolitan areas over a long time span (1980-2011), I am able to show that residents traded one type of homogeneity for another in response to political outcomes. I utilize time lags and metro area fixed effects to handle the problem of endogeneity, as race and class sorting can, in turn, generate different political outcomes (Massey and Hajnal 1995, Friesema 1969, Nelson 1992). In this chapter, I analyze the relationships between cities within metropolitan areas. I concentrate on the ways in which the politics of the central city (the city with the largest population in the metro area) affects demographic residential patterns in the suburbs. I find that when central cities elect minority mayors, when central city expenditures are higher and favor policing, a greater share of metropolitan area segregation is accounted for between cities rather than within them. I also show that in metropolitan areas where land use regulations are stricter in the suburbs than in central cities, more segregation is accounted for across cities. In short, when central city politics do not favor their interests, white and upper class residents are more likely to reside in different cities rather than in different neighborhoods and they lock in these sorting patterns through public policy. In the final section of the chapter, I show that communities with more whites and homeowners receive a disproportionate share of municipal spending.

Understanding the Link Between Segregation and Suburbanization

People choose where they live based, in part, on the types and quality of public goods and services provided in a community, as well as the taxes required to provide those goods and services (Tiebout 1956, Ely and Teske 2015, Banzhaf and Walsh 2008). However, not all residents are equally able to match these preferences with housing location. Low-income households have less choice than do high-income households because amenities (including schools, parks, and public safety) are capitalized into housing prices and rents. Racial and ethnic minority households have also been severely limited in their ability to live where they choose. In part, this is the due to the fact that minorities have lower average levels of income and wealth. But, as previous chapters have shown, it is also the result of concerted efforts by white homeowners to segregate them.

The long history of enforced racial segregation in America has been well documented. Between 1900 and 1940, neighborhood-level residential segregation expanded dramatically throughout the United States (Cutler, Glaeser, and Vigdor 1999). A variety of mechanisms ghettoized racial and ethnic minorities including violence and intimidation perpetrated by white residents, restrictive covenants written into housing deeds, and racial steering by real estate agents (McWilliams 1964, Sugrue 1996, Kruse 2005, Lassiter 2006). As previous chapters have shown, local, state, and federal policies also worked to establish and perpetuate segregation along race and class lines. Through actions like the passage of racial zoning ordinances (Chapter 2), the generation of neighborhood investment ratings through the Home Owners Loan Corporation (Hillier 2005), and official acquiescence to violent activity in protection of homes and neighborhoods (Hirsch 1983), governments pursued policies that limited the mobility of minority households (Ross 2008) between 1900 and 1940.

Around the time of the Second World War, patterns and strategies of segregation began to change. Segregation levels within cities leveled off, but ghettos grew much larger when minority populations increased in cities outside of the South (Cutler, Glaeser, and Vigdor 1999). Similar to previous decades, white homeowners utilized a variety of mechanisms to bar minorities and renters from moving to their communities. Organizing collectively through homeowners' associations, white homeowners controlled government decision making on matters such as the razing of slums, the rebuilding of downtowns, the placement of public housing, and zoning decisions that concentrated negative externalities in poor and minority neighborhoods.

However, as Chapter 4 revealed, starting slowly during the 1940s and then more rapidly during the 1950s and 1960s, white homeowners began to see their exclusive political control chipped away. The massive influx of wartime workers dramatically changed the racial and socioeconomic makeup of many large cities. In the 157 cities that had populations of at least 50,000 in 1940, the white population share declined about eight percentage points between 1940 and 1970 (from 90 to 82). By 2011, the white share of these cities decreased drastically to 52%. However, the share of renters *also* declined during this period, as homeownership rates expanded.[98] At the same time, black and Latino Americans' sustained battle for civil, economic, and political rights gained ground. As racial minorities began to contest and even win political representation, the open housing movement brought the possibility of neighborhood integration, and civil unrest coursed through many large cities. This period became fraught with uncertainty

[98] I only have time series data on homeownership rates for 60 cities. In these places, the share of homeowners rose from 35% in 1940 to 48% in 1970. Nationwide, the homeownership rate expanded from 43.6% to 63% during this period (Bureau of the Census, Historical Statistics of the United States, Colonial Times to 1970). http://www.census.gov/library/publications/1975/compendia/hist_stats_colonial-1970.html

and fear for many whites placed an increasingly high value on segregation as they joined the ranks of homeowners.

Cutler, Glaeser, and Vigdor (1999) provide evidence that since the 1990s, white homebuyers' willingness to pay a premium for homogenous neighborhoods is the central factor perpetuating segregation. Overt racism has decreased dramatically over the last several decades (Schuman et al., 1997), but whites continue to express a preference for same race neighbors (Charles 2003) and minority neighborhoods continue to be perceived as having poor-quality amenities (Bobo, Kluegel, and Smith 1997, Ellen 2000, Emerson, Chai, and Yancey 2001, Krysan 2002, Bayer, Ferreira, and McMillian 2007). Ellen (2000) shows that a growing black population leads whites to leave neighborhoods and/or be unwilling to enter them. Card, Mas, and Rothstein (2008) report a distribution of tipping points (the size of the minority population that affects white population flows) ranging from 5% to 20%. Once a neighborhood reaches the tipping point, it quickly becomes predominantly inhabited by racial and ethnic minorities. White preferences for homogeneity are undoubtedly enhanced by persistent discrimination in the real estate and mortgage industries which limit minority access to some neighborhoods (Pager and Shepherd 2008, Gaslter and Godfrey 2005, Bobo 2001, Farley et al. 1994, Bobo and Zubrinski 1996).

However, while white preferences for white neighbors help to make sense of the fact that whites live in different *neighborhoods* than nonwhites, they do not help to clarify why whites live in different *cities*. Why, even as neighborhoods have grown more integrated, have cities become less so? The answer is politics and political control. Boustan (2010) finds that residents are willing to pay a 7% premium on housing in order to live in a higher-income suburb, in part, to gain access to higher school quality and lower property tax rates. Baum-Snow and Lutz

(2011) and Lassiter (2006) provide evidence that court-ordered integration of city schools led some white parents to seek out homogenous, suburban school districts. Kruse (2005) shows that when Atlanta's whites lost segregation battles and political control, many chose suburban homes. I build on the findings of these scholars to show that suburban sorting along race and class lines is also linked to central city elections of minority mayors, larger city budgets and a greater share of spending on police.

The rapid increase in the population of the suburbs during the post-war period was mostly not the result of white flight. Rather, rising incomes, low-cost federally-backed mortgages, the lucrative federal mortgage deduction, new housing construction in suburban tracts, and an extensive highway system all worked to bring residents to the periphery (Gotham 2000, Nall forthcoming). Yet, in the early decades of the post-war period, suburban living was much more accessible to whites and homeowners than to people of color and renters (Kruse and Sugrue 2006, Jackson 1985). This pattern eventually changed, allowing many racial minorities and renters live in suburban communities today (Frasure-Yokely 2016). However, as Briffault (1990) explains, "the increased heterogeneity of suburbia as a whole is usually not matched by a greater diversification *within* particular suburbs. There are now more poor and working-class people, more minorities and more industrial and commercial sites in suburbia. But poorer, working-class or black suburbanites are likely to live in different jurisdictions separate from those inhabited by affluent or white suburbanites" (p353). These trends have converged to increase divisions along race and class lines across city lines (C.S. Fischer et al. 2004, M.J. Fischer 2008).

In previous decades, processes of consolidation and annexation made city boundaries malleable so that those moving away from the center of the city would have resided within city

limits (Teaford 1979). However, in the post-war period, state annexation laws changed and political boundaries ceased to keep pace with residential spread (Briffault 1990). As a result, the number of incorporated municipalities in metropolitan areas grew and suburbs gained population, economic activity, and political power (Danielson 1976, Miller 1981, Burns 1994).

As independent municipalities, suburbs have the power to regulate land use for all parcels within their borders. Local governments employ land use regulations to manage the character of their community. Consequently, regulatory environments vary significantly from place to place. Cities are capable of enacting minimum lot sizes so that all development must be located on a certain acreage of land, requiring developers to preserve open space in their development, determining the number of multi-family units that will be allowed within city limits, requiring developers to pay a share of infrastructure improvements associated with new development, offering short/long review periods for zoning changes and building permits, and involving few or many local actors in the approval and planning process. Gyourko et al. (2008) find that there is a strong, positive correlation between different regulations. Specifically, if a city regulates in one area, it is significantly more likely to regulate in other areas as well. Einstein et al (2017) provide evidence that the accumulation of regulations reduces the supply of multi-family housing by allowing residents opposed to development to delay the process and file lawsuits. Gyourko et al (2008) also find that community wealth is positively related to regulatory environments. Places with high median home values, more college-educated residents, and higher incomes are most likely to police land use.

Public Opinion on Local Spending

In order for political preferences to be related to population sorting, it must be the case that different groups have different orientations toward government spending and different

policy priorities. At the national level, the gap between white and nonwhite support for government programs like social services, education, and assistance to the poor, as well as beliefs about the optimal size of government is persistent, systematic, and substantively large (Kinder and Winter 2001, Winter 2006, Jackman 1994, Tate 1994, Kinder and Sanders 1996, Dawson 1994, Bowler and Segura 2011). A related, but distinct gap between high and low socioeconomic status individuals also exists (Gilens 2005, Bartels 2008). Whites and the affluent tend to favor limited government while people of color and those of lower socioeconomic status are more supportive of spending and intervention. In an overview of this large literature, Hutchings and Valentino (2004) explain that the black/white opinion gap typically ranges from 35-50 points on matters dealing with race (like affirmative action and government aid to minorities), and more than 20 points on policies that are not explicitly racial, like government spending on welfare, social services, and education (see also Winter 2006, Federico and Luks 2005, Sears, Hensler, and Speer 1979, Kinder and Sears 1981).

There is less research on these questions at the local level, but scholars have found large racial and socioeconomic status divides with regard to candidate choice (Hajnal and Trounstine 2013b, Hajnal 2009), satisfaction with city services (Hajnal and Trounstine 2013a, Van Ryzin et al. 2004, Durand 1976), and trust in government (Rahn and Rudolph 2005, Marschall and Shah 2007). Hajnal and Trounstine (2013b) find that the largest divide in support for mayoral candidates is black versus white residents, with the divide between Latinos and whites close behind. The divide between Asians and whites is smaller, but persistent, as is the divide between high and low socioeconomic status individuals. In an analysis of the determinants of service evaluations among local residents, Hajnal and Trounstine (2013a) find that race stands out as the most powerful predictor. Again, the largest divides are between black and white and Latino and

white respondents, but class divides are also significant. In sum, white and wealthy residents tend to have more conservative spending preferences and support different candidates than do minorities and the poor at both the local and national levels. When political patterns favor nonwhite and poor interests, white and upper-class residents are inclined to select different localities. In the next sections, I provide evidence of these political contributors to segregation.

Measuring Suburbanization, A New Approach

In order to show that political outcomes affect segregation across city lines, I use a segregation measure that can be decomposed into within-city and across-city components. This measure allows me to take advantage of different predictions depending on the level at which segregation occurs and to control for aggregate preferences for homogeneity. In some metropolitan areas, whites and homeowners tend to be segregated from nonwhites and renters in different neighborhoods (indicating segregation at a low level of geography). In others, race and class sorting is more prevalent across city lines (indicating segregation at a higher level of geography). If a city increases its budget, there is no reason to believe that this would induce residents to sort into different *neighborhoods* but, I argue, it could lead to sorting into a different *city*.

While households may choose residential locations that result in more homogenous neighborhoods for a variety of reasons, only cross-city segregation ought to be affected by the *total* bundle of public goods provided by the city and the election of city officials. Because different racial and economic groups have different preferences for local representatives and policies, when budgets or election outcomes are less favorable to white and homeowner preferences, these residents should be more likely to sort into residential locations outside of city

boundaries.[99] We most commonly think of segregation across city lines as a process of suburbanization, but sorting between suburbs is another version of the same pattern. The result should be an increase in the share of metropolitan segregation across cities as opposed to within them.

To determine whether or not city political patterns favoring nonwhite and renter interests affect metropolitan segregation, I constructed a dataset measuring segregation in primary metropolitan statistical areas from 1980-2011 GeoLytics' Neighborhood Change Database (NCDB) and the 2007-2011 American Community Survey. These data allowed me to create a panel dataset measuring segregation at the census-tract level for each metropolitan area. To measure segregation, I use the *H* Index described in Chapter 1. The *H* Index allows for decomposition of within-city and across-city components.[100] It measures the evenness of dispersal of groups across geographic units (in this case, Census tracts, cities, and metropolitan areas).

The groups I use to calculate the *H* Index here are white/nonwhite, renter/homeowner, and wealthy/non-wealthy. Since 1980, the Census has tabulated the number of residents in each Census tract that self-identify as racially white and ethnically not-Latino; these individuals are classified as whites in my analysis. All other racial/ethnic combinations are classified as

[99] There is no evidence that the inverse is true. When budgets favor white/wealthy preferences, poor and minority residents have not been found to move to communities that prioritize their demands and needs. For instance, Levine and Zimmerman (1999) investigate the potential for states' welfare programs to act as magnets for the poor. They find little support for this hypothesis. The process of gentrification – where affluent residents return to the central city – is another scenario that could lead to movement among poor residents. Here too, scholars have found no evidence that gentrification leads poor households to leave their housing units (Vigdor, Massey, Rivlin 2002). The most likely explanation, of course, is that it is whites and the wealthy who have had the greater ability to choose where they live. Beyond this, political outcomes are typically much more responsive to the preferences of whites and the wealthy (Hajnal 2009; Gilens 2014).

[100] The approach is similar to the one taken by C.S. Fischer et al. (2004) who analyze trends over time in the level at which segregation occurs. In contrast to C.S. Fischer et al. (2004), I seek to determine whether such patterns are related to city policy choices, not just time.

nonwhites. The Census gathers tenure information on all occupied housing units, noting whether they are rented or owned. The share of units rented versus owned comprises my measure of segregation. Finally, the Census reports income categorically, not continuously, so wealthy refers to the share of families in each census tract with incomes above particular thresholds for each census year. [101] These thresholds were determined by calculating the average family income for all Census tracts in the United States for each Census year. The wealthy threshold represents the income bin with its starting point closest to the 90th percentile of the distribution. The thresholds for each census year are: $35,000 for 1980, $75,000 for 1990, $100,000 for 2000, and $150,000 for 2011. All families with this amount of income or more are included as wealthy.[102]

As explained in Chapter 1, the *H* Index measures the degree to which the diversity of subunits differs from the diversity of the larger unit, expressed as a fraction of the larger unit's total diversity and weighted by the subunit's share of the total population. For each census year, I calculate an *H* Index for all cities within a metropolitan area, denoted H_{m_c} and all tracts within each city, denoted H_{c_t}.[103] These *H* Indices reveal how diverse each census tract is given the diversity of the city and how diverse each city is given the diversity of the metropolitan area.

$$H_{m_c} = \sum_{c=1}^{C} \frac{P_c}{P_m}\left(\frac{E_m - E_c}{E_m}\right)$$

[101] I use family as opposed to household income because the NCDB does not report household income at the tract level.

[102] Census tracts range from 0 to 100% wealthy, with a mean of 18%, a median of 13%, and a standard deviation of 16%.

[103] Census tracts are perfectly nested within states and counties. However, in some cases tracts cross city lines. In these cases, GeoLytics assigned the tract to the city containing the largest share of the tract population. In 2011, tracts are weighted by the share of population contained in each city. Observations are unique when defined by year, tract, city, county, and metropolitan area. Tracts located in unincorporated areas within a metropolitan area are combined as a single unincorporated unit. Tracts outside of metropolitan areas are not included in the analysis. I use Metropolitan Statistical Areas and where possible, Primary Metropolitan Statistical Areas as the highest level of aggregation (not Consolidated Metropolitan Statistical Areas which are much larger).

$$H_{c_t} = \sum_{t=1}^{T} \frac{P_t}{P_c}\left(\frac{E_c - E_t}{E_c}\right)$$

P represents total population of the geography *t*, *c*, or *m*.

These two indices can be combined produce a total *H* Index for the metropolitan area which is equal to the *H* Index calculated for the metropolitan area at the tract level, H_{m_t}.

$$H_{m_t} = \sum_{t=1}^{T} \frac{P_t}{P_m}\left(\frac{E_m - E_t}{E_m}\right) = H_{m_c} + \sum_{c=1}^{C} \left(\frac{P_c}{P_m}\right)\left(\frac{E_c}{E_m}\right) H_{c_t}$$

I analyze the percentage of total metropolitan area segregation that can be attributed to cross-city segregation as opposed to within-city segregation. I have one observation per metropolitan area in 1980, 1990, 2000, and 2011. The dependent variable in my analyses is the share of total segregation in a metropolitan area that is determined by segregation across cities versus within them:

$$share_across = \frac{H_{m_c}}{H_{m_t}}$$

My argument is that city politics affects segregation patterns. Because I only have one measure of segregation for each metropolitan area, I analyze the effect on segregation of city politics in the city with the largest population in the metropolitan area. For example, in the Detroit-Warren-Livonia metropolitan area, I estimate the relationship between Detroit's city expenditures and the share of metropolitan segregation that is attributed to whites living in different cities than nonwhites (which happens to rise from 51% to 88% between 1970 and 2011). Table 5.1 provides aggregate descriptive statistics for the central cities versus non-central cities in my analysis as of 2011.

Table 5.1: Central vs. Non-Central Cities, 2011

	Central Cities	Suburbs
% White	58%	73%
% Black	19%	9%
% Latino	16%	12%
% Asian	4%	4%
% in Poverty	21%	12%
% Renters	47%	32%
Median HH Income	$42,796	$61,670
% Wealthy	9%	13%
N	323	4,145

The table reveals that suburbs are whiter, wealthier, and filled with more homeowners than central cities.

In Chapter 4, I argued that in the postwar period, white homeowner neighborhoods felt threatened by increasing electoral contestation by minority candidates and the successes of the open housing movement. Public opinion surveys reveal that racial and income groups are divided over the proper size of government. Further, studies have shown that white opinion on government spending is powerfully shaped by attitudes toward the group perceived to be the beneficiaries of the spending (Nelson and Kinder 1996). During the 1960s and 1970s many central cities became associated with rising crime rates (Wilson 1987). Today, whites link crime and criminality with blackness (Peffley Shields, and Williams 1994; Gilliam and Iyengar 2000, Gilliam et al 1996). For wealthy, white, homeowners with the ability to choose suburban living, it is plausible that the election of minority mayors, increases in the municipal budget, and shares of the budget going toward policing in central cities all may have played a role in encouraging segregation across city lines.

To analyze these relationships, I regress the share of metropolitan area segregation determined across cities on independent variables capturing political and policy control in the

central city. The first is a variable noting whether or not the central city had a *Minority Mayor* (African American, Hispanic, or Asian) at any point in the decade prior to the year in which segregation is measured. These data are from a number of different sources, including Vogl (2014), Hopkins and McCabe (2012), and my own research using websites and newspaper accounts of elections. The variable is a dummy variable coded 1 if the central city had a minority mayor and coded 0 if the mayor was white in all years of the prior decade. Next I add two spending measures: inflation-adjusted *Direct General Expenditure Per Capita* and the proportion of the city budget spent on *Policing.*[104] These variables come from the Census of Governments State and Local Government Finance files from 1977 to 2012.[105] The data are collected in years that end with 2 and 7 and I used linear interpolation to generate estimates of city expenditures in 1980, 1990, 2000, and 2011 to match the Census population data. I add the natural log of the *Population* as a control because large cities have different spending patterns than small cities and size may affect segregation patterns by offering residents greater ability to sort themselves into like neighborhoods. Finally, I add a measure of the *Violent Crime Rate* in the central city to capture local conditions to which both policy and movers might have reacted.[106] These data represent 209 metropolitan areas and include a total of 618 observations. Summary statistics are included in appendix Table A5.1.

There is an obvious endogeneity problem with the assertion that city elections and budgets can affect residential locations. That is, we know that as home-owning whites choose to

[104] Police protection expenditures include, "expenditures for general police, sheriff, state police, and other governmental departments that preserve law and order, protect persons and property from illegal acts, and work to prevent, control, investigate, and reduce crime" Pages 5-58 in The U.S. Bureau of the Census Government Finance and Employment Classification Manual available at: http://www2.census.gov/govs/pubs/classification/2006_classification_manual.pdf

locate in the suburbs as opposed to central cities, the remaining central city population will have different policy and candidate preferences. The success of black mayoral candidates in this scenario is what Friesema (1969) called the "Hollow Prize." To attempt to mitigate problems this pattern might cause for the analysis, the mayoral data are measured in the decade prior to the segregation data and all of the remaining measures are lagged 10 years. Additionally, my analyses include fixed effects for metropolitan area, so that the estimated effects of politics are within, rather than across areas.

Is it the case that politics favoring nonwhite and poor preferences in central cities is associated with additional cross-city segregation? In short, yes. Table 5.2 presents the results.

Table 5.2: Effect of City Spending Patterns on Share of Metropolitan Segregation Attributed to Cross-City Segregation

Minority mayor refers to previous decade, all other measures lagged 10 years

Table 5.2 tells a consistent story. When central cities elect minority mayors, when the spend more money, and when a larger proportion of their budget is spent on policing a larger proportion of the metropolitan area's total segregation along race and class lines is accounted for across cities rather than within them. In short, more liberal policy in the central city leads to more segregation across city lines while more conservative spending patterns in center cities lead to less. As Table 5.1 makes clear, non-central cities are whiter, wealthier, and more heavily populated with homeowners than central cities. This suggests that it is wealthy whites who make the choice to reside outside of the central city when policies favoring poor and minority interests are enacted. Conversely, wealthy white residents choose to remain in the central city when budgets are more austere. Overall, the results are strongest and most consistent for racial segregation. As has been true throughout this book, race is the clearer dividing line.

With regard to racial segregation in particular, the results are powerful. If we compare, on the one hand, a city with a white mayor in the 25th percentile of the distribution on per capita spending and police expenditure, to one with a minority mayor and in the 75th percentile on the

spending measures, the metro-area racial segregation accounted for across cities increases from 35% to 46%. This is equivalent to the difference between the patterns of segregation in the Wichita, Kansas area (*share_across_race* = 0.355), and the Waco, Texas area (*share_across_race* = 0.468) or the Charlotte, North Carolina area (*share_across_race* = 0.358) and the Portland, Oregon area (*share_across_race* = 0.465).[107]

Land Use Regulation and Suburban Segregation

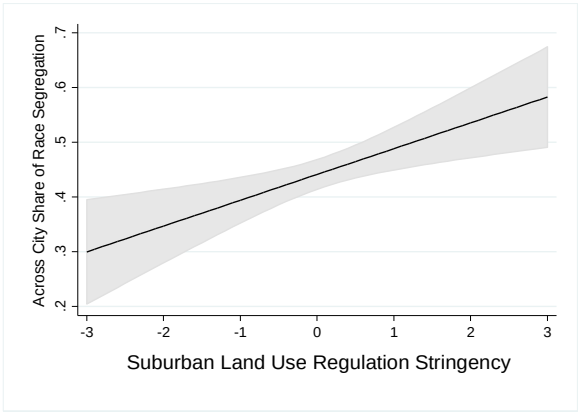
A number of scholars have emphasized the increasing role of land use regulation in the maintenance of segregation (Rothwell 2011, Pendall 2000, Orfield 2002). Scholars have often argued (although not demonstrated), that this tendency has generated a shift from the predominance of racial segregation toward class segregation (Mieszkowski and Mills 1993, Fischel 2004). The work that empirically investigates the relationship between land use regulation and segregation (e.g. Rothwell and Massey 2009, Glaeser and Ward 2006, Berry 2001) has not made a distinction between segregation within cities and segregation across them. This is an important omission, because homogenous suburban municipalities ought to be able to utilize land use regulation much more effectively than homogenous neighborhoods within cities, as municipalities wield more political power. If my argument is correct, that whites and homeowners seek to use local policy to protect home values and control the distribution of public goods, then metropolitan areas with more intense land use regulation in the suburbs should also have greater race and class segregation across cities. This is exactly what I find.

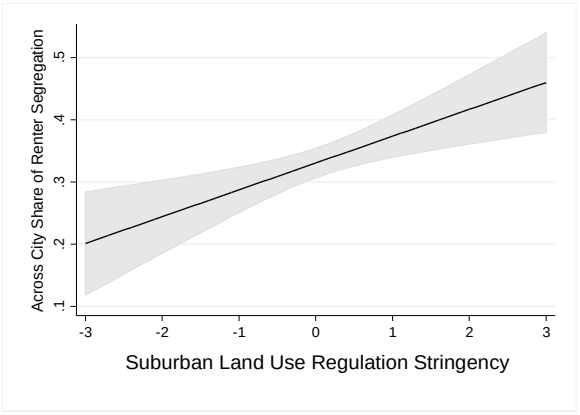
To provide evidence of this link, I use the Wharton Residential Land Use Regulatory Index (WRLURI) developed by Gyourko, Saiz, and Summers (2008). This index is built from a 2006 survey of local governments regarding the characteristics of the regulatory process, rules of

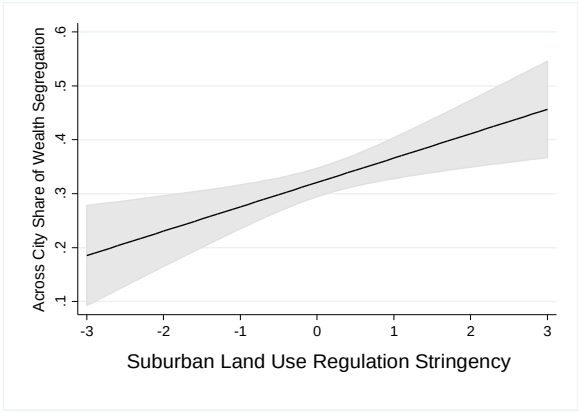
[107] These statistics are for the year 2011.

local residential land use regulation, and regulatory outcomes. These data were combined to measure the, "stringency of the local regulatory environment in each community" (Gyourko et al. 2008, p3). The survey contains data for more than 2,700 municipalities. For each metropolitan area, I determined the average WRLURI for all suburban communities. I then calculated the difference between the center city WRLURI and suburban WRLURI. This difference measure provides an estimate of the degree to which suburban municipalities have more stringent land use regulations than the central city for each metro area. I combined these data with the segregation measures described in the previous analyses – the share of the metropolitan area segregation accounted for across cities rather than within them. The WRLURI data are only available at one point in time, so I analyze the correlation between each region's *Share Across* and the *WRLURI Difference* in 2011 using OLS regression. Figure 5.3 displays the marginal effect of suburban land use regulation stringency on race, renter, and wealth segregation across cities.

Figure 5.1: Correlation Between Suburban Land Use Regulation Stringency & Segregation Across Cities







Suburban land use controls are significantly related to the degree to which segregation is accounted for across rather than within cities in metropolitan areas. The graphs also make clear that there is no difference between the effects of land use regulation on race versus class segregation. They are equally effected.

I've argued that white homeowners institutionalized segregation in order to protect their public goods and property values. The result of these policies in the post-war period has been to increase the disparity in service provision across cities. To show this, I draw on the same spending and segregation data described in the previous section. First, I aggregate all inflation-adjusted expenditures per capita by metropolitan area, for each year. This total expenditures per capita variable represents the collective dollars spent by municipal governments in a metropolitan area. I divide each municipality's expenditure by this total to generate the share of metropolitan spending accounted for by each city. I calculate a similar measure for population, generating the share of metropolitan population accounted for by each city. The ratio of these two quantities, the *Spending Equity Ratio*, is my first dependent variable.

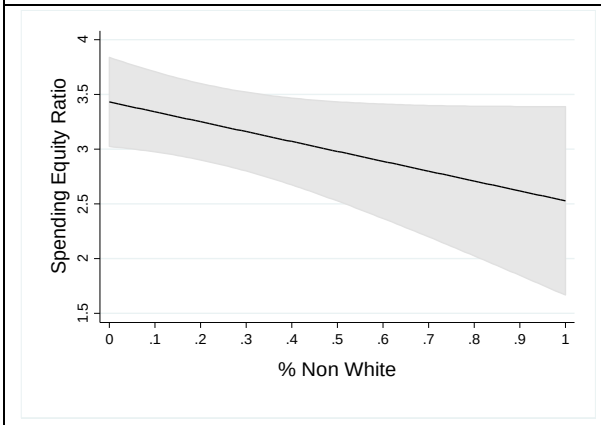
$$Spending\ Equity\ Ratio_j = \frac{E_j/E}{P_j}$$

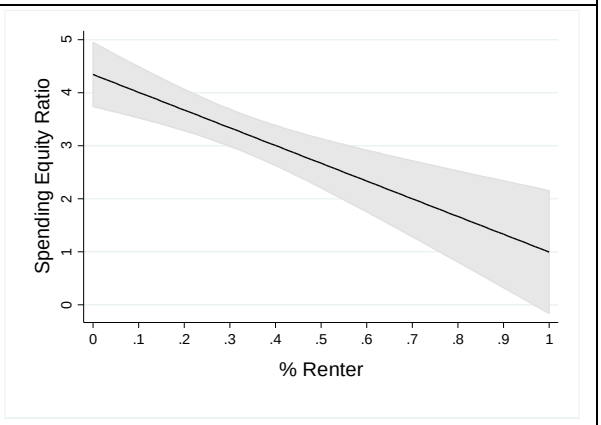
Where E_j is the per capita expenditure by city j, E is the total expenditures in the metropolitan area, and P_j is the share of the metropolitan population represented by city j.

This ratio measures the disparity between the percentage of the population represented by a city and the percentage of total resources received by that population. If resources are distributed exactly equally across the population, the ratio takes a value of 1; values less than 1 indicate that the community receives fewer resources than its population size would predict, and values greater than 1 indicate an abundance of resources. Between 1972 and 2012, this measure averaged 0.4 for central cities and 2.5 for suburbs.[108] Suburban residents receive two and a half times the resources that their population share justifies, while central city residents receive less than half of the amount of resources that their population share justifies. This is the case despite the fact that central cities spend more, on average, per resident than do suburbs. Unsurprisingly, communities with larger populations of racial and ethnic minorities and more renters have a lower *Spending Equity Ratio*. Regressing the *Spending Equity Ratio* on the share of the city that is *Nonwhite* and the share that *Rents* their homes, including fixed effects for years and errors clustered by metropolitan area, yields Figure 5.2.

[108] Calculated for all cities with more than 1,000 residents and all metropolitan areas in which I have data on more than one city.

Figure 5.2: Effect of Race and Class on Spending Equity





Given that cities with more homeowners and more white residents are more likely to garner a larger share of total resources spent in metropolitan areas, we should also expect that metropolitan areas with more segregation along race and class lines will witness more variation in spending from city to city. This is exactly what I find. My dependent variable in this analysis is a measure developed by Rhode and Strumpf (2003) called the coefficient of variation (CV). The CV captures the degree of heterogeneity in spending for a metropolitan area. It is calculated as the ratio of the standard deviation of spending to the mean of spending.

$$CV_{msa} = \frac{\sqrt{\sum_j P_j \left(E_j - M\right)^2}}{M}$$

Where E_j is the per capita expenditure of city j, M is the mean per capita expenditure for all cities in the metropolitan area, and P_j is the share of the total metro area population in city j. Rhode and Strumpf (2003) use this measure (calculated for the entire nation, not by metropolitan area) to show that over time, governments across the United States have grown more alike in their spending. I find the same – the mean CV declined about 17.5% between 1972 and 2012, from

1.32 to 1.09. However, more segregated metropolitan areas changed more slowly than less segregated areas. To see this, I regress the CV on racial, renter, and wealth segregation across cities (H_{m_c}). I add fixed effects for year to account for the declining time trend. Table 5.3 presents the results.

Table 5.3: Correlation Between Spending Heterogeneity and Segregation

	Column 1		
	β	Std. Err	P>|t|
Racial Segregation Across Cities	1.02	0.321	0.001
Renter Segregation Across Cities	1.83	0.661	0.006
Wealth Segregation Across Cities	-0.086	0.917	0.925
Constant	1.295	0.066	0.000
N	3149		
R^2	0.031		

Note: Fixed effects for year included but not presented.

The data reveal that metropolitan areas with more racial and renter segregation across cities – that is, where whites/ nonwhites, renters, and owners tend to live in different municipalities, we see more heterogeneity in municipal budgets. Combined with the results presented in Figure 5.2, we can see that communities with large populations of renters and racial minorities in segregated metropolitan areas have access to a much smaller share of the total dollars spent by local governments. Segregation is correlated with inequality; exactly as its architects intended.

Conclusion

Even after decades of progressive change in racial attitudes and growing concern over income inequality, America remains a segregated nation. Increasingly, segregation along race and class lines has occurred among cities rather than within them. I have argued that city politics has played a role in this change. Overall, whites and the wealthy individuals seek smaller, less

active local governments. When city policy does not favor their interests, these types of residents are more likely to trade homogenous neighborhoods within cities for homogenous cities instead. When central cities in metropolitan areas have more active policy agendas, when they spend more on community development, and when property taxes are higher, we see greater segregation across city lines. Whether this is because white homeowners leave central cities or never move in, the result is a higher degree of separation between cities in metropolitan areas. These patterns become fixed by suburban land use regulations that shape the character and structure of these communities.

Chapter 6: Segregation and Public Goods Provision, 1982-2012

Chapter 5 revealed that suburbanization has produced inequalities in spending patterns from city-to-city and I have argued that this was precisely the goal segregations' proponents. But segregation has another set of consequences that we might say were unintended; consequences for the polarization of politics at both the local and national levels. This chapter and the next make a case for this claim.

Many United States cities function without regular problems. They have well-kept roads, sewers that never overflow, and public parks with swing sets and restrooms. Others, however, struggle to maintain balanced budgets, fail to adequately equip or staff their police forces, and offer little assistance to residents of limited means. What explains these differences? One obvious answer is simply wealth. The history of suburbanization detailed in previous chapters suggests that whites and homeowners have ensconced themselves in homogenous municipalities. Given the strong correlation between race, property ownership, and wealth, income differences across communities could explain much of this variation. Except they don't. Although the relationship is statistically significant, the correlation between city level median income and per capita direct general expenditure is only about 0.037 in my data.

At a very basic level, the generation of public goods requires cooperation. Why is it then that some cities find it more difficult to cooperate than others? Scholars have identified racial/ethnic diversity and changes in diversity as prime suspects in determining under-provision of public goods (e.g. Alesina et al. 1999, Hopkin 2009). Nonetheless, diversity alone does not generate a lack of cooperation in city politics. It is only when cities are also segregated along racial lines that we see lower public goods provision. Segregated places are politically-polarized places. The gulf between whites and minorities in segregated places makes it less likely that

they will find common ground in support of a bundle of taxation and expenditures, driving down collective investment. It is segregation, not diversity that contributes to inequality.

I provide evidence for this argument using election data from 25 large cities between 1990 and 2010 and demographic data matched to city finance data from 1982 to 2012 in more than 3,000 cities. To handle the problem of endogeneity in the finance analysis, I instrument for segregation using the number of waterways in a city. I find that segregated municipalities spend less on a wide range of public goods. This lower spending has consequences. In the final section of the chapter, I find that racially segregated cities also have more sewer overflows per capita.

I focus here (and in the next chapter) on racial segregation alone. A series of tests revealed that renter and wealth division do not produce similar results. These findings are bolstered by the historical evidence which indicates that it is race and not class division that generates the starkest conflicts in city politics. Throughout, I control for indicators of wealth and homeownership to ensure that the results are not conflating race and class.

Literature and Hypotheses

Local politics, more so than national or state politics, concerns battles over space. This is because local governments control the location of negative and positive externalities (like pollution-producing factories or public parks) and also because many of the functions that local governments provide are allocational in nature (e.g. where police officers will be deployed and which roads will be repaved). One of the few powers that is reserved nearly exclusively by local government is that of zoning or planning. As a result, geographic areas within cities (e.g. neighborhoods) are frequently important actors in municipal politics.

At the same time, neighborhoods in America remain highly segregated along racial lines (see Chapter 1). Although neighborhood racial segregation has lessened in recent decades, today, the typical white American lives in a neighborhood that is overwhelmingly white, while Black, Latino, and Asian Americans live in substantially more integrated places (Logan and Stults 2011).[109] These patterns have created stark divides between white and nonwhite communities (Enos 2011). When a city is residentially segregated by race, issues cleave along racial and not just spatial lines (Massey and Denton 1993).

Furthermore, in segregated cities, divisions across racial groups are likely to be exacerbated because the political priorities and opinions of racial groups are likely to be more divergent than they are in integrated places. Neighborhood racial isolation is associated with a high degree of racial intolerance, resentment, and competition among all racial groups (Oliver 2010, Chapter 7). This correlation is due to both self-selection and interpersonal interactions (Rodden 2010). When deciding where to live, people with racially intolerant attitudes often seek same race neighbors (Charles 2003, Boustan 2012) either because they want to minimize contact with other race individuals (Massey and Denton 1993) or because they associate other race neighborhoods with poor neighborhood quality on dimensions such as schools, crime, and property values (Helper 1969, Ellen 2000, Bayer, Ferreira, and McMillian 2007, Krysan et al. 2008). However, living in different types of neighborhoods may also change individuals' perspectives. In integrated neighborhoods, regular, casual interaction may work to counteract dominant, negative stereotypes (Allport 1954, Oliver and Wong 2003). The result of both population sorting and/or neighbors' influence is that individuals who live in homogeneous

[109] African Americans, Latinos, and Asians live in neighborhoods that are comprised of 22%-46% of their own group.

neighborhoods are more likely to harbor negative stereotypes about other groups (Oliver 2010, Oliver and Wong 2003).

Yet, at higher levels of geography (e.g. in cities, counties, and metropolitan areas) it is integration or diversity that correlates with intolerance, prejudicial attitudes, increased racial tension, less cooperative behavior, and lower spending on public goods (Key 1949, Glaser 1994, Branton and Jones 2005, Taylor 1998, Campbell et al. 2006, Alesina et al. 1999, Vigdor 2004, Hopkins 2009, Poterba 1997). As a result, racial competition, racial resentment, and racial conservatism are positively correlated with homogeneity at the neighborhood level, but negatively correlated with homogeneity at the city level (see Oliver 2010 for a detailed account of these conflicting patterns).[110] A severely segregated city is one that is diverse overall and has many homogeneous neighborhoods – both characteristics which point towards a high degree of racial conflict.

This higher degree of racial conflict in segregated cities has obvious political implications. Levine (2014) has found that racial segregation is strongly predictive of partisan political divisions in metropolitan areas and that these political divides result in an unwillingness to cooperate on metropolitan-wide policy solutions. We can expect a similar pattern at the city level. First, in segregated cities, racial groups should be more divided with respect to political priorities. Second, diverse but divided cities may be less able to come to a consensus about the production of basic government services, and thus, will be less supportive of public goods provision. This second hypothesis speaks directly to the claim that diversity drives down

[110] There are a few exceptions to this pattern. A handful of scholars have *not* found that diversity increases tolerance at the neighborhood level. Gay (2006) and Oliver and Mendelberg (2000) find no relationship between neighborhood racial context and racial attitudes. Enos (2016) shows that that homogeneity decreases voter turnout among whites and also decreases support for conservative candidates. Cho, Gimpel and Dyck 2006 find that homogeneity decreases turnout among Asian Americans in some cases, but increases it (or has no effect) in others. Leighly and Vedlitz (1999) find that homogeneity correlates positively with turnout for whites.

collective investment (Alesina et al. 1999). As Benoy Jacob (2013) has persuasively argued, not all diversity is equivalent. When whites and nonwhites live in the same city, the pattern of residential integration ought to factor into expectations about public goods expenditures. White and nonwhites may live as next door neighbors, but they also may not. If segregation represents preferences or attitudes that are incompatible with collective investment, then uneven distribution of groups, not diversity per se, ought to correlate with lower public goods spending.

Segregation and Political Polarization

In municipal politics, vote patterns and policy priorities are shaped by racial cleavages more so than *any* other demographic division (Hajnal and Trounstine 2013a, Hajnal and Trounstine 2013b, Hajnal and Trounstine 2014). While ideology, partisanship, and class all play important roles in determining vote choice and support for municipal administrations, conflicts among racial groups are predominant. If segregated cities are more politically polarized, these racial divides should be most pronounced in places with a high degree of residential segregation. To determine whether or not this is the case, I analyze the relationship between residential segregation patterns and racial divisions in mayoral elections in the nation's largest cities between 1990 and 2010.

To estimate the effect of segregation on racial polarization, I use a dataset compiled by Hajnal and Trounstine (2014) that measures support for winning mayoral candidates across different racial groups in primary and general elections in large cities. The data include 91 separate contests from 25 cities. Vote by race data were compiled from a combination of exit polls, pre-election surveys, homogenous precinct analyses, and ecological inference.[111]

[111] These data are described completely in Hajnal and Trounstine (2014).

Summary statistics and a list of cities included in the analysis are provided in appendix Tables A6.1 and A6.2.

For each election, I calculated the difference in support for the winning candidate between black and white voters, Latino and white voters, and black and Latino voters. The dependent variable in this analysis is the absolute value of the largest difference in support for the winning candidate between any two racial groups. For instance, in Philadelphia in 2003, exit polls reported that 24% of white voters supported the winner, John Street, compared to 88% of black voters, and 47% of Latino voters. In this election the black-white divide was 0.64, the Latino-white divide was 0.23, and the black-Latino divide was 0.41. Therefore, the dependent variable takes the value of the black-white divide, 0.64. In 62 of the 91 contests, the largest divide was between black and white voters, in 13 contests it was the divide between Latino and white voters, and in 16 contests the largest divide was between black and Latino voters.[112] The distribution of racial divides across cases is listed in appendix Table A6.2.

As described in Chapter 1, my primary independent variable is a measure of segregation called Theil's *H* Index. The *H* Index measures the degree to which the diversity in each neighborhood differs from the diversity of the city as a whole, expressed as a fraction of the city's total diversity and weighted by the neighborhood's share of the total population.

$$H = \sum_{n=1}^{N} \frac{P_n}{P_c}\left(\frac{E_c - E_n}{E_c}\right)$$

Where *P* represents the total population of neighborhood *n* or city *c* and E is the entropy of *n* or *c*. *H* varies between 0, where all neighborhoods have the same composition as the entire city, and 1 where all neighborhoods contain only one group.

[112] As an alternate measure of division, I took the difference in support between white voters and the average of support among black and Latino voters. The results are extremely similar.

I calculated the *H* Index for all United States cities using Census-tract level demographic data from the 1980, 1990, and 2000 Censuses of Population and Housing and from the 2011 American Community Survey.[113] To start, I use four groups in the calculation of entropy: white (non-Hispanic), black (non-Hispanic), other (non-Hispanic), and Hispanic/Latino.[114] I then combine Blacks, Hispanics, and Other races into a single nonwhite group for comparison. For reference, the mean *H* Indices for each city in the analysis are shown in appendix Table A6.2.

I include a number of control variables in addition to the *H* Index. One of the primary arguments in the literature is that racially and ethnically diverse populations will have heterogeneous political preferences which then drives low spending on public goods. If this is the case, we should see more racial polarization in the vote as diversity rises. Thus, I include the proportion of *Blacks*, *Latinos*, and *Asian Americans* in the city and a measure of *Diversity* known as the Herfindahl Index[115]:

$$Diversity = 1 - \sum_{r=1}^{R} \pi_r^2$$

I also include control variables that are shown by Hajnal and Trounstine (2014) to affect racial polarization in voting and which may also be correlated with segregation. I account for the *Median Household Income*, proportion of the population *Renting* their homes, proportion of the population with a *College Degree*, the race of the candidates in the election (a dummy variable coded 1 if the election featured *Biracial* candidates), a measure noting whether or not the

[113] Tract-level data for 1980, 1990, and 2000 come from a proprietary product developed by GeoLytics called the Neighborhood Change Database (NCDB), which matches and normalizes Census tracts over time. The data from the 2011 American Community Survey (ACS) are available for download through the Census ftp server located at http://www2.census.gov/.

[114] The 1980 tract-level data only disaggregate the non-Hispanic population into Whites, Blacks, and Others, so I am unable to include Asians as a separate group.

[115] This calculation includes five racial groups: white (non-Hispanic), black (non-Hispanic), Asian (non-Hispanic), Hispanic, and other.

election was *Non-partisan*, an indicator for *Primary* elections, and the size of the total *Population* (logged). Finally, I include fixed effects for year and region and random effects for cities.

In Model 3, I also add a measure of the average *Ideology* among the city's white residents to determine whether or not segregation is merely a proxy for a conservative white population. This measure was constructed using General Social Survey (GSS) data from 1998, 2000, 2002, 2004, 2006, and 2008. Using restricted access data, I geo-coded each respondent in the GSS to his/her city of residence. I then took the mean ideology score for each city's white respondents for each year (higher values indicate more conservative respondents).[116] I interpolated ideology for odd years and then merged these data to the racial polarization data set. In order to preserve as many observations as possible, I matched GSS data from the most recent year for each election.

The results presented in Table 6.1 offer strong support for the hypothesis that more segregated cities are also more politically polarized.

[116] I dropped city/years from the GSS that only contained a single respondent.

Table 6.1: Racial Polarization in Segregated Cities

Note: Multi-level mixed-effects linear regressions with fixed effects for region and year, and random effects for cities.

The relationship between segregation and political polarization is powerful. A city in the 10th percentile of the segregation distribution can be expected to have a 35 percentage point divide between different racial groups' support for the winning candidate, while a city in the 90th percentile of segregation has a predicted racial divide of 63 percentage points.[117] These results hold even with the inclusion of racial demographics. Segregation, not just diversity, matters for polarization. The data also indicate (comparing columns 1 and 2) that there is no significant difference in accounting for segregation among multiple racial groups as opposed to accounting

[117] Estimates were generated from the regression presented in column 1 with all other variables held at their mean values. Predicted effects were generated using the "margin" command in Stata 12.

for segregation of whites from nonwhites.[118] This makes sense given that whites are much more likely to live in homogenous neighborhoods than are other racial and ethnic groups and given that the most pronounced political division is typically between whites and one or more minority groups, rather than among minority groups. These results suggest that political polarization depends on the degree to which *white* residents live in exclusively white neighborhoods.

I have argued that segregation generates political divisions because the politics of space become intertwined with race. It is possible though, that segregation is simply correlated with a more ideologically conservative white population which then generates divides in support for candidates. As the third column reveals, the relationship between segregation and polarization appears to be unaffected by the conservatism of the white population. In fact, the relationship between ideology and polarization is such that cities with more conservative white populations have smaller racial divides, underscoring the conclusion that racial polarization is not driven by ideological divisions. In the next section, I ask whether or not this polarization extends beyond support for candidates to a lack of consensus over policy. In short, I find that it does.

Diversity and Segregation in the Aggregate

Scholars have provided evidence that racially diverse places and those that are becoming increasingly diverse spend fewer public dollars on productive public goods (Alesina et al. 1999, Hopkins 2009). I have argued that segregation, not just diversity, should matter in municipal politics. In the first section of this chapter, I showed that segregation is related to political polarization, even after accounting for racial demographics. If it is the case that segregated populations are less able to come to a consensus over citywide policy decisions, we should also

[118] The 95% confidence intervals for these coefficients are nearly completely overlapping. Additionally, adding both coefficients to the same equation and running a post-estimation Wald test of equality indicates no significant difference.

see less support for government spending in segregated cities after accounting for racial demographics.

In order to analyze this hypothesis, I draw on the Census of Governments city and township expenditure data from 1982, 1987, 1992, 1997, 2002, 2007, and 2012.[119] To these data, I merged interpolated data from the 1980, 1990, 2000, and 2010 Census of Population and Housing, and from the 2007-2011 American Community Survey (ACS). In the broadest sample, I have data for 3,113 cities, which range in size from about 750 residents to more than 8 million.[120] To capture overall spending on public goods, I analyze the effect of segregation on per-capita *Direct General Expenditures.*[121] I follow this with analyses of operations expenditures on specific budgetary categories including *Roads and Highways, Police, Parks, Sewers*, and a combined category of *Welfare, Health, and Housing and Community Development.*[122] I also analyze per capita *Revenues* coming from the city's own residents (as opposed to intergovernmental revenues) as an indication of the burden of funding the populous is willing to bear.[123] All spending data are in thousands of 2012 dollars. Summary statistics are shown in appendix Table A6.3. As above, the primary independent variable is the *H* Index to measure segregation. In the tables and figures below, I present results using the two-group (white and nonwhite) index; results from the multi-group index and isolation index are very similar.

---

119 Available at http://www2.census.gov/pub/outgoing/govs/special60/. Filename is "_IndFin_1967-2012.zip".
120 Data are available for many more cities in 2012 than in prior years (largely because I have Census data for more places in 2011). I only use observations from 2012 that are also included in 2007 to create a consistent panel.
121 All analyses are restricted to cities with non-zero expenditures in the category in question because the data do not distinguish between zero expenditures and missing data.
122 Operations expenditure totals were generated by taking the total spending in each category less any capital expenditures in that particular year. The category of welfare, health, and housing/community development represents the primary expenditures by cities used to directly support people in economic need.
123 In contrast, the categorical expenditure variables include all spending on a certain target regardless of the source of the funds.

To account for the alternative explanation that diversity drives down spending, the analyses include the proportion of the population that is *Black*, *Asian*, and *Latino* as well as a measure of overall *Diversity*. Controlling for demographics also helps account for the fact that white and minority preferences for government spending differ. Racial and ethnic minorities support more government spending than whites on a large number of programs at all levels of government (Hutchings and Valentino 2004). In the aggregate then, we might expect cities with larger populations of racial and ethnic minorities to support more per capita expenditure, just as Boustan et al. (2013) find. But if my theory is right, cities with more segregation and similar shares of minority residents ought to witness smaller budgets and lower spending on public goods compared to cities with less segregation because the likelihood of cooperation ought to be fundamentally different in these types of places.

The analyses below also control for the total *Population* (logged), the proportion of the population *Over Age 65*, the proportion of the population with a *College Degree*, the proportion of each 100 residents *Employed as Local Government* workers, the proportion of households that *Rent* their home, and the *Median Household Income*. These controls are meant to capture demographic dimensions that affect both segregation and expenditures (through both preferences and need). For instance, we might expect cities with large populations of government workers to have higher levels of spending, while the reverse might be the case in cities with older populations. An important alternative explanation for a negative relationship between segregation and spending could be city wealth. Segregated cities might be poorer cities for some reason, and may simply have fewer resources to spend on public goods. Controlling for the proportion of the city that rents and the median household income are intended to account for

this possibility.[124] Finally, I include fixed effects for cities. This allows me to analyze the effect of segregation within the same location over time and controls for the many factors (such as age of the city, differentials in costs for service provision, taxation powers and limits, etc.) that might lead cities to differ in expenditure patterns cross-sectionally. I cluster standard errors by city. I exclude from the analyses cities with only a single Census tract because the measure of evenness is constant (by definition).

I begin, in Table 6.2, by regressing per capita *Direct General Expenditure* on *Segregation* with the controls described above. Then, in the second column, I replace *Diversity* with *5 Year Changes* in racial group shares (following Hopkins 2009) to determine whether or not changes in diversity could be the driving factor.[125] In the third column, I add the mean *Ideology* of city residents (calculated from the GSS for all city residents as described above) to account for the possibility that segregated cities are more ideologically conservative. In alternate models (not shown), I add a control for renter segregation. The coefficient is insignificant and does not affect the results presented below.

[124] In alternative analyses I tested the inclusion of proportion of the city in poverty and median home values with no change to the pattern of results.
[125] Hopkins (2009) uses 10 year changes in racial group shares. I chose 5 years in order to preserve more observations in the time-series. The results are similar with 10 year changes.

Table 6.2 provides strong evidence that segregation and public goods spending are negatively related, even in the presence of changing demographics, diverse populations, and conservative residents. The effects of segregation are substantively meaningful and statistically significant. Increasing the segregation index from the 25th to 75th percentile (from .01 to .10) in the base model lowers per capita direct general expenditure from $1,413 to $1,299. A difference in total spending of more than $100 per resident could dramatically affect the quality of public goods that individuals experience given that the average per capita operating expenditure on police is about $190 and about $51 on parks. In Table 6.3, I show that the depressive effect of segregation extends to individual categories of public goods spending as well.

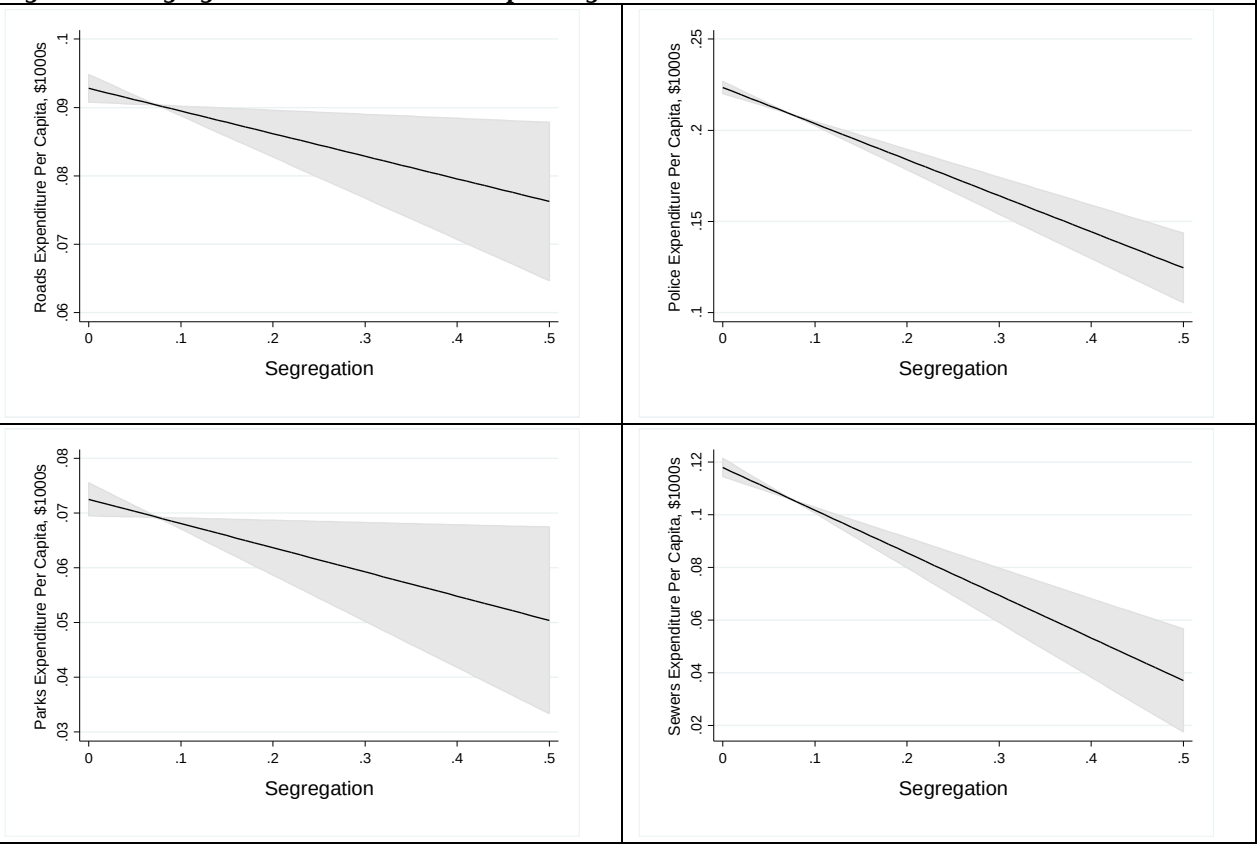
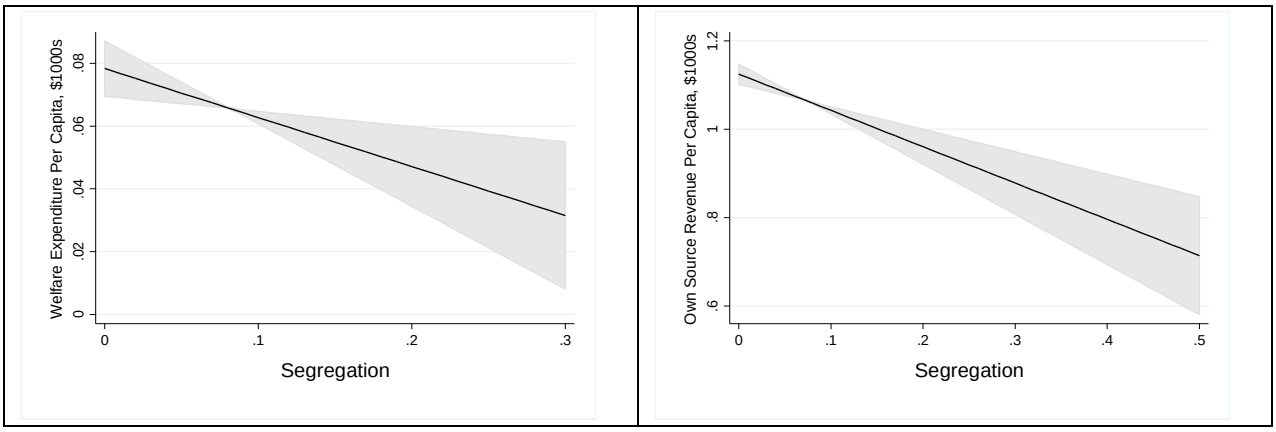
Clearly, spending on public goods is lower in cities with greater segregation. Across all six categories displayed in Table 6.3, segregation exerts a significant negative effect. Figure 6.1 presents these results graphically.

Figure 6.1: Segregation and Public Goods Spending





Note: Figures show the predicted relationship between Theil's H segregation index and per capita spending on public goods in constant 2012 dollars. Gray shading represents 95% confidence intervals.

Tables 6.2 and 6.3 also reveal that while segregation is negatively related to public goods investment, more diverse communities are mostly associated with higher levels of spending as the positive coefficients on diversity and on percent black and Latino indicate. Given that racial and ethnic minorities are both more supportive of public goods spending and more likely to live in segregated places (which see less support for public goods), it is important to ask what the overall impact of these countervailing effects is. Table 6.4 shows how segregation affects public goods provision across the range of values of diversity. I divide the sample of cities into quintiles of percent nonwhite (with 3,366 city-years in each quintile) and then, after estimating the model displayed in column 1 of Table 6.2, I predict Direct General Expenditure per capita at the minimum and maximum values of segregation for each quintile, holding all other variables at their mean values given the quintile. Table 6.4 shows the difference in these predicted values for each quintile of percent nonwhite.

Table 6.4: Change in Direct General Expenditure Per Capita by % Nonwhite at Minimum and Maximum Levels of Segregation

Quintile of % Nonwhite	Average % Nonwhite	Average Segregation Level	Change in Predicted Direct General Expenditure Per Capita*	95% Confidence Interval
1	4%	0.030	-$490	(-$656, -$325)
2	10%	0.041	-$870	(-$1163, -$576)
3	19%	0.066	-$970	(-$1298, -$643)
4	33%	0.108	-$930	(-$1244, -$616)
5	65%	0.125	-$846	(-$1132, -$561)

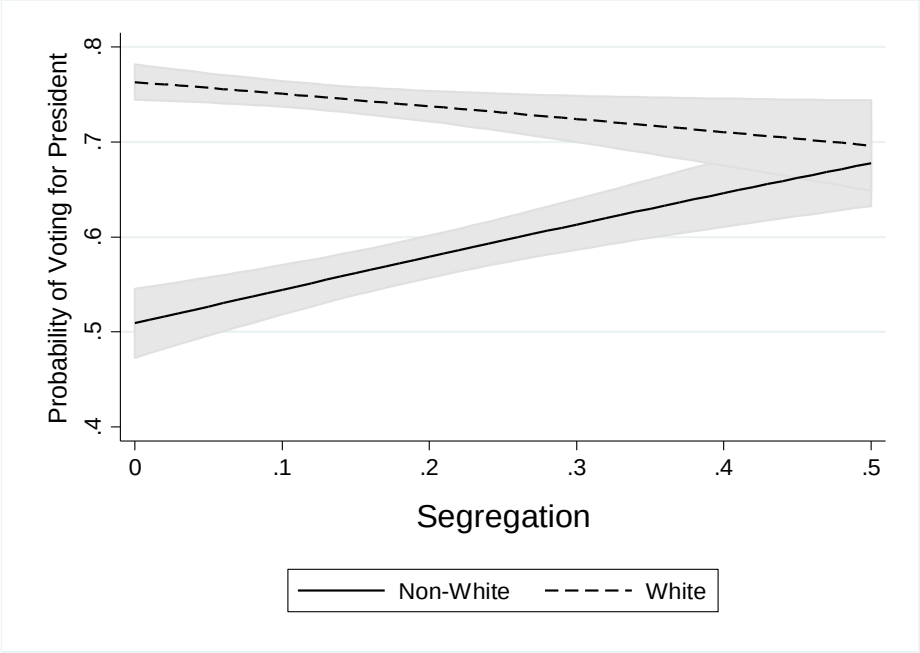
*Predicted values generated from regression displayed in column 1, Table 7.2. Change is from the minimum to maximum level of segregation within a quintile of percent nonwhite.

Table 6.4 reveals substantial declines in direct general expenditure as segregation increases, regardless of the size of the minority population. Segregation has the largest effect in cities with moderately sized minority populations (where minorities comprise 19-33% of the population), but even in majority-minority cities (where minorities make up more than 50% of the population) and cities that are overwhelmingly white, increasing segregation decreases investment in public spending. The fact that segregation has the most pronounced effect in the middle quintiles offers indirect evidence that it is white residents responding to significant minority concentrations driving the negative relationship between segregation and public goods spending. An alternative possibility is that low turnout among minority residents drives this pattern. As Figure 6.2 shows, this case is extremely unlikely, given that turnout among minority residents is actually higher in more segregated cities while turnout among whites is lower.

To test this possibility, I draw on data from the General Social Surveys conducted between 1998 and 2008; years for which I was able to determine respondents' city of residence

(see Chapter 7 for additional details on this dataset). I estimate the probability that a respondent *Voted* in the most recent presidential election. Using logistic regression, I regress this variable on the level of *Segregation* in the respondent's city. To understand how segregation operates differently for different groups, I interact the level of segregation with a dummy variable coded 1 if the respondent is *White and Non-Hispanic*, and 0 otherwise. I control for the respondent's level of *Education*, whether or not they have *Kids at home*, their *Gender*, whether or not they are *Married*, their *Income*, and whether or not they are a *Government Employee*.

Figure 6.2: Correlation between Segregation and Turnout by Race



At low levels of segregation, white turnout is much higher than minority turnout, but the lines converge as segregation increases. Furthermore, using the racial polarization dataset described in the first section of this chapter, I find that turnout and segregation are positively

correlated in the aggregate. These patterns strongly suggest that politics is more contentious in more segregated communities. Thus, a lack of participation by residents who support high spending is not likely to be the cause of lower public goods investment.

However, even with controls, one might still worry about the causal relationship between segregation and spending. I have argued that segregation should suppress public goods spending. However, it is entirely possible, perhaps quite likely, that some unmeasured set of factors affect both spending and segregation (or that the reverse is true, and spending levels affect segregation patterns). Since we cannot randomly assign segregation to determine its effect on city spending, I use an instrumental variable approach to study the relationships.

A great many factors affect residential location and the distribution of different types of residents across neighborhoods. One set of factors that affects both property values and the ability for communities to maintain a preferred degree of homogeneity are natural and manmade barriers. For instance, freeways and railroad tracks frequently divide more desirable and less desirable parts of town (Ananat 2011). But railways and freeways are often built with the intent to segregate racial communities (Bayor 1996). Instead, I focus on waterways (including large streams and rivers), which vary in number across cities and are arguably exogenous to segregation and spending given that they are not man-made. The use of waterways as an instrumental variable was introduced by Hoxby (2000) who used streams to estimate the governmental fragmentation of metropolitan areas. Cutler and Glaeser (1997) rely on Hoxby's waterways data as an instrument for metropolitan area racial segregation. My instrument differs in two ways. First, and most importantly, my data capture waterway counts and segregation patterns at the *city* level rather than at the metropolitan-area level. Secondly, I use a different source file for the waterways data and a different method for determining whether a waterway

ought to be counted within the boundaries of a community.[126] In order to use waterways as an instrument for segregation, I gathered the "rivers and streams" geographic information system map file from the National Hydrologic Remote Sensing Center which is part of the National Oceanic and Atmospheric Administration (an agency in the US Department of Commerce).[127] I added Census TIGER Line boundary files for all places in the United States as of 2000.[128] I then generated counts of waterways for each place and added these counts to the finance data described previously. Overall, the correlation between the number of waterways and the H Index is a powerful 0.37, and the F-statistic on the excluded instrument is 3,999, which is considerably higher than the typical target of 10.[129]

The current analyses use the same dependent variables as were presented in Tables 6.2 and 6.3 (per capita spending on various public goods). The number of waterways is used as an instrument for the *H* Index. Waterways are also correlated with other characteristics that are important to both segregation and spending patterns. The most important of these characteristics is the size of the population which is correlated with both the number of waterways and the level of segregation. People have settled near waterways since antiquity, and larger cities are also much more likely to be segregated than smaller cities (perhaps because there are more neighborhoods from which to choose). To account for this, I include logged population

[126] Hoxby (2000) uses a hand count of streams that are 3.5 miles in length and "of a certain width" supplemented with data from the Geographic Names Information System which lists the latitude and longitude of smaller streams. Instead, I use geographic information system maps as described in the main text and include all large streams and rivers regardless of length and width. Hoxby (2000) attributes a stream to a Metropolitan Statistical Area (MSA) if it terminates in the MSA (Rothstein 2007), whereas my analysis attributes a waterway to a community if it flows through the community at all (not just at its origin or destination).

[127] The "rivers and streams" shape file is available at: http://www.nohrsc.noaa.gov/gisdatasets/. It was most recently updated in 2008.

[128] Boundary files are available for download by state here: http://www2.census.gov/geo/tiger/TIGER2010/PLACE/2000/

[129] This F-statistic is drawn from a simple two-stage regression instrumenting segregation with waterways and including no additional controls.

as an instrument in the first stage.[130] In both the first and second stage regressions, I include the same control variables as presented in Table 6.2, with two changes. Because the number of waterways is constant in my dataset, I do not add fixed effects at the city level.[131] Instead, I include fixed effects for region and year. Secondly, I add a lagged version of the dependent variable to account for the high correlation between observations over time for the same city and the fact that local budgets are typically changed incrementally from prior years. The results from this instrumental variable approach are displayed in Table 6.5. For presentation purposes, the first stage results are relegated to appendix Table A6.4.

[130] In alternative specifications, I use the number of waterways per capita as the instrument. The pattern of the results is exactly the same.
[131] The omission of fixed effects allows for the inclusion of all cities regardless of the number of Census tracts.

Note: Two stage least squares regressions with fixed effects for regions and year (not shown); Instrumented: Two-group H Index of segregation; Excluded Instruments: # of Waterways, Population logged.

Regardless of the statistical approach used, segregation appears to have a powerful, depressive effect on public goods provision in cities. The pattern of results in Table 6.5 reflects the OLS regression findings presented in Table 6.2. After accounting for demographic differences, cities with more segregation tend to have smaller budgets, they tend to extract fewer resources from their residents, and spend less on roads, policing, parks, sewers, and support for the poor.

But perhaps lower spending is what residents prefer. After all, many elections have been won on platforms promising austerity and frugality. In the final section of this chapter, I explore what the consequences of low spending might be by analyzing a universally disliked event: sewer overflows.

Segregation and Sewer Overflows

The federal Environmental Protection Agency (EPA) monitors municipal sewer systems for overflow events. According to a 2004 EPA report to Congress, approximately 860 billion gallons of untreated wastewater were released into communities between 2001 and 2003 when sewer systems' capacities were exceeded. Any single overflow might occur for many reasons – excessive wet weather, pipe blockages, equipment failure, or insufficient capacity. However, generally, as Tessin (2009) explains:

> The performance of a sewer system is strongly related to capital fund-raising….Without adequate investment, excessive groundwater can enter sewers through cracked pipes and ingrown tree roots. Aging pipes can break and send sewage to the surface. Growing populations can cause wastewater flow to exceed the system's design capacity….For these reasons, local governments that do not invest enough capital typically experience more sewer overflows and other system failures…(p168).

Some federal and state grants are available for sewer system maintenance, but the vast majority of funding to reduce overflows comes from local sources (EPA 2004). According to

my data, the most segregated cities spend about $200 less per capita each year on their sewer systems. In the aggregate, this translates to an average of about $60,000 less per year spent on sewers (after controlling for all of the other demographic variables included in the regressions above). When city engineers plan, build, extend, and repair sewer systems, they take into account variables like population growth and average precipitation, as well as potential deviations from those estimates.

Analyses of effective or responsive governmental policy typically needs to take into account variation in constituent preferences. For instance, a community that spends very little on protection of open space or on recycling may be accurately representing the views of its residents. Sewer overflows are different. No one wants a river of fecal matter running down their street or flooding their basement. Thus, it seems reasonable to assume that more frequent overflows are, without qualification, worse than fewer overflows. That said, voters and sewer engineers may not agree on the level of resources needed to prevent overflows and therefore, raising funds for capital improvements may be challenging. If it is the case, as I have asserted above, that more segregated cities will have more trouble coming to political consensus about public goods provision, then we ought to expect more segregated cities to witness more sewer overflows – all else equal. In order to determine whether or not this is the case, I utilize data collected by the Environmental Protection Agency in 2004.

In this data collection, the EPA gathered information on overflows from 25 state environmental agencies between 2001 and 2003.[132] In total, the EPA reported about 35,000 different overflow events from several thousand sewer agencies. The EPA data do not include any geographic identifiers other than the name of the sewer agency, and so, I matched these

[132] The data were generously provided to me by Jeff Tessin who had secured the data from an EPA staff member for his PhD dissertation.

names to cities by hand. After dropping cases in which the sewer operator was not a municipal government (e.g. metropolitan water districts or county governments), and cases in which the EPA data provided insufficient detail to identify the municipality, I determined the location of 19,817 overflow events. I aggregated these events to the city level and was able to match these data to segregation measures and Census data for 1,417 cities.

The median number of overflows during this period was 2, while the mode was 1. A few cities with enormously high numbers of overflow events pull the mean to 50. For this reason, I take the natural log of the number of overflow events for each city and standardize it by the city's population. This *Logged Overflows Per 1000 Persons* measure serves as my dependent variable. My main independent variable is the city's *H* Index of racial segregation measured in 2000 if available and 2010 if not. I control for the natural log of the *Total Population* to account for the possibility that cities serving more people are likely to have more advanced engineering for their sewer systems by necessity. I add fixed effects for states for two reasons. The first is that the EPA data collection gathered statistics form state agencies which may have had different reporting standards. The second reason is to account for the different environmental, regulatory, and funding environments cities in different states face. In a second regression, I add controls for other city demographics. I add the share that *Rents* their homes to account for the possibility that homeowners may be more likely to act politically to prevent overflows. I include the share of the population that is *Urban* to capture the difficulties rural areas may face in providing sewer systems to a dispersed population. I include the share of the population that is *Black*, *Asian*, and *Latino* to determine whether or not diversity alone can account for poor performance. I add the city's *Median Household Income* and *Per Capita Subventions* to measure the city's capacity to

raise funds for sewer maintenance and expansion. The results of these OLS regressions with robust standard errors are shown in Table 6.6 (summary statistics are in appendix Table A6.5).

Note: Linear regressions with fixed effects for states, robust standard errors presented.

The data reveal a significant correlation between segregation and sewer overflows. Living in a city with very little segregation, one can expect about 1.5 overflows per year on average. This increases to nearly 2.5 overflows in cities at the 95th percentile of the segregation distribution. Not only do segregated cities see lower spending on public goods, but they also witness worse performance as well.

Conclusion

The evidence presented here indicates that racial segregation plays a significant role in access to public goods. Segregated cities are comprised of homogeneous neighborhoods embedded in larger diverse communities. While African Americans, Latinos, and Asians are today, fairly likely to live as neighbors, whites remain in isolated enclaves. Because local governmental decisions often concern spatial allocation, neighborhoods are important municipal

actors in local politics. In more segregated places, neighborhood interests become overlaid with racial division. Segregated cities are more racially polarized in elections and may be less likely to generate policy consensus. The result is that cities with more segregation have smaller public goods budgets. Segregated cities raise fewer dollars from their residents and spend less money on roads, law enforcement, parks, sewers, welfare, housing, and community development. This low spending may have significant consequences. For example, segregated cities also see more sewer overflows.

Patterns of residential location reveal that white residents are more likely than people of color to live in cities with low levels of segregation. In my dataset, nearly 74% of nonwhite residents live in cities in the top quintile of the segregation distribution, compared to only 48% of whites. What this means is that compared to whites, nonwhites are much more likely to live in communities that struggle to generate adequate public goods for their residents. Not only are whites segregated from racial and ethnic minorities within cities, but they are also segregated from people of color across city lines. This fact means that access to public goods is segregated along racial lines as well. As the nation has become more diverse, it has also become more unequal. Segregation and public goods play important roles in linking these phenomena.

Chapter 7: The Local Roots of Modern Conservatism

Between the late 1940s and mid-1960s, fights over racial integration pervaded the politics of America's cities. Throughout the United States, residents battled over the integration of public schools, public transportation, pools, parks, golf courses, and of course – neighborhoods. In detailed case studies, historians have shown that white resistance to desegregation in urban centers across the country, gave rise to a new rhetoric that emphasized the protection of private property and homeowners' rights (Kruse 2005, Lassiter 2006, Self 2003, Sugrue 1996). These historical studies argue that the rise of conservatism and Republican allegiance associated with suburban America today was actually rooted in the conflictual racial politics of central cities. In this chapter, I provide evidence that these patterns were widespread. I show that battles over the control of public space and public goods in postwar urban America contributed to the transformation of the demographic landscape and affected public opinion. People who would come to live in segregated neighborhoods, either by choice, compulsion, or happenstance, developed political attitudes and loyalties that differed significantly from similarly situated residents in more integrated places.

First, I show that federal school desegregation orders generated increases in the number of segregated neighborhoods in metropolitan areas. In this analysis, I take advantage of the randomness desegregation order timing to substantiate the link. Then, I provide evidence that the relative whiteness of a neighborhood in 1970 is a powerful predictor of political attitudes and loyalties today. People who live in places that were whiter than their metropolitan area in 1970 were more likely to vote for the Republican presidential candidate in 2008 and are more conservative than their individual attributes (e.g. race, gender, marital status, age, education, income, presence of children) would otherwise predict. Conversely, those who live in places that

were more diverse in 1970 are more liberal today. However, even with a set of individual-level controls, it is difficult to convincingly estimate the effect of neighborhoods on public opinion. Some unmeasured characteristic might cause certain neighborhoods to be more or less diverse than the larger metropolitan area in 1970, and for individuals who live there to be more or less liberal. Given existing evidence that racial attitudes became a more important predictor of vote choice and public opinion during this same period (Carmines and Stimson 1989), it is important ensure that these relationships are being driven by the attributes of neighborhoods and not omitted individual-level variables. To do this, I instrument for the relative whiteness of neighborhoods using two geographic features: land elevation (controlling for waterfront areas) and distance from the nearest big city.

The consequences of segregation on individuals' life chances are well known; and as Thomas Sugrue (2015) writes, "the effects…are devastating."[133] Segregation increases inequality on many different socio-economic dimensions (Cutler and Glaeser 1997, Ananat 2011). The results presented here indicate that segregation also has powerful political consequences - increasing divisions in both public opinion and voting behavior.

Entanglements of Ideology and Integration

At the onset of the Second World War, the United States was already a very segregated nation. All large cities had clearly defined neighborhoods inhabited by people of color and others inhabited by whites – a pattern generated by both private choices and public policies (Massey and Denton 1988). [134] As a result of the economic collapse during the Great Depression

133 https://www.washingtonpost.com/opinions/its-not-dixies-fault/2015/07/17/7bf77a2e-2bd6-11e5-bd33-395c05608059_story.html

134 However, on the whole, the United States, both rural and urban, was still overwhelmingly white in 1940. About 10% of the population was black, about 1.7% of the population could be considered Hispanic/Latino, and about

and then material scarcity during the war, the nation faced a severe housing shortage during the 1940s. When increasing numbers of blacks moved from rural areas into cities and from the South to the North and West, the boundaries of existing black neighborhoods were pushed to their limits. In the Southwest, the Latino population also swelled with wartime employment.[135] These pressures resulted in explosive social and policy conflicts along racial lines. Because city governments had the power to zone, to permit development and locate nuisances, and thus to determine the value of property, these fights were central to city politics. As Self (2003) argues, "the effects of property [valuation] are far-reaching…They structure all kinds of interactions - from where one can buy a home to where politics is organized, from how police interact with neighborhoods to where children go to school. The struggle for the postwar city was over no less than the power to control and organize space…" (p18).

In response to postwar demographic changes, white homeowners sought to protect their neighborhoods (which they considered to be the reward for their hard work and frugality) from disruption and disorder. In the minds of many, pursuit of these goals required racial exclusivity. Sugrue (1996) reports that in Detroit, as elsewhere, "a majority of whites looked to increased segregation as the solution to [the] 'colored problem'" (p215). Whites, particularly those who owned their homes, believed that they had a right to certain neighborhoods and the public benefits (e.g. schools, safety) associated with those spaces. They understood minority demands for integration and court ordered desegregation plans as undermining this entitlement (Kruse 2005, p126). Whites justified exclusion with fiscal arguments; claiming that, "since Negroes are

0.1% Asian. http://www.latinamericanstudies.org/immigration/Hispanics-US-1850-1990.pdf; https://www.census.gov/population/www/documentation/twps0076/twps0076.pdf

[135] http://www-bcf.usc.edu/~philipje/Segregation/Haynes_Reports/Contours_PRR_2001-04e.pdf. Hundreds of thousands of Mexican descendants were deported during the Great Depression, so the overall Latino share of the population changed little.

so poor and pay virtually no taxes, they are actually not entitled to get more public services than the whites care to give them…" (Myrdal 1944, p336). When blacks *did* receive benefits, it was believed that whites unfairly bore the financial burden of their support. To illustrate this point, Kruse (2005) quotes a segregationist poem that made rounds in Atlanta in 1957:

> Po' white folks must labor, 'tween sun and sun,
> To pay welfare taxes whilst we has de fun,
> We doan pay no taxes, we doan make no goods,
> We just raise little niggers, way back in the woods.... (p127).

Above all else, whites feared that integration would jeopardize their single largest investment – the value of their home (Helper 1969), as well as the quality of their neighborhood (Kruse 2005). The tight coupling between property values, public goods, and racial exclusivity was inexorably tied to the racism embedded in the real estate market (Hayward 2013) and the poor public goods that cities had provided to neighborhoods of color in decades past (Myrdal 1944, Torres-Rouff 2013). Kruse (2005) explains that, "by the time white homeowners confronted racial transition at their neighborhood's borders, the American real-estate industry had completely embraced the idea that such racial transition would, without doubt, lead to a devastating decline in property values" (p60). Public policies like redlining and expulsive zoning[136] and private actions like racial steering and white flight would make this relationship true over the long run.[137]

[136] Expulsive zoning is the practice of siting industrial, semi-industrial, or other nuisances in neighborhoods of color in order to both preserve white neighborhoods and induce black movement into particular parts of the city.
[137] In the short run, blacks paid much higher prices than whites for comparable housing (Cutler and Glaser 1997). This fact was what made it so lucrative for individual whites to abandon neighborhood protection and move to the suburbs. In Atlanta, Kruse (2005) analyzes the property values in a neighborhood that transitioned from white to black between 1950 and 1960, and finds that the property values rose 27 percent over this decade.

Although many whites agreed on the desirability of residential segregation,[138] they were stymied by various hurdles. The Supreme Court had ruled racial zoning (the designation of certain neighborhoods as being inhabitable only by whites) unconstitutional in 1917, so a perfectly direct policy approach to residential segregation was not an option.[139] Instead, the preservation of white communities required collective action to prevent individual homeowners from selling or leasing to minority residents. As minority populations expanded and white homeownership rates skyrocketed, hundreds of white homeowners' organizations arose in the 1940s, 50s, and 60s (Sugrue 1996, Kruse 2005).[140] Such organizations were often created by real estate developers to protect the value of their investment. This was a charge taken seriously by property owners. These (typically all white) "civic associations, productive associations, improvement associations, and homeowners' associations" (Sugrue 1996, p211) fought the building of public housing in their neighborhoods, sought representation on planning boards, and battled open housing laws (Self 2003).[141] Importantly, they relied on racial restrictions in housing deeds (and racism in the real estate market) to maintain neighborhood exclusivity. But the Supreme Court ruled restrictive covenants unenforceable in 1948 (*Shelley v. Kraemer*), and an open housing movement swept the nation. Then, in the 1950s, other tools of segregation came under fire as the court struck down separate-but-equal accommodations in a series of cases.[142]

---

[138] In 1964 only 27% of white Americans supported general integration (Schuman et al 1985).
[139] Many white neighborhoods also utilized violence to defend their borders (Meyer 2000, Hirsch 1983). Although tolerated (even encouraged) by the police and political establishment of some cities, murders and arson were technically illegal as well.
[140] In some cases, the link between segregationists and homeowners' groups was direct. For example, the head of Atlanta's West End Cooperative Corporation had gotten his start in community organizing as the head of Klavern No 297's Housing Kommittee (Kruse 2005 p54).
[141] They also served as social organizations welcoming new neighbors and organizing block parties (Sugrue 1996).
[142] e.g. *Muir v. Louisville Park* 1953, *Brown v. Board of Education* 1954 & 1955, *Holmes v. Atlanta* 1955, *Dawson v. Baltimore* 1955, *Rice v. Sioux City Memorial Park Cemetery* 1955, *Browder v. Gayle* 1956, *Burton v. Wilmington* 1961, *Johnson v. Virginia* 1963, *Simkins v. Cone Memorial Hospital* 1963, *Watson v. City of Memphis* 1963.

By this time, nearly all cities utilized zoning in some fashion and many invoked the power of eminent domain to shape development through, for example, the permitting of multi-family housing, the razing of slums, and the placement of highways, public housing, and industry. In the past, white homeowners had successfully used these tools to configure residential demography (Nightingale 2006) – but they became even more important in the face of new court decisions and the rising Civil Rights Movement.[143] At the same time, racial violence continued to erupt. However, local elites were committed to maintaining peace in their cities (Ogorzalek 2017). So, in order to convince city governments to defend their turf, white neighborhoods needed to change their approach.

In city after city, white middle class, homeowners turned away from claims based on racial exclusivity and began to press their demands in terms of rights; a tactic Sugrue (1996) terms "defensive localism" (p210). White residents fought for the, "'right' to select their neighbors…the 'right' to do as they pleased with their private property…and the 'right' to remain free from what they saw as dangerous encroachments by the federal government," (Kruse 2005, p9). Local governments responded with neighborhood protection by pursuing "racial stability through spatial apartheid" (Lassiter 2006, p52). In the South, these arguments were the moderate path – a response to violent white supremacy on the right and integrationists on the left (Lassiter 2006, Kruse 2005). The fact that rights-based language gained ground in all regions of the United States meant that it offered a powerful basis for the rise of a national movement.

[143] Throughout this period, neighborhood organizations also sought to maintain the color line using private mechanisms as well. For instance, some organizations raised funds to repurchase homes sold to black families in order to sell them back to whites. They also pressured real estate agencies and lenders to refuse to sell to black buyers. Additionally, they set fire to homes on the black market and newly purchased homes by black owners (Kruse 2005, Sugrue 1996). The problem with such tactics is that they were always susceptible to a sort of prisoner's dilemma. It was incredibly lucrative for a single white homeowner to sell her home to a black family and this idea made individual white owners skittish about neighborhood transition. Neighborhood organizations constantly urged owners to think of the common good rather than their bottom line, but frequently failed.

The discourse had several facets. Subscribers claimed support for racial integration in theory (so as to distinguish themselves from the ugliness of Jim Crow), but angrily opposed government intervention in racial uplift or equalization (Lassiter 2006, p137). In fact, integration was typically viewed in zero-sum terms – gains for blacks equated to losses for whites. Government attempts to produce equal outcomes were understood to be an elevation of minority rights above those of the majority (Sugrue 1996, p227), a form of "reverse discrimination" (Lassiter 2006, p123). Policy solutions to redress inequality were cast as the work of an insidious, "'liberal elite' made up of judges, intellectuals, and government bureaucrats" (Hall 2005, p5).

Further drawing on racialized beliefs about the distribution of tax burdens, neighborhood defenders argued that they should not have to pay for public benefits or welfare for those who did not contribute to the public pool. So when people of color demanded, and then the court ordered, desegregation of public spaces and residential communities, these views culminated in all out tax-revolts among white residents. In cities like Atlanta, whites urged the city government to eviscerate the public budget, eliminate bus lines, as well as close pools and public parks (Kruse 2005). Whites voted down bonds for civic improvements, abandoned public schools, and railed against an activist government. In the end, many of these residents would leave the city altogether – packing up their belongings and their newly appropriated ideology and moving to the suburbs (Nall 2015, Boustan 2010).

Yet, suburban growth largely happened for market reasons that were unrelated (or at least, only tangentially related) to racial conflict in cities (Jackson 1985). As Chapter 1 revealed, by 1970, a plurality of the population lived in suburbs and more than 60% of Americans owned their homes. As the pace of suburbanization and homeownership picked up, arguments

surrounding neighborhood defense lost explicit racial designations of who contributed and who did not and who had a right to high property values and good services and who did not. As Self (2003) explains, the move away from making overt racial claims was, "intended to inoculate segregation and white privilege against charges of racism" (p268). This new language offered a "color-blind" approach to the maintenance of neighborhood boundaries. This rhetoric perpetuated the myth that residential segregation was a matter of economics and individual choice. White homeowners came to see segregation as the consequence of "meritocratic individualism" – not fostered by public policy or law (Lassiter 2006, p1). Those who lived in segregated minority neighborhoods could thus be blamed for their condition, making them undeserving of social assistance.

Maintaining exclusively white neighborhoods in the central city was possible with the help of cooperative city governments. But it was much easier in the suburbs, where a combination of public policies and private actions made homeownership only available to white residents (Jackson 1985, Hayward 2013). By 1970, neighborhoods (both within central cities and outside of them) that had maintained their whiteness despite the massive demographic shifts over the preceding 30 years had developed a distinctive, conservative approach to politics throughout the nation. Homeowners in these places expected low taxes, they rationalized racial segregation and inequality as the product of meritocracy, and they conflated white exclusivity with high property values (Self 2003, Lassiter 2006). They couched their demands in terms of protection of individual property rights. In so doing, they drew on a long tradition of American conservative principles emphasizing economic individualism, limited government, and equality of opportunity, but not outcomes (Feldman 1988, McClosky and Zaller 1984, Kinder 1998).

Nearly forty years later, these neighborhoods continued to foster distinctive politics. Whether or not new arrivals to defended neighborhoods had been involved in the earlier battles, they came to, "accept the politics born out of white flight all the same. They embraced a new middle class rhetoric of rights and responsibilities" (Kruse 2005, p245). The Republican Party came to embrace the neighborhood defenders. Starting in the 1960s and throughout the 1970s, Republicans positioned themselves as the party that would help whites to resist social change and impose order in their environments (Hetherington and Weiler 2009, Carmines and Stimson 1989). These ideals held sway in defended neighborhoods and residents dutifully sorted themselves into the Republican Party.

The arguments appropriated in support of neighborhood defense in the 1950s and 60s are still visible in politics today. In the 2012 presidential election, Republican nominee Mitt Romney proclaimed:

> There are 47 percent of the people who will vote for [the Democratic incumbent] no matter what…who are dependent upon government, who believe that they are victims, who believe the government has a responsibility to care for them, who believe that they are entitled to health care, to food, to housing, to you-name-it. That that's an entitlement. And the government should give it to them….These are people who pay no income tax…My job is not to worry about those people. I'll never convince them they should take personal responsibility and care for their lives (Corn 2013).[144]

Like the homeowners' organizations of the mid-century, Romney's statement invoked a class (not race)-centered view of deservingness. Forty-seven percent of the American public, Romney implies, "doan pay no taxes," and rely on government benefits for subsistence. Romney's claim

[144] More boldly, 2016 Republican nominee Donald Trump's first wife explained, "I have nothing against Mexicans, but they [come] here — like this 19-year-old, she's pregnant, she crossed over a wall ….She gives the birth in American hospital, which is for free. The child becomes American automatically. She brings the whole family, she doesn't pay the taxes, she doesn't have a job, she gets the housing, she gets the food stamps. Who's paying? You and me." http://nypost.com/2016/04/03/ivana-trump-opens-up-about-how-she-advises-donald-his-hands/

that these non-contributors do not take personal responsibility for their lives recalls the meritocratic arguments white homeowners made in the past about their success and their neighborhoods. It is unsurprising then, that defended neighborhoods have offered disproportionate support to Republican candidates and conservative policies in recent years.

The Effect of Context

To say that neighborhoods condition political views and actions is not novel. A great deal of research investigates contextual effects on public opinion and political behavior. A significant portion of this literature focuses (as I do here) on the community's racial composition.[145] Some scholars find that diversity produces tolerance (e.g. racial contact theory; Allport 1954, Oliver 2010, Sigelman et al. 1996). Others find the reverse - that large minority populations are related to racial intolerance and lack of support for spending on race-focused or race-coded policies (e.g. racial threat theory; Key 1949, Gay 2006, Huckfeldt 1986, Orey 2001, Taylor 1998, Bobo and Hutchings 1996, Blalock 1967, Alesina and Glaeser 2004, Tolbert and Hero 1996, Plotnick and Winters 1985, Enos 2016, Baybeck 2006). Scholars also find a negative relationship between diversity and support for taxation, spending, and public goods provision more generally (Alesina et al. 1999; Glaser 2002; Alesina and Spolaore 1997; Easterly and Levine 1997; Poterba 1997; Habyarimana et al. 2007, 2009; Putnam 2007; Cutler et al. 1993; Goldin and Katz 1999, Hopkins 2009, Vigdor 2004). My argument draws on both of these frames to argue that rights-oriented conservatism was fueled in an environment of racial threat (integration in the 1940s, 50s, and 60s), but became entrenched in an environment of racial isolation (whiteness of the neighborhood in the 1970s). Today, white conservatism at the

[145] Other work on context analyzes social networks (Eulau and Rothenberg 1986, Zuckerman 2005), partisan contexts (Ceaser 2013 and DiSalvo 2006) and economic contexts (Gay 2006, Books and Prysby 1999, Oliver 1999, Oliver and Mendelberg 2000)

individual level is associated with homogeneity *not* diversity in neighborhoods. The whiteness of a neighborhood could produce individual-level conservatism through two different mechanisms: the nonrandom migration of individuals into or out of whiter neighborhoods (i.e. sorting/selection), or by directly affecting the ideology of residents (i.e. treatment). The sorting mechanism is supported by research demonstrating the existence of white flight (Boustan 2010, Nall 2015) and work that offers evidence of residential choice based on differing preferences for integration and other community features (Mummolo and Nall 2016, Cho, Gimpel and Hui 2013, Bishop and Cushing 2008, Card, Mas, and Rothstein 2008, Charles 2006). A treatment effect is consistent with work showing that particular types of places generate distinctive preferences as a result of features like population density or community size (Rodden 2011, Gainsborough 2001, Ogorzalek 2017, Oliver 2001).

Treatment is also consistent with work revealing differences across places that magnify the individual attributes of inhabitants – such as when minority neighborhoods lack elite networks (Wilson 1987, Widestrom 2015). A treatment effect is further predicted by scholarship that finds that neighborhood homogeneity breeds racial hostility and intolerance due to a lack of exposure to or contact with neighbors of different backgrounds (Oliver and Mendelberg 2000, Oliver and Wong 2003). Finally, a treatment effect is indicated by scholarship demonstrating what Acharya, Blackwell, and Sen (2016) refer to as the "historical persistence of political attitudes" (p2). Patterns of race relations developed during early periods of American history generated opinions and behaviors among whites in particular places that were transmitted over time and remain detectable in modern politics (see also Hersh and Nall 2016). My argument is similar: battles over integration that occurred mid-century imbued defended neighborhoods with distinctive political attitudes that are communicated through processes like neighborhood social

interaction (Huckfeldt and Sprague 1995) and/or "low-intensity cues" - the casual observation of ones' neighbors (Cho and Rudolph 2008).

Very likely, both selection and treatment processes are at work here. Some residents of defended white neighborhoods brought their conservatism with them; others adopted it after arriving. Today, defended neighborhoods are also likely to continue to attract movers with conservative preferences. Without detailed panel survey data, I cannot discern which is the more powerful factor. What I am able to demonstrate is that neighborhood traits from the 1970s predict conservatism at aggregate and individual levels above and beyond the mobility of the population and the demographic makeup of the neighborhood today.

Conservatism and Race

Just as it is not novel to propose that neighborhoods affect political behavior, it is also not novel to propose that modern conservatism and Republican voting are rooted in racial conflict (see Hutchings and Valentino 2004 for a thorough review). Indeed, it is uncontroversial to state that the Civil Rights movement was a catalyst for partisan realignment, as Southern Democrats abandoned the party championing the rights of Black Americans (Frymer 1999, Carmine and Stimson 1989, Miller and Shanks 1996).

Since the 1970s, scholars have argued that white public opinion shifted mid-century, from a willingness to endorse Jim Crow style race prejudice/biological racism to subtler/symbolic expressions of racial resentment (see for example, Sears and Kinder 1971, Kinder and Sears 1981, McConahay 1982, Sears 1988, Kinder and Sanders 1996, Sears et al. 1997, Bobo 1983, Bobo, Kluegel, and Smith 1997, Schuman et al. 1997).

Additionally, a sophisticated literature on public opinion and political behavior reveals that racial attitudes are strongly predictive of views toward redistributive spending (Bobo and Kluegel 1997, Sears 1988, Kinder and Sanders 1996, Rabinowitz et al. 2009, Federico 2005, Gilens 1999, Quadagno 1994, Luttmer 2001) and government policies that have become racially coded (Winter 2006, Valentino, Hutchings, and White 2002, Mendelberg 2001, Hurwitz and Peffley 1997). If an individual holds negative stereotypes of racial minorities, he or she is likely to oppose expenditures on functions like welfare, and even all government spending in some settings (Sears and Citrin 1982).

What I add to these debates is not a link between racial politics, public opinion, ideology, and party identification, but a new perspective on location. The marriage between rights-based conservatism and white perspectives on race was amplified in the crucible of *city* politics throughout the postwar period not just at the state and national levels. And neighborhood defense appears to have played a causal role in the development of a host of conservative political opinions that appear to be "nonracial" (Hutchings and Valentino 2004, p6).

Empirical Evidence

I've argued that local battles over integration of public spaces in the postwar period led some whites to pursue exclusively white neighborhoods. To generate government support for segregation, neighborhood defenders turned to a set of conservative arguments that highlighted their meritocratic success. Because the Republican Party protected defenders' rights to choose their neighbors, it won their allegiance. If my argument is correct, we should find 1) that integration pressures are related to a higher incidence of exclusively white neighborhoods and 2) that residents of homogeneous white neighborhoods are more conservative and more Republican.

Testing these claims requires that I measure the presence of exclusively white neighborhoods (as the dependent variable in the first hypothesis, and as the independent variable in the second). To do this, I constructed a dataset using a proprietary product developed by GeoLytics called the Neighborhood Change Database (NCDB). The NCDB matches and normalizes census tracts between 1970 and 2000, allowing for a direct comparison of neighborhoods over time. To this, I add census tract data from the 2011 American Community Survey, matched to 2000 boundaries. I refer to neighborhoods that have a greater share of white residents than the metropolitan area as a whole as white defended neighborhoods; conversely, neighborhoods that have a greater share of residents of color than the metro area are called minority dominated neighborhoods. I use this relative conception because many residents are constrained to a particular metropolitan area by preferences or needs (Mummolo and Nall 2016), but the choice of neighborhood within that metro area may be more flexible. I capture this dynamic by measuring the demographic makeup of neighborhoods *compared to* the demographic makeup of their larger metropolitan area. This variable is the *Tract-Metro Difference in Percent White Residents.*[146] Neighborhoods that are whiter than the metro area as a whole have a positive value and those that have more people of color take on a negative value. In 1970, the average neighborhood was only very slightly whiter than the metro area (Mean= 0.018), but the distribution has a long left tail, indicating many neighborhoods that were overwhelmingly populated by people of color; by 2011, the distribution was more normally distributed, with a mean just slightly less than zero. This difference in distributions reflects the diversification of the nation and the well-documented finding that neighborhood level segregation between whites

[146] The census did not tabulate whites separately from Hispanics in 1970, but did in 1980, 1990, 2000, and 2011. Where possible I use non-Hispanic whites

and people of color has declined substantially since the 1970s (Vigdor and Glaeser 2012, Frey 2014).

In order to determine the effect that pressures for integration had on neighborhood demographics, I take advantage of a dataset compiled by Nathaniel Baum-Snow and Byron Lutz (2011) that records the timing of federal court orders for desegregation of public schools in central cities.[147] Although *Brown v Board of Education of Topeka* determined the unconstitutionality of segregated schools, a specific court order was nearly always required for large, central city districts to pursue desegregation plans. The data include court orders implemented between 1960 and 1990 for 92 central school districts in metropolitan statistical areas. Of these 92 orders, 48 are in the South, 9 are in the Northeast, 20 are in the Midwest, and 15 are in the West.

My examination does not include metropolitan areas that never faced a desegregation order. The factors that led some metro areas to receive court-ordered school desegregation plans and others not to receive such plans are most certainly not random, and are likely related to the outcome of interest here (the presence of white defended and minority dominated neighborhoods). Inclusion of the districts with no court order would thus be likely to violate the identifying assumption on the desegregation parameter. However, for those central cities in metropolitan areas that *did* receive an order, the timing of that order is plausibly exogenous to unobserved time-varying factors *within* metropolitan areas that might affect segregation due to the vagaries of the judicial process. The precise date at which court orders took effect was

[147] The data are described completely in the statistical appendix to Baum-Snow and Lutz (2011)'s paper. The appendix is available at: https://www.aeaweb.org/aer/data/dec2011/20080918_app.pdf

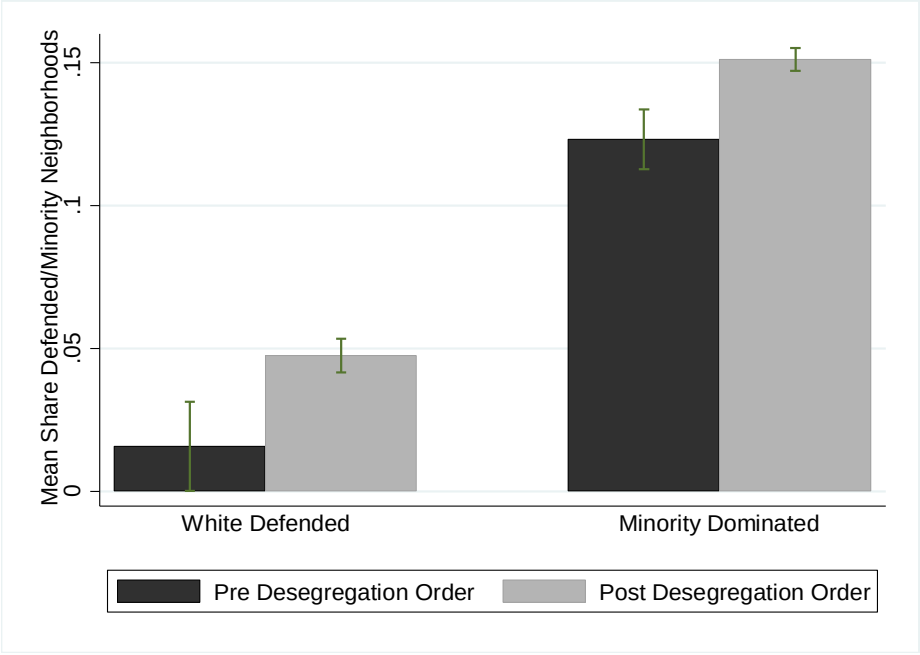
related to differences in the length of the appeals process for otherwise similar metropolitan areas (Baum-Snow and Lutz 2011).

Including Metropolitan Statistical Area (MSA) fixed effects ensures that the analysis compares the presence of defended/minority neighborhoods before and after the implementation of the court order in each metro area, while accounting for variation across MSAs. For each metropolitan area, in each of four census years (1970, 1980, 1990, and 2000), I calculated the mean *Tract-Metro Difference in Percent White* and the standard deviation of this measure. I then generated a count of census tracts that were either greater than or less than one standard deviation away from the mean racial difference for each census year in each MSA. These counts form the numerator for the share of all neighborhoods that are *White Defended* or *Minority Dominated*. These shares serve as dependent variables in my analyses. The key independent variable in my analysis, *Desegregation Order*, is a dummy indicator coded from the Baum-Snow and Lutz (2011) data noting whether or not a desegregation order was in place in the MSA's central city for a given census year. The analysis compares the number of defended/minority neighborhoods before and after the implementation of desegregation by the federal government in each MSA.[148] As controls, I add the log of the *Total Population* in the MSA, the share of MSA households *Renting* their homes, the *Wealthy* share of households (households with incomes above the 90th percentile), and the population *Density* of the MSA. While it is unlikely that these factors are related to desegregation order timing, directly, it is possible that they reflect an underlying time trend that influenced implementation as well as the propensity for

[148] Of the 92 metro areas in the dataset, 64 had orders implemented between 1970 and 1990. Because tract-level data was not available for most areas in 1960, I am unable to estimate change for 28 metro areas. These MSAs are still included in the regressions – just with no change on the desegregation order variable.

segregation. Figure 7.1 displays the marginal effects of desegregation orders, holding the control variables at their mean values.

Figure 7.1: Federal Desegregation Orders Increase Residential Segregation



The figure shows that desegregation orders significantly increased the share of neighborhoods that were both white defended and minority dominated. On average, desegregation orders generated about 30 new homogeneous neighborhoods in metropolitan areas. Homogeneity was achieved when **whites** moved within cities to new neighborhoods and to the suburbs.[149] Approximately two-thirds of the exclusive white neighborhoods in this dataset

[149] Baum-Snow and Lutz (2011) provide evidence that Black families responded to desegregation orders by moving into newly integrated central school districts suggesting that changes in homogeneity of neighborhoods would have been driven by white not black movers.

are located in suburban places and about three-fourths of the homogeneous neighborhoods of color are located in central cities.

Did these homogeneous neighborhoods produce identifiably different politics? In short, yes. To provide evidence of this claim, I measure the homogeneity of neighborhoods continuously for a single year - 1970. I use 1970 because this year marked the height of residential segregation in America and the end of the post-war period of massive demographic change (Cutler, Glaeser, and Vigdor 1999). First, I analyze the effect of neighborhood homogeneity on the aggregate 2008 presidential vote. Then, I turn to individual-level data. I find that homogeneity in 1970 predicts conservatism today.

My first dependent variable is the 2008 *Democratic Share* of the two-party presidential vote aggregated to the census tract level for the 49 states that collect vote data by precinct.[150] Precinct-level vote returns are available from the Harvard Elections Database Archive.[151] Using ArcGIS, I combined the precinct vote data with 2000 census tract boundaries available from the National Historic Geographic Information System archive.[152] I aggregated precinct-level votes to the census tract level.

My independent variable is the *Tract-Metro Difference in Percent White, 1970*. This measure captures the difference between the tract-level share of residents who were white and the metro area-level share of residents who were white in 1970. I control for the 2000 tract-level *Percent White*, the share of the tract that *Rents* their home, and the share of the tract's households

150 Oregon conducts all elections by mail, so geographically allocated votes are not available.
151 A combined, projected polygon shapefile was very generously provided to me by Clayton Nall.
152 Because precinct boundaries sometimes cross-tract boundaries, I calculated the land-area share of each precinct falling within each census tract. I used this geographic share as a weight on the total votes for the Democratic and Republican candidates before aggregating precinct vote totals to the tract level.

that are *Wealthy* (incomes above the 90th percentile). These variables account for the possibility that whiter tracts in 1970 are simply populated by more whites and homeowners today, and so, are more conservative only as a result of their current demographics. I also add the *Density* of the census tract (total population divided by total area) to account for Rodden's (2011) argument that the source of modern liberalism is housing density. To investigate the role of selection, I add a measure of the share of the tract's residents who lived in the same house in 1995. In a third analysis, I add fixed effects for region. In all analyses, I use ordinary least squares regression and cluster errors by MSA. Table 7.1 presents the results of these regressions. Summary statistics are shown in appendix Table A7.1.

Table 7.1: Effect of 1970 Relative Whiteness on 2008 Democratic Vote Share

A neighborhood of color in 1970 (*tract-metro difference* = -0.5), delivered about 84% of its votes to Barack Obama in 2008. A neighborhood that was white defended in 1970 (*tract-metro difference* = 0.5) offered Obama only 42% of its votes in 2008.[153] Obviously,

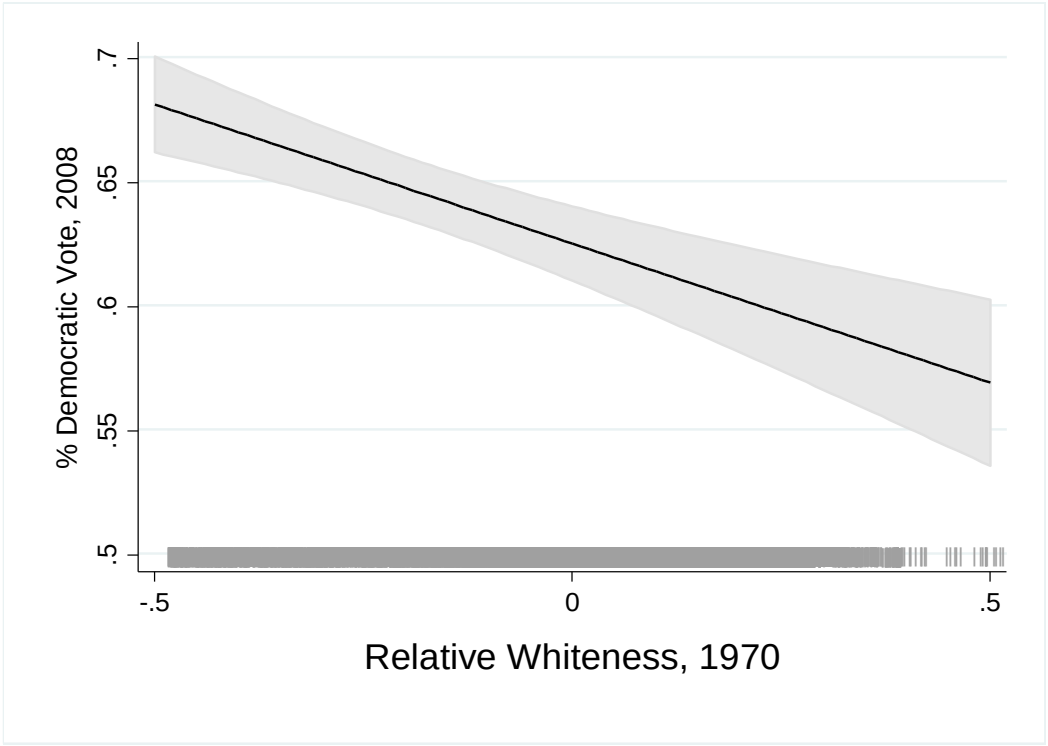
[153] Estimates generated following the regression presented in Column 1, using the margins command in Stata 14.

demographic patterns are persistent – one explanation for this outcome is that these neighborhoods that were white defended and minority dominated in 1970 are still populated with whites and people of color today. But as Column 2 shows, even accounting for contemporary demographics, neighborhoods that were relatively whiter in 1970 were about 11 percentage points less likely to support Obama relative to McCain. The difference between the least white and most white neighborhoods in 1970 is 22 percentage points – even controlling for whiteness in 2000.

Contrary to a pure selection story, census tracts with more stable populations were more (not less) likely to support Obama and there is no interaction effect between stability of the population in 1995 and the whiteness of the neighborhood in 1970. That is, if selection were entirely driving these results, we would expect that tracts that were both white in 1970 and had a large share of movers would be most likely to support the Republican candidate. This is not what we see. Holding all other variables at their mean values, Figure 7.2 presents the results from Column 2 graphically for the densest portion of the distribution on the independent variable.[154]

[154] This portion of the distribution reflects the concepts of white defended and minority dominated neighborhoods. The mean value of the 1970 tract-metro difference in percent white for minority dominated neighborhoods was -0.5 and 0.25 for defended neighborhoods.

Figure 7.2: Effect of 1970 Neighborhood Characteristics on 2008 Presidential Election Votes, Controlling for Demographics in 2000



The third column of Table 7.1 reveals that the relationship holds even when accounting for differences in mean levels of Democratic support across regions. Despite the robustness of the effect of 1970 demographics on 2008 presidential votes, it is possible that some set of uncontrolled factors affect the relative whiteness of neighborhoods in 1970 and Republican support in 2008. In an effort to determine a causal neighborhood effect, I instrument for relative whiteness in 1970 with topographical features measured at the census tract level - relative elevation of the census tract (accounting for waterfront neighborhoods) and the tract's distance from the nearest large city.

Starting perhaps with Burgess's concentric zone model of urban social structure (1925), scholars have noted that metropolitan areas often develop such that the most desirable residential neighborhoods are those that are as far as possible from the central business district, but still within commutable distance. From early on, distance from the center denoted privilege; and the historical record indicates that movement to outer lying areas was more available to whites than people of color for many decades (Jackson 1985).[155]

To measure distance from the nearest central city, I used 2010 place boundaries available from the National Historic Geographic Information System. Using data from the 2011 American Community Survey, I determined the largest population center in each metropolitan area. I converted these central cities and 2000 census tracts to centroids in ArcGIS. I measured the Euclidean distance between the closest central city and each census tract (using a near table with only one match). To generate a normal distribution, I took the natural log of this distance. The resulting measure, *Distance to Center City* (logged), is my instrumental variable.

To be useful, an instrumental variable must predict the primary independent variable, but not directly affect the dependent variable. As explained above, there is good reason to believe that a neighborhood's distance from the nearest central city positively affects the share of residents who are white in that community. There is no reason to believe that neighborhoods that are far from the city center will house Republican supporters *aside* from their demographic characteristics. However, race is not the only relevant demographic trait. Living outside of the city center also requires residents to be able to afford housing and commuting costs and

[155] That said, at no point in American history has it been the case that black central cities have been ringed by heavily populated white suburbs. This is because when suburbs WERE all white (in the 1920s), they were not heavily populated and central cities were majority white as well. By the time some central cities became majority minority, suburbs had also become more integrated. This fact is further evidence that the correct measure of residential racial context is the racial makeup of the neighborhood as compared to the metropolitan area as a whole.

obviously, race is correlated with socio-economic status. I account for this by adding the share of households in the tract that *Rents* their homes, and the share of households that are *Wealthy* as of 1970 in the first stage of the instrumental analysis.

As in the regressions presented in Table 7.1, my instrumental analysis controls for the share of the population that is white in 2000, the share of the tract that lived in the same house in 1995, and the tract's population density. My dependent variable is again the tract-level aggregate measure of the two-party *Democratic Vote Share* in 2008. I use a two stage least squares regression, with errors clustered by MSA. Table 7.2 presents the results of this estimation.

The results of the instrumental variable analysis offer strong additional support for my argument that the defended/minority status of a neighborhood in 1970 continues to exert a powerful, independent, causal effect on partisanship in modern elections. The political identity of neighborhoods appears persistent. In the next section, I provide individual-level evidence of the conservatism of defended neighborhoods.

Individual Level Conservatism

Obtaining individual-level survey data that is representative of city populations is notoriously difficult (Tausanovitch and Warshaw 2014). The costs of sampling across many localities, in addition to the complexity of designing specific surveys for each community, are typically prohibitive for scholars. Instead, I take advantage of the long time series and consistent battery of questions asked by the General Social Survey (GSS). The GSS administers a survey

to an average of 2,000 respondents representing adults living in non-institutional arrangements in the United States on a biennial basis. I create a new dataset built from restricted access GSS data from the 1998, 2000, 2002, 2004, 2006, and 2008 surveys.[156] To the GSS data set, I merge tract and MSA level census data from 1970. To measure contemporary neighborhood demographics, I add linearly interpolated data from the 1990 and 2000 Census of Population and Housing and the 2007-2011 American Community Survey. For tracts not included in the American Community Survey, I use 2000 census data for all years of the GSS. The combined dataset includes tract-level data for 12,188 respondents from 117 metropolitan areas with an average of about 100 respondents per metro area.[157] Although the GSS asks an enormous range of questions each year, only a subset of the survey questions is repeated. This repetition is crucial for my ability to estimate neighborhood effects because I rely on pooling across years to gain a large enough sample size. As a result, I restrict my analyses to questions that include at least 5,000 usable responses. At this threshold, the analyses include an average of 50 responses from each MSA. For the most part, my analyses only include white respondents, as this is the relevant population for my theory.[158] I begin by determining the demographic characteristics of individuals who live in neighborhoods that were defended/segregated in 1970. In this analysis, my dependent variable is the 1970 *Tract-Metro Difference in Percent White* described above. My independent variables include several demographic traits that are known to correlate with vote choice and ideology (Miller and Shanks 1996, Carmines and Stimson 1986, Green, Palmquist and Schickler 2002): the respondent's race (a dummy variable coded 1 for *White, non-*

156 These are the years for which the GSS was able to provide census tract level information for every respondent, which is essential to my analysis. The tract-level information was provided in response to a sensitive data request submitted to the National Opinion Research Center at the University of Chicago.
157 Respondents who live outside of metro areas are excluded from these analyses.
158 It is interesting to note that the results hold for non-white respondents as well. This adds further evidence to my claim that neighborhood context is associated with political conservatism above and beyond the aggregation of residents' demographic traits.

Hispanic)[159], *Age*, *Education* (where 0 is less than high school and 4 is a graduate degree), sex (coded 1 for *Female*), the total number of *Kids* under the age of 18 living at home, marital status (coded 1 for *Married*), and inflation adjusted *Income.*[160] I also add the variable *Mover*, that is coded 1 if the respondent lived in a different city or state when she was 16 years old and 0 if she has lived in the same city.[161] To account for the hierarchical structure of the data, I estimate a multilevel mixed-effects linear regression via maximum restricted likelihood, with random effects at the MSA level. This strategy adjusts the estimates and their errors for place-based correlations in attitudes. Table 7.3 presents the results (summary statistics are shown in appendix Table A7.2).

[159] The GSS has a relatively small sample of non-Black racial and ethnic minorities, so I combine all nonwhite racial/ethnic categories.

[160] Approximately 10% of the observations are missing income data. I imputed observations by regressing income on age, education, gender, race, work status, marital status, the number of people in the household, the size of the city, the presence of children at home, and dummy indicators for year for the non-missing observations, generating predicted values, and replacing the missing observations with the predictions.

[161] Ideally, we would like to know whether or not the respondent moved neighborhoods as well, but the GSS does not ask this question.

The estimation reveals few surprises. For example, holding all other variables at their mean values, white respondents live in neighborhoods that were whiter than the metro area in 1970 (0.06), while respondents of color live in neighborhoods that were less white (-0.04). More educated respondents live in neighborhoods that were whiter, as do married, and higher income respondents. Respondents who had moved cities or states since they were 16 chose neighborhoods that were about 4 percentage points whiter than the metro area. Respondents who live in the same city tend to live in neighborhoods that mirrored the metro area. Those with children living at home tend to live in neighborhoods that were less white in 1970, but among middle and high-income respondents this effect reverses. That is, middle and high-income families with kids at home live in significantly whiter neighborhoods.[162] A similar interactive effect occurs with age. Among the poor, older residents live in neighborhoods that were significantly less white in 1970, but among middle and high-income residents, there is no relationship between age and neighborhood characteristics. These results point to several interesting conclusions. First, the results appear to indicate that neighborhoods that were whiter than the metro area in 1970 are more expensive and more desirable. They also suggest that sorting is likely to have played a role in the development of ideology and partisanship of particular places. Finally, these results indicate that it is necessary to control for all of these individual demographic characteristics in any estimation seeking to identify neighborhood effects. I turn to this task next.

I begin with an overview of individual-level partisan affiliation and ideology. I use the 1970 *Tract-Metro Difference in Percent White* as my independent variable in all analyses. My

[162] This interactive relationship is available upon request.

first dependent variable is the respondent's *Partisan Identification*. Respondents were asked, "generally speaking, do you usually think of yourself as a Republican, Democrat, Independent, or what?" Follow up questions asked for the strength of partisanship and pushed independents to identify as leaners. The resulting measure is a seven-point scale running from strong Democrat to strong Republican. Next, I analyze *Ideology* (where 1 is extremely liberal and 7 is extremely conservative), and finally *Republican Presidential Vote*, coded 1 if the respondent voted for the Republican candidate in the most recent election and 0 otherwise.[163] I control for all of the demographic traits included in Table 6.3 except one – *Mover*. I omit this variable because it is missing for a large share of the total observations. Its inclusion does not affect the results presented (and the coefficient is not significant in any of the estimations). In a second set of analyses, I add controls for current neighborhood attributes to provide additional evidence that the political character of neighborhoods was developed historically. These neighborhood variables are the *Percent White* and *Percent Homeowners* in the tract, linearly interpolated for each year of the survey. Both sets of analyses are presented in Table 7.4.

[163] For this last analysis, I use a multi-level mixed effects logistic regression to account for the binary dependent variable.

As was true in the aggregate, at the individual level, the historical persistence of neighborhoods is clear. Places that had defended their exclusive white character as of 1970 are home to significantly more Republican and conservative residents today. This is the case even when we account for both individual and aggregate demographic traits that predict partisanship and ideology.

The same pattern holds when I replace the dependent variable with particular policy items.[164] Respondents who live in neighborhoods that were whiter in 1970 are more likely to view government spending as adequate or too high on categories like social security, parks, and mass transit, and they are more likely to believe that individuals, not the government, should be responsible for health, wealth, and the standard of living.[165] For instance, respondents were asked to place themselves on a five-point scale where at one end the government should do more to solve our country's problems and at the other end the government should leave things to individuals and private businesses. Comparing whites who live in neighborhoods that were minority dominated in the 1970s to those who live in neighborhoods that were white defended moves responses in a conservative direction by about a half of a standard deviation on this scale (from an average of 2.8 to 3.3).

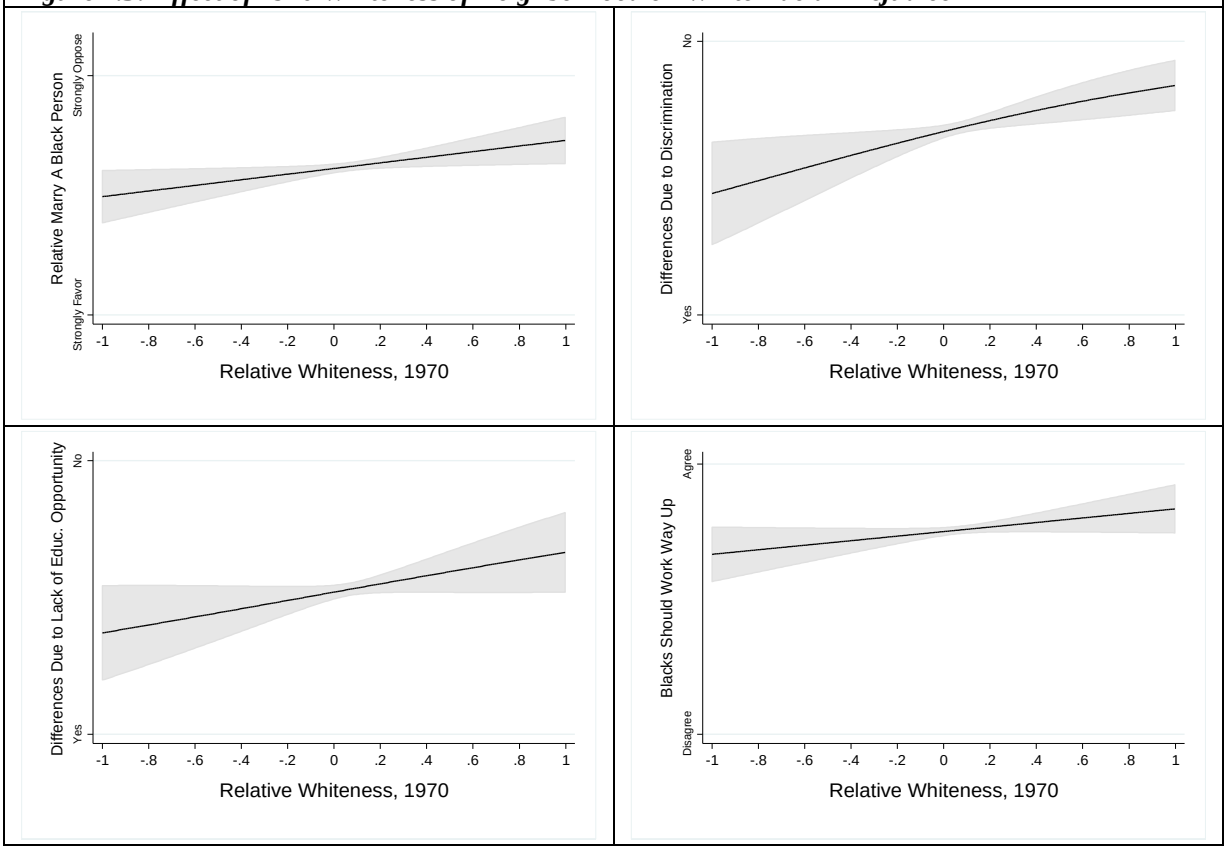
[164] These questions were not asked of all respondents in all years. As a result, in some of the specific policy areas discussed below the total number of respondents falls below 5,000. However, it never falls below 3,000.
[165] One question on which 1970 neighborhood whiteness was not associated with support for lower spending was education. When asked whether or not the government was spending the right amount "improving the nation's education system", there was no difference in the responses of individuals who live in neighborhoods that were whiter in 1970. Although this is obviously circumstantial evidence, it is plausible that the defended neighborhoods have higher quality schools and this is a feature that attracts certain residents who are supportive of higher educational expenditures.

Prejudice and Policy

If integration battles are linked to the ideology of defended neighborhoods, then we would expect residents of these places to have particularly conservative views when it comes to race. I find strong support for this contention. There are many different questions that tap racial views included in the GSS. I use several as dependent variables that are both common in the literature and have a long enough time span to generate sufficient respondents. I begin with an analysis of racial affect and prejudice. The first question asks respondents whether or not they would be in favor of having a family member marry a black person. The second question probes views on inequality. It states "On the average (Negroes/Blacks/African-Americans) have worse jobs, income, and housing than white people." Then it asks: "Do you think these differences are mainly due to discrimination?" and/or "Because most (Negroes/Blacks/African-Americans) don't have the chance for education that it takes to rise out of poverty?" Finally, I analyze responses to the question, "Do you agree strongly, agree somewhat, neither agree nor disagree, disagree somewhat, or disagree strongly with the following statement: Irish, Italians, Jewish and many other minorities overcame prejudice and worked their way up. Blacks should do the same without special favors."

All dependent variables are coded so that higher values equate to a more conservative position. The structure of these analyses is the same as those included in the top panel of Table 7.4 (mixed effects maximum likelihood estimation with random effects for MSAs and controls for individual demographic characteristics). Rather than present regression tables, Figure 7.3 graphically display the marginal effects on *Tract-Metro Difference in Percent White, 1970* holding all other variables at their mean values.

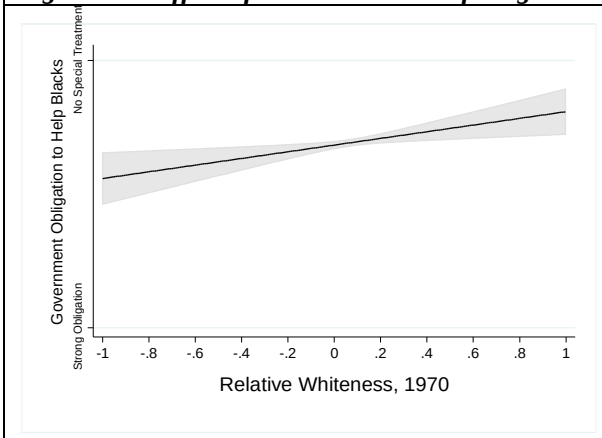
Figure 7.3: Effect of 1970 Whiteness of Neighborhood on White Racial Prejudice



The results presented in Figure 6.3 offer a consistent picture of white residents who live in neighborhoods that were whiter than the metro area in 1970. They are more strongly opposed to having a relative marry a black person, they are less likely to see persistent racial inequality in jobs, income, and housing as the result or discrimination or educational opportunities, and they are more likely to agree that blacks should have to work their way up like white ethnic groups In sum, residents of whiter neighborhoods are more likely to want to avoid close contact with blacks, to blame blacks for conditions of inequality, and put the onus on individuals to advance their position.

These attitudes translate into conservative views on race-targeted policies. To show this, I analyze two questions. The first question reads "Some people think that (Blacks/Negroes/African Americans) have been discriminated against for so long that the government has a special obligation to help improve their living standards. Others believe that the government should not be giving special treatment to (Blacks/Negroes/African Americans). Where would you place yourself on this scale?" Responses were coded on a five-point scale ranging from strong obligation to no special treatment. The second question focuses on affirmative action and asks whether or not respondents are "for or against preferential hiring and promotion of blacks." The responses are coded on a five-point scale ranging from strongly favoring to strongly opposing. Figure 7.4 presents the marginal effects of the regression of these policy responses on *Tract-Metro Difference in Percent White, 1970* holding all other variables at their mean values.

Figure 7.4: Effect of 1970 Whiteness of Neighborhood on Support for Race-Targeted Policy



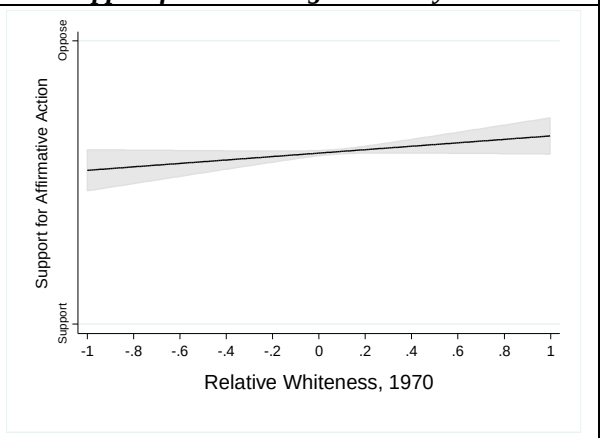


Figure 7.4 reveals that residents who live in neighborhoods that were whiter in 1970 are more likely to hold conservative views on race-targeted policy. They are less likely to feel that the

government has an obligation to make right discrimination against blacks and less likely to support affirmative action.

Conclusion

In sum, there is strong evidence that the language and ideology developed around integration battles in post-war urban America persists. During the tumultuous 1940s, 50s, and 60s, faced with changing legal and rhetorical regimes, white homeowners seeking to keep minorities out of their neighborhoods began to shed the language of racial exclusivity. They understood the defense of their homes and spaces as a defense of their rights as homeowners and freedoms as individuals. Hayward (2013) describes this as the development of an "identity story," a story about "who 'we Americans' are: about what we value, what we want and deserve, and what it is that serves our good" (p119). Hayward is clear though – the Americans included in this vision were not all Americans, but rather all *white* Americans.[166] Yet, the privileged residents of defended neighborhoods promulgated the argument that "race doesn't matter" (Hayward 2013, p176). Instead, they relied on a frame that emphasized their hard work, frugality, and investment in their children's education. This perspective persists in these places. This chapter links 1970s neighborhood demographics to feelings of distance from African Americans, a belief that racial inequality is the result of lack of individual motivation, opposition to policies that redress disparities in outcomes across racial groups, and commitment to conservatism more generally. Residents who live in defended neighborhoods today are more

[166] Hayward (2013) situates the genesis of this identity story earlier in the 20th century than I do here. She argues that it was borne of economic need among developers seeking land use planning and financial support from the government. My narrative is not incompatible with her view. It makes sense that the language adopted by rights-oriented white neighborhoods was readily available when they needed to use it. Hayward argues that the narrative of Americans as a homeowning people developed by real estate interests functioned as a "frame to many ordinary stories" (p167).

likely to identify as Republicans and more likely to vote for Republican presidential candidates.

The local roots of modern conservatism are deep.

Chapter 8: Conclusion

In the early decades of the 20th Century, homeownership rates in the United States were already much higher than in many other advanced democracies. As of 1914, in the United Kingdom 10% of households owned their homes (House of Commons Research Paper, 1999). In the United States the figure was about 45%.[167] During the late 1940s homeownership rates for France and Germany were about 31% and 27% respectively (Kohl 2014). For most families, the home was (and is) the single largest component of household wealth (Knoll et al 2014). Not only homeowners, but all property owners, land-oriented businesses (like real estate agencies), and local governments reliant on property taxes, had a strong incentive to protect and enhance the value of property. In a world of limited resources, they also had a strong incentive to politically control the distribution of public goods increasingly offered to city dwellers.

Yet, homeownership and political power were not equally available to all urban residents. In 1900, the homeownership rate among whites was more than double the rate among blacks (Collins and Margo 1999). Chinese and Japanese immigrants were barred from owning property completely in many states, and everywhere the vast majority of blacks, Asians, and Latinos were prohibited from voting (Keyssar 2000). Thus, as America became an urban nation, it was white property owners who dictated the policies of local governments. They used their power to pursue segregation. By invoking the power of land use regulation and zoning, city governments institutionalized prevailing race and class hierarchies.

In cities across the country, "Chinatowns" (McWilliams 1964, p105), Sonoratowns (Torres-Rouff 2013, p139) and "Niggertowns (Litwack 2004, p9) were walled-off by a combination of public policy, violence, and custom. Local governments then proceeded to

[167] https://www.census.gov/hhes/www/housing/census/historic/owner.html

systematically underinvest in these neighborhoods, denying them adequate sewers, paved roads, garbage collection, or public health initiatives. By the onset of the Second World War, city governments had become proficient segregators. When millions of dollars were spent renewing and rebuilding urban communities, segregation was reinforced and deepened.

By the hands of local governments the foundation of Sampson's (2012) powerful 21st century neighborhood effects, was laid. Using Chicago as a lens with which to view large, diverse cities, Sampson shows that today, neighborhoods differ significantly with respect to "crime, poverty, child health, protest, leadership networks, civic engagement, home foreclosures, teen births, altruism, mobility flows, collective efficacy, [and] immigration" (p6). These differences, Patrick Sharkey (2013) explains, are "*not* attributable primarily to factors that lie within the home or within the individual," but rather to the place itself, passed down from generation to generation (p21). Sampson (2012) argues that, as a result of racial segregation, neighborhood disadvantage is "most pronounced in the black community." These inequalities, Sampson tells us are, "durable and multiplex but not inevitable or natural" (p99).

The consequences are irrefutable. Scholars have persuasively demonstrated that segregation causes higher poverty rates for blacks and lower poverty rates for whites (Ananat 2011), lower high school and college graduation rates among blacks (Cutler and Glaeser 1997), higher imprisonment rates (Burch 2014), and higher rates of single-motherhood among blacks (Cutler and Glaeser 1997). Neighborhood disadvantage is also related to black/white income inequality, lack of employment stability among blacks, and larger gaps in cognitive skills between blacks and whites (Sharkey 2013). Cohen and Dawson (1993) show that neighborhood poverty undermines blacks' attachment to and involvement in the political system. I've shown that segregation leads to racial political polarization and underfunding of public goods.

Cumulatively, these results suggest that both growing up and living in disadvantaged places, while not wholly determining one's fate (e.g. Vance 2016), does leave little margin for error. "Mobility out of the poorest neighborhoods," Sharkey (2013) says "may be even less common than mobility out of individual poverty" (p35). Perversely, home ownership in this environment serves to limit mobility rather than enhance it.

In the first half of the 20th century, advantaged and disadvantaged neighborhoods resided within the political boundaries of large central cities. In the second half of the century, when the suburbs captured most of the population growth, the physical, and more importantly political, distance between advantage and disadvantage widened. Today, the most advantaged places are located outside of central cities altogether so that the most disadvantaged residents have no direct role to play in decisions about building affordable housing, expanding public transportation, or diversifying schools. In these places residents are more politically conservative; they vote at higher rates for Republican presidential candidates, support low taxes, want limited spending, and see inequality as the result of individual failings. Recent research suggests that privatization of public services is the most recent response to integration. Trounstine (2015) finds that a greater share of communities' security and educational needs are met through private provision in more diverse communities. Similarly, Betts and Fairlie (2003) show that native-born American families are more likely to send their children to private high school in response to increased immigration. Given this distribution of preferences and opinions, proposals to reduce inequality through mechanisms like regional governments or tax-base sharing (e.g. Orfield 2002, Katz 1999) are simply politically infeasible.

However, moving the policy debate to the state or federal level, could be more workable. Given that property owners' anxiety about protecting their investment is the driver of the many

patterns I reveal in this text, one solution would be to address this concern directly. William Fischel (2015), has argued that reducing federal tax-subsidies for owner-occupied housing would curtail homeowner demands for exclusivity.

State governments may also be able to make significant progress in generating outcomes that approach equality. There are lessons to be learned from the history of public school provision and finance. In a detailed historical analysis comparing the Charlotte and Atlanta metropolitan areas, Lassiter (2006), finds that the large geographic footprint of Charlotte's school system ensured that school integration would be successful. Conversely, Atlanta's fragmentation ensured that it failed. This indicates that states could analyze school district and municipality incorporation with an eye toward integration; limiting fragmentation and opportunities for segregation. Lafortune, Rothstein, and Schanzenbach (2015) show that recent school finance equalization policies have focused not on the gap in funding between advantaged and disadvantaged districts, but rather on ensuring a minimum adequate level of funding for all districts. They find that these reforms significantly reduce inequalities in student achievement outcomes between districts.

School finance reform has been possible because state constitutions guarantee the provision of public schooling and lawsuits (and threats of lawsuits), have forced the hand of state legislatures. Education is not the only public good guaranteed in state constitutions though. In fact, state constitutions are the locus of many positive rights. As Zackin (2013) details, they also obligate state governments to "care the poor, aged, and mentally ill, preserve the natural environment…and protect debtors' homes and dignity" (p3). Bridges (2015) demonstrates that state constitutions provide state governments substantial authority in the regulation of water provision and the protection of labor. Leonard (2010) outlines state constitutional requirements

mandating provision of health care and public health. Thus, the centralization of public goods financing, or at least the provision of a minimum level of public goods support through state governments is possible, though obviously politically contentious. At the end of the day, what is clear is that much is at stake in the local provision of public goods and the politics of segregation.

Data Appendix

Chapter 1

Coding of Foreign Born Populations 1900-1940

The Census of Population and Housing collected detailed breakdowns regarding the origin of immigrant populations for large cities between 1900 and 1940. However, the categories of origin changed from Census to Census. I created similar categories by combining subcategories (e.g. I created a Poland variable by combining Austrian Poland, German Poland, and Russian Poland). Using the table available at: http://www.census.gov/population/www/documentation/twps0029/tab04.html, I created a category of immigrants from Southern and Eastern Europe, Asia, and Latin America. Because immigrants from Turkey in Asia were only separately categorized in some Census years, all Turkish immigrants are coded as being Southern and Eastern European, regardless of continent. The category foreign born nonwhite was created by adding the foreign born populations from countries that the 1930 Census designated as sending a majority of immigrants who were classified as nonwhite (China, Japan, India, Mexico, and West Indies).[168] To generate a measure of foreign born diversity, I calculated a Herfindahl Index:

$$Diversity = 1 - \sum_{f=1}^{F} \pi_f^2$$

where, π_f is the population share of the foreign-born group f and F is the total number of foreign-born groups (52). The following foreign born groups were listed in Censuses 1900-1940. The table presents summary statistics for all 291 cities included in these data.

Country of Origin	Mean	Std. Dev.	Min	Max
Africa	0.01%	0.04%	0.00%	1.20%

Segregation by Design

By Jessica Trounstine
University of California, Merced

Abstract:
Over the course of the 20th century the spatial scale of residential segregation along race and class lines increased. In the late 1800s, whites and people of color, renters and owners, poor and wealthy, were separated from each other in small clusters, so that residential segregation occurred block-to-block. By the middle of the 20th century segregation patterns had transformed; residents became segregated neighborhood-to-neighborhood. Throughout the post-war period, segregation between whole cities rose as the nation suburbanized. In recent decades, city-to-city segregation has remained remarkably persistent despite increasing neighborhood integration. Because political representation is geographically determined, these changing patterns have had profound political consequences – generating opportunities for exclusion and increasing polarization. I argue that local governments have been instrumental in driving and shaping these patterns; and they have done so largely in the name of protecting both property values and exclusive access to public goods for white property owners. When property values and public goods exclusivity were threatened, property owners changed their tactics – shifting the spatial of segregation higher. This process has always been Segregation by Design.

Conventional wisdom holds that segregation and the resulting deficit in services that the poor and people of color experience in American cities is driven by a combination of individual racial prejudices, market logic, and federal policy. This is an insufficient account because it ignores the institutional setting in which racism, economics, and federal law are embedded. Local politics structures the way in which *all* of these forces unfold.

Using qualitative historical evidence from large cities throughout the United States and quantitative data from hundreds of cities, I demonstrate that segregation and the unequal distribution of public goods accruing to individuals and neighborhoods are a function of local policies and political battles. Land-use planning, zoning, and redevelopment have been utilized by white homeowners and businesses seeking to enhance property values and monopolize public goods to generate segregation and inequality in access to benefits for over 100 years.

The changing spatial patterns of segregation have had important implications for political representation. Poor and minority residents have become more isolated and less able to secure political responsiveness and public benefits. In turn, segregation affects both local and national politics. In cities, segregated communities are more polarized and less willing to fund public goods. At the national level, neighborhoods that successfully resisted integration during the civil rights era are markedly more conservative today.

Instead of receding, segregation within cities and between cities and suburbs has grown over the past several decades, further antagonizing the imbalance of public benefits between the haves and the have-nots.

Introduction

"Segregated people in a nation that professes to be a democracy soon become a frustrated people. Those who segregate others soon become frightened, insecure people forced to accept and invent prejudice to justify their actions" Robert C. Weaver, *The Negro Ghetto*, 1948

City services sustain, prolong, and even save lives. In the latter half of the 19th century, urban American began a rapid ascent. City populations and economies were booming. But so too were their filth, their disease, and their divisions. By 1900, infectious and parasitic diseases killed nearly 8 in every 1,000 residents; accounting for more than 45% of all deaths (Tippett 2014) and more than 60% of deaths in children (Guyer et al 2000).[1] Between 1900 and 1940, the overall mortality rate in the United States declined by 35%[2] (Linder and Grove 1947) and the infectious disease mortality rate declined by 75% (CDC 1999).[3] In some cities in 1900, 30% of babies would not live to celebrate their first birthday (Meckel 1990). Estimates indicate that between one quarter and one half the decline in total mortality can be attributed to the development of public water and sewer systems. Local public works significantly reduced outbreaks of diseases like cholera, typhoid fever, diarrheal diseases, and malaria (Cutler and Miller 2006, Troesken 2004).[4] Over time, the growth of municipal fire and police forces, street cleaning and refuse disposal, childhood vaccination and physical examination programs, regulation of food supplies (e.g. requirements for milk pasteurization), and the implementation of

[1] Pediatrics. 2000 Dec;106(6):1307-17. Annual summary of vital statistics: trends in the health of Americans during the 20th century. Guyer B1, Freedman MA, Strobino DM, Sondik EJ.
[2] Total mortality declined from 17 per 1,000 persons to 11 per 1,000 persons.
[3] http://www.cdc.gov/mmwr/preview/mmwrhtml/mm4829a1.htm#fig1
[4] It is important to note that the dramatic improvement in mortality from water and sewer systems required the development of filtration and treatment techniques, which were not immediately available when the systems were first built.

building codes all worked to prolong life expectancy (Condran and Cheney 1982, Haines 2001, CDC 1999).

However, such benefits were neither inevitable nor universal. From the beginning poor and minority neighborhoods received fewer and lower quality services: they were less likely to be connected to sewers, have graded and paved streets, or benefit from disease mitigation programs.[5] Today, the quality of public goods in the United States remains highly variable. Some people have access to well-paved and plowed roads, sewers that never overflow, public parks with swing sets and restrooms, adequately staffed police and fire forces, and clean water. Others do not have access to these resources. The quality of such services is largely a function of the neighborhood, city, and state in which a person resides. The degree to which the poor and people of color have been concentrated into identifiable residential locations (e.g. segregation), varies from place and to place, and everywhere has changed dramatically over time.

Over the course of the 20th century the spatial scale of residential segregation along race and class lines increased (Logan et al 2015, Reardon et al 2009, Lee et al 2008). In the late 1800s, whites and people of color, renters and owners, poor and wealthy, were separated from each other in small clusters, so that residential segregation occurred block-to-block. By the middle of the 20th century segregation patterns had transformed; residents became segregated neighborhood-to-neighborhood. Throughout the post-war period, segregation between whole cities rose as the nation suburbanized. In recent decades, city-to-city segregation has remained remarkably persistent despite increasing neighborhood integration. Because political representation is geographically determined, these changing patterns have had profound political

[5] This book explores race and class divisions in local politics and residential locations. There are many ways one might go about defining these groups. As explained in more detail in Chapter 1, I focus on divisions between whites and nonwhites, and homeowners and renters. I use the terms minority and nonwhite interchangeably. I also use the terms black and African American interchangeably.

consequences – generating opportunities for exclusion and increasing polarization. I argue that local governments have been instrumental in driving and shaping these patterns; and they have done so largely in the name of protecting both property values and exclusive access to public goods for white property owners. When property values and public goods exclusivity were threatened, property owners changed their tactics – shifting the spatial of segregation higher. This process has always been Segregation by Design.

An example from Southern New Jersey is illustrative. Camden and Cherry Hill, New Jersey are similarly sized cities, just across the Delaware River from Philadelphia. Camden is home to two superfund (toxic waste) sites; Cherry Hill is home to none.[6] In Camden only 1.7% of state roads had good pavement in 2004[7] compared to 35% in Cherry Hill.[8] Camden has 22 combined sewer overflow outfalls (where raw sewage and storm water may be released to the surface during wet weather), while Cherry Hill has zero. Camden offers no e-waste recycling and no yard waste collection; Cherry Hill provides both. In 2012, Camden's water supply ran so low that residents were required to boil water for consumption and were prohibited from watering their gardens.[9] In contrast, Cherry Hill has a clean, plentiful water supply. The Cherry Hill Public Library has more than 400,000 circulating materials, more than 300 adult programs and classes, and 67 public computers.[10] In 2011, Camden shuttered the doors of its main library and handed control of the remaining two small branches to the county.[11] Cherry Hill offers 63 recreational facilities (parks, art centers, tennis courts, etc.) for its residents and supports 13

different swim clubs.[12] Camden has 25 parks and 8 community centers.[13] Between 2007 and 2012, Camden's city budget declined by about $245 per resident, while Cherry Hill's increased by about $12 per capita. Clearly, living in Camden is unlike living in Cherry Hill. So, how did Cherry Hill and Camden get to be so different?

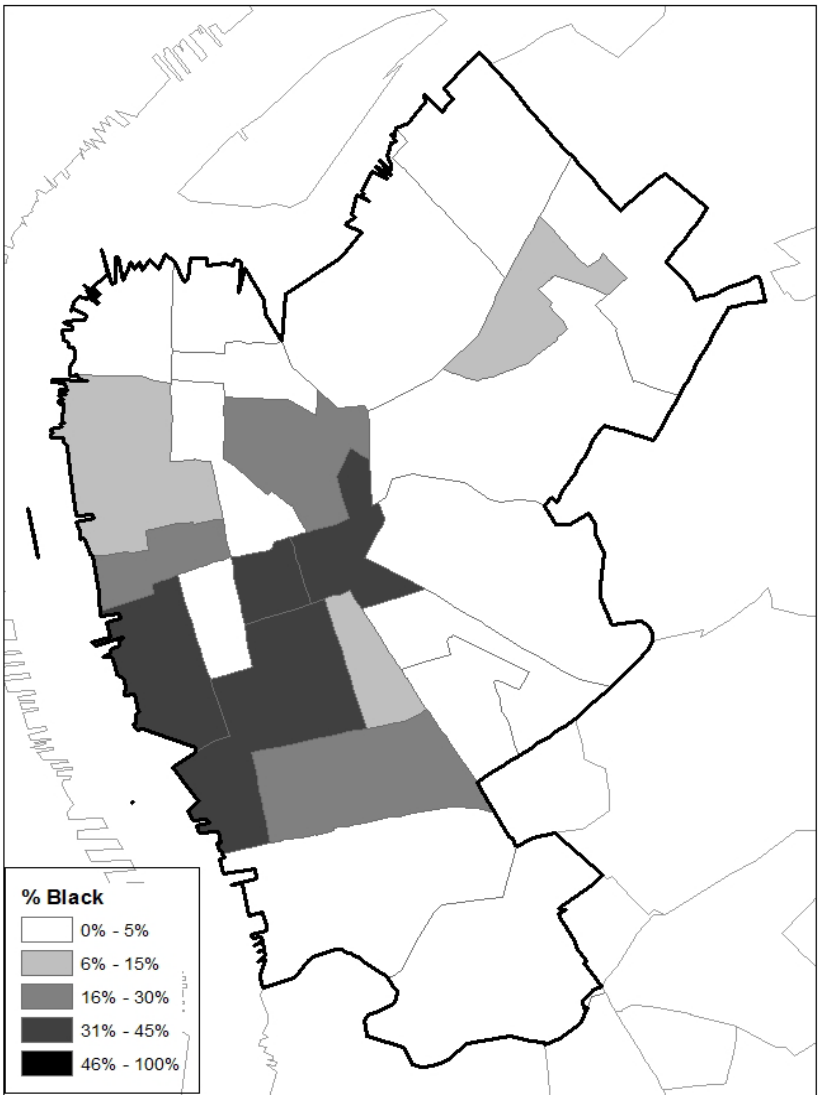
The story begins with a focus on Camden at the turn of the century. Although Cherry Hill was incorporated as a municipality in 1844, it remained a small, undeveloped agricultural community in the first few decades of the 20th century. In 1900, Camden had a population of nearly 76,000 residents. The city boasted 55 miles of sewers, 79 miles of water mains, and about 38% of the city's streets were paved; figures that suggest that Camden's development was right in-line with national averages. Also similar to other cities, were Camden's level of race and class segregation. By the turn of the century, Camden was home to two well-established free black communities named Fettersville and Kaighnsville (Garwood 1999). Established in the 1830s (Fettersville) and 1840s (Kaighnsville), these communities were comprised of small lots affordable to people of modest incomes, many of whom were African American (Garwood 1999). One of Fettersville's neighborhood churches, the Macedonia African Methodist Episcopal Church, was believed to be a stop on the Underground Railroad (Garwood 1999). While the majority of Camden's black residents lived in Fettersville and Kaighnsville, both neighborhoods were predominately populated with white, working-class residents.

According to the 1900 Census, the wards representing Fettersville and Kaighnsville were about a quarter African American. For a city in which African Americans only comprised 8% of the total population, clearly, blacks were not evenly spread across the city. But, the extent and scale of black segregation would increase dramatically by 1940. By 1940, the share of black

[12] http://www.cherryhill-nj.com/Facilities
[13] http://ecode360.com/8508679

residents had increased to 11%, but this growth in the black population was concentrated geographically in the central and southern parts of town. Figure 1 shows that by 1940, the black concentration in parts of Camden exceeded 50%.

Figure 1: Segregation in Camden, 1940



The creation of Camden's segregated neighborhoods echoed the creation of segregated neighborhoods throughout the United States. Camden city government used zoning laws, the placement of segregated schools, and public housing to create and enforce residential segregation between whites and Africans Americans, as well as between renters and homeowners. New Jersey's zoning enabling statute specified that regulations "must be made with reasonable

consideration, among other things…with a view of conserving the value of property," (Cunningham 1965). Camden first authorized zoning in 1928 and like other early zoning adopters, moved quickly to ensure that land use policy was used strategically to protect the interests of white home-owning residents.

By 1930, Camden was a bustling central city. It had more than 118,000 residents and spent nearly $950 (in 2012 dollars) per capita on municipal expenditures – well above the national median. But the stress of the Great Depression left Camden with an enormous burden of vacant and uninhabitable properties (Housing in Camden, 1942)[14]. And, so it was one of the earliest recipients of federal slum clearance and public housing funding in the 1930s (Pommer 1978). In 1938, two buildings were erected – one for whites and one for blacks. When the program was expanded in the 1940s two more projects were built; also segregated. Unsurprisingly, the neighborhoods around each project increasingly came to reflect the race of public housing occupants (Williams 1966a[15]). Later, when Interstate 95 was run through the city, "an attempt [was] made to eliminate the Negro and Puerto Rican ghetto areas" (New Jersey State Attorney General report, quoted in Rose and Mohl 2012, p108).

Overtime, neighborhood segregation in Camden rose; climbing more than 50% in the first half of the 20th Century. As would be the case in cities throughout the United States, Camden's city government underprovided services to its black neighborhoods (Helzner 1968[16], Silvotti 1968[17])

Starting around the time of the Second World War, the city faced desegregation pressures on a number of different fronts. In 1881, the state of New Jersey passed a law prohibiting the segregation of schools by race (Wright 1953). But, as of 1944, no black children attended white elementary schools (Jensen 1948). When the NAACP sued the district, officials responded that black parents had simply not requested attendance at their neighborhood schools. So, the NAACP took out ads in the Camden Courier Post to convince parents to do just that. In 1947, hundreds of black children enrolled in previously all-white schools (Wright 1953).

School desegregation was just one of the first of many signs of racial transition in Camden. In 1951, the city witnessed its first biracial contest for city council when Dr. Ulysses S. Wiggins, the president of the Camden NAACP Branch, was nominated on the Republican ticket (Chicago Defender April 21, 1951). He lost, but in 1961, Elijah Perry became the city's first African American city council member (Riordan 1996[18]). In 1954, the New Jersey Supreme Court ordered public housing to be desegregated and the first black families moved into white buildings in 1966 (Williams 1966a, Williams 1966b[19]). And in 1969 and 1971, the city erupted in violent race riots, touched off by police brutality against black and Latino residents.

In 1940, the little hamlet of Cherry Hill had a population just under 6,000 residents; they were 91% white and 9% black.[20] Not only small, the city was economically weak, having defaulted on its bond obligations been placed in receivership by the state government during the Depression (Shay v Delaware 122 N.J.L. 313, 316 (N.J. 1939), Cammarota 2001). But after the war, while housing and schools in Camden were integrating, Cherry Hill's population and economy exploded, as was true of suburbs throughout the nation.

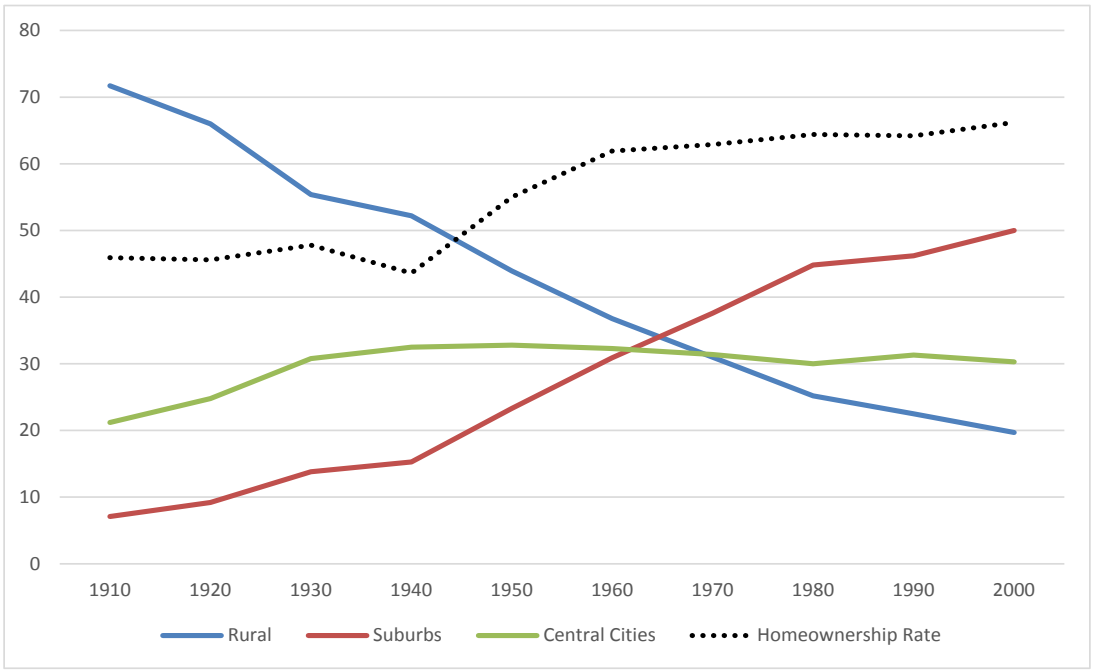
Drawn to places like Cherry Hill by the attractiveness of low-cost federally insured mortgages, the development of new homes and new employment opportunities in outlying communities, and easy commuting along newly built federal highways, the nation suburbanized and white homebuyers moved to the periphery (Jackson 1985). After the war, Cherry Hill witnessed a tenfold increase in 30 years. During the same period, Camden lost 13% of its residents.

Figure 2 shows the share of the total population living in rural areas, central cities, and suburbs over the 20th century. The graph reveals that the pace of suburbanization increased sharply during the postwar period so that by 1970, a plurality of the population lived in suburbs.[21] The homeownership rate increased at the same time. This latter fact is important because it helps to explain the driving force behind exclusionary zoning adopted by suburban communities.

[21] Rural here refers to population outside of any metropolitan area. A suburb is an area inside of a metropolitan area, but outside of the central city. City refers to the central cities of metro areas. https://www.census.gov/prod/2002pubs/censr-4.pdf p33; https://www.census.gov/hhes/www/housing/census/historic/owner.html

Figure 2: Share of Total U.S. Population Living in Different Types of Places



As Camden rushed to utilize more than $30 million in federal redevelopment funds to revitalize its flagging urban center, Cherry Hill was busy implementing zoning restrictions that effectively prohibited the development of low-or even moderate-income housing (Cammarota 2001). In 1975, black residents of Mount Laurel, New Jersey (a suburb close to Cherry Hill both geographically and demographically) along with several local chapters of the National Association for the Advancement of Colored People (NAACP), won a class action lawsuit challenging Cherry Hill's type of exclusionary zoning. As a direct result of this decision, Cherry Hill was required by the state to zone for thousands of low-income housing units. The city declined to do so. As of 2015, Cherry Hill continued to face litigation for its failure to zone for

affordable housing.[22] As is true in many places throughout the United States, exclusionary economic zoning cannot be disentangled from race. One activist argued "many residents carried racist feelings about affordable housing, fearing it would attract poor blacks and Hispanics."[23]

Figures 3 and 4 reveal how segregation between Camden and Cherry Hill changed between 1970 and 2010.

Figure 3: Segregation in Camden and Cherry Hill, 1970

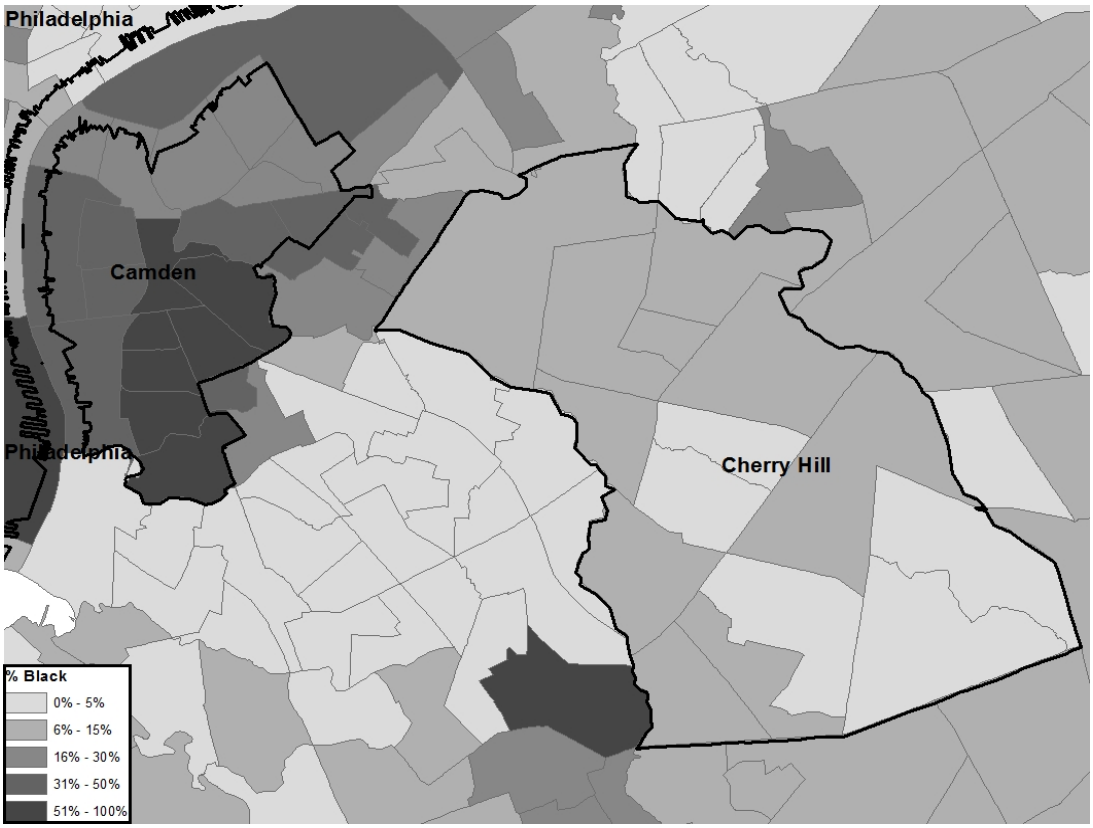
Figure 4: Segregation in Camden and Cherry Hill, 2010



In 1960 Camden was 76% white; and the maps show that in 1970, although home to many more people of color than was true in 1940, Camden still had several exclusive white neighborhoods. These white neighborhoods had all completely disappeared by 2010. So, even though Cherry Hill diversified to a limited extent, a greater share of segregation occurs between these cities than within them.

Those who left Camden during the postwar period and those who moved to Cherry Hill were largely white, middle-and upper-class. As of 2014, about 39% of Camden's population owned their homes, 5% were white, and the annual median household income was $26,000. In Cherry Hill, 80% owned their homes, 75% were white, and the median household income was

$89,500.[24] In 2012, per capita taxes in Cherry Hill were double Camden's. Camden simply cannot afford to offer the services that Cherry Hill provides. The segregation along race and class lines between these two cities, and the resulting inequality in access to public goods was produced by public policy. It is a pattern that was replicated many times over throughout the United States; a postwar version of similar patterns that had developed at the turn of the 20th century.

A Theory of Segregation by Design

In the late 1800s as industrialization brought thousands of migrants and immigrants into cities, people of color and the poor were spatially isolated, not by ward or census tract, but by building and street (Logan et al 2015). What this means is that although blacks, Latinos, and Chinese residents were unlikely to live next door to white homeowners, they *were* quite likely to live down the street. By 1940, segregation shifted up to the neighborhood level (Cutler et al, Massey and Denton), so that large swaths of many cities had become predominately black or white, and both poor and wealthy residents became increasingly clustered in most places. By the onset of the Second World War, every large city in America had parts of town where people of color lived, and parts of town where the poor lived. Sometimes, but not always, these neighborhoods overlapped. Race and class segregation both increased by more than 50% between 1900 and 1940. These concentrating trends continued at a slower pace throughout the postwar period until 1970, when both race and class neighborhood segregation peaked. Neighborhood segregation by race has declined since 1970, but segregation by class has

[24] http://www.census.gov/quickfacts/table/PST045215/3410000,3400712280,00

increased.[25] During the post-war period segregation between cities increased and has remained stable since that time (Massey and Hajnal 1995, Farrell 2008, Fischer et al 2004).

Two classic economic models of individual choice appear to predict these different patterns of segregation. Thomas Schelling (1971) argued that extreme racial segregation could result from individual decisions about where to live, given even mild preferences for having neighbors of the same race. Only a small number of racially intolerant white residents can cause a neighborhood to rapidly transition because as each intolerant white resident is replaced with a black neighbor, whites with lower and lower levels of intolerance choose to leave, creating neighborhood-to-neighborhood segregation. The second individual choice model predicts city-to-city segregation. Charles Tiebout (1956) proposed that residents with similar preferences for taxation and public goods provision should sort themselves into cities with like-minded neighbors. To the extent that heterogenous preferences for tax and spending levels (or ability to pay) overlap with heterogenous demographics, they will also generate segregation.[26]

The trouble is that both theories are subject to instability in the absence of collective enforcement mechanisms (Oates 1969, Oates 1981, Fischel 1992). That is, for an individual to ensure that her neighborhood remains white and has access to a nice public park, she needs the cooperation of her neighbors. But, neighbors may have individual incentives that undermine the achievement of other residents' collective goals. For instance, it can be extremely lucrative for a white homeowner to sell her home to a black buyer. This is especially likely to be the case when black housing options are restricted and when the black population is expanding. As Hamilton

[25] The precise pattern of class segregation depends on the measures used to indicate class. Income segregation has increased significantly since the 1970s (although remains lower than racial segregation), while homeowner/renter segregation has increased by a smaller amount.

[26] Banzhaf and Walsh combine Schelling and Tiebout's insights into a single model that establishes that preferences over public goods and demographics are mutually reinforcing in the generation of segregation (2010).

(1975) explained, individual incentives can also undermine the Tiebout model. It also makes fiscal sense for a resident who prefers high quality public goods, but is unable to afford high tax rates, to locate the smallest, least expensive home in a wealthy city. The taxes this resident pays do not support the share of the public goods she utilizes, but she benefits from them nonetheless. In Hamilton's tale, this behavior could lead to wealthy residents chasing each other around to try and maintain exclusivity. In the first instance, the collective goal of maintaining the white neighborhood is undermined by sellers seeking the highest sale price. In the second instance, the provision of public goods is undermined by residents who do not pay the full cost.

Governments can promote collective action by generating enforcement of collective goals; and here it is *local* governments that play the starring role, because they alone regulate land-use. By invoking their powers of control over land-use and making choices about service provision, local governments can affect the aggregate demographic makeup of communities and the spatial distribution of residents and services, thereby generating and enforcing segregation. The goal of these policy choices is stability (or enhancement) of property values and the protection of public goods quality.

As North (1990) explains, the relative bargaining strength of different interests in any community will dictate the structure of its rules. Such rules, he tells us, are frequently devised in to promote private rather than public interests (p48). The history of local land-use planning and service provision fits squarely within this theoretical perspective. Property owners (and those who derive their livelihood from property, like realtors and lenders)[27], seek both property value appreciation and protection from losses in value. Because tax levels, service quality, and

[27] Developers, while also obviously earning their livelihood through property only sometimes have goals that are aligned with homeowners'. In some settings, developers prefer fewer regulations on development (allowing them to build smaller homes on smaller lots or denser multifamily structures, for example), but in others they are strong proponents of restrictive mechanisms like large lot zoning and racial covenants.

neighborhood demographics are capitalized in property values (see Hilber 2011 for a review), property owners invest considerable energy into dictating local policy (Fischel 2001, Stone 1989; Logan and Molotch 1978).

In the United States, property owners have always been disproportionately white; and property value has been tied to the race of occupants and neighbors (Hayward 2013, Freund 2007). Furthermore, as Bradford, Malt, and Oates (1969) argued, the quality of many public goods, like education and public safety, is predominantly affected by the characteristics of the residents themselves rather than inputs from the government. Together these circumstances have given property owners a powerful incentive to regulate who lives where since the very earliest years of urbanization. In particular, white property owners have long been concerned with excluding certain types of people from their communities.

From the earliest years of city development, white, native-born Americans had a racialized, classist understanding of property value and deservingness of public benefits. In particular, it was widely accepted that poor and minority neighbors negatively impacted property values and were less deserving of benefits than property owners and whites. Local policies like zoning and redevelopment serve these ends, and the result has been segregation along race and class lines.

The very first laws generating segregation were adopted in the first decade of the 20th century, to protect both property values and public goods exclusivity. Over the course of the next 100 years, when property owners were stymied in their attempts to create exclusivity by demographic shifts, loss of political control, or meddlesome higher levels of government seeking to promote equality, they adopted new strategies to achieve segregation, often increasing the spatial scale of exclusivity to achieve their goals. For instance, when first industrialization and

then the explosion of war time economies pulled great numbers of working class people of color to cities, many black and Latino neighborhoods swelled, threatening to spill into white, home-owner communities. City governments were called upon to use policy levers like land use regulations, zoning, the placement of thoroughfares and public housing to consolidate, and then circumscribe minority communities. When state and federal courts ordered desegregation of communal spaces like parks, golf courses, and swimming pools, local governments again used control over land use to alter the residential map. In the post-war period, big city governments became unreliable allies in this pursuit. When the federal court ordered desegregation of schools and when white owners saw threats to their political power in central cities, they ensured that suburban governments protected their interests.

The Geography of Inequality

Political geography is comprised of nested units: neighborhoods within wards, wards within cities, cities within states, and states within the nation. When residential segregation maps onto political geography, political divisions become fused with race and class divisions. This has two important consequences. First, segregation generates inequalities between race and class groups because in a world of scarce resources, the politically powerful deny public goods to those who are politically weak. Segregation within cities and suburbanization across city lines has meant that the benefits experienced by racial and ethnic minorities and low-income individuals are inferior to the benefits experienced by whites and the wealthy. Second, segregation generates political polarization between race and class groups and ultimately, inhibits cooperation.

Segregation generates inequalities because it allows political elites to target public goods toward supporters. At one time, public goods were segregated directly, through laws which

dictated that whites and blacks (and often Native Americans, Latinos, and Asians) could not attend the same schools, sit in the same area on public transportation, utilize the same parks, pools, libraries, or hospitals, be incarcerated in the same facility, or be buried in the same public cemeteries.[28] The legal segregation of public goods allowed city, county, and state governments to provide unequal funding for black and white schools, black and white hospitals, and black and white playgrounds (thereby generating unequal quality). This meant that compared to whites, blacks received inferior public goods than whites regardless of where they lived. But by the middle of the 20th century, public goods inequalities had largely come to be determined by residential segregation instead of directly. [29]

This transformation occurred in part as a response to the 1896 decision *Plessy v. Ferguson* which dictated equality in separate facilities. It was cumbersome and expensive to develop separate and equal services in diverse communities. The duplication of schools, parks, hospitals and cemeteries for black (Asian, Latino, and Native American) and white residents meant higher expenses (CQ Researcher 1947).[30] Such costs arose not only from the establishment of facilities that would not have been needed if the facilities were integrated, but also from the loss of efficiency that the replication of equipment and personnel entailed.[31] Obviously, these costs were minimized when nonwhite facilities were severely underfunded

---

[28] Jim Crow laws demanded or permitted segregation in settings far beyond the reach of public goods including everything from seating in theaters and circuses, to marriage and sex, to the playing of checkers or dominos in private homes (Woodward 1955). Furthermore, laws mandating segregation were but one way in which the rights of racial and ethnic minorities were violated during this period. For instance, various laws barred minority individuals from testifying on juries against white defendants, denied them citizenship status, prohibited their access to certain professions, excluded them from owning land, and of course, prevented them from voting.

[29] The choice between segregating public goods directly and segregating public goods via residential segregation was not confined to the South. Leon Litwack (1961) writes of the antebellum north "legal and extralegal discrimination restricted Northern Negroes in virtually every phase of existence," (p64). More details on Jim Crow segregation in the north are provided in Chapter 3.

[30] http://library.cqpress.com/cqresearcher/document.php?id=cqresrre1947110700

[31] One study of St Louis's segregated school system found that 75% of the city's transportation costs in 1951-52 were spent transporting Negro school children who lived in outlying areas to colored schools in the center of the city (Russell 1954).

(Myrdal 1944, p342), but in the wake of *Plessy v. Ferguson* and successive lawsuits urging cities toward equal (albeit separate) facilities, residential segregation became an attractive alternative. After the many midcentury court decisions striking down any separate facilities (e.g. Brown v. Board of Education), residential segregation became the only remaining option (CQ Researcher 1947, Kruse 2005). In addition to being constitutional, residential segregation was also an efficient mechanism for producing inequalities across multiple public goods at once.

A similar transformation occurred in the post-war period, as neighborhood level segregation was traded for city level segregation. In 1948, when the Supreme Court ruled restrictive covenants unenforceable in *Shelley v. Kraemer*, white neighborhoods lost one of their most effective means of defense against integration. The 1968 Fair Housing Act further limited white collective action. As technological changes enhanced suburban service delivery and commute possibilities, and as the federal government subsidized homeownership outside of the central city, segregation across city lines rose. Moving outside of city boundaries allowed suburbanites to provide high levels of public goods for their residents without having to pay for services for nonresidents. For the privileged, suburbanization was an even more efficient mechanism of segregation than choosing separate neighborhoods within the city. As Hayward (2009) has argued, suburbs offered the opportunity to, "engage in exclusionary zoning practices…to opt out of supporting public housing…and even opt out of supporting public transportation within the boundaries of their municipalities," all while allowing suburbanites to, "pool their tax monies…to provide schooling and other public services." (p149). In addition to offering efficiency, suburbanization also freed residents from having to fight for control of the city government. Indeed, suburban flight was encouraged by a loss of political power in the central city.

In many ways, these inequalities in access to public goods are precisely the goal of segregation's promoters. But, a second consequence of increasing correspondence between political geography and demographic division, is an increase in political polarization. Within cities, segregation generates stark divides between racial groups, leading segregated cities to underprovide public goods. But, even beyond city borders, segregation is consequential. The process of building and defending white homeowner neighborhoods created new ideological commitments to a meritocratic discourse that depicted inequalities as being the result of the free-market, and choices made by black and poor residents, rather than the result of actions taken by government or white homeowners. The new ideology that was bred in defended white homeowner neighborhoods took root, growing into a modern conservatism that prioritized protection of property, self-reliance, and individual achievement (Self 2003, Lassiter 2006, Kruse 2005). Over the years, this conservatism has persisted, inculcating new neighbors with the same perspective.

Empirical Expectations

The preceding argument generates several broad predictions which I test in various ways throughout the coming chapters. First, I predict that some communities will be more likely to desire segregation than others: these are places that have a taste for segregation and/or have significant resources to protect. These places will be most likely to implement local policies like zoning, urban renewal, and restrictive land use regulations. When communities seeking segregation are thwarted in their ability to generate exclusivity, they'll seek to change the spatial scale of segregation – moving to exclusive neighborhoods and exclusive cities. Second, I predict that these local policies work to generate segregation along race and class lines. Third, I predict that residential segregation generates inequalities in access to public goods. Finally, I propose

that residential segregation will cause political polarization in both local and national politics. No chapter or time period contains tests of all of these predictions; but together they tell a compelling story. For more than 100 years property owners (and those who derive their livelihood from property) have urged local governments to enact policies that institutionalize segregation along race and class lines to protect their property values and control the distribution of public goods; and I show that they have been incredibly successful.

I find that segregation along both race and class lines has been promoted by white homeowners and land oriented businesses for more than 100 years. Where these interests dominated city government, segregation grew more rapidly. I also find that as segregation increased, service investment in white homeowner neighborhoods increased. As whites lost control over the distribution of benefits, they moved to the suburbs and continued to expand service delivery. Today, a greater share of public dollars is spent by suburbs than by central cities. Finally, I reveal that in more segregated places political polarization is greater and poor and minority residents have access to lower quality public goods.

Important Caveats

Schools (or lack thereof)

This is a book about segregation, and only rarely do I engage a discussion of schools. This will seem a glaring omission to many readers, especially because many pieces of my argument overlap with accounts offered by education scholars. The literature exploring inequality of educational opportunities is extremely dense and well developed (see Reardon and Owens 2014 for an overview). As Stephen Macedo writes, "Local control, when combined with local funding, and district-based assignment of pupils to schools, has created a geography marked by stark inequalities centered on class and race: a new form of separate and unequal"

(Macedo 2003, p743 in "School Reform and Equal Opportunity in America's Geography of Inequality"). The arguments that I advance here compliment and underscore much of this research. One might view this book as an extension of these arguments to the provision of *all non-school local public goods*.

My focus here is on the various policies that local governments use to generate segregation; and the consequences of segregation for local and national politics. The vast majority of the governments that I study do not play a direct role in the governance of schools or the provision of public education. That is, most cities in the United States do not spend money on educational services; and most public school students (about 85%) attend schools that are governed by school districts not municipalities. One could approach school district politics as I have done for municipalities – analyzing decisions about the drawing of catchment zones, policies on bussing, and the allocation of resources across schools in the same district. But, this would require vastly different data than what I have gathered.

That said, school enrollment and quality plays a major role in individual decisions about where to live. So while I do not analyze the politics of school districts, my argument attempts to take school dynamics into account when analyzing the impetus for segregation. For instance, I use federal desegregation orders to study how segregation changed in the post-war period.

Data Hurdles

The data that I use to reveal the patterns described above differs in important ways from previous research. Most scholars who analyze the determinants of segregation focus either on metropolitan level segregation (e.g. Dreier et al 2004, Jackson 1985) or neighborhood segregation (e.g. Massey and Denton 1993)[32]; and on racial segregation (e.g. Charles 2003) or

[32] M.J. Fischer (2008), Reardon, Yun and Eitle (2000), C.S. Fischer et al (2004), and Rhode and Strumpf (2003) are notable exceptions. However, none of these authors analyze the political causes or consequences of segregation.

class segregation (e.g. Bischoff and Reardon 2013) – but these types of sorting are intricately linked. Class segregation and racial segregation are correlated, but they are not identical. Determining both the causes and consequences of segregation requires taking these linkages into account. The data that I have collected measure segregation both within and across cities, they account for both race and class divisions, and cover city expenditures on a wide range of services during the entire 20th century. This required the encoding of archival data, the generation of new spatial data using GIS, and the compilation of thousands of digitized observations from the United States Census. The comprehensiveness of the data allows for a more complete picture of the patterns of segregation over time and allows for an analysis of the factors that give rise to this variation.

I find generally, that I am better able to explain the causes and consequences of racial segregation. In part this is because the data for measuring racial segregation are available for a longer time series and at a finer grain of detail than the data for measuring class segregation. But, the historical record is also clear that exclusion of other races has been a more powerful driver of these processes than exclusion of the poor. This is evidenced by the fact that many neighborhoods contain a mixture of homeowners and renters, as well as varied income levels, even when they are dominated by a single racial group. As a result, racial segregation has always been higher than class segregation. However, today, local policies that generate class based exclusion are generally upheld by courts, while race based exclusion is not. Additionally, income inequality has increased in recent decades. As a result, class segregation has risen and will likely continue to rise, even while racial segregation declines.

Throughout my empirical analyses I face profound causal challenges. In some cases my analysis is plagued by reverse causality: do white residents move to the suburbs because the

central city elected a black mayor, or did the moving of white residents make it possible for a black mayor to get elected? In other cases, my analysis suffers from an inability to disentangle selection from treatment: does living in a homogenous white neighborhood make people more conservative or do people with conservative views move to homogenous neighborhoods? In still other cases, my argument would be aided by evidence of strategy on the part of local elites, but none exists: zoning generates greater segregation, but could this have been an unintended consequence?

In each chapter I describe the hurdles presented by the (lack of) data and my strategies for overcoming them. Generally, I seek to build a case for my argument using both detailed qualitative evidence and quantitative evidence from hundreds or even thousands of places. I often draw on the timing of events for evidence of causality and, where I am able I utilize instrumental variables to underscore my findings.

Contributions to Existing Literature

This book contributes to a number of dense literatures including work focused on segregation, public goods, attitudes toward outgroups, and political inequality. Although a great deal has been written on each of these topics, very little research engages more than one of these areas. For instance, Tiebout's (1956) seminal article arguing that consumer-voters pick communities which best satisfy their preferences for public goods ignores the role of race, segregation, and inequality in these choices and is silent about the ways in which public goods packages are developed. Other scholars (Alesina et al 1998) show that diversity drives down collective investment in public goods, but do not consider the ways that geo-spatial arrangements might affect this relationship. Still others have shown that whites' desire for homogeneity has played a role in generating racial segregation between cities and school districts (Reber 2005,

Baum-Snow and Lutz 2011, Boustan 2010). However, these works largely ignore the political mechanisms by which such preferences are realized (e.g. the development of zoning policies).[33]

Outside of (excellent) case studies focused on one to two metropolitan areas at a time (Danielson 1976, Hirsch 1983, Sugrue 1996, Kruse 2005, Lassiter 2006, Kraus 2000), to date most of the research analyzing the relationship between segregation and public policy has focused on national level programs like the Federal Housing Administration underwriting guidelines (Jackson 1985) or the Home Owners Loan Corporation neighborhood investment ratings (Hillier 2005).[34] With such far reaching effects, the focus on these programs has been well placed, but has tended to obscure considerable subnational variation; and while the case studies offer invaluable historical detail, they are unable to provide evidence of broader patterns of the effect of local policies on segregation. In short, while scholars have documented changing patterns in racial and class segregation, they have not demonstrated the ongoing role of city politics and local service policy in creating segregation and growing inequality. I show how patterns of local service delivery, zoning laws, and other local policies not only mirrored patterns of segregation but also very much drove them – not only in the pre-civil rights era, but also in recent decades.

Although many scholars have suggested that segregation across neighborhoods or between cities and suburbs fosters inequalities in access to public goods (Massey and Denton

[33] Baum-Snow and Lutz analyze the effect of school district desegregation orders on suburbanization. So, while they focus on the effect of a public policy, they are not concerned with policies that intentionally aided segregationist preferences.

[34] Important exceptions include Rothwell (2011) who analyzes the effect of low density zoning on metropolitan area racial segregation and Dreier et al (2004) who suggest (although they do not provide direct evidence) that zoning and redevelopment affect economic segregation across cities. Cutler, Glaeser, and Vigdor (1999) find support for a theory of "collective action racism" prior to 1970. They show that housing prices for equivalent quality housing were higher for blacks than for whites implying that whites acted collectively to limit black housing choices. However, the authors do not provide any analysis of the types of collective action in which whites engaged beyond speculating that restrictive covenants and racial zoning may have played a role. Importantly, Cutler et al do not distinguish between collective actions that occur in the public versus private realm.

1993, Burns 1994, Dreier et al 2004), very little research offers systematic evidence of this intuition.[35] Other scholars have carefully documented the pernicious effects of segregation on individual level outcomes (Ananat 2011, Cutler and Glaeser 1997), but have not offered a direct link between these outcomes and allocation of public goods. I offer quantitative and qualitative data showing that segregation across both neighborhoods and cities allows governments to disinvest in poor and minority communities and this produces unequal access to public goods. These results help to explain why social mobility is tied to place, as scholars like Sharkey (2013) and Sampson (2012) find, and demonstrate the consequences of public policy and segregation for larger patterns of inequality.

Much of the work investigating the determinants of segregation (both within cities across neighborhoods, and within regions across cities and suburbs) argues or assumes that the important driver of racial segregation is prejudice – that is, attitudinal predispositions toward racial and ethnic minority groups. This is an insufficient account. It is insufficient first because racial segregation has not declined as precipitously as one would predict given dramatic changes in overt expressions of racism. I argue that the institutionalization of prejudice through local public policy makes segregation more rigid. Second, pure prejudice does little to explain the rise of class segregation. I argue that if we understand segregation as a mechanism to protect public goods and property values, increasing class segregation is predictable. Finally, a pure prejudice account leaves unexplored the basis for these predispositions. I argue that beliefs about the acceptability of different demographic groups as neighbors (e.g. what we might take to be pure

[35] An important exception is Troesken (2001) who provides direct evidence of the relationship between segregation and public goods inequalities. He shows that cities with racial segregation were more likely to generate unequal access to municipal water and sewer connections in the late 19th and early 20th centuries.

prejudice) were influenced by the distributions of public goods and battles over those distributions decades ago.

Contrary to some scholars' conclusion that the core problems of segregation have been alleviated, I show that segregation persists, that segregation has grown across cities, and that government policies continue to play a central role in perpetuating segregation.[36] White, wealthy Americans are still trying to segregate themselves. And local governments still tend to invest more toward whites and the wealthy. I build this argument through seven substantive chapters and a conclusion that considers omissions from the book and forecasts the path forward.

Chapter Summaries

In order to orient the study, in Chapter 1, I provide descriptive information regarding changes in segregation and public goods spending over the course of the 20th century. I offer an overview of patterns that will be linked through the chapters that follow. I begin by providing a broad overview of spending between 1900 and 1940. It reveals that cities increased expenditures on street paving and lighting, refuse collection, sewers, libraries, health, education, public safety, and recreation, and increased revenue from taxes. During this early period, cities became modern service providers.

Next, I explore early patterns of race and class segregation. I show that racial segregation increased dramatically between 1890 and 1940 while class segregation increased marginally. It was in the cities with the largest budgets that segregation increased the most. Then, I turn to analyzing fiscal and segregation patterns between 1970 and 2011. I argue that during this period, white property owners turned to suburbanization as their primary mechanism for protecting

[36] Several recent headlines make this claim "Glimpses of a Ghetto-Free Future," "Segregation Continues to Decline in Most U.S. Cities, Census Figures Show," "The End of the Segregated Century: Racial Separation in America's Neighborhoods, 1890-2010."

property values. After 1970 the dominant trend in both race and class segregation was increasing differentiation between cities. During this period, suburban governments grew more intensely than central cities so that by 2011, central cities accounted for a smaller share of total metro area spending than they had in 1970.

In Chapter 2, I provide the first piece of evidence directly linking the patterns described in Chapter 1 by showing that public goods considerations drove efforts to segregate in the early decades of the 20th century. Acting in response to white homeowners and land-oriented businesses, local government policy explicitly sought to exclude people of color from white neighborhoods and poor individuals from wealthy neighborhoods. In empirical analyses I analyze the factors that encouraged the adoption of zoning laws and the role that zoning laws played in the development of race and class segregation. I find that exclusion was most adamantly pursued in cities that had become significant providers of public goods, where property taxes were high (and so, raising property values was attractive), and where political support for Progressive reform was strongest. I supplement this analysis with qualitative evidence that reveals the many factors local governments utilized to promote segregation, including strategies like the siting of segregated public goods such as parks and schools. Finally, this chapter reveals that zoning laws had their intended effect: early zoning adopters segregated more rapidly over the next several decades compared to cities without similar ordinances and zoned cities witnessed greater inequalities in housing values.

Chapter 3 documents the unequal provision of public goods that early segregation allowed. Using historical case study evidence, I show that poor and minority neighborhoods consistently received worse public amenities like road paving, and health clinics. I draw on detailed ward level data from Baltimore, Boston, Chicago, and Philadelphia to show that sewer

extensions were less likely to be built in neighborhoods with higher proportions of African American and renting residents. As a result, inequality in water and sewer access was greater in more segregated places. I show that these inequalities persisted. Using data on all tracts in all cities in the United States, I provide evidence that whites and minorities, and renters and homeowners had differential rates of access to public sewers in more segregated places in 1970, 1980, and 1990. I argue that these inequalities in service provision affected the ways in which white and wealthy residents would come to view poor and minority neighbors. Daria Roithmayr (2014) points out, "we see the strongest evidence of continuing discrimination in housing markets" (p18). This is because the roots of this bias are whites' conscious and subconscious beliefs about the effect of nonwhite and renter neighbors on property values and the quality of public goods – beliefs that were fostered by government choices at the turn of the 20th century.

Chapter 4 provides evidence of municipal policy effects on segregation in the middle of the 20th Century. By 1940, segregation was entrenched, as were the unequal allocations of public goods. But patterns would change in the post war period. In some places segregation along racial lines increased, while in others it had already begun to decline (as it would everywhere after 1970). Class segregation began a slow ascent and then leveled off. As was the case in the first time period analyzed, local public policy played a role in these patterns. I provide evidence that cities that more vigorously implemented urban renewal programs grew more segregated along both race and class lines. I also show that during the 1960s and 70s, in many cities white homeowners lost the political power needed to police the borders of their neighborhoods and control the distribution of public goods. I argue that such changes made suburban living a more attractive option than living in homogenous neighborhoods within cities.

Between 1970 and 2000, the major change in segregation patterns occurred between cities. That is, neighborhoods became more racially integrated within cities, but whole cities became more racially homogenous. Class segregation across cities also increased during this period. Chapter 5 offers an analysis of the role of local political control in generating these changes. Using demographic and finance data from all metropolitan areas in the United States between 1980 and 2000, I show that larger budgets, higher spending on policing, and minority mayoral victories are associated with more segregation across city lines. Where whites maintained control they were less likely to move to the suburbs. Throughout the postwar period cities and suburbs alike moved away from explicitly racial strategies toward class based tactics, such as large lot zoning and limiting multi-family developments, to ensure segregation. I show that more restrictive zoning by suburban cities increased both race and class segregation. As a result, suburban communities made decisions that profoundly affected non-suburban residents while preventing them from participating in the decision making process. In this context, representative government, policy responsiveness, and political equality became hollow concepts.

In Chapters 6 and 7, I focus on the consequences of segregation for modern politics. In Chapter 6, I analyze the consequences of segregation within cities. Quite ironically given early claims that segregation was the best solution to racial discord, I show that segregation is associated with deep race and class divisions that dominate city politics today. Polarization makes cooperation difficult and, I show that segregated cities have smaller city budgets and spend less on individual categories of expenditure such as roads, policing, parks, and sewers. Underinvestment means that city services do not operate well. Focusing on one measurable area

of public goods provision, I demonstrate that sewer overflows are more frequent in segregated cities.

In Chapter 7, I focus on the effects of segregation for national level politics. I draw on case study and large-n evidence to show that the integration of public spaces and residential areas encouraged whites and the wealthy to move to the suburbs during the postwar period, which allowed for more control over political decisions and the distribution of public goods. Then, I draw on restricted-access General Social Survey data geo-coded to 1970 Census tracts to show that residents who live in neighborhoods that were whiter than the metropolitan area as a whole in 1970 are much more conservative than those who live in more integrated places. I argue that this conservatism is rooted in the battles over integration that occurred in earlier decades.

In the conclusion of the book, I pull the many pieces of evidence presented previously into a single framework and discuss what the future holds. I reiterate my main claim: local governments pursue segregation at the behest of politically powerful interests. This allows politicians to target public goods towards some residents and away from others, resulting in differential access to public goods. Segregation generates unequal political outcomes which in turn, reinforces segregation. By linking neighborhood level segregation to suburbanization, I suggest that preferences for separation have changed in form, but not intent over time. Going forward we can expect additional change. Rather than seeking residential segregation, some individuals will choose to leave the public realm altogether – relying more heavily on private provision of services like education, policing, and park space. We have some evidence that privatization has increased even as many cities have become more integrated. The drive to protect property values, ensure good schools for children, and safe streets for families has

remained a powerful force. In the final section of this concluding chapter I consider some potential policy solutions to these seemingly intractable problems. I suggest that the most promising path forward is to utilize lessons from school finance reform (e.g. Lafortune, Rothstein, and Schanzenbach 2015) to guide state governments' approach to producing more equal access to a range of local public goods.

Chapter 1: Segregation and Public Goods over the 20th century

At the turn of the 20th Century, cities in the United States experienced intense demographic change. The first waves of African American migrants left the South for Northern communities, and immigrants from Europe streamed across the borders until the onset of World War I and the implementation of restrictive immigration laws. By the middle of the Century, the spatial distribution of residents was markedly different than it had been 50 years prior; and patterns would change again over the ensuing 50 years. Until the onset of the Great Depression, expenditures by local governments also grew rapidly. It was during this period that the foundation for modern urban politics was laid across the nation. This growth in municipal spending continued unabated for the next 100 years, but it was uneven, favoring suburbs at the expense of cities. This chapter charts and links changes in both demographics and service provision in metropolitan America.

I begin with a presentation of data on the growth of expenditures during the first four decades of the 20th century. I analyze demographic correlates of this growth, showing that homeownership, wealth, diversity, and density were all associated with expanding municipal governments. This, I argue, explains why white homeowners and land-oriented businesses pursued residential segregation: to protect property values and capture public goods. Next, I present the changing patterns of race and class segregation for these early decades. I show that cities with greater spending became more segregated. I then turn to an analysis of spending and segregation between 1970 and 2010, concentrating on the effects of suburbanization. I provide evidence showing that the level at which segregation occurred shifted during this time. While neighborhoods within cities became less segregated, cities started to look increasingly different

from one another. As the next several chapters will reveal, the changing level of segregation has had significant implications for the allocation of resources.

The Rise of Urban America

In the year 1800, only 5% of the population of the United States lived in cities and approximately 90% of the workforce was tied to agriculture. For the next half century, this figure inched modestly upwards, so that by 1850, 15% of population lived in urban areas.[37] After the end of the Civil War, the pace of urbanization (and industrialization) increased dramatically. By 1900, the nation was 40% urban and in 1920, the Census reported a majority urban nation for the first time. This trend continued; today the nation is approximately 80% urban.

As industrialization advanced, massive demographic shifts accompanied the economic changes. Cities began to fill with migrants and immigrants seeking work in the new factories and service sectors. During this period, most workers commuted to their jobs by foot, limiting the distance residential neighborhoods could be located from places of employment. The result was massive overcrowding – in some cities as early as the first decades of the 1800s. Housing and sanitary capacities became overextended; epidemics and conflagrations were rampant. O'Connor (1984) offers a vivid description of early 19th century Boston:

> Within the heart of the old city…things had deteriorated badly over the years…Its meandering streets…were hedged in by four and five-story houses that blocked out the sunlight. Pedestrians were in constant danger of being knocked down by stagecoaches, or bowled over by droves of pigs being hustled to market….[An] abominable stench rose above it all. Not merely the oily fish smells from the docks, the briny tang of salt water, or the sickish odor of the mudflats at low tide. This was the repulsive reek of

[37] The Census determines whether a particular geographical area is urban based on population size and density. Rural territory is any area that is not urban. Starting in 1900, the Census has defined urban areas as all places with at least 2,500 residents. From 1910-1950, urban areas only included incorporated places (e.g. cities) that met the size threshold. In more recent decades, the determination has been a combination of size and density; urban areas contain at least 2,500 people have a density threshold of at least 1,000 people per square mile.

> uncontrolled street refuse and untended garbage. To make matters worse, the city's sewerage system emptied out into the Town Dock… (p80).

Despite the clear benefits of moving away from the center of town, the nature of transportation and the needs of industry meant that even while they grew larger and more diverse, cities in the 1800s experienced low levels of segregation along race and class lines. At this time, the population of urban blacks was heavily concentrated in Southern cities. My dataset includes demographics for 296 cities from the 1900 Census of Population and Housing. These cities housed about 1.2 million black residents; approximately 64% of whom lived in the South. In an early analysis of *The Negro Ghetto* (1948) Robert Weaver explained, "in the cities of the Old South, like Charleston and New Orleans…most of the dwellings occupied by Negroes were either servants' quarters in the rear of the better houses or shacks on streets where low-income groups of whites also lived," (p8). In the north, Weaver says blacks "usually lived in clusters in racially mixed neighborhoods," (p9-10). However, detailed research on New York and Chicago by Logan et al (2015) reveals that although northern blacks did not live in "*predominately* black neighborhoods", they did live in "*disproportionately* black…neighborhoods," (p1062). What this means, is that while neighborhoods were mixed in the aggregate (thereby generating low measures of segregation), the housing available to blacks and other racial minorities in urban areas, was nonetheless heavily restricted from the start. Yet, because political representation is frequently defined at the neighborhood level, with low levels of neighborhood segregation, blacks and other minorities were likely to benefit from public goods provided to white homeowners.

Until about 1930, "state and local governments were *the* governments of most Americans" (McDonald and Ward 1984, p14). This was especially true with respect to fiscal

affairs. To the extent that *any* government would have addressed the negative externalities associated with rapid urbanization, it would have been viewed as the responsibility of the city (and their parent states). Yet, throughout the first half of the 19th century, city governments were fairly limited in scope. The economies of early cities were largely commercial, and a dedication to privatism and the market generally dictated political affairs (Monkkonen 1988, Warner 1968, McDonald 1986). A large and meddlesome government was something to be suspicious of and few cities provided extensive public services. Government was run by (and services were often partially funded by) the wealthy – typically merchants. As Bridges (1984) explains of New York City in 1830s, "it is impossible to determine where government began and noblesse oblige (and the church) ended" (p72).

In most instances, services were handled by volunteers (e.g. fire brigades) or part-time, municipally funded workers (e.g. night watchmen); and while city budgets provided contributions toward these services, city responsibilities were largely focused on regulating access to urban activities (like city markets). But by the end of the 19th century, city governments began to adopt a new orientation toward public goods provision and city leadership began to shift away from wealthy merchants and toward career politicians. As a result, services came to be increasingly funded by city budgets, not charitable contributions. Monkkonen (1988) argues that city goals had been broadened by the 1890s to include:

> Protecting private property (firefighting); suppressing crime; controlling behavior in public areas; building and maintaining streets and sewerage systems; aiding the poor, schooling children and sometimes adults; funding public libraries; providing recreation and entertainment; supporting a minimal level of health; temporarily assisting all persons incapable of caring for themselves…; enforcing public morality; expending direct financial aid to private capital…; and constructing not-for-profit public buildings in which to house these activities (p218).

Historians do not agree on what caused the transition from the regulatory approach of antebellum governments to what Monkkonen calls the "service city" by the late 1800s. Yet, with one exception (Brown and Halaby 1984), scholars have not analyzed this development quantitatively in more than a handful of cities. Simply put, we lack systematic, quantitative knowledge of the factors that affected the development and expansion of city government at the turn of the 20th century when significant variation was present. In 1902, for example, the median per capita expenditure of local governments in cities over the size of 25,000 (n=160) was about $11, but the standard deviation was more than a third of that amount ($4). Some cities spent very little providing services for residents, others, a great deal. If city governments were once limited and weak, why did some choose to begin providing services for residents while others lagged behind?

The dominant paradigm is to understand the growth of city government as the necessary response to the negative externalities of increased population growth and density such as pollution, congestion, conflagration, crime, and disease (see for example Griffith 1927, Still 1948, Glaab and Brown 1967, Chudacoff 1975, Anderson 1977, Troesken 2004). Scholars have generally recognized that the capacity to fund such developments through taxation and debt varied widely across cities (Dilworth 2005, Cutler and Miller 2006, Monkkonen 1988).[38]

Some scholars argue that managing racial and ethnic diversity in growing, compact cities was an essential driver of the development of municipal government. In an analysis of city relief spending in 1929, Cybelle Fox (2012) argues that native-born Americans and social welfare workers sought to Americanize foreign-born populations by drawing them into the reach of government. Tebeau (2003) shows that the development and expansion of fire services was an

[38] Research indicates that prior to the advent of the municipal bond market, cities were largely unable to invest in large infrastructural development.

attempt to confiscate power from ethnic fire brigades, ensuring that firemen would be loyal to the city and not to their group. Similarly, Monkkonen (1988) argues that spending was a mechanism to manage conflict. As cities grew, he says, the bureaucracy of municipal government was invoked to manage conflict and Americanize newcomers as a substitute for small town interactions. In support of this thesis, Brown and Halaby (1984) find a substantial, positive relationship between expenditures and percent foreign born. But contrary to these arguments, Goldin and Katz (2008) show that community *homogeneity* was key in the expansion of free public schooling. A large literature linking diversity and limited public goods provision underscores this finding (Alesina et al. 1999, Poterba 1997, Vigdor 2004, Hopkins 2009, Habyarimana et al. 2007, 2009, Miguel and Gugerty 2005, Miguel 2004, Algan et al. 2011, Fearon and Laitin 1996). This leaves no clear prediction regarding the direction of the relationship between diversity and spending.

Several accounts emphasize demands made by emerging middle-class residents (Yearly 1970), as views regarding what it was the duty of government to provide evolved (Myrdal 1944). McDonald (1986) suggests that property owners in particular wanted good public services which led to high spending through debt. Others highlight the demands of newly minted professionals engaged in the private provision of services, who would benefit from public funding. Teachers pushed for public education; fire fighters pushed for fire forces (Katznelson and Weir 1985, Tebeau 2003). Along these same lines, Monkennen (1988) highlights the growing role of planners, real estate developers, and professional bureaucrats who helped to build the Progressive reform movement (see also Hays 1964, Bridges 1997, Tretter 2012 on Progressivism and growth).

City Spending Data

To provide a description of historical expenditure patterns, I use a new dataset built from a number of government sources that includes data from the turn of the century to the Second World War. Starting from 1902, the Bureau of the Census has been responsible for collecting data on the finances of local governments. With a few exceptions, the data have been collected annually for cities that meet a particular population threshold (which has varied over time). The Federal Reserve Archive (http://fraser.stlouisfed.org/) has digitized copies of the paper Census reports up until the year 1941, and I encoded a series of relevant variables from these digital reports at five year intervals.[39] Thus, I have fiscal data from 1902, 1907, 1912, 1917, 1923,[40] 1927, 1932, and 1937, as well as other governmental data from a number of early special Census reports.[41] I encoded socioeconomic data from the Census of Population and Housing in 1900, 1910, 1920, 1930, and 1940. In order to be able to analyze the diversity of the population, I gathered data on the country of origin for all of the foreign born residents in each city. Details on the coding of foreign born groups are included in the appendix. Linear interpolation was used to create intercensal estimates for all of the socioeconomic variables. In my largest sample, I have a total of 1,397 city-year observations, which includes data from 262 cities.

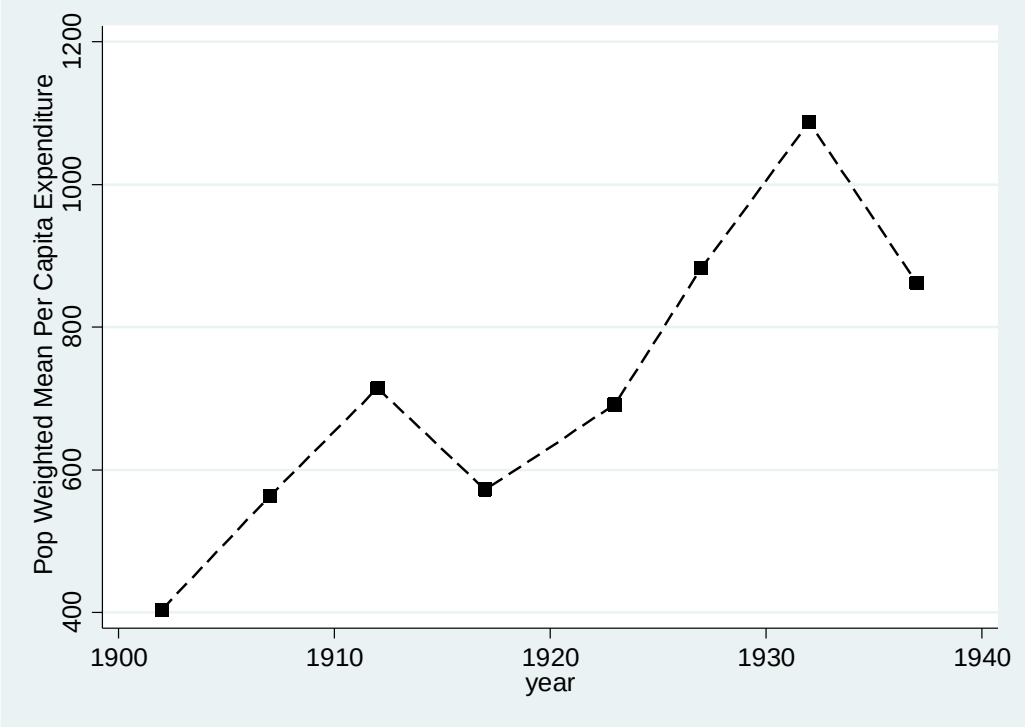
[39] The five year interval was selected to match the interval that the Census of Government used starting in 1952. From 1902-1903, the report was entitled "Statistics of Cities Having a Population of over 25,000." From 1904-1908, it was entitled "Statistics of Cities Having a Population of over 30,000." From 1909-1931, it was entitled "Financial Statistics of Cities Having a Population of over 30,000." From 1932-1941, it was entitled "Financial Statistics of Cities Having a Population of over 100,000." Collection of data on local governments was spotty between 1942 and 1952. The Census resumed regular collection of data at five year intervals starting in 1952.

[40] The report produced in 1922 was limited to very basic data and lacked many of the variables of interest. The 1923 report was used instead.

[41] These include the General Statistics of Cities: 1909: Including Statistics of Sewers and Sewage Disposal, Refuse Collection and Disposal, Street Cleaning, Dust Prevention, Highways, and the General Highway Service of Cities Having a Population of Over 30,000; Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems: 1912; General Statistics of Cities: 1915: Including Statistics of Governmental Organizations, Police Departments, Liquor Traffic, and Municipally Owned Water Supply Systems, in Cities Having a Population of Over 30,000; General Statistics of Cities: 1916: Including Statistics of Parks, Playgrounds, Museums and Art Galleries, Zoological Collections, Music and Entertainments, Swimming Pools and Bathing Beaches, and Other Features of the Recreation Service.

I begin with an analysis of total *Per Capita City Expenditure* as the dependent variable.[42] All data are shown in real (2012) dollars to make comparison to the modern period more straightforward. As Figure 1.1 shows, development of municipal budgets was rapid over this time period. The graph displays the population-weighted mean of per capita total expenditure, plotted against time for all cities that had more than 30,000 residents in 1902. Tables 1.1 and 1.2 show inflation adjusted (but unweighted) mean per capita spending and revenue on various categories over the same time period.

Figure 1.1: Municipal Expenditures Per Capita
In 2012 dollars



[42] This measure includes all general expenses, expenditures on interest, and outlays for the municipal corporation.

Table 1.1: Municipal Budgets in the Early 20th Century
Per capita expenditures in 2012 dollars

year	Expenditure	General Expenditure	Outlays	Revenue	Taxes	Subventions
1902	$313.0		$ 114.2	$425.5	$269.3	$20.6
1907	$409.7	$279.2	$174.0	$418.6	$285.6	$24.4
1912	$562.0	$323.0	$207.9	$541.7	$364.9	$27.3
1917	$456.7	$274.7	$168.0	$408.8	$314.6	$22.1
1923	$587.0	$393.9	$205.2	$491.5	$431.2	$29.2
1927	$700.7	$460.9	$247.3	$586.7	$521.9	$32.2
1932	$868.7	$700.3	$173.3	$807.4	$710.8	$65.0
1937	$670.9	$682.2	$115.5	$704.0	$643.9	$126.9

Table 1.2: Municipal Spending in the Early 20th Century
Per capita expenditures in 2012 dollars

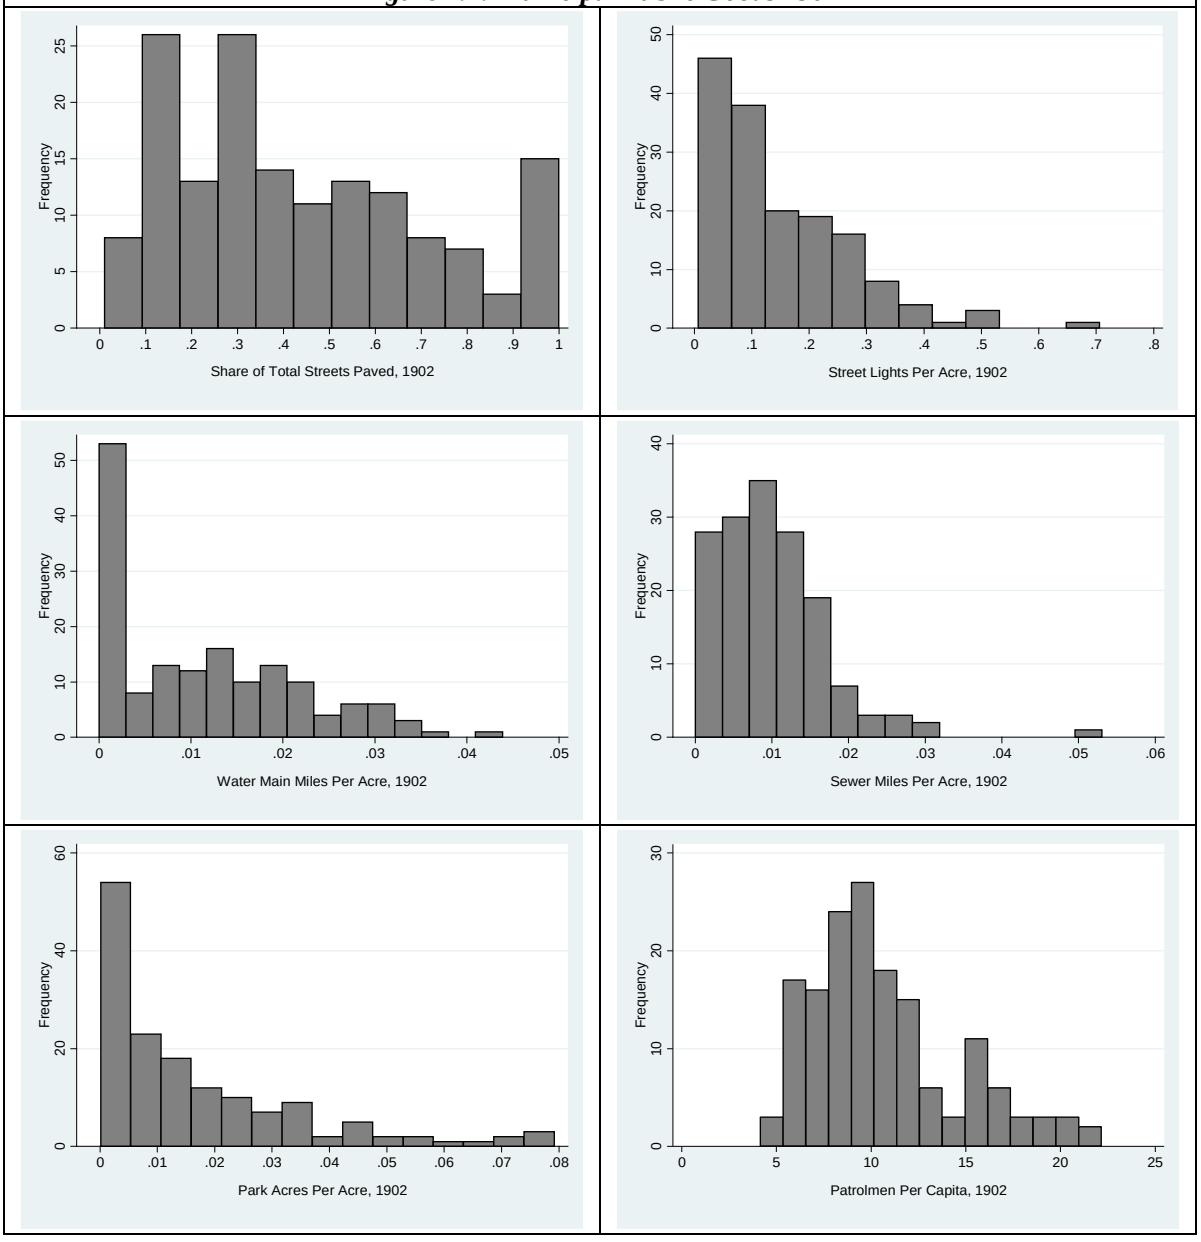
Year	Inspections	Refuse Collection	Sewers	Libraries	Police	Fire	Health	Highways	Recreation	Schools
1902	$1.3	$4.6	$3.7	$3.0	$28.9	$31.1	$4.8	$43.2	$6.5	$84.4
1907	$1.4	$6.7	$4.6	$4.4	$31.4	$35.4	$4.6	$38.7	$7.3	$96.0
1912	$2.2	$19.6	$5.0	$5.1	$33.3	$37.9	$6.2	$42.2	$10.1	$107.7
1917	$1.9	$16.1	$3.8	$4.0	$27.0	$29.2	$6.3	$32.6	$8.9	$97.5
1923	$2.4	$11.9	$5.1	$5.6	$36.1	$39.8	$9.0	$39.0	$11.9	$161.8
1927	$3.0	$14.1	$5.9	$6.7	$43.6	$45.2	$11.2	$43.4	$13.1	$202.3
1932	$3.9	$18.7	$7.7	$10.7	$63.2	$57.2	$17.7	$51.6	$22.3	$257.5
1937	$3.4	$16.1	$7.9	$10.7	$60.3	$53.5	$11.5	$43.4	$21.2	$233.0

The figure and tables reveal that during this period, city expenditures grew across the board. In every category, from sanitation to safety, from health to highways, American cities became modern service providers. Spending slid back during the time of the First World War and the Great Depression, but otherwise followed a steep upward trajectory. Over the next 70 years, growth continued. In 2012, per capita spending was literally 10 times what it had been in 1902. Yet, even at the start of the period, growth was uneven.

Figure 1.2 shows histograms of a number of different public goods that were provided by cities in 1902, including the share of total street miles that were paved, the number of street lights per acre, water main miles per acre, sewer miles per acre, park acres per acre, and

patrolmen per capita. All of the distributions are widely spread. Clearly, significant variation existed.

Figure 1.2: Municipal Public Goods 1902



To analyze the correlates of expenditure, I regress the natural log of inflation adjusted *Expenditures Per Capita* on several variables intended to capture explanations offered in the historical literature. Many scholars have argued that cities responded to pressing needs as they arose. For instance, Glaab and Brown (1967) argue that industrialization and population growth generated demands that were fulfilled by city government. While my dependent variable is measured as per capita spending, it is still possible that large and/or dense cities may have required higher levels of spending (if, for example, fires or diseases were more likely to spread in such places). Monkkonen (1988) argues that the need for social control through bureaucratization was greatest in large cities. Alternatively, large cities may have benefitted from returns to scale, and therefore may have been able to provide services for a lower cost. To test for these possibilities, I include a measure of the *Total Population* (logged) and *Density* (total population divided by total acres).

The analyses also include two different measures of diversity. The first is the share of all residents that were classified as *Nonwhite* by the Census of Population and Housing. During this period, racial categorization was in flux (Roediger 2005) and the determination of race was made by Census takers (Nobles 2000). However, generally speaking, the *Nonwhite* category included Blacks, Asians and Asian Americans, Native Americans, and sometimes Mexican/Latin Americans. Persons of mixed race were typically identified as nonwhite.

The second measure of diversity is a Herfindahl Index:

$$Diversity = 1 - \sum_{f=1}^{F} \pi_f^2$$

where, π_f is the population share of the foreign-born group *f* and F is the total number of foreign-born groups. There were 52 different foreign-born groups recorded by the Census during this

period (listed in the appendix), and the resulting diversity index ranges from a low of 0.23 to 0.94, with a mean of 0.84.[43] This illustrates that the foreign-born population in the United States was extremely diverse.

As explained above, property owners were among the most supportive of investing in new services (McDonald 1986). However, scholars also report a general tendency among the populace to rail against high taxes and profligate spending of city governments in the late 19th and early 20th centuries (Bridges 1984). According to Monkkonen (1988), this belief was particularly pronounced among property owners. To investigate the role of support for spending among owners, I include the proportion of housing units occupied by *Home Owners*. To measure the wealth of the community I include the *Assessed Value* of all property in the city. McDonald (1986) provides compelling evidence that this measure accurately captures the level of economic development in the city – which should correlate positively with ability to fund city services.[44] Finally, to capture the argument that the development of city services was driven by the emerging professional class (including land developers and planners), I add the share of adults employed as *Professionals*.[45] Because I have missing data on a number of variables, I begin with a presentation of the results using only density and population as independent variables. I then add the remaining variables iteratively. Summary statistics for all variables are in appendix Table A1.1.

[43] Making these categories comparable across censuses required some recoding. For instance, in 1930 and 1940, Irish immigrants were separated by Northern and Southern Ireland. I combined these categories to make the data comparable to the 1900, 1910, and 1920 censuses, which included only one category for Ireland.
[44] However, McDonald (1986) finds that when assessed value rose in San Francisco, politicians tended to lower tax rates, perhaps resulting in little difference in expenditure.
[45] The other occupational categories coded by the Census during this period were trade, manufacturing, domestic work, and agriculture. In 1900, the category professionals included actors, architects, artists, clergymen, dentists, electricians, engineers and surveyors, journalists, lawyers, literary and scientific persons, musicians, government officials, physicians, teachers, and other professionals.

These variables are admittedly insufficient to capture all of the important differences across cities during this period. So, rather than attempt to explain variation across cities, I pursue a more modest goal – to describe variation within cities over time. To do so requires that I use a city fixed effects model for the analysis. This strategy overwhelms much of the variation present in the data, but it allows for a more precise estimate of the effect of each of these contextual variables on spending. Table 1.3 presents the results.

Table 1.3: Factors Affecting City Wide Expenditure

	Logged Per Capita Expenditure								
	β	Std. Err	P>|t|	β	Std. Err	P>|t|	β	Std. Err	P>|t|
Population (log)	0.520	0.037	0.000	0.329	0.047	0.000	0.263	0.051	0.000

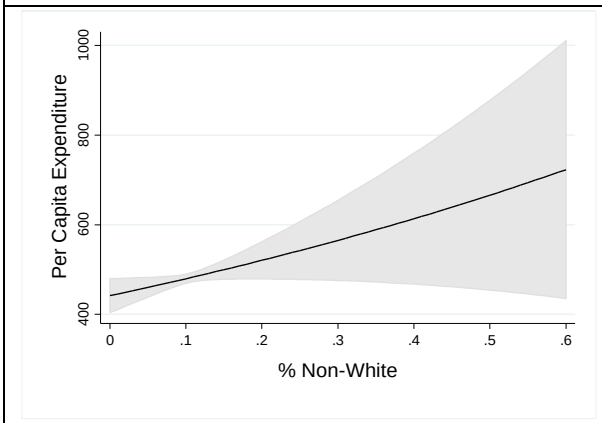
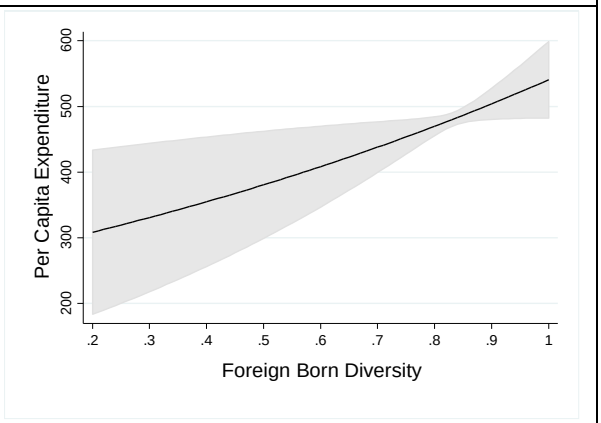
ρ	0.681			0.606			0.567		

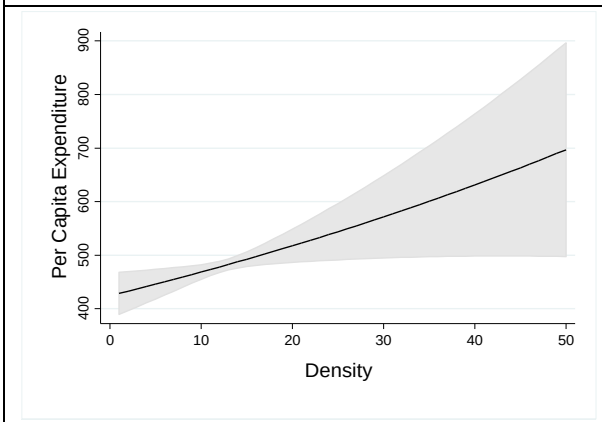
Note: Fixed effect for cities included, but not presented

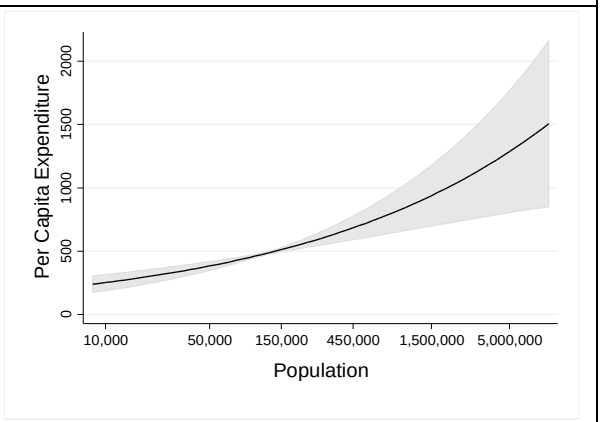
The regression reveals that the factors identified by historical research *do* correlate with expenditures. Cities that were more diverse (either having more nonwhite residents or a diverse foreign-born population from many different places) spent more money. Those places with large, dense populations witnessed higher spending per resident. In an alternate analysis, I add the number of fires per capita that the city experienced in 1902 and 1907. This variable is powerful. Increasing from the 25th to the 75th percentile (from 3 to 5 fires per 1000 people each year), increased spending by $50 per resident. Cities were clearly responding to the negative externalities associated with urbanization. Finally, cities with more capacity and demand (higher property values, more homeowners, and more professionals) also had larger budgets. These results are shown graphically in Figure 1.4. Figures show the marginal effect of each independent variable, holding all other variables at their mean value.

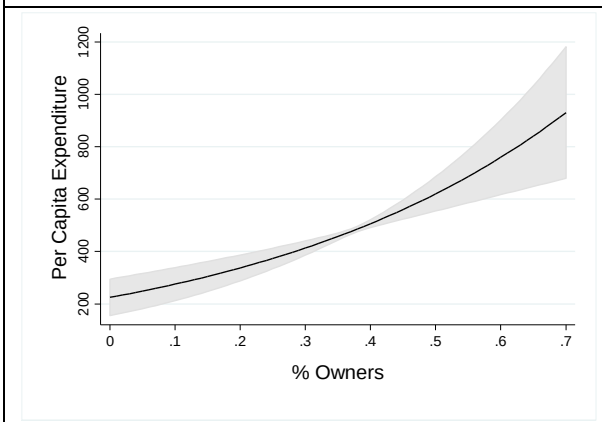
Figure 1.4: Factors Related to Expenditure in Cities, 1902-1937

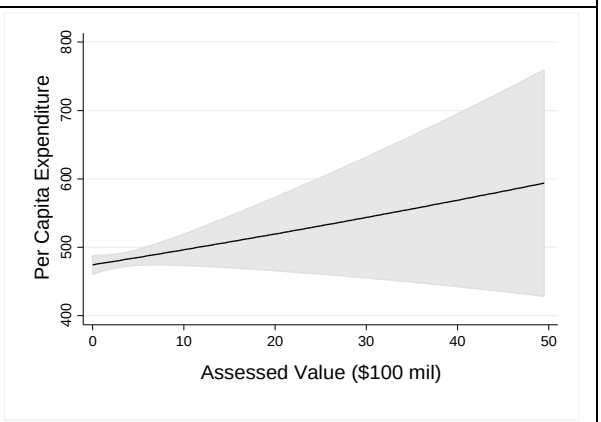


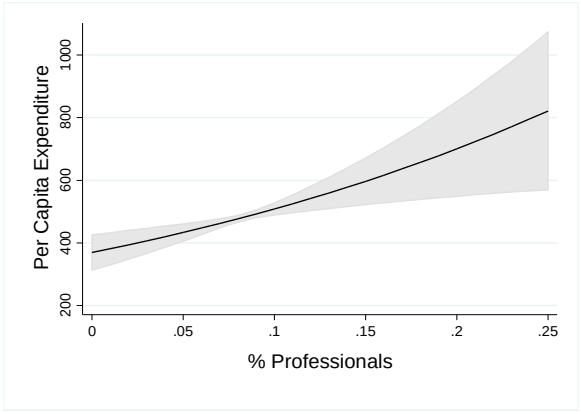












In this book, I argue that white, homeowners sought to institutionalize the residential segregation of poor and minority residents in order to protect their property values and control the distribution of public goods. They were supported in this pursuit by land-oriented businesses. The pattern of relationships presented in Table 1.1 and Figure 1.4 begin to explain this impetus – particularly the positive correlation between property ownership, assessed value, percent professionals, and municipal expenditures. Holding all other variables at their means, a city that was in the 25th percentile of home-owning, assessed value, and professionals (30% owners, $43 million in assessed value, 6% professionals) spent about $378 per resident. A city in the 75th percentile of all three measures (45% owners, $218 million in assessed value, 10% professionals) spent about $588 per person.

These relationships were circular. Local service provision was understood to increase the value of property. It was for this reason that the property tax was thought to be the most appropriate avenue for supporting local expenditures, as owners would be able to "recoup at least part of the levies in the form of higher real property worth" (Benson and O'Halloran 1987). Thus, property owners sought high levels of municipal services, which were expected to bring both direct benefits (from having access to clean water, paved streets, reliable fire-fighting, etc.)

and indirect benefits through increases in property values. In turn, cities expected owners to fund public goods. Yet, even in the early 20th century, owners were prone to believing that city governments were wasteful and they often opposed increases in taxes. Residents wanted high quality services, but were loath to pay for them.

Property owners' orientation toward both government and services was related to the emerging understanding of *who* should benefit from publicly-funded improvements (Myrdal 1944). The cities with the fastest growing service provision were also cities with high levels of racial and ethnic diversity. As Tretter (2012) explains, growth in municipal service provision operated "within a framework of white supremacy" (p10). Controlling who accessed the new benefits was of utmost importance. During this period, the vast majority of blacks, Asians, and Latinos lived in places where they lacked the right to vote; and everywhere, foreign-born residents had to be naturalized before participating (Keyssar 2000). Thus, the preferences of these groups hardly played a direct role in formation municipal policy. A white voter living in Birmingham in 1902 could be certain that no matter how much money the local government raised in taxes, black residents would have little say in how that money was spent. The same was true for a San Franciscan thinking about his Chinese neighbors and for an El Paso resident concerned with Mexicans in his city (Myrdal 1944, Chen 2000, Fox 2012). However, most public goods provided by cities were not targetable to individuals.[46]

When municipal governments provide streetlights and sewers, even those ineligible to vote benefit from these services. But, residential segregation could limit equality of access. Segregation made targeting services – at least to groups, if not individuals – easier. As will be

[46] Municipal jobs, particularly when distributed as patronage, are an exception to this statement. However, despite early accounts to the contrary, the presence of political machines actually depressed spending (Trounstine 2008, Fox 2010, Brown and Halaby 1984). Thus, it appears to be the case that growth in municipal governments has never really been driven by the logic of patronage.

shown in detail in the chapters to come, segregation allowed city governments to collect taxes from poor and minority residents, but underprovide services to them – thereby holding down the total tax bill. Oates (1981) explains that for many important local services such as education and public safety, the characteristics of residents are more important in determining the quality of the public good output than budgetary contributions. Thus, the generation of race and class segregation via policy enacted by local governments (such as zoning or urban renewal), was, in and of itself, a mechanism to improve municipal service provision. Segregation also ensured that the presence of poor and minority neighbors would not threaten property values. As the chapters ahead will show, it was in those places where city spending was high that segregation was institutionalized through local public policy; such institutionalization was pursued most adamantly by white owners and developers of property.

Explaining and Measuring Segregation

The high level of residential segregation in America has been tremendously well-documented (see Charles 2003, Ross 2008, and Boustan 2012 for extensive literature reviews). A smaller, though still well-developed, body of literature is focused on class segregation (see Bischoff and Reardon 2013 and Jargowsky 1996 for reviews). The debate over the fundamental causes of segregation is extensive and nuanced. Scholars have focused on two primary explanations: individual preferences for same race/income neighbors (particularly among whites and the wealthy) and market explanations (e.g. differences in the socioeconomic status of different racial groups and the ability to pay for quality housing/transportation among the poor).

Research on racial segregation largely concludes that the driving force behind residential separation is white preferences for same race neighbors (Cutler et al. 1999, Bayer, Ferreira, and

McMillian 2007, Charles 2006).[47] Boustan (2010) finds that in northern metropolitan areas, between 1940 and 1970, every black arrival from the South was associated with 2.7 white departures to the suburbs. Several scholars show that differences in socioeconomic characteristics such as education, income, wealth, and family structure cannot fully account for segregated living patterns for blacks, but *does* explain a fair amount of the segregation of Latinos and Asians (Bayer et al. 2004, Erbe 1975, Massey and Denton 1987 and 1993, Iceland and Wilkes 2006). Logan summarizes by explaining that racial segregation for blacks is due to the inability to "translate higher income…into residential mobility" (Logan 2011 p15).

Several scholars find that income inequality is an important driver of economic segregation (Bischoff and Reardon 2013, Watson 2009). Others concentrate on selection. Alesina et al. (2004) show that people are willing to give up economies of scale in order to avoid being in a jurisdiction with significant income heterogeneity and Bayer, Ferreira, and McMillian (2007) reveal that households self-segregate on the basis of education.

The links between race and class segregation also form a considerable literature. Some scholars like Denton and Massey (1991), Krysan et al. (2008), and Emerson, Chai, and Yancey (2001) find that whites avoid black neighbors *because* they are black, while others like Ellen (2000), Yinger (1997), Taub et al. (1984), and Harris (1999) argue that whites use black neighbors as a proxy for neighborhood quality. That is, whites do not avoid black neighbors per se, but rather choose what they perceive to be better neighborhood amenities or neighbor characteristics like wealth.

With only a handful of exceptions (e.g. Rothwell 2011, Pendall 2000), quantitative research on the causes of segregation ignores the political context in which it occurs. Local

[47] A small amount of scholarship shows that black preferences for same race neighbors contributes to segregation (Bayer, Ferreira, and McMillan 2007, Fossett 2006)

policies and political battles are crucial for understanding *how* white/wealthy preferences for homogeneity and socioeconomic inequalities are translated into residential patterns. To be sure, scholars have extensively documented the *private* mechanisms by which these factors affect segregation (e.g. via racial steering, mortgage discrimination, and willingness to pay for homogenous neighborhoods). But even private mechanisms may be shaped by local policies and political concerns. For example, I argue that white beliefs about available amenities in poor and minority neighborhoods are, in part, the product of under provision of public goods early in the 20th century. Cutler et al. (1999) find that these beliefs contribute to whites' willingness to pay higher housing prices in whiter neighborhoods. In the next section, I provide the first piece of evidence for this argument. Segregation is correlated with city expenditures – places that provide more services are also more segregated.

There are many different ways to measure segregation (e.g. the degree to which groups are disproportionately distributed across geographic space). Indices of segregation are typically correlated with each other, but capture different theoretical dimensions of separation and so, measure different things (Massey and Denton 1988). The two most commonly used measures are the index of dissimilarity and the index of isolation which can be intuitively interpreted respectively as the proportion of a racial group that would need to move neighborhoods in order to generate an even racial distribution given the racial makeup of the larger community, and the racial makeup of the neighborhood in which the typical member of the racial group lives. While these are obviously meaningful dimensions of segregation, neither measure includes the most relevant information from a political perspective. In politics, what matters is not just how individuals from different racial groups are distributed across neighborhoods, but also how large each racial group is relative to others and how big of an impact each neighborhood might have

on the vote. That is, we need a measure that weights diversity by group size and weights evenness by population size. The *H* index developed by Theil (1972) meets these criteria.

Theil's *H* Index measures the difference between the diversity of the city and the weighted average diversity of individual neighborhoods. Diversity scores for each neighborhood and the city as a whole are influenced by the relative size of racial groups, while the overall index is influenced by the relative size of each neighborhood, giving more weight to larger than to smaller places. Both types of weighting are key to understanding the political implications of segregation. We should expect the effect of segregation to be most pronounced when minority groups are unevenly dispersed across geographic units *and* represent a substantial share of the population.

Theil's *H* has a number of other useful qualities. Importantly, for understanding city politics, Theil's *H* can be calculated for more than two groups at a time (unlike either the dissimilarity or isolation indices). Additionally, it is the only index that obeys the principle of transfers in the multi-group case - the index declines when a minority resident (theoretically) moves to a neighborhood with fewer minority residents (Reardon and Firebaugh 2002). Finally, as will be discussed in the next section, Thiel's *H* is additive and can also be aggregated to higher levels or decomposed into its constituent parts.

Theil's *H* Index is built from Theil's entropy score which is a measure of diversity itself

$$E = \sum_{r=1}^{R} (\pi_r) \ln \frac{1}{\pi_r}$$

where π_r represents the proportion of the population in racial group r (or class group r if the index is measuring class segregation). The higher the entropy score, the more diverse an area

is.[48] The score ranges between 0 and the natural log of the total number of groups *R*. It is maximized when individuals are evenly distributed among the different racial groups (e.g. when

$$\pi_r = \frac{1}{R} \text{ for all } r$$

).[49] Entropy is calculated for each neighborhood individually and for the city as a whole.

The *H* Index measures the degree to which the diversity in each neighborhood differs from the diversity of the city as a whole, expressed as a fraction of the city's total diversity and weighted by the neighborhood's share of the total population.

$$H = \sum_{n=1}^{N} \frac{P_n}{P_c}\left(\frac{E_c - E_n}{E_c}\right)$$

Where *P* represents total population of neighborhood *n* or city *c* and E is the entropy of *n* or *c*. *H* varies between 0, where all neighborhoods have the same composition as the entire city, and 1 where all neighborhoods contain only one group.[50] This *H* Index serves as a key outcome to be explained throughout the book.

The dataset that I constructed to measure segregation is built from a number of different sources. The calculation of the *H* Index requires data on population characteristics at the sub-city level. Cutler et al. (1999) digitized sub-city demographics on race and immigration for 178 different cities from the 1890- 1950 Censuses. To this, I add available data that I encoded on homeownership from the 1900 Census and data from the Elizabeth Mullen Bogue files (1975) on

[48] Where any group's share of the population is 0, the natural log is set to zero, as is the convention in the literature (Iceland 2004).
[49] A scatterplot relating a white/nonwhite calculation of E to percent white is included in appendix Figure A1.1.
[50] In all analyses, neighborhoods are represented by Census tracts, which are relatively stable, contiguous geographic areas containing approximately 4,000 people. Most studies of segregation (e.g. Massey and Denton 1993) use Census tracts as a proxy for neighborhood (although this is not without debate, see for instance Logan et al. 2015).

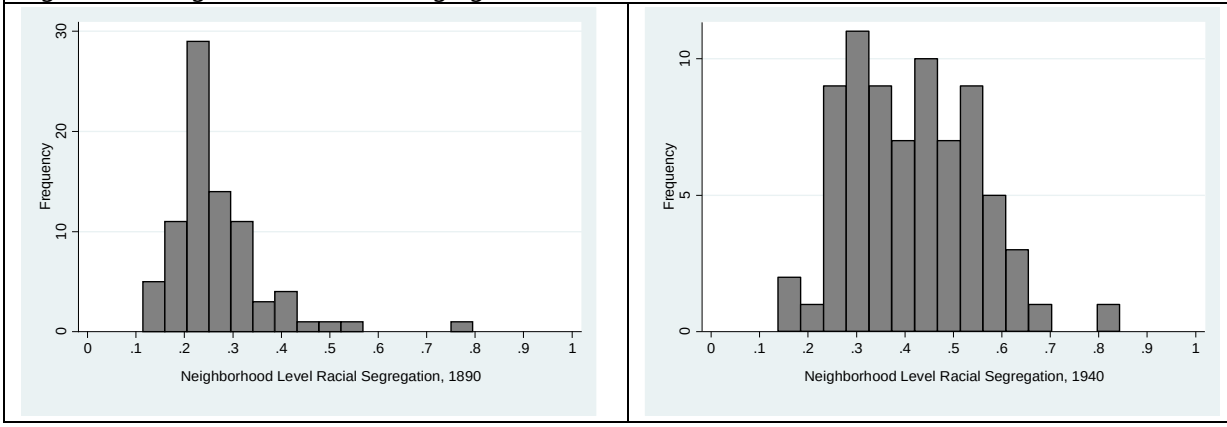
homeownership from the 1940 census.[51] For the 1970-2000 Censuses, I rely on a product developed by GeoLytics called the Neighborhood Change Database (NCDB). The NCDB matches and normalizes Census tract boundaries for each Census year, allowing for direct comparison in demographic changes across time. Finally, I add data from the 2007-2011 American Community Survey. These data allow me to create a panel dataset measuring segregation at the Census-tract level for cities and metropolitan areas for more than 100 years.

Figure 1.4 plots the distribution of racial segregation scores in 1890 and 1940, using data for the 80 cities with populations of at least 25,000 and with at least 1,000 blacks as of the 1890 Census.[52] In 1890, racial segregation patterns were similar from place to place, and generally fairly moderate – although higher than some historical analyses indicate (Cutler et al. 1999). Both features had changed substantially by 1940.

[51] The data from 1900-1940 are collected at the ward level (political units for electing city council members). Starting in 1940, the Census published tract-level data for some cities. Wards tend to be larger in area than tracts and therefore, suggest a smaller value of the segregation index without actually representing a lower level of segregation. To account for this, I adjust all ward-level estimates by a correction factor calculated using a set of 47 cities that reported both ward and tract-level data in 1940.

[52] For all figures presented in this chapter, the two groups used to calculate the *H* index are whites and all others for years 1890-1970. For 1980-2011, the groups are non-Hispanic whites and all others. Throughout the book, I calculate the *H* Index by tract-city-county-msa (Metropolitan Statistical Area). This means that cities which cross county lines end up with multiple observations. This is necessary because Census tracts are nested within counties – not cities. When presenting any analysis at the city level, I use the observation representing the largest share of the city population.

Figure 1.4: Neighborhood Racial Segregation in 1890 and 1940



Note: The white/nonwhite *H* index for 1890 is calculated using wards as the base population unit with an additional correction factor to make the data comparable to tract-level estimates. The *H* Index for 1940 is calculated at the tract level where available and at the ward level otherwise. Data provided by Cutler et al. (1999) and Bogue (1975).

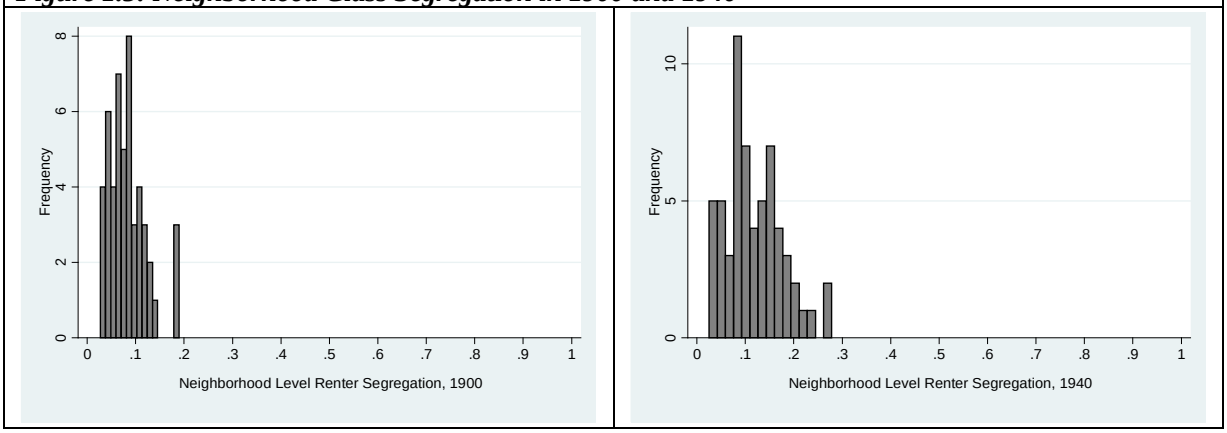
In all but a handful of cases, neighborhood-level racial segregation rose between 1890 and 1940 – on average rising 0.15, a change of about 65%. But the standard deviation is large at 0.13; some cities segregated much more intensely than others. There are many ways to consider measuring class segregation. Throughout the book I use two measures – the distribution of renters versus homeowners, and the concentration of households in the top income threshold.[53] The correlation between owner and wealth segregation is about 0.60. I rely primarily on the former measure for two reasons. First, it is available for the entire time period. More importantly, the existing scholarship indicates that it is property ownership – not wealth – which is the more important driver of local political participation and preferences (Fischel 2000, Oliver and Ha 2007). The downside of this measure is that, at an aggregate level, it is very resistant to

[53] The Census reports income categorically, not continuously; wealthy refers to the number of families in each Census tract with incomes above particular thresholds for each Census year. I use family as opposed to household income because the NCDB does not report household income at the tract level. The thresholds were determined by calculating the average family income for all Census tracts in the United States for each Census year. The wealthy threshold represents the income bin with a starting point closest to the 90th percentile of this distribution. The thresholds for each census year are: $35,000 for 1980, $75,000 for 1990, $100,000 for 2000, and $150,000 for 2011. All families with this amount of income or more are categorized as wealthy. Census tracts range from 0 to 100% wealthy, with a mean of 18%, a median of 13%, and a standard deviation of 16%.

change as the housing stock changes more slowly than demographics. Wealth segregation is a more straightforward measure of the residential divisions along socioeconomic lines, but it is only available starting with the 1970 Census and is less directly affected by city policy.

To demonstrate change over time, Figure 1.5 presents data on the renter/homeowner distribution within cities. This figure reveals that class segregation started off much lower and was more consistent from city to city as compared to racial segregation, and increased a small amount (0.037) between 1900 and 1940.

Figure 1.5: Neighborhood Class Segregation in 1900 and 1940



To determine how segregation correlates with expenditure in the pre-war period, I add to the segregation dataset the measure of *Logged Expenditures Per Capita* described in the previous section. Because segregation data are measured every decade, and expenditures in years ending in 2 and 7, I interpolate spending data. I then lag spending by five years under the assumption that demographic sorting takes time to respond to budgets. I regress *Racial Segregation* and *Renter Segregation* on the lagged *Expenditures* variable. As in the previous section, I add fixed effects for cities. This fixed effect model analyzes the relationship between lagged expenditures and racial segregation over time within cities. This accounts for variation across cities on all other dimensions that might affect segregation and spending.

Table 1.4: Correlations Between Spending and Segregation

	Racial Segregation			Renter Segregation		
	β	Std. Err	P>|t|	β	Std. Err	P>|t|
Expend. Per Capita, 5 year lag (logged)	0.100	0.010	0.000	0.026	0.003	0.000
Constant	-0.238	0.059	0.000	-0.052	0.018	0.005
N	368			179		
Number of Cities	118			56		
R^2 within	0.292			0.383		
R^2 between	0.020			0.010		
ρ	0.802			0.931		

Note: Fixed effect for cities included, but not presented.

The results, presented in Table 1.4, indicate a positive correlation between spending and segregation. The R^2 suggests that about 30 to 40% of the variation in city segregation levels can be explained by variation in the budget. Places with larger budgets were more segregated five years later compared to cities with smaller budgets up until the Second World War. For a host of reasons, this relationship would change going forward.

Suburbanization – Another Form of Segregation

Teaford (1979) argues that two conflicting forces animated city development in the late 19th and early 20th century. On the one hand, socioeconomic diversity generated an impetus for separation. As early as the mid-1800s, "the urban population was resolving itself into separate geographic spheres – factory zones, ethnic neighborhoods, upper-middle-class retreats, race track havens – and each zone sought local self-government as a means of protecting its own particular interests" (Teaford 1979, p23). This separation, Teaford shows, led to the explosion of newly incorporated municipalities. But, over the course of the next 50 years, many of these tiny new cities consolidated and/or were annexed into larger central cities for one primary reason: the provision of city services. Prior to 1900, suburban governments were simply unable to provide the quality of sewers, clean water, paved streets, uniformed police forces, and fire-fighting that

was available in the central city. As a result, as cities became more diverse, the forces of separation pulled people into different neighborhoods, but not into different cities.

However, in the period following the Second World War, America began to suburbanize rapidly (Rappaport 2005). Scholars have detailed the role that automobile accessibility (Glaeser, Kahn, and Rappaport 2008), highway construction (Nall forthcoming), federal programs encouraging home ownership (Jackson 1985), changes in the building industry, and rising incomes (Margo 1992) played in the growth of suburbs. The vast majority of people who arrived in the bucolic, grassy, neighborhoods filled with single-family homes were whites with incomes slightly (although not dramatically) higher than the median income of the central city (Cutler et al. 1999, Winsberg 1989). By about 1940, many larger suburbs were able to compete with central city service provision, thus increasing the attractiveness among residents, industry, and business to move away from the center. As Teaford (1979) explains, "while the forces encouraging unity were weakening, the forces of separatism and disunion remained powerful" (p84). Thus, in the middle of the century, central cities stopped growing politically and suburbs arose as powerful actors in the metropolitan universe (Teaford 1979, Danielson 1976, Miller 1981, Burns 1994). In 1970, more than half of all metropolitan area populations lived outside of the central city; a figure that would grow to two-thirds over the next 30 years. The rise of suburbs decoupled residential spaces from job spaces, and encouraged suburban residents to prioritize neighborhood amenities and property values in political decision making (Teaford 1979, Fischel 2004).

As they moved outside of the central city, suburbanites sought to protect their investments (high quality public goods and property values) in much the same way as their predecessors had – by institutionalizing segregation through public policies like land use

planning and zoning. Thus, the impetus toward separation in the latter half of the 20th century played out across, rather than within, city lines. The level of segregation is of crucial importance to politics. When cities are not segregated by neighborhood, district representation ensures that all residents within a particular location are likely to be provided similar services. When a district councilor wins a public park for his neighborhood all those who live nearby benefit. As the level of segregation shifts from blocks to neighborhoods, residents are more likely to lose representation. Still though, when segregation occurs across neighborhoods within cities, it is possible for residents of segregated neighborhoods to affect the delivery of municipal services through the political process. If a heavily minority neighborhood lacks a public park, residents from this neighborhood might mobilize to try to elect a mayor or city council member who is responsive to their demands. But when segregation occurs across cities, heavily minority cities have no ability to affect the distribution of public goods from neighboring white towns.

To understand how segregation patterns have changed over time, I compiled a measure of segregation that accounts for segregation both within cities and across them. In order to do this, I build on the measure of segregation presented in the previous section – Thiel's *H* Index. Theil's *H* is suited to this purpose because it is perfectly additive for nested geographies (Reardon and Firebaugh 2002, C.S. Fischer et al. 2004). In my case, census tracts are nested within cities, and cities are nested within metropolitan areas. Residents can be segregated in two ways – across neighborhoods within cities, or across cities within metropolitan areas. My measure combines these two types of segregation.

As explained above, the *H* Index measures the degree to which the diversity (*E*) of subunits differs from the diversity of a larger unit. For each Census year, I calculate *H* Indices at the two levels that are of interest – within cities and across cities. Respectively, these measure

the extent to which Census tract diversity differs from city diversity (H_{c_t}) and the extent to which city diversity differs from metropolitan area diversity (H_{m_c}). [54]

$$H_{c_t} = \sum_{t=1}^{T} \frac{P_t}{P_c}\left(\frac{E_c - E_t}{E_c}\right)$$

$$H_{m_c} = \sum_{c=1}^{C} \frac{P_c}{P_m}\left(\frac{E_m - E_c}{E_m}\right)$$

Where *P* represents total population of the tract *t*, city *c*, or metropolitan area *m*, and *E* represents the entropy of the geography ($E = \sum_{r=1}^{R}(\pi_r)\ln\frac{1}{\pi_r}$).

I combine the two indices to produce a total *H* Index for the metro area calculated at the tract level, H_{m_t}.

$$H_{m_t} = \sum_{t=1}^{T} \frac{P_t}{P_m}\left(\frac{E_m - E_t}{E_m}\right) = H_{m_c} + \sum_{c=1}^{C}\left(\frac{P_c}{P_m}\right)\left(\frac{E_c}{E_m}\right)H_{c_t}$$

To illustrate the two levels of segregation, Figure 1.6 provides images from a map of the population developed by Dustin Cable for the Weldon Cooper Center for Public Service at the University of Virginia. The map includes one dot for each person in the United States as of the 2010 Census, color coded by race (blue for white, green for African American, red for Asian, and orange for Latinos). [55]

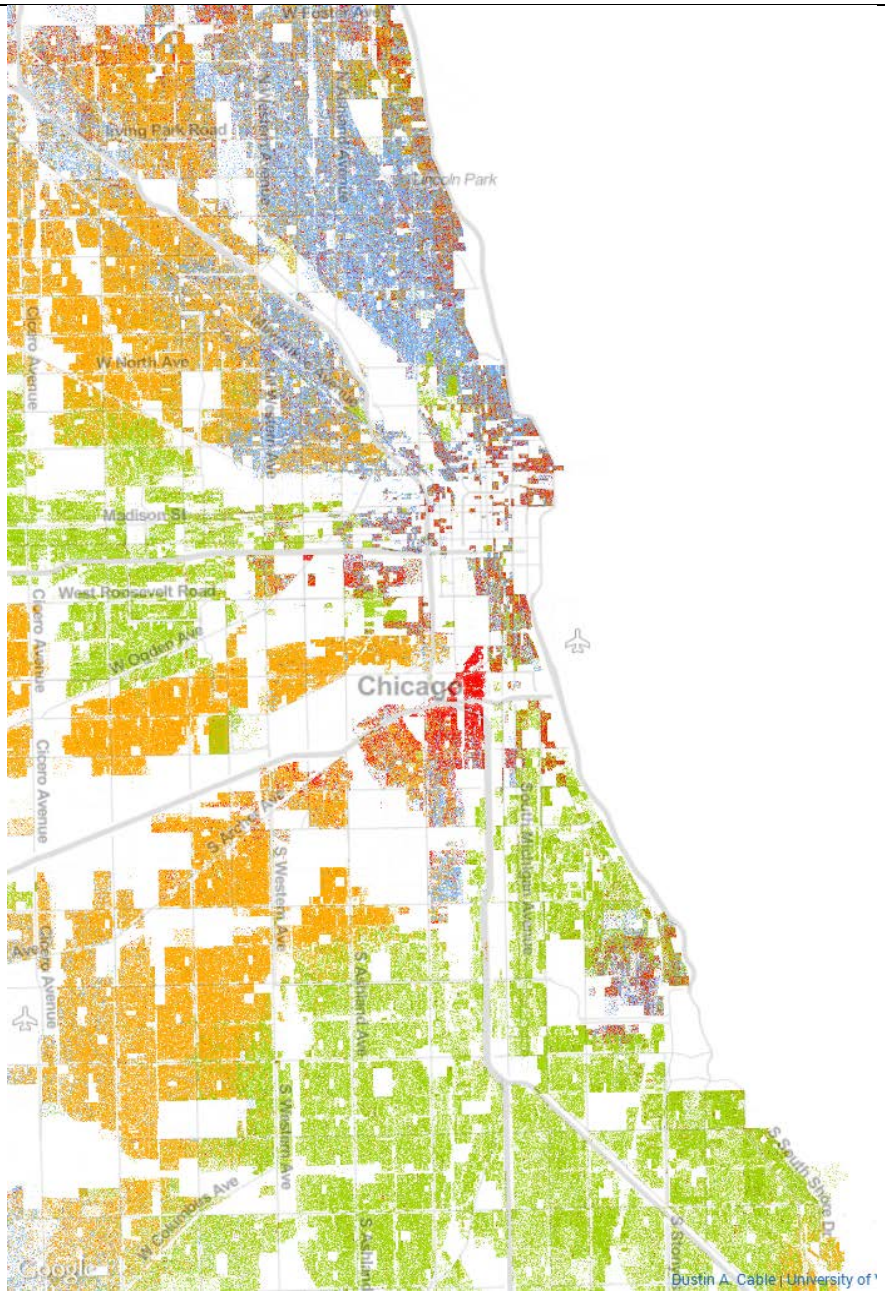
[54] Census tracts are perfectly nested within states and counties. However, in some cases, tracts cross city lines. In these cases, GeoLytics assigned the tract to the city containing the largest share of the tract population. In 2011, tracts are weighted by the share of population contained in each city. Observations are unique when defined by year, tract, city, county, and metropolitan area. Tracts located in unincorporated areas within a metropolitan area (even if they are denoted as places by the Census) are combined as a single unincorporated unit. Tracts outside of metropolitan areas are not included in the analysis. I use Metropolitan Statistical Areas and where possible, Primary Metropolitan Statistical Areas, as the highest level of aggregation (not Consolidated Metropolitan Statistical Areas which are much larger).

[55] Available at http://demographics.coopercenter.org/DotMap/index.html.

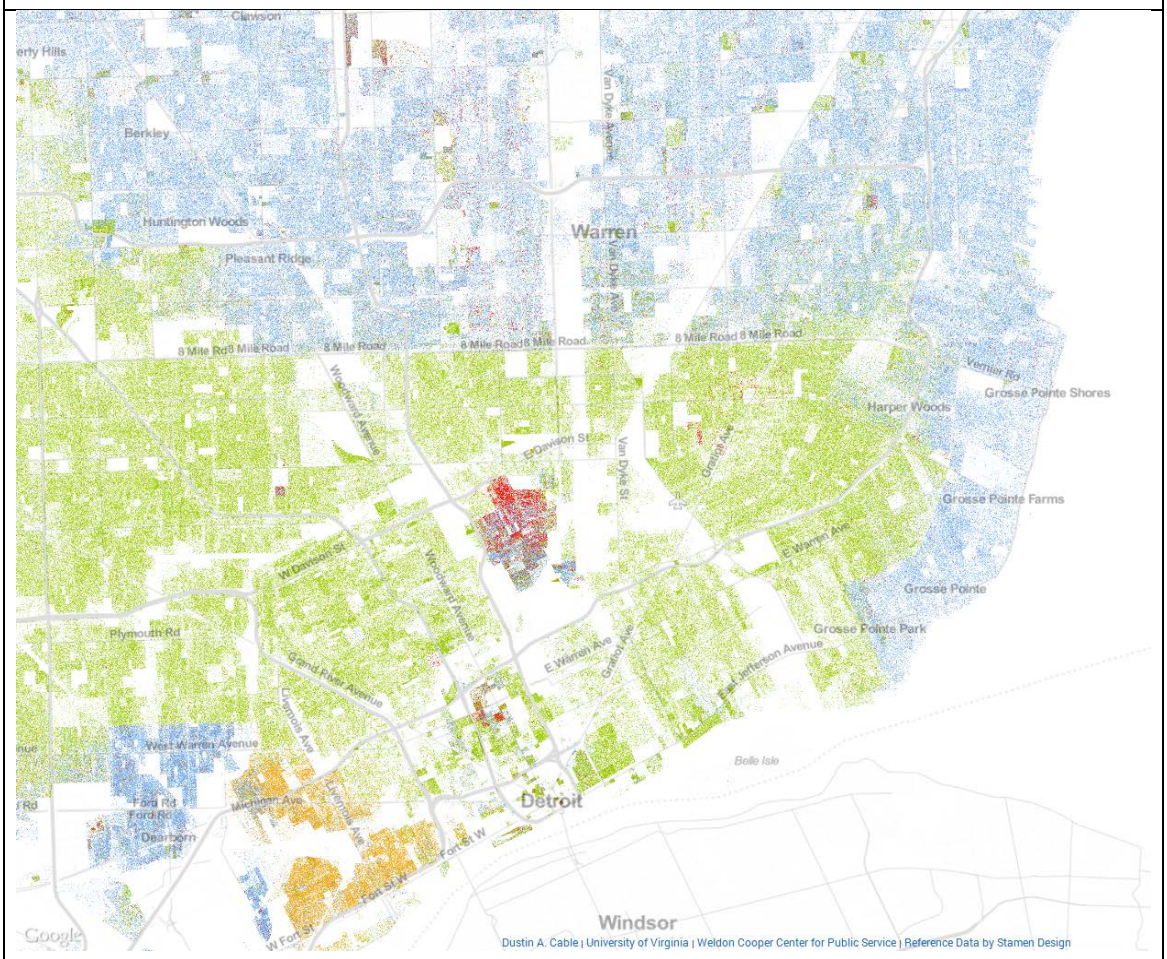
The upper panel shows Chicago, Illinois – a city in which whites are segregated from nonwhites in different neighborhoods (indicating a high amount of segregation across tracts within the city, H_{c_t}). The bottom panel shows a section of the Detroit, Michigan metropolitan area where racial sorting is much more prevalent *across* city lines as opposed to within them (indicating a high value of H_{m_c}).

Figure 1.6: Segregation Within City vs. Across Cities, 2010

Chicago, Illinois: Segregation within a City



Detroit, Michigan: Segregation Across City Lines



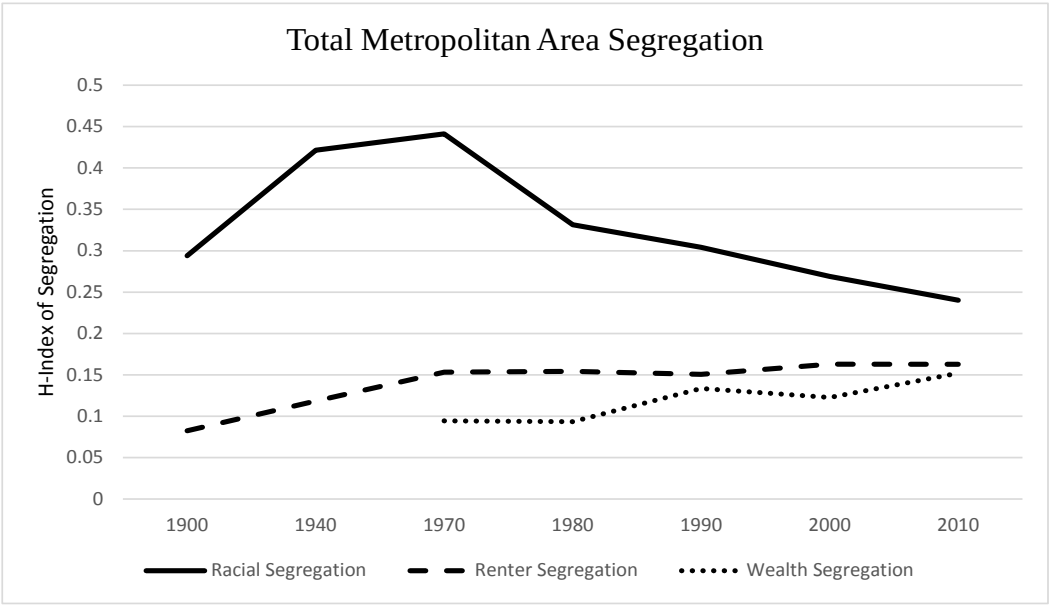
The maps make it clear that white and nonwhite residents of Chicago live in homogenous neighborhoods. Overall, the city is very segregated. The value of H_{c_t} in 2011 for Chicago was 0.379; the value of H_{m_c} (total segregation across cities) for the Chicago metropolitan area was 0.192. In the bottom panel, the neighborhoods within the cities of the Detroit metropolitan area are much more homogenous. The stark horizontal divider between the blue and green dots is 8

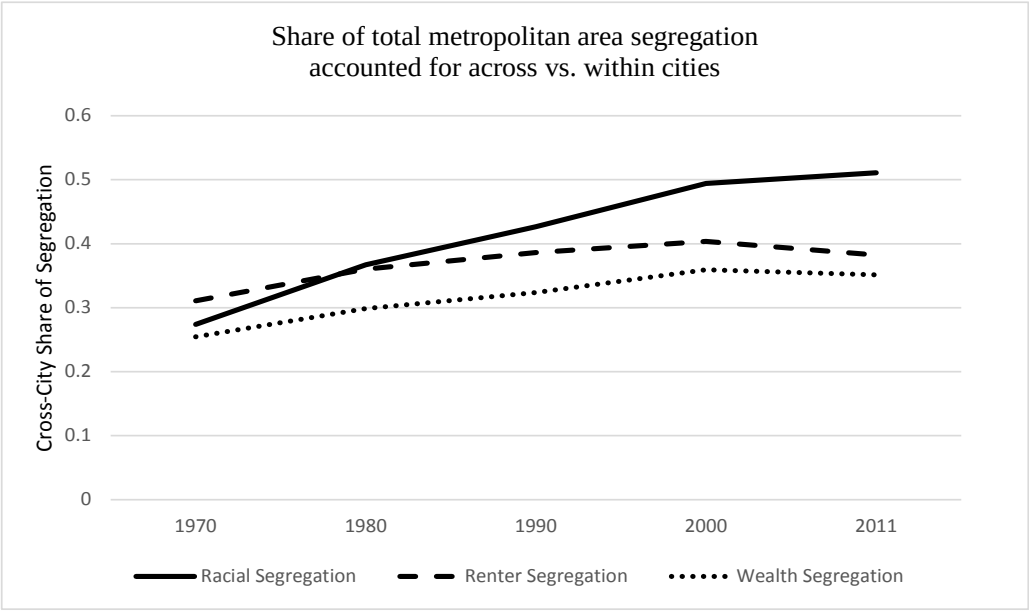
Mile Road which marks the boundary between Detroit and the neighboring ***city*** of Warren. A similar vertical division can be found on the right hand side of the picture, noting the boundary between Detroit and the cities of Grosse Pointe, Grosse Pointe Park, Grosse Pointe Farms, and Grosse Pointe Shores.[56] The value of H_{c_t} (within city segregation) in 2011 for Detroit was 0.220, while the value of H_{m_c} for the metropolitan area was 0.395.

How has metropolitan area segregation changed over time? The top panel of Figure 1.7 shows total metropolitan segregation measured at the tract level (H_{m_t}) since 1900, while the bottom panel shows the share of that segregation that was accounted for across cities rather than within them ($\frac{H_{m_c}}{H_{m_t}}$) from 1970-2011.

[56] The maps are shaded based on population density, hence the darker colors in Chicago.

Figure 1.7: Changing Metropolitan Segregation Patterns





These figures reveal that by 1970, racial segregation had peaked and begun to decline, while class segregation began a slow ascent. Between 1970 and 2011, in nearly every

metropolitan area in the United States, neighborhood segregation was exchanged for city level segregation along both race and class lines. The figures also show that historically, class segregation was much lower than racial segregation, but by 2011, the indices had converged substantially. The relationship between race and class segregation also increased over time. In 1990 (the earliest date for which I have data on all 330 metropolitan areas), the correlation between race and renter segregation was 0.19. It rose to 0.32 in 2011. The correlation between race and wealth segregation increased from 0.46 to 0.51 over this same period. The link between race and wealth segregation across city lines is even stronger; it was 0.70 in 2011. This tightening link between race and class is driven by changes in both race and class segregation, both within and across cities. However, these remain distinct demographic patterns.

Chapter 2: Local Government Action Contributes to Segregation 1900-1940.

Segregation along both race and class lines grew in tandem with the growth of cities (Meyer 2000). Race, ethnic, and class enclaves developed as urbanization brought white migrants, African Americans, and immigrants to cities (Teaford 1979). At the turn of the century, the predominant pattern of segregation occurred building by building, block by block, and sometimes several blocks by several blocks, but typically not by neighborhoods (Logan et al. 2015, Meyer 2000). Many cities featured multiple racial, ethnic, and class enclaves (Kellogg 1982, Rabinowitz 1978). In Philadelphia, for instance, about 40% of the black population lived in central city wards (4th, 5th, 7th, and 8th); but there were significant clusters of black homes in the 14th, 15th, 20th, 22nd, 26th, 27th, 29th, 30th, and 37th wards too (DuBois 1899). In Atlanta blacks lived in "Shermantown, Mechanicsville, Hell's Half Acre, Bone Alley, and Pigtail Alley," as well as "Darktown….Peasville…and Jenningstown," (Rabinowitz 1978, p106). By 1940 neighborhoods had become much more homogenous. So, while the residential location of people of color and the poor was nearly always restricted, the pattern of segregation changed during the years leading up to the Second World War. In this chapter I argue that local governments played a role in producing this change. Governments adopted zoning and other policies that created or reinforced segregation in service to business elites and white, property-owning constituents who were demanding a larger, more active city government.

In the very large social science literature on the causes and maintenance of race and class segregation, the contributions of local government are given limited attention.[57] Boustan (2012) concludes, "the most important [factor in the generation of residential segregation] appears to be individual choices of white households" (p318). Hayward (2013) agrees, arguing that restrictive

[57] The contributions of the federal government, on the other hand, are well covered (Jackson 1985, Massey and Denton 1993).

covenants were, "a more significant mechanism of racial segregation," than local government activities (p59).[58] Other scholars combine private and public actions into a single theoretical construct. For example, Cutler et al. (1999) provide evidence of "collective action racism" which involves, "specific policy instruments such as racial zoning or restrictive covenants prohibiting sales to blacks, or organized activities such as threatened lynchings or fire bombings that discourage blacks from moving into neighborhoods" (p476). Similarly, Dreier et al. (2004) associate racial zoning laws with biased real estate codes of ethics, racial steering, insurance redlining, and white violence concluding that, "racial segregation thus stems from the routine practices of the private real estate industry" and the spontaneous choices of urban residents "as well as from government policy" (p 120).

The role of government was important. For one thing, using the state to engage in promote restrictive collective action is qualitatively different than arranging segregation privately. Marshalling the power of city government institutionalizes prejudicial behavior and denies victims recourse. As Abrams (1955) explains, "passions and prejudices…unsanctioned by government…exhausted themselves" (p206). But when democratically elected local governments developed policies promoting segregation they became, "instruments of oppression against minorities" (p207).

Furthermore, while prejudicial attitudes and behavior were widespread during this period, government action was more variable. Understanding where and when local governments worked to create segregation along both race and class lines helps to clarify where segregation was likely to become entrenched and where it was more fluid, as well as provide insight into the factors that generate consequential local policy decisions.

[58] Of course, restrictive covenants required government action for enforcement. However, they could be generated without government involvement.

In this chapter, I explore the factors that contributed to the adoption of zoning laws. I argue that zoning was enacted by political elites seeking to manage the distribution of public goods to their core supporters. To present that argument, I first offer a historical narrative detailing the adoption of zoning laws by municipal governments. Then, I present a quantitative analysis of these adoptions. I find that cities with higher property taxes and larger budgets (where more was at stake), where Republicans (who led the municipal reform movement) had greater support, and where political participation was low (and thus more likely to be heavily skewed toward middle-upper class, native, white voters), zoning ordinances were more likely to be adopted. Finally, I analyze the effect of zoning adoption on future levels of segregation. I show that cities that were early adopters of zoning went on to become more segregated along both race and class lines than similarly situated cities without early zoning plans.

The dawn of the 20th century was an exciting time for local government. Populations exploded as the industrial revolution took hold. In this environment, the limited, caretaker approach to city governance became suddenly and profoundly insufficient for maintaining health, order, and property. Monkonnen (1988) explains, "cities could have chosen to ignore sewage, crime, unschooled children, and slow transportation by simply tolerating higher disease rates, offense rates, illiteracy rates, and traffic tangles" (p4). City governments did not take that path. Instead city governments worked aggressively to shape their social and economic environments. As Chapter 1 revealed, between 1890 and 1940, cities became modern – providing services like clean water, fire protection, police patrol, and road paving. It was in this environment that cities also began to seek control over space and residents' use of space through zoning and city planning. The end goal of this control, as was true of most Progressive Era reforms, was to improve the lives and opportunities for businesses and residents – more

specifically, US born Anglo residents (Tretter 2012, Woodward 1955, Toll 1969, Brownwell 1975).

As Monkonnen indicates, it was far from obvious that cities would assert control over their environments, but the rapid spread of slums, worries about skyscrapers blocking natural light, fears of conflagration, and concern about public health threats provided early inspiration for cities to invoke their policy power of regulation over nuisances (Toll 1969).[59] Reformers debated the correct policy solutions for these ills, recommending for example, density restrictions (Woodbury 1929), stricter building codes (Power 1983), the removal of alley dwellings (Silver 1997), or policies, including increased public transportation, that would encourage suburban homeownership for the working class (Baar 1996). In many cases, typically at the urging of local chambers of commerce, city councils chose to pursue zoning – regulating the use, height, and area of buildings and land (Brownwell 1975). Zoning was sometimes, but often not, combined with general development plans for the city. While zoning became wildly popular, planning did not. This decoupling of zoning from planning was viewed negatively by some leaders of the early planning movement who thought the creation of homogenous neighborhoods would be likely to reinforce social divisions and inequality (Toll 1969). Of course, this was often precisely the goal of zoning supporters.

The rise of social Darwinism contributed to the attraction of zoning as a solution for burgeoning problems. Social Darwinists argued that the evolution of humanity would follow a process of natural selection in which the environment played a defining role. As a result, controlling the environment was of utmost importance (Toll 1969). A related body of literature

[59] A number of important court battles ensured that zoning would be constitutionally allowed for the promotion of health, safety, welfare, and morals and did NOT constitute the deprivation of life, liberty, or property (see Hayward 2013 and Toll 1969 for overviews).

came to understand race and the differences between racial and ethnic groups as biologically rooted, hence, immutable (Hayward 2013). According to this doctrine, the inherent inferiority of blacks and other people of color (Native Americans, Chinese, Japanese, Mexicans), the preservation of "race purity" demanded, "segregation and discrimination in recreation, in religious service, in education, before the law, in politics, in housing, in stores, and in breadwinning" (Myrdal 1944, p58). Additionally, scientific and medical experts as well as politicians believed that the unsanitary habits and homes of the poor and people of color spread epidemic disease (Shah 2001, p6). In combination, these new theories offered a convincing rationale for the creation of special districts to quarantine offending groups. By 1930, about half of all large cities in the US had adopted comprehensive zoning plans.

Political leaders often used threats to public safety as a rationale for legislating segregation. New York's 1916 zoning law, the first comprehensive zoning ordinance in the nation, sought to limit the health threat posed by skyscrapers which blocked natural light and so, contributed to the spread of tuberculosis (Toll 1969, p154). Because immigrants and Blacks were viewed as disease carriers, segregating them was a typical goal of zoning. In San Francisco, the first city to segregate explicitly on the basis of race, whites had grown increasingly paranoid that Chinese residents were spreading diseases like smallpox and tuberculosis and in 1890, enacted an ordinance that required all Chinese residents and their businesses to move, within 60 days, to the section of town which had been set aside for, "slaughterhouses, tallow factories, hog factories, and other businesses thought to be prejudicial to the public health or comfort" (McClain 1996, p224). In Baltimore, segregationists agreed that, "blacks should be quarantined in isolated slums in order to reduce the incidents of civil

disturbance, to prevent the spread of communicable disease into nearby white neighborhoods, and to protect property values among the white majority" (Power 1983, p301).

The belief that zoning would create stability in property values was widely held and generated strong support from land owners, commercial organizations, bankers, realtors, and developers (Abrams 1955, Brownell 1975, Weiss 1987). Boston's first height restriction was passed in 1892 at the behest of downtown property owners who feared that the new skyscrapers would lead to an oversupply of office space and drive down property values (Kennedy 1992). In some places, this view had to be cultivated. In Los Angeles, for example, some developers were opposed to the city's 1908 zoning law because they worried it would inhibit growth (Weiss 1987). To combat such reservations, early supporters of zoning made sure to argue that their proposals would, "enhance, not detract from property values," (Toll 1969, p150). Zoning could easily have been invoked to improve the quality and health of working and lower class neighborhoods and limit land speculation (as some of the early reformers argued it should); however, "political pressures from those less inclined toward broad civic improvement" won out (Silver 1997, p24).

As zoning practices spread through the 1920s, emphasis on the enhancement of property values became the dominant argument; almost universally, it was believed that the wrong sorts of people residing or sometimes even working in an area could negatively impact property values. Abrams (1955) quotes an early real estate text which argued that, "…property values have been sadly depreciated by having a single colored family settle down on a street occupied by white residents," and another that claimed a similar effect of "unassimilated aliens." Both prescribed "rigid segregation" as a solution, "no matter how unpleasant or objectionable the thought may be to colored residents" (p159).

Aside from adding wealth to property-owning and voting residents, city governments had an even more powerful reason to protect and enhance property values – taxes (Lees 1994). An advertisement run by 5th Avenue merchants in the March 5th and 6th, 1916 editions of the New York Times argued that failure to support the city's new zoning plan would lead to "vacant or depreciated property," which would lead to "reduced taxes, leaving a deficit made up by extra assessment on other sections" (p5). Rising property values allowed municipal governments to grow without increasing tax rates. When some property values actually declined, municipal officials faced the unwelcome task of raising tax rates or cutting the budget.

As municipal governments began to spend vast sums on improving the lives and environments of residents, ensuring that the right (white/wealthy) residents benefited from the new city services became of utmost importance. This goal was clear to observers at the time. Booker T. Washington explained that, "the negro objects to being segregated because it usually means that he will receive inferior accommodations in return of the taxes he pays." Such objection stemmed from the belief that segregation would ensure that, "the sewerage in his part of the city will be inferior; that the streets and sidewalks will be neglected, that the street lighting will be poor; that his section of the city will not be kept in order by the police and other authorities, and that the 'undesirables' of other races will be placed near him." Thus, Washington concluded, "when a negro seeks to buy a house in a reputable street he does it not only to get police protection, lights and accommodations, but to remove his children to a locality in which vice is not paraded" (Washington 1915, p113-114). Frequently, white elites made arguments that taxing whites to pay for black public goods (like schooling) was "an indignity." One delegate to the Louisiana Constitutional Debate in 1864, incredulous at the proposition asked, "Shall we tear the slave away from his master and then force the master to educate him?"

(Louisiana Constitutional Debate, quoted at length in Bond 1934, p16-17). As a result, in many cities (see Chapter 3), black areas lacked municipal services such as, "paving, water, sewerage, lighting and garbage removal," (Knight 1927, p53; also Myrdal 1944).

Given that zoning was viewed as a way to both increase property values and maintain exclusivity in the distribution of public goods, it is unsurprising that Southern cities made early use of zoning to hem in expanding black neighborhoods and create clear dividing lines between white and black residential areas. Of course, the development of racial zoning in the South was part of a much larger process of reconfiguring race relations after the Civil War. During the period of Reconstruction and Redemption, whites subordinated, exploited, and killed blacks, but even in this context, the legal segregation of the races was not a foregone conclusion (Woodward 1955). [60] In fact, although Jim Crow laws were widespread, most Southern cities did not legislate residential segregation directly.[61]

Blacks being able and willing to live in white neighborhoods was a necessary (although not sufficient) condition for the enactment of legislation. Baltimore passed the first racial zoning law directed at blacks in 1910 following the violent response of white residents as black migrants moved into previously all white areas. Baltimore's ordinance prohibited whites and blacks from moving into city blocks occupied by a majority of members of the other race. Quite aware of the requirements of the 14th amendment, the Baltimore council argued (and the Maryland Supreme Court agreed), that because the ordinance placed the same limitations on both racial groups it

[60] One vivid example of the ways in which Jim Crow changed existing practice comes from New Bern, North Carolina. In 1913, the city aldermen passed an ordinance which required that all "colored bodies" buried in the public cemetery be dug up and moved to a segregated location.
http://www.newbernsj.com/article/20140209/Opinion/302099914

[61] Rabinowitz (1978) argues that the picture was different with respect to schooling. Here, segregation was immediate and unchanging after the end of the war.

was not discriminatory (Virginia Law Review 1916).[62] The vote of the city council fell along party lines with all of the Democrats in support and all of the Republicans opposed.[63] Republicans were joined in their opposition by the entire community of black residents, some real estate brokers, and white homeowners who lived in integrated neighborhoods (Power 1983). Democrats were not just responding to their white voters in their promotion of segregation. Limiting black residential location also bolstered Democratic political power by ensuring that blacks would be packed into certain wards; thereby reserving the rest of the city for Democratic control (Rabinowitz 1976).

In some places, black political power slowed or inhibited the enactment of segregation ordinances (Rice 1968). In St. Louis, an effort to pass a segregation ordinance failed because it was opposed by a significant number of city elites (including most of the city's leading Republicans, labor interests, religious leaders, and newspapers). The National Association for the Advancement of Colored People (NAACP) and the Knights of Pythias lobbied the St. Louis city government tirelessly and ultimately convinced 21 of the 28 aldermen and the mayor to vote against it. In 1912, the city went so far as to station five police officers at the house of a black family to protect them from, "possible attack by whites who resent what they term a 'Negro invasion' in their residential district" (*The Crisis* 1912 Vol 4, No 6, p272). In a low turnout election in 1916, supporters of the segregation ordinance won a city referendum and the city immediately began mapping the race of each city block. (Meyer 2000 19-21). In Kansas City, Missouri, blacks had a modest amount of political power due to their ties to the (Democratic)

[62] Although the Court agreed with the city's reasoning about the 14th amendment, it ultimately declared the ordinance unconstitutional because its provisions were retroactive thereby representing a taking by the government. (*State v. Gurry* 121 Md. 534 (1913))

[63] Republicans were generally (tepidly) supportive of black rights in Baltimore and between 1890 and 1931, six black Republicans served on the Baltimore City Council (Greene 1979). Over the course of their careers, these councilors led the city council to provide significant contributions to Baltimore's black community; but none were able to defeat the segregated housing legislation.

Pendergast machine. Despite support from a significant segment of the city's white population, a racial zoning ordinance never made it past the lower chamber of the city council (Meyer 2000).

Bacote (1955) reports that throughout the late 1800s in Atlanta, black support was frequently courted by white factions. For instance, in the 1891 election, black candidates were nominated for council positions in the 1st, 4th, and 6th wards on the Citizens' ticket (an anti-prohibitionist faction of the Democratic Party). White factions did this when they were in danger of losing the election – in 1891 the anti-prohibition Democrats were worried about a Populist victory. To prevent white factions from seeking black support in the future, the Democratic Party adopted the white primary in 1892, and the state of Georgia enacted a new constitution in 1908 which included a character requirement, a literacy test, and made property ownership a condition for registration (Bayor 1996). These changes severely restricted black participation, ensuring that white factions would only rely on white votes. The evisceration of the black electorate and black representation opened the way to the city's enactment of segregation ordinances (Key 1949, Kousser 1974, Woodward 1955).

Atlanta enacted a racial zoning ordinance on the heels of a violent race riot in 1906. The riot erupted after local newspapers reported four alleged (but never substantiated) assaults upon white women by black men. According to Garrett (1969), the riot was ignited by the sight of black passengers riding next to whites on street cars. A white mob killed and beat dozens of black Atlantans over the course of three days. A concerted organizing effort among the city's African American population followed. White elites and politicians denounced the riot, and a public/private relief fund was even established for families of the murdered victims (Garrett 1969). However, the riot also led many whites to conclude that, "separation of the races is the only radical solution of the negro problem in this country" (Charleston News and Courier,

quoted in the New York Times, September 30, 1906). Following the passage of the ordinance in 1913, all blocks in the city were assigned racial designations based on the race of the majority of current residents (Silver 1997).

Fighting racial zoning was one of the early nationwide causes to be adopted by the NAACP (Rice 1968, Meyer 2000) and due to the organization's work, in 1917, the Supreme Court ruled racial zoning unconstitutional in *Buchanan v. Warley*. In the *Buchanan* decision the justices did not seek to protect the rights of black property buyers or to prohibit "amalgamation of the races," but rather to protect the right of white owners to, "sell or lease their lands and houses to whomsoever they pleased" (Virginia Law Review 1928, p531).[64] Nonetheless, the Chicago Defender declared that the, "hydra-headed monster of segregation…was killed by the Supreme Court," and argued that the, "decision [was] a direct slap in the face to white southern oligarchy." (November 10, 1917). According to Rice (1968), it was also a, "victory for moderate whites and Republicans" (p197).

Following *Buchanan*, many cities sought to enact constitutionally defensible racial zoning plans by turning to comprehensive city plans (Silver 1997).[65] In 1914, a racial zoning ordinance was proposed in Birmingham while the *Buchanan* case was already moving through the court. A group of black attorneys convinced the Birmingham city council that they could face a costly legal battle if the Court ruled against Louisville's ordinance. In order to prevent this, and to appease white demands for segregation, the council chose instead to adopt a

[64] The Court found that the ordinance improperly restricted the rights of property owners to dispose of property. It did not challenge the separate-but-equal doctrine that was in place as a result of the 1896 *Plessy v. Ferguson* decision.

[65] San Francisco was the first city to utilize a form of use zoning for a racial purpose. In 1885, the city enacted a set of regulations for laundries operating in residential areas in an attempt to keep Chinese residents (who owned nearly all of the laundries and typically lived above them) from white neighborhoods. The law was invalidated by the Supreme Court in the 1886 case *Yick Wo v. Hopkins* in which the Court found that a law which is race neutral on its face may still violate the 14th amendment if administered in a prejudicial manner.

comprehensive zoning plan in 1926 that included racial designations for different city zones (Connerly 2005). Atlanta's 1922 revision of the zoning ordinance combined zoning categories of land use and building regulations with racial designations. For instance, the city's master zone map noted that, "unless otherwise designated on this map, all areas designated as dwelling house districts are also class H1 height districts and white race districts." Other areas were designated as "colored district and an apartment house district" or "colored district and dwelling house district."[66] In 1929, the zoning code was again revised, this time including a prohibition on occupying a home on a street where the majority of residences were occupied by persons whom the resident was forbidden to marry by law (Meyer 2000). Eventually, the court ruled against these ordinances and by the 1930s segregationists had dropped the racial designations in favor of comprehensive zoning.

As the court struck down plans that endorsed outright racial segregation, the case for other forms of zoning had been building. A series of judicial decisions established the bounds of permissible approaches to regulating the uses and size of buildings. For instance, the court determined that exercise of police power (e.g. the authority to regulate behavior and enforce order), "must be reasonably adapted to the purpose of protecting some interest of the community," (C.C.S. 1925 p417) and that nuisance regulation and other use restrictions, "must bear a substantial relation to the public health, safety, morals or general welfare" (Monchow 1928, p323). Zoning ordinances spread rapidly throughout the 1920s, particularly after the Supreme Court determined that comprehensive zoning would not require cities to compensate owners for losses in prospective land values in the 1926 case *Euclid v. Ambler Realty Company*.

[66] https://cityloci.files.wordpress.com/2014/07/6-atlanta-19291954.pdf

Zoning adoption was also propelled by the Republican-led federal government. In 1922, under the direction of Secretary Herbert Hoover, the Department of Commerce issued a template for state enabling laws in the Standard State Zoning Enabling Act. The Act was published in 1924 and a revised edition was released in 1926. Thus, while Republicans tended to oppose zoning in the South, they were frequently the drivers elsewhere. In Boston, Republicans were shut out of city government by the powerful Democratic organization, leaving them to pursue zoning laws through the Massachusetts state legislature instead (Kennedy 1992, p113).

The arguments surrounding the adoption of comprehensive zoning were broad but imbued with municipal Progressivism's race and class prejudices (Bridges 1997, Trounstine 2008). Comprehensive zoning supporters highlighted benefits such as the "adequate provision of light and air," "stabilization [sic] and protection of property values," "protection and maintenance of the home and home environment," "to apply the most up-to-date methods of sanitation and hygiene, "simplifying the problems of street traffic regulations," and the prevention of congestion (A.C. Holliday 1922, p217). By separating industrial, commercial, and residential uses into separate districts each with standard regulations regarding the use, height, and area of buildings, zoning would make, "every town, city or village a more orderly, convenient, economic and attractive place in which to live and work," (A.C. Holliday 1922, p218,). One key to ensuring high property values and orderly living arrangements was the ability for zoning ordinances to prevent noxious uses from polluting residential neighborhoods (Fischel 2001). Apartment buildings constituted one such noxious use.

In *Euclid v. Ambler*, Justice Sutherland explained that the apartment house is often a, "mere parasite, constructed to take advantage of the open spaces and attractive surroundings... interfering by their height and build with the free circulation of air and monopolizing the rays of

the sun…depriving children of the privilege of quiet and open spaces for play enjoyed by those in more favored localities…until, finally, the residential character of the neighborhood and its desirability as a place of detached residences are utterly destroyed. Under these circumstances, apartment houses, which in a different environment would be not only entirely unobjectionable but highly desirable, come very near to being nuisances." (p394-395).

In allowing the protection of single-family home neighborhoods, *Euclid* laid the groundwork for the long-term shift from a country segregated by race to one that became increasingly segregated by income. In the early 20th century, race and income were so strongly overlapping that denying apartment buildings in a neighborhood of single-family homes would also largely prohibit blacks and many immigrants from residency. Making this point, Bruno Lasker, editor of Survey Magazine asked:

> "Why, in this country of democracy, is a city government, representative of all classes of the community, taking upon itself to legislate a majority of citizens – those who cannot afford to occupy a detached house of their own – out of the best located parts of the city area, practically always the part with the best aspect, best parks and streets, best supplied with municipal services and best cared for in every way? Why does it deliberately 'segregate' the foreign-born who have not yet become sufficiently prosperous to buy or rent a home under building regulations which preclude the possibility of inexpensive development and construction?" ("Unwalled Towns," *The Survey*, Volume 43, 1920, p677).

Lasker suggested that the answer to his question was the dominance of politics by wealthy property owners who sought to employ, "public power for the purpose of protecting sectional interests" ("The Issue Restated," The Survey, Volume 44, 1920, p278). Segregation enforced via zoning was a means to accomplish this end. In cities like Chicago, Kansas City, and Los Angeles, some of the most powerful voices in support of zoning were homebuilders and real estate boards who stood to gain monetarily from segregation (Gotham 2000).

With such wide-ranging positive effects for powerful interests, it is easy to see why zoning became so popular. Yet, by the close of the 1920s, many cities had not yet adopted zoning plans. I have argued that zoning was a tool that enables elected officials to make it easier to limit the distribution of public goods to certain constituents and to ensure high property taxes, and that it was successfully implemented where zoning supporters had political power. In order to provide more systematic evidence of this argument, I collected data on all of the cities that enacted *zoning ordinances* between 1900 and 1930. I gathered racial zoning information from several reports including Rice (1968), Connerly (2005), Silver (1997), and numerous issues of the NAACP's *Crisis Magazine*. To encode general zoning plans, I drew on an article published in *The American City* by Norman Knauss in 1929, which listed the years that zoning ordinances were enacted. Knauss reports having sent a survey to all municipalities with the authority to enact zoning. His list includes 768 municipalities that reported having an ordinance. I coded the city year in which zoning was enacted as a 1 and years leading up to that date as a 0. Cities exit the analysis once they enact zoning. Cities that were included in the Census but had no zoning law by 1929 are coded 0 for the entire time period. Zoning is my dependent variable. To these data, I merged city spending and demographic data culled from the Census (which are described in Chapter 1).

My primary independent variables are per capita total *Expenditure* and *Property Taxes*. I log the total expenditure variable because the data have a strong rightward skew. I expect both of these variables to be positively correlated with zoning. Where spending and property taxes were higher, local officials would have a greater incentive to protect the existing distribution of public goods and the total tax revenue. I include two additional political variables – the county-level *Republican presidential vote share* (linearly interpolated for non-election years) and county

level *Turnout* of age-eligible voters.[67] Republican vote share is a rough proxy for the degree of support for regulatory policy, of which zoning was an example. I expect that greater Republican support will be associated with a higher likelihood of implementing zoning – except in the South. A range of voting restrictions were in place throughout the time period under consideration (Keyssar 2000) and I include the turnout of the age-eligible population to capture the permissiveness of the electoral environment. This measure is preferable to including state level laws like the poll tax or literacy test because it allows for sub-state variation in the electoral setting. Generally, higher turnout is associated with greater participation of the poor and people of color (Hajnal 2010); populations that both tended to be opposed to zoning plans and stood to lose from their implementation. Thus, I expect that where turnout was higher, the likelihood of enacting zoning was lower.

A wide range of alternative explanations for the adoption of zoning were proposed by contemporary observers and later analysts of the movement, many of which are correlated with the political factors I seek to test. Writing about racial segregation laws, Woodward (1955) argues that the economic depression at the end of the 1890s led to "aggression against the minority race" (p81). To account for this possibility, I include a measure of the share of the total population that was *Unemployed*, linearly interpolated from the Census of Population and Housing. Fischel (2004) claims that zoning adoption followed the invention of trucks and busses, which made it feasible for businesses and apartment buildings to be built in residential and suburban areas, away from rail lines. I include per capita spending on *Roads*, which include street paving, street cleaning, and street lighting to capture differences in vehicular accessibility. In the "History of Zoning," Gordon Whitnall explains that, "the practice of zoning began…when

[67] This denominator includes men over the age of 21 until 1919 and both women and men over the age of 21 in 1920 and later elections.

the concentration of population in cities began to be pronounced" (1931, p2). The "urge for zoning" he goes on to say, "has arisen from the desire and the necessity to bring some order out of the chaos that has resulted from the anarchistic development of our cities." I include the *10 year rate of change* in total population and population *Density* (persons per acre) to capture urbanization. To measure threats of disease and conflagration, I include per capita spending on *Health care* and *Fire-fighting*.

As described above, contemporary supporters of segregation ordinances often asserted the protection of white, single-family neighborhoods as the primary goal. To measure the social threat of black and foreign populations, I include the share of the population that is *Black*, *Foreign Born White*, and *Foreign Born Non White*. To measure the threat of lower-income (apartment dwelling) populations I include the share of the population *Renting* their homes. To capture the presence of noxious industry that might be better contained in a zoned city, I include the share of the employed population working in *Manufacturing*. This variable also captures an argument presented by Connerly (2005): that industrialists preferred to maintain segregated cities in order to dampen the threat of union organizing across racial lines.

Many scholars (e.g. Woodward 1955, Myrdal 1944, Blumer 1958) understand segregation as a mechanism to bolster hierarchical racial control, as social distance may preserve the relative status advantage of whites. For instance, Wade (1967) argues that segregation was, "rooted in the white's need for discipline and deference," and that it, "provided public control to replace dwindling private supervision of the master over his slave" (p278). If this is the case, we should expect that cities with existing patterns of segregation would be most likely to institutionalize the practice. It is also possible, however, that cities with high levels of segregation would have had no need for legislation (see Silver 1997 on Roanoke). To adjudicate

between these two possibilities, I include a dummy variable coded 1 if the city had *Segregated Schools*. This variable is encoded from Johnson (2015) who characterizes states as requiring segregation, permitting segregation, prohibiting segregation, or with no segregation statutes. My variable is coded one for states that require segregation, .5 for states permitting segregation, and 0 for all others. Bobo, Kluegel, and Smith (1997) argue that the political institutionalization of Jim Crow ideology was driven by the needs of the Southern economy, particularly the exploitation of black agricultural labor. On the other hand, Godsil (2006) suggests that whites with a significant stake in retaining a large black laboring class may have opposed racial zoning, as such ordinances might lead black workers to leave the city. To account for either possibility, I include for the share of the workforce employed in the *agricultural sector*. If Bobo et al.'s theory applies to zoning, we would expect a positive relationship between agricultural dominance and zoning. We'd expect the inverse if Godsil is correct.

My observations represent 4293 city-years from 240 cities. All spending data are inflation adjusted and linearly interpolated. Census data are linearly interpolated as well. I run logistic regressions with errors clustered by city. I include fixed effects for region, which means that these comparisons are all within the same area of the country. That is, the regressions analyze the effect of city expenditures on the adoption of zoning in each of four regions – West, North, Midwest, and South. Column 1 shows the base model with no controls. Column 2 includes all of the above-described controls. In Column 3, I change the dependent variable to focus on racial and comprehensive zoning. Here, the dependent variable is coded 1 when the city adopts either race zoning or comprehensive zoning and is coded zero otherwise. In this analysis, I present an interaction between Republican vote share and region to show how party

politics differed in the South. These results are presented in Table 2.1 and summary statistics are shown in appendix Table A2.1

Table 2.1: Effect of Local Political Factors on Zoning Implementation

Note: Logistic regressions; Robust Standard Errors clustered by city

Table 2.1 offers strong support for my claim that cities with greater public goods expenditures and more property tax revenues were more likely to implement zoning ordinances. With all else equal, shifting from the minimum per capita expenditure (about $4) to the maximum (about $476), changes the probability of adopting a zoning ordinance from 0.004 to 0.15. Similarly, cities with the lowest property taxes per capita (about $2) rarely adopted zoning ordinances, while those with the highest taxes ($67 per person) had around an 18% chance of implementing zoning. Where turnout of the voting age population was higher, zoning was less likely to be adopted. This result supports Toll's (1969) claim that, "the demand neither for zoning nor for planning had grown out of any widespread outcry in the cities of the United States" (p199). Zoning adoption appears to have been led by the Republican Party, except in the South, where Republican voting strength limited the likelihood of adoption of comprehensive and racial zoning ordinances.[68] These data fit the historical narrative presented above well.

In addition, many of the control variables suggest interesting patterns. For instance, there is no evidence that larger racial and ethnic minority populations drove zoning adoption. Nor did greater threats to public health or conflagration increase the likelihood of zoning. Contrary to Fischel's prediction, zoning was not more common in cities with more spending on roads. Economic factors appear to have played a more important role. Zoning adoption was more likely in cities with higher unemployment and with greater shares of the workforce employed in manufacturing and agriculture. It was also more likely in cities with more renters (particularly in the case of comprehensive and racial zoning). This conclusion is bolstered by a secondary analysis in which I add a measure of renter segregation in 1900 for 42 cities. Where renters were

[68] Cities with reformed institutional structures were not more likely to adopt zoning. In fact, nonpartisan cities were somewhat less likely to adopt. This effect is largely driven by cities in the South where nonpartisan laws may have advantaged Republicans.

more segregated from homeowners, zoning was much more likely to be implemented. This finding suggests that homeowners were more supportive of zoning measures when they lived in more defined neighborhoods to protect. It is also clear that zoning ordinances were much more likely to be enacted in places that had a preference for segregation. Where segregated schools were the law, cities were more likely to adopt zoning. In additional analyses I find that cities with marked segregation at the turn of the Century, particularly in the South, were also more likely to adopt zoning. These results support the contention that zoning was a mechanism used to reinforce existing racial hierarchies. In the next section I provide evidence that this was precisely its effect.

Zoning Generates Segregation

As Chapter 1 revealed, race and class segregation existed prior to the introduction of public policy measures that would separate residents and land uses. The history of private mechanisms producing segregation is well understood (e.g. Jones-Correa 2000, Meyer 2000, Burgess 1994, Myrdal 1944). Blacks, immigrants, and the poor tended to live in areas that were removed from native white middle class residents for a variety of reasons. Rabinowitz (1974) explains, "some of the housing segregation was voluntary: Negroes sought proximity to their jobs, welcomed the freedom from white surveillance, and enjoyed the company of other blacks" (p98). More important was "black poverty, which limited housing options" and "white pressures to keep blacks out of their neighborhoods" (p98). Restrictive covenants, clauses written into property deeds specifying restrictions on the use of the property, were widely used to bar undesirable neighbors from occupying properties starting in the late 1880s (Fogelson 2005). Mortgage discrimination and real estate steering were institutionalized in the early 1900s (Helper 1969). However, Hayward (2013) explains that the problem with relying on black poverty or

restrictive covenants to maintain segregation was that the market was susceptible to encroachment, requiring coordination and constant vigilance against potential violators (Brooks 2002, McAdams 2008). Marshaling the power of municipal governments to restrict land use offered developers and property owners the promise of a protected investment.

Evidence indicates that zoning adopted in the early 1900s followed patterns created by private actors (Burgess 1994, Tretter 2012). Writing in 1929, M. T. Van Hecke explained, "zoning programs are frequently influenced by restrictions in deeds. Where a very substantial area has been set aside for a high type use through the medium of deed restrictions, and that area is sufficiently large and geographically distinctive, zoning officials ordinarily recognize the character of the development and classify that section accordingly, so that the objectives of the statutory and deed restrictions are the same" (p420). Both supporters and opponents of zoning argued that the new laws would simply reinforce patterns produced by the market. Supporters, like Robert Whitten, creator of Atlanta's post-*Buchanan* comprehensive zoning plan, claimed that zoning would serve to lessen racial antagonism and economic loss by making the future of development more predictable as it enforced existing segregation patterns (Toll 1969 p262). Opponents suggested that zoning would add unnecessary (and some argued, unconstitutional) regulation when restrictive covenants were perfectly suited to the job of preserving neighborhoods and property (Virginia Law Review 1928, Ellickson 1973, Hayward 2013 pp118-119, Denzau and Weingast 1982, Berry 2001).

Aside from freezing private decisions in public policy, zoning also had the potential to generate race and class segregation through implementation. Ostensibly, zoning is undertaken in the interest of the city as a whole, but this, "depends entirely upon the way in which the work is done" (Van Hecke 1929, p414). This is because zoning, as an administrative task, requires

innumerable small decisions by municipal officers who may, consciously or unconsciously, bias outcomes toward some groups and away from others. E.T. Hartman (1925) explains, "chief among the problems are the granting or refusal of permits in accordance with the law, the decisions of the board of appeals in appealed cases, and appeals from either or both by interested parties" (p162-163). As is true of any regulation, zoning serves political purposes (Denzau and Weingast 1982). The discretion inherent in applying zoning laws meant that local officials could deny permits to builders who sought to house nonwhite or poor families and/or make exceptions for developers serving white and upper class residents (Bayor 1996, Meyer 2000). Abrams (1955) explains, "those who build for whites can get a modification pro forma. But the moment an unwelcome group appears, the officials stand firm" (p210). Until 1949, the Federal Housing Administration officially encouraged the use of zoning to generate race and class segregation (Stearns 1962). Valuators were instructed that, "the best artificial means of providing protection from adverse influences is through the medium of appropriate and well-drawn zoning ordinances" (Federal Housing Administration 1936, *Underwriting Manual*, Part II paragraph 227). Zoning was understood to protect locations "against declines in value or desirability" (section 306(2)) by preventing the, "infiltration of business and industrial uses, lower class occupancy, and inharmonious racial groups" (paragraph 229).

As Berry (2001) notes, providing evidence of the effects of zoning on segregation has proved challenging because zoning is ubiquitous today.[69] But as the first section of this chapter revealed, in the first decades of the 20th century, zoning adoption was variable. I argue that this variation shows that early zoning adopters became more segregated cities – even accounting for the degree of segregation that existed when zoning laws were adopted. My dependent variables

[69] Berry (2001) takes advantage of the lack of zoning laws in Houston and their presence in Dallas to show that private controls – particularly covenants – produce the same outcomes as zoning laws.

in these analyses are *Change* in the level of *Race* and *Class segregation* between about 1900 and 1970. More specifically, I subtract the level of segregation at the earliest point in my dataset from the 1970 of segregation of non-Hispanic whites and renters. The earliest measures for racial segregation are from 1890, 1900, or 1910. For renter segregation, the earliest measure is 1900 for most cities.[70] As explained in Chapter 1, the segregation of renters is an imperfect measure of class segregation – but it is the only measure that allows me to capture change over time.

My primary independent variables are drawn from the data described for Table 2.1. I expect that racial segregation will be most closely linked to racial zoning and comprehensive zoning (as the historical discussion indicated), while class segregation will be tied to all forms of zoning. In the analysis of racial segregation, my independent variable is a dummy variable noting whether a city adopted either a race based or comprehensive zoning ordinance in the period 1900 and 1930. These *Early Zoning Adopters* are coded 1, and cities that did not adopt racial or comprehensive zoning are coded 0. In the analysis of renter segregation, cities are coded 1 if they adopted any type of zoning ordinance between 1900 and 1930 and zero otherwise. I control for the *Change in City Population* between the earliest point of measurement for each city and 1970. Table 2.2 presents these results.

[70] I have data in 1900 for 49 cities. To increase the number of usable observations, I include the level of renter segregation in 1940 for 14 additional cities. The correlation between renter segregation in 1900 and 1940 is .8676. The results are nearly identical (though less precise) using only the data from 1900.

Table 2.2: Zoning's Effect on Race and Class Segregation

	Change in Racial Segregation 1900-1970		Change in Renter Segregation 1900-1970	
	β	P>|z|	β	P>|z|
Early Zoning Adopter	0.133	0.001	0.036	0.061
Change in City Population	0.000	0.002	0.000	0.000
Constant	0.057	0.103	0.026	0.181
N	88		63	
R^2	0.198		0.222	

Note: OLS Regressions

The results in Table 2.2 are striking – cities that were early adopters of zoning ordinances grew more segregated over the next 50 years compared to cities that were not early adopters. Around 1900, cities that adopted zoning had very similar racial segregation rates to non-adopting cities (0.265 for adopters and 0.287 for non-adopters). By 1970, cities that adopted early zoning ordinances had segregation levels about 10 points higher on average (0.489 compared to 0.390). Zoning also exacerbated renter segregation. Cities that were not early adopters saw about a 4 percentage point increase in renter segregation between 1900 and 1970 compared to an 8 percentage point increase in cities with zoning.

Furthermore, zoning had significant consequences for property value inequality (as its promoters had hoped). To measure property value inequality, I created a *Property Value Gini Index* built from median home values at the census tract level in 1970. Cities in which all census tracts have very similar 1970median home values have a low score on this measure, while cities that witness inequality in property values from neighborhood to neighborhood have a high score. Regressing the property gini on the dummy variable for early zoning adoption, including state fixed effects produces a coefficient of 0.09 (SE=0.003). Cities without early zoning had an average 1970 property gini of 0.04, compared to 0.13 among early zoning adopters. This difference is greater than a standard deviation on the gini index.

Of course, zoning was not the only mechanism available to local governments to promote race and class segregation. One of the most successful strategies of directing residential locations without force was the placement of segregated amenities. Austin, Texas was a pioneer in this practice. The city's 1928 comprehensive zoning plan found that, "the Negroes are present in small numbers, in practically all sections of the city, excepting the area just east of East Avenue and south of the City Cemetery. This area seems to be all Negro population" (page number). So, the plan recommended that, "all facilities and conveniences be provided the negroes in this district, as an incentive to draw the negro population to this area." This strategy would, "eliminate the necessity of duplication of white and black schools, white and black parks, and other duplicate facilities for this area" (Koch and Fowler 1928, p57). Soon after the adoption of the plan, Austin's city council pursued this approach, providing a park, school, and sewer connections for African Americans only in this one section of the city. The council went on to duplicate the strategy for Latinos (Tretter 2012). In the 1940s and 50s (as I discuss in Chapter 4), the siting of segregated public housing followed a similar pattern.

Another tactic cities used to shape minority residential patterns was the use of eminent domain and the placement of public improvements. Abrams (1955) reports, "Sites abutting Negro developments have been acquired for railroad stations, incinerator dumps, urban redevelopment, public housing projects, roads, and similar improvements. These improvements sometimes tend to cut off the minority area from the rest of the city and stem the expansion of its living space" (p212). Such decisions became increasingly frequent as the federal government provided funds for redevelopment. As I show in Chapter 4, cities that spent more urban renewal dollars also became more segregated.

Cities also engaged in several strategies that enhanced/protected private decisions generating segregation. Chief among these was the refusal to deploy police forces to protect blacks from white violence when they sought to buy or rent homes in white neighborhoods. In many places, police routinely prevented the poor and people of color from setting foot in wealthy white areas at all (Meyer 2000, Myrdal 1944).[71] In some places, city governments took actions to aid the effectiveness of private deed restrictions (Hirsch 1983). For example, the mayor of Baltimore established a special Committee on Segregation to help coordinate deed restrictions in white neighborhoods. The committee included the city's building inspector, representatives from the health department, real estate agents, and neighborhood improvement association members (Meyer 2000).

Conclusion

This chapter has provided the first piece of quantitative evidence along with qualitative historical references that suggest that local governments influenced patterns of segregation by taking into consideration public goods provision as well as the wishes of wealthy business elites and white property-owning constituents. Local governments institutionalized prejudicial behavior and promoted segregation through the use of zoning ordinances.

Political elites enacted zoning ordinances in order to control the distribution of public goods in the city. They justified their zoning and segregation legislation with the argument that the poor and minorities had habits that were harmful to public health. One of the main goals of zoning ordinances was to create property values that were stable; this was highly supported by influential groups including home and landowners who did not want "others" settling in their

[71] As was the case with zoning, the use of police to support segregationists was variable. For instance, Meyer (2000) reports several examples of police providing support for black residents in New York City, St Louis, and Baltimore.

areas and decreasing the value of their investments. Local governments had no objections to keeping the property values high and stable, as this allowed them to refrain from raising taxes.

One major consequence that resulted from enacting zoning ordinances was that cities that adopted them early became more segregated in terms of both race and class lines. When cities restricted land use and the location of specific buildings, this created areas that were homogenous, leading to the reinforcement of inequality and social divisions.

In 1917, the Supreme Court ruled that zoning ordinances were indeed unconstitutional. This led many cities to turn their attention to comprehensive city plans and other forms of zoning that did not make outright segregation obvious. New comprehensive city plans were fueled by continuing race and class prejudice, and influenced the long-term shift from racial segregation to segregation by income level.

The historical references presented in this chapter support the argument that local government politicians used zoning as a mechanism to control the distribution of public goods towards their supporters and away from others, as well as create and maintain high property values in their cities. Zoning was an implemented effectively in areas where those in favor of zoning had political power to turn racial and class prejudice into legislation. Cities that were early adopters of zoning ordinances grew to be ten percent more segregated over the following fifty years than did cities that were not early adopters. The results also illustrate that zoning ordinances doubled the amount of renter segregation. In these early adoption cities, property values would also become more unequal by 1970.

Local governments used zoning ordinances as a mechanism to solidify, through institutionalization, existing racial hierarchies and prejudice, and this practice has had long-lasting effects. When cities could have used zoning to enhance the life of all residents, local

government officials catered to the private interests of their supporters and utilized policy tools including the placement of segregated amenities, public improvements, eminent domain, and redevelopment funds to protect and increase property values. The consequence of these practices was the generation of long-standing race and class segregation and prejudice.

Chapter 3: Inequality in Public Goods Provision, 1900-1940

Throughout the first decades of the 20th century, neighborhoods became increasingly homogenous along both race and class lines. By 1940, white/nonwhite segregation had increased by an average of 63%, while renter segregation increased by 54%.[72] Chapter 2 provided evidence that cities pursued race and class segregation in an effort to ensure the protected delivery of public goods to constituents with political power – namely land owners, realtors, developers, and white homeowners. Segregation served this goal because both local public goods and local political representation have a spatial component. While it is difficult to deny particular households access to sewer lines or a local public park, it is much easier to deny particular neighborhoods. Thus, as segregation geography shifted, so too did public goods inequalities.

Nothing about the existence of residential segregation necessitates inequality in service provision; it only makes it easier to produce if it is what city officials prefer to do. In fact, early planning advocates often argued that taking race into account when developing city plans was the key to *protecting* black communities and ensuring that they received, "all necessary municipal services – paving, city water, sewers, electricity, fire, and police protection…" (Knight 1927, p137).[73] While it was clear that public facilities would be separate, some planners insisted that there would be, "equal opportunities and facilities" (Virginia Law Review, 1928, p526). In most places though, inequality was the norm as, "housing segregation…permit[ted] any prejudice on the part of public officials to be freely vented on Negroes without hurting whites" (Myrdal 1944, p618).

[72] As described in detail in Chapter 1, renter segregation remained at lower levels than race segregation throughout this period.
[73] Knight, Charles. 1927. Negro Housing in Certain Virginia Cities, Publications of the University of Virginia Phelps-Stokes Fellowship Papers, Number 8

As Abrams (1955) explains, "though often merged into a single neighborhood, the ghetto was not always a slum nor the slum always a ghetto….the slum-ghetto was created when those of a single ethnic minority group lived not only in a ghetto but also in bad housing" (p76). Local governments contributed to the development of slum-ghettos by providing worse city services to neighborhoods populated predominantly by certain groups. Myrdal (1944) explains that the argument offered in support of these unequal allocations was the (erroneous) belief that whites paid all of the taxes, and so were therefore entitled to all of the benefits. It followed that, "whatever [Negroes] get is a charitable gift for which they should be grateful" (p336).

Over the long run, this pattern of government behavior contributed to the development of negative stereotypes about the people who lived in the slum-ghetto (e.g. that racial minorities or the poor, "*cause[d]* the deterioration of the places in which they live[d]" Hayward 2013, p64, emphasis in original). This is what Glenn Loury (2002) refers to as a "politically consequential cognitive distortion" because the disadvantage observed among a group of people is assumed to be, "intrinsic to that group when, in fact, that disadvantage is the product of a system of social interactions," which then leads observers to be opposed to policy solutions or systemic reform (p26). It was in the early part of the 20th century that the foundation for continuing inequality in the 21st century was laid. By building inequality into the physical landscape, cities added, "unprecedented durability and rigidity to previously fragile and fluid [social] arrangements" (Torres-Rouff 2013, p257).

In Chapter 2, I provided evidence that political power in the hands of opponents could slow or inhibit the enactment of such policies. A similar pattern existed with respect to the distribution of benefits. In many cities, political participation of lower socio-economic status groups and racial minorities limited the degree to which public goods were allocated unequally.

When these groups were able to assert political power through voting strength or in official positions, they received more benefits from municipal governments.

In this chapter, I show that between 1900 and 1940, neighborhoods that were identifiably poor or inhabited by minorities were allocated lower quality services including road paving, public health efforts, and sewer extensions. I draw on detailed data from Atlanta, Birmingham, Baltimore, Boston, Chicago, and Philadelphia to provide this evidence. Where relevant, I discuss mobilization efforts on the part of underserved groups that limited the extent of unequal allocation. I also show that in the case of sewer connections, this inequality persisted into the latter half of the century. Using data from all places included in the Census in 1970, 1980, and 1990, I provide evidence that where minorities and renters were more concentrated (e.g. in more segregated cities) they were less likely to be connected to public sewers.

A common argument promoted in the literature, as early as the 1930s, was that class, not race, was the more important determinant of inequality. A 1932 report commissioned by President Hoover stated, "These conditions of Negro housing in our cities are not the result of any willful inhumanity on the part of our society. On the contrary, they merely emphasize the present shortcomings of our individualistic theory of housing…The Negro's housing problem is part of the general problem of providing enough housing of acceptable standards for the low-income groups in our society" (Johnson 1932, p.viii). Myrdal (1944) also argued that, "in the North there is little, if any, direct discrimination…What inequality there is in the Negro's consumption of public services in the North is due mostly to poverty, lack of education, and other disabilities which he shares with other lower class persons in the region" (p335). Thus, the belief that blacks endured worse conditions than whites solely because of their lower socio-economic status, was widespread. As will be shown throughout this book, this was not true in

either the historical or modern period, regardless of the measures used or the region studied. Race and class exert powerful, independent effects on distributional outcomes.

Jim Crow and Public Goods Inequalities

Until the mid-1950s (and in some places long after), many Southern (and some Northern) cities generated inequalities in public goods by segregating access directly and then underfunding nonwhite services. Of all of the public goods residents sought to secure, none was as important as schooling. As of 1947, all southern states, along with Arizona, Indiana, Kansas, and New Mexico required or allowed segregation of schools (CQ Researcher 1947). Until the mid-1930's, about 75% of public school revenues were completely locally derived (Snyder 1993).[74] In the post-war period state and then later, federal government contributions rose. According to the data described in Chapter 1, localities spent an average of $103 (in 2012 dollars) per capita on schooling in 1902, representing about 35% of total expenditures. Per capita spending rose dramatically over the next 25 years (to $203 in 1927), but not as quickly as other expenditures. In 1927, schooling represented about 31% of local budgets. Until (and in some places even long after) *Brown v. Board of Education* was decided in 1954, racial segregation in schools was generated directly – that is, *residential* segregation was not needed to

[74] Technically, most schools in the United States are governed by approximately 13,000 independent, single purpose governments called school districts, rather than by cities. Not only are the governments that provide schooling and garbage service different entities, with separate budgets and separately elected officials, they do not often share the same boundaries. Today, only about one quarter of cities over 50,000 people have boundaries that are coterminous with a single school district (Fischel 2007). However, the 1902 Census Statistics of Cities reports that, "In most cities [included in the report] the schools are under the control of the city government, or of a school district, practically coterminous with the city" (p21). In his study of modern district boundaries, Fischel (2007) confirms that older cities are much more likely to have coterminous boundaries. It is for this reason that I include a discussion of schooling in this section. The figures cited in this paragraph combine revenue and expenditure for the municipality and the district as reported by the Census. However, it is not proper, even during this early period, to think of expenditures on schooling as being exchangeable with expenditures on other types of services. That is, increasing school spending did not directly impact funds available for policing, although one might imagine a theoretical budget constraint that the voters could impose on all governments. Due to a lack of clarity both theoretically and statistically, for the most part, I do not consider school district revenue and expenditure as part of the municipal budget in the remainder of this book.

ensure that whites and Blacks attended different schools. This was true in both the North and South. As one observer explained, "contrary to the general impression, this doctrine [of segregated schools] is of Northern and not of Southern origin. It originated in fact in the Quaker state of Pennsylvania and the abolitionist state of Massachusetts, and; although it repudiates any implication of a superior and an inferior race and insists on equal opportunities and facilities…" (Virginia Law Review 1928, p526). Litwack (1961) found that, "by the 1830s, statute or custom placed Negro children in separate schools in nearly every northern community" (p115).

In 1912, the Census reported expenditure data on schools separated by race in 40 communities. Unsurprisingly, white schools were better funded than black schools. I estimate that these cities spent about $4 per white resident and about $2.6 per black resident (in 1912 dollars).[75] However, the ratio of spending in black to white schools differed by region. While Northern black schools were not, as the Virginia Law Review implied, equally funded – it was the case that the disparities were greater in the South. For cities in the Midwest, the ratio was 0.846, compared to 0.685 in the Northeast, and 0.573 in the South.[76] School enrollments were also lower among black children. For the 1902-1903 school year, about 56% of black children were enrolled in school in Southern states, compared to 72% of white children (DuBois and Dill 1911, p24).[77] In some places with substantial black populations, no black schools were provided

[75] This is an estimate because I used linear interpolation to estimate the total white and Negro population in each city in 1912. The figure represents the total amount of funding for white and Negro schools reported by the Census divided by my population estimates.

[76] It is important to note that these data only represent a fraction of the communities with black schools or significant numbers of black school aged children (see discussion on page 122 in Financial Statistics of Cities Having a Population of Over 30,000: 1912). The 40 communities included in this special Census report spent less overall on schooling compared to other communities (about $3.6 per capita vs. $4.8 per capita). Compared to data reported in DuBois and Dill (1911), these figures appear to understate the discrepancy in funding between black and white schools.

[77] W.E. Burghardt DuBois, PhD and Augustus Granville Dill A.M., editors, The Common School and the Negro American: Report of a Social Study Made Under the Direction of Atlanta University, No. 16.

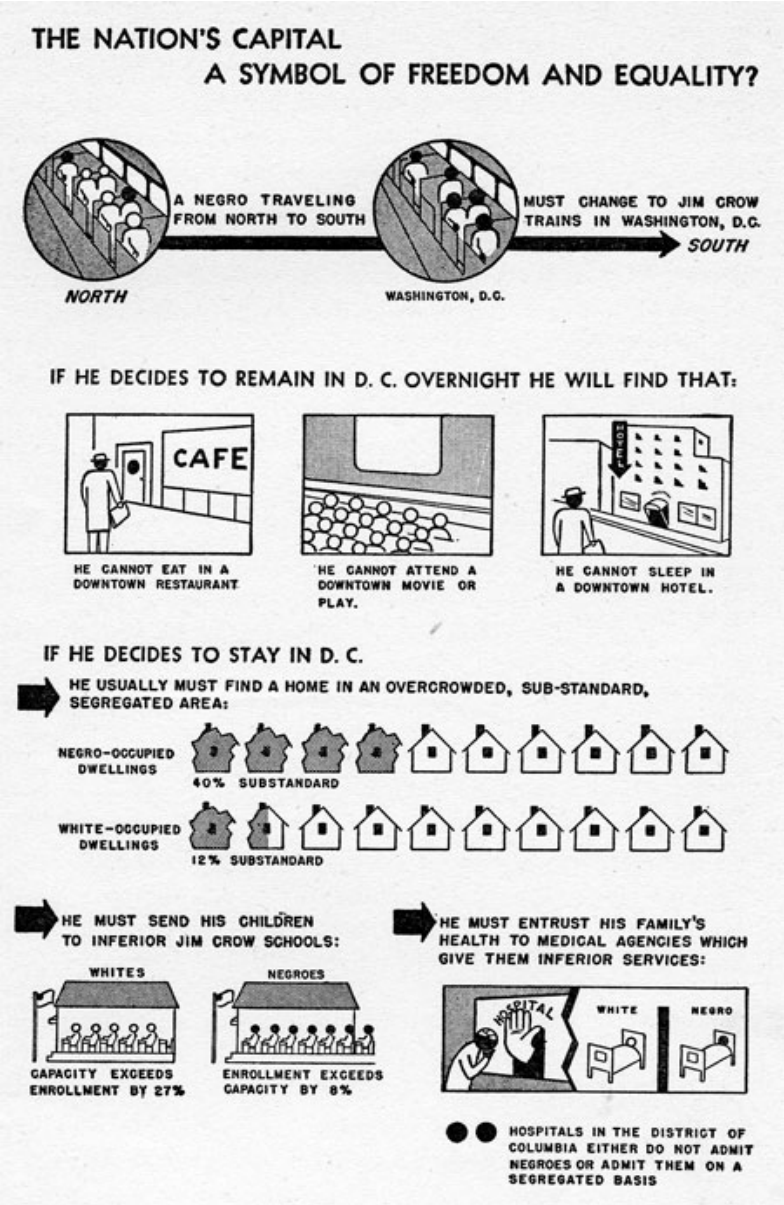
at all (Dubois and Dill 1911). Indeed, as Rabinowitz (1978) has argued, segregated schools actually represented an improvement in many communities because the alternative was complete exclusion – not integration.

Black schools had fewer teachers per child, shorter school years, and inferior physical infrastructure (DuBois and Dill 1911, Myrdal 1944). Teacher pay also differed substantially. For instance, in 1908 Georgia, the average teacher salary for whites was $45.47 compared to $26.37 for blacks (DuBois and Dill 1911). Despite similarly sized populations of white and black school children, Atlanta provided only 15 black grammar schools in 1920 compared to more than 40 grammar schools for white children. But not all white schools were treated equally. Schools serving poor whites (largely immigrants) were also, "older, less well equipped and often more overcrowded" (Myrdal 1944, p338).

Everywhere, blacks paid property taxes that were used to support white schools. Myrdal (1944) explains, "whenever the proportion of Negroes in the population is high, and the standard of Negro schools is kept well below that of white schools, the white educational system can derive substantial gains from segregation. Segregation makes discrimination possible; discrimination means lower expenditures for Negro schools, and the white population thus gets a vested interest in separation" (p341). In 1917, the Negro-at-Large series sought to catalogue reasons for the increasing Northern migration among Southern Blacks. The results of the organization's survey were printed in the Atlanta Independent. The third most important reason (after unhappiness with Jim Crow laws and disenfranchisement) dealt with inequality in school funding. The survey stated, "At present Negroes pay their proportion of taxes directly and a big portion in-directly through their rents, yet Negro schools receive in some cases less than 30 per cent of their just desserts" (reported in West 1976, p14).

However, the extent of inequality differed from place to place. DuBois and Dill (1911) report that in Washington D.C., where blacks sat on the Board of Education and held an assistant superintendent position, "there is no discrimination in the pay of teachers or in the requirements for teachers or in the course of study laid down" (p32). St. Louis and Baltimore both offered black high schools during this period. A 1954 study of inequality in education funding in St. Louis found that black schools were underfunded given their enrollment, but the difference was only about 5% and teacher pay was nearly identical (Russell 1954). In Atlanta, an active chapter of the NAACP sought to mobilize black voting power to improve public services in general and schooling in particular. In spite of a series of restrictions on voting (e.g. the white primary, poll taxes, etc.), the organization was able to register enough blacks to vote to sway some elections (Bacote 1955). In 1919, black Atlantans organized to defeat a bond package that would have solely funded white schools. So, in 1921 sponsors of the referendum sought black support in exchange for a black high school (West 1976).

Schools were not the only public good that was segregated directly during this period. Recreational facilities like parks, swimming pools, bath houses, and golf courses were also designated for white use only in many Southern cities. In Atlanta, blacks had three recreational sites compared to 22 for whites (Kruse 2005, p75). In 1954, The Atlanta Urban League calculated that whites had access to one acre of park land for every 155 residents compared to one acre of park land per every 1020 black residents. As a result, black parks witnessed severe overcrowding and much more rapid degradation (Kruse 2005). Myrdal (1944) writes, "virtually the whole range of…publicly administered facilities…are much poorer for Negroes than for whites" (p335). A graphic from President Truman's Report of the President's Committee on Civil Rights (Wilson 1947) makes the point visibly:



Although Jim Crow legislation was efficient at producing racial inequality, it was not perfect. As the Truman Report explained, "Following the *Plessy* decision, the Supreme Court for many years enforced with a degree of leniency the rule that segregated facilities must be equal. Gradually, however, the Court became stricter about requiring a show of equality"

(Wilson 1947, p82). Separate-but-equal facilities increased costs dramatically (Myrdal 1944). Additionally, some public goods could not be segregated directly. Troesken (2004) argues that, "because most cities and towns installed their water and sewer systems before 1920, during an era of relatively low residential segregation, it was difficult to construct systems that underserved African Americans without also underserving whites" (p91). As a result, he finds that the delivery of clean water and sewage disposal had a dramatic effect on lowering black mortality in the South. Furthermore, in some places, white public opinion had already begun to develop in opposition to overt racial prejudice and blacks were able to make headway in pursuing integration. Boston desegregated its schools in 1855 after sustained protest by blacks and abolitionist whites (Mabee 1968). By 1947, eighteen states had enacted antidiscrimination legislation prohibiting direct segregation (Konvitz 1947). Even some Southern cities (e.g. Atlanta) witnessed a significant local voice in opposition to Jim Crow (Kruse 2005). As direct segregation became untenable and the black population of these cities expanded, residential segregation became the obvious solution. Furthermore, unlike Jim Crow legislation, residential segregation permitted the separation of poor residents from wealthy residents in addition to the separation of residents of color.

Inequalities Generated Through Residential Segregation

When the nonwhite or poor community was segregated residentially, systematic denial of services was possible. A mid-century analysis of "American Negro, Puerto Rican, and Mexican" housing in large cities found that,

> "Garbage collections, building inspections, street maintenance, and other city services are less satisfactory than in other areas. The abnormal number of rat bites in Harlem, for example, may be ascribed not only to proper upkeep but to the ready supply of uncollected garbage in the streets. Southern cities and some in the North omit street paving and sidewalks in Negro sections. In hills sections the residents try to fill gullies in

> the streets with broken masonry, worn-out linoleum, and other trash" (Abrams 1955, p74-75).

In Birmingham, a committee of Black professionals protested the city's 1923 segregation ordinance saying that while blacks "would prefer to live to themselves," black neighborhoods, "are without the necessary sanitary arrangements, street improvements, lights, police protections, and the necessary comforts given other people in the municipality" (Connerly 2005, p44).

Among the most ambitious and expensive public goods that cities developed in the first decades of the 20th century were the delivery of clean water and removal of waste through sewer systems. Sewer and water mains were built along major roads, and homes located along these lines would have had the opportunity to be connected to the system. Troesken (2004) suggests, in a detailed analysis of Savannah and Memphis, that it appears that segregation, "facilitated efforts to underprovide African Americans with sewer and water systems" (p91). I build on Troesken's case studies by analyzing sewer and water extensions over time in four cities: Baltimore, Boston, Chicago, and Philadelphia. These cities all witnessed increases in racial and renter segregation between 1900 and 1940 and had data available on sewer construction.

To measure segregation, I calculated the *H* Index (as described in Chapter 1) for Baltimore, Boston, Chicago, and Philadelphia using ward-level demographic data from the 1900, 1910, 1920, 1930, and 1940 Censuses of Population and Housing.[78] For racial segregation, I use whites and nonwhites as the groups in the calculation of the measure. For class segregation, I use renters and homeowners. Table 3.1 shows each city's *H* index in 1900 and 1940 measuring white/nonwhite segregation and renter/homeowner segregation.

[78] In order to make these scores comparable to modern data, I adjust the scores using a correction factor to make the ward-level estimates similar to the tract-level estimates used in later decades.

Table 3.1: Segregation Increased in the early 20th C					
	Race			Class	
	1900	1940		1900	1940
Baltimore	0.43	0.60		0.07	0.12
Boston	0.33	0.52		0.09	0.11
Chicago	0.46	0.84		0.09	0.15
Philadelphia	0.29	0.44		0.04	0.09

If the argument that I have presented is correct, it should be the case that nonwhite and renter households should have been less likely to have access to water and sewer connections in more segregated cities. Unfortunately, I do not have the individual-level data to test this hypothesis. However, there are also aggregate implications of my theory. If elected officials were taking demographics into account when making decisions about where to build sewer extensions, we should we witness an interactive effect between segregation and the demographics of a neighborhood. As segregation increases, it should be the case that the share of residents who are nonwhite or renters should have a more powerful negative effect on new sewer extensions.

The data I use for this analysis were provided by the Center for Population Economics at the University of Chicago in the Historical Urban Ecological dataset (which is really a collection of many different datasets and maps). The dataset (Costa and Fogel 2015) includes ward boundaries for the four cities listed above between 1900 and 1930 and also includes a map of each city's sewer system. The sewer map includes the year different segments of the system were built. Using ArcGIS, I created counts of sewer segments in each decade for each ward and combined these counts with ward-level data from the Census of Population and Housing.

Observations are arranged by ward-census year. That is, each observation represents one ward in a city in a single year. The dependent variable in the analysis is the *Total New Segments*

built in each ward before the next census. The key independent variables are the share of each ward's total population that is *Black* and the share of occupied housing units that were *Rented* (as opposed to owned). These demographic variables are interacted with each city's *H index of segregation* (for race and class respectively) in a given Census year.

I control for the *Total New Segments* built in the city in each decade to account for the slackening pace of sewer development over time. I include the *Total Segments* built in the ward at the completion of the sewer system to account for the variation in sewer needs across wards. I also control for the proportion of those total segments that were built at the beginning of each decade in the variable *Percent Built*. Finally, I account for the share of the ward population that is *Foreign Born* to account for the possibility that city governments were providing fewer benefits to immigrant neighborhoods (which would have correlated with renter neighborhoods).

An important alternative (and undoubtedly true) explanation to rule out is that black and renting residents chose housing that lacked public services because it was less expensive. I do this by taking advantage of time. I explore the pattern of sewer line extensions in each decade between 1900 and 1940 given the racial makeup of each ward at the beginning of the decade. For instance, the total number of extensions built between 1900 and 1910 is regressed on the share of the ward that was black and the share that were renters in 1900. Because the dependent variable is a count of sewer segments, I fit a Poisson regression.

I was able to obtain data at the ward-level detailing racial makeup for every decade between 1900 and 1940, but data on renters is only available for 1900 and 1940. Because ward boundaries changed dramatically in some cities between these years, interpolation is not possible. Additionally, the Census did not tabulate data on renters in 1940 for the city of Chicago. As a result, adding the proportion of renters to the models significantly decreases the

number of observations. For this reason, I present the model without the inclusion of renters in the first model, and with the proportion of renters in the second.

The results, presented in Table 3.2, reveal a powerful negative relationship between the share of the ward that was black or renting and new sewer extensions in more segregated cities.

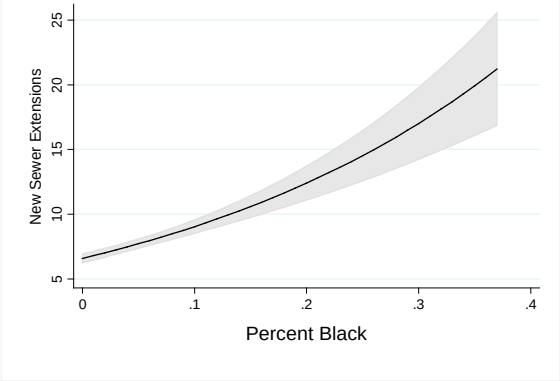
Agenda Item #5.1.
Page 2657 of 3230

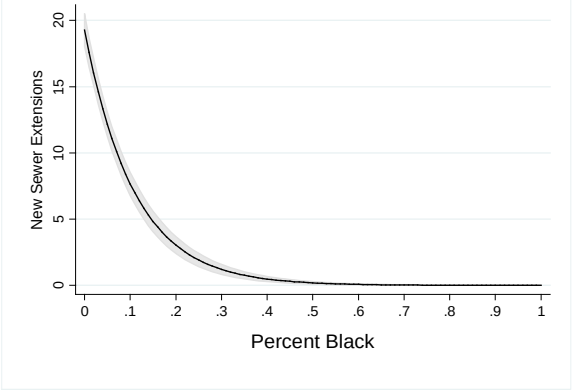
The data indicate that in more segregated cities, heavily black and renter wards were unlikely to receive new sewer lines. Figure 3.2 plots the predicted number of new sewer segments across the full range of black and renter population shares for the least and most segregated city-years in the dataset. The graph in the top right makes clear that majority black wards see no additional investment in their sewer systems. A similar pattern exists for wards with increasingly large renter populations in cities that were segregated by class.

Figure 3.2: Predicted Sewer Extensions at the Minimum and Maximum Level of Segregation

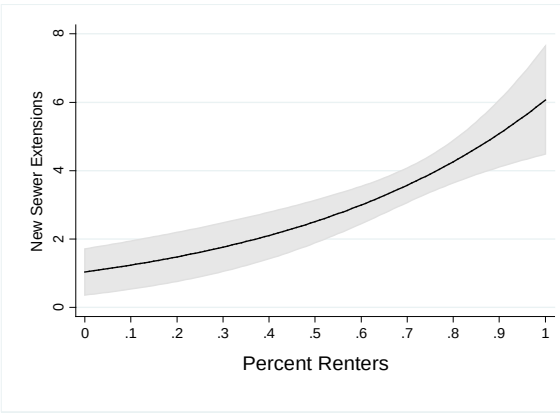
Minimum Racial Segregation (0.29)



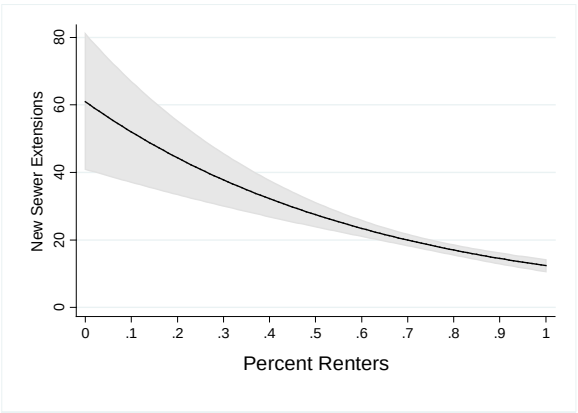
Maximum Racial Segrgation (0.86)



Minimum Renter Segregation (0.04)



Maximum Renter Segrgation (0.11)



In integrated cities however, the reverse is true: larger black and renting populations increase sewer line extensions. This may seem puzzling at first glance – but it is not. Troesken (2004) explains that the reason for this apparent generosity was self-preservation. He says:

> …discrimination in this arena was costly to white politicians and voters in at least three ways. First, given the networked structure of these systems it was difficult to deny service to African-American households and neighborhoods without also denying service to white households and neighborhoods…. Second, in a world where blacks and whites lived in close proximity, 'sewers for everyone' was an aesthetically sound strategy. Third, failing to install water and sewer mains in black neighborhoods increased the risk of diseases spreading from black neighborhoods to white ones (p9-10).

As a result, to the extent that sewer systems were built prior to rising segregation, variation in sewer system service did not disproportionately affect any demographic group. In Richmond, Virginia, neighborhood segregation actually declined between 1890 and 1930, and one contemporary observer wrote, "With the completion of the 1925 program practically the whole of Richmond was sewered and supplied with city water" (Knight 1927, p51).

In other cities, organized political action on the part of nonwhites and the poor mitigated inequalities. Bond passage in Atlanta required approval of two-thirds of votes cast and the two-thirds majority had to constitute a majority of registered voters – so by simply registering and not turning out, African Americans could ensure defeat at the polls (West 1976, Bayor 1996). In 1919, Black voters defeated a one-million-dollar bond package that was to provide, "for improvement of waterworks, a motorized fire department, erection of a museum at cyclorama, and the construction of a crematory with electricity generating facilities," after being told that, "blacks would receive no benefits from the measures" (West 1976, p13). When a new package was submitted to voters in 1921, it included $2,850,000 for water works and $750,000 for the viaduct (Atlanta Independent, February 24, 1921, p4). The mayor promised to appoint a special commission of colored citizens to advise the Bond Commission regarding the distribution of the

funds (Atlanta Independent, February 24, 1921, p4). On election day, Atlanta's "colored citizens…voted for every improvement named on the ballot" (Atlanta Independent, March 10, 1921, p4).

In some cities, sewers were built at the behest of property owners and developers. This was the situation in Birmingham and Los Angeles. In cities with this type of process, land-owners played a crucial role in the eventual sewer map. Because very few land owners were people of color, blacks in Birmingham and Mexicans and Chinese residents in Los Angeles lacked the opportunity to request sewer extensions or connections. While it might seem reasonable to explain inequality in access as the result of these economic differences, cities had other means by which to compel development. In Birmingham, sanitation and building codes were ignored in black neighborhoods (Connerly 2005), and in Los Angeles the city council ordered sewers to be built at the, "cost and expense of the several parties owning property along its route." However, they declined to compel sewer building in Sonoratown or Chinatown (Torres-Rouff 2013, p224; quoting Los Angeles City Council minutes, April 4, 1873). Because most Mexican and Chinese residents were renters, this refusal was a significant benefit extended to their landlords. As a result, in both cities, the absence of sewer and water service was concentrated in minority neighborhoods.

In this next section, I ask whether this unequal pattern of sewer development continued to affect minority and renting residents in the latter half of the 20th century. In order to investigate this question, I draw on the GeoLytics Neighborhood Change Database which matches and normalizes Census tract boundaries between 1970 and 1990. This normalization allows for direct comparison of tract attributes across time. I use this database to construct the race and

renter *H* index (as described in the previous section) for 4,566 incorporated municipalities and 800 unincorporated county areas.

The dependent variable in my analysis is the share of housing units in a given census tract that is connected to *Public Sewers*. My primary independent variables, similar to the previous analysis, are the share of the tract population that is *Nonwhite*, and the share of households that are *Renters*. These variables are interacted with each city's *H* index *of segregation* (for race and renters respectively) in each year. I control for the proportion of *Wealthy Families* in the tract (those earning incomes above the 90th percentile for a given Census year: $15,000 in 1970, $35,000 in 1980, $75,000 in 1990), the total *City Population*, and the total number of families connected to *Public Sewers* in the city. I include fixed effects for region and cluster the errors by city. The results are presented in Table 3.3 (summary statistics are in table A3.2).

Table 3.3: Nonwhite and Renter Sewer Access in Segregated Cities

R^2	0.327		

As was the case in the early period, between 1970 and 1990 renters and nonwhite residents continued to have inferior sewer access in more segregated cities. Of course today, overall sewer

access is high; the median census tract has 97% of homes connected to public sewers. The point demonstrated by this analysis is that both in the past and today, lack of access to public sewers is disproportionately concentrated among minority and renting residents.

Delivery of other public goods followed a similar pattern to sewer development and clean water provision. In 1900, 8,000 automobiles were registered in the United States; by 1940 the figure was 27.5 million (Federal Highway Administration 1997). But during this same period, actual spending on roads increased very little and dropped as a share of total budgets.[79] This meant that road paving distribution was an intensely political decision and different areas of the city were treated differently. One study of four Virginia cities reported, "a general lack of paving in the Negro residential areas" (Knight 1927, p53). In Los Angeles, Torres-Rouff (2013) explains, "many paved streets ran through the Anglo residential neighborhoods and commercial center but abruptly yielded to dirt as soon as they crossed into Sonoratown and Chinatown" (p226). A 1958 study of Birmingham analyzed white and black blocks in a single working class neighborhood and found that about a third of the black blocks had unpaved streets on three or four sides compared to only 6% of white blocks (Connerly 2005, p31).

As described in the introduction, mortality rates in cities during this time period, particularly the early years, were high. A budding public health movement sought to utilize government funds to address disease contraction and death. Cities created new public health departments, passed regulations regarding the storage and transport of milk, sent inspectors to stores and dairies, and engaged in large scale fumigation efforts. In all of these activities, white and homeowner neighborhoods were treated more protectively than neighborhoods inhabited by

[79] In a sample of 84 cities for which I was able to obtain data between 1902 and 1937, mean per capita road spending was $44 in 1902 (in 1912 dollars) and $43 in 1937. It reached a high of $51 in 1932. Road spending represented about 13% of city budgets in 1902 and about 8% in 1937.

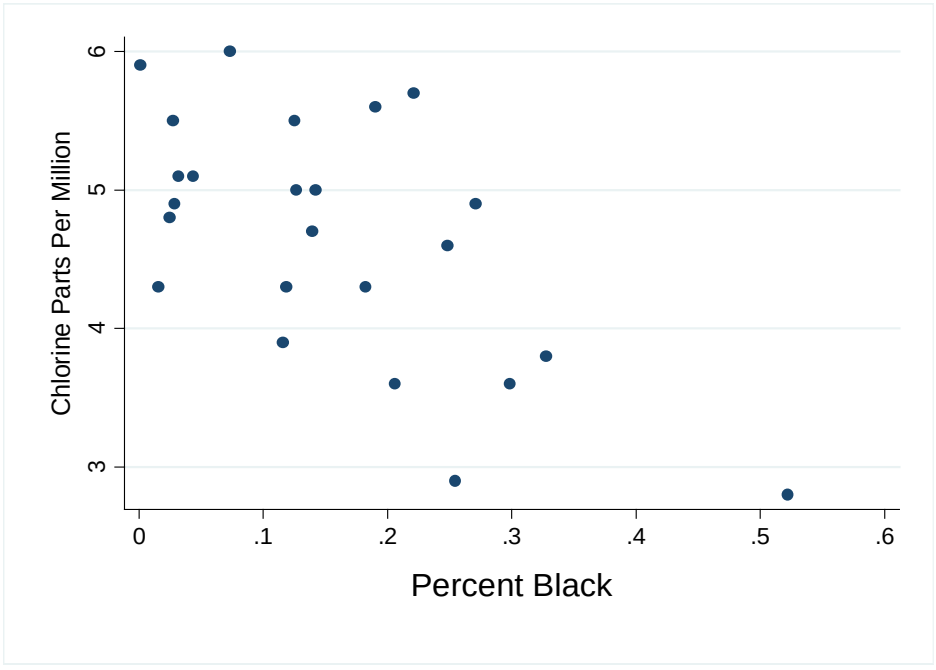
renters and minorities. In 1915, the nationwide infant mortality rate was 57% higher among nonwhites than whites. One study of 4 southern cities determined that nearly 1 of every 2 black babies died (Meckel 1990 p.142). Even still, black infants were "almost entirely" excluded from the "early part of the infant welfare campaign," (Meckel 1990, p142).

A 1914 analysis of Baltimore's Public Health department by the United States Surgeon General found that regulations were not enforced in the poorer parts of town. The report explained:

> An inspection was made by me of the stores selling milk in two of the districts of the city. One was located on the outskirts of the city in a good neighborhood…In every store the milk was sold in unbroken packages, was kept in a separate compartment of a large refrigerator and the conditions were as good as could be expected…The other district visited was of a different type altogether. It was located in the slums, among the foreign population. Here all the milk was sold in bulk under the most insanitary conditions. To make regulations here is practically hopeless. There are but three things to be done – stop the sale of milk in such places, establish a municipally controlled dairy within the district, or prohibit the sale of anything but bottled milk in original packages… (Fox 1914, p37).

In 1901, the Baltimore Health Department (reported in HUE dataset by Costa and Fogel 2015) reported an assessment of water quality in each ward. Only one ward had water that was classified as "Very Muddy" (as opposed to clear, fairly clear, cloudy, or muddy). That one ward was 52% black. The same ward also had the lowest level of chlorination in the entire city. In fact, there was a powerful negative relationship between chlorine parts per million and the share of black residents in a ward. Figure 3.3 provides a scatter plot of the data.

Figure 3.3: Chlorination of Water in Baltimore Wards, 1901



Not only were services provided differentially, but many cities engaged in a practice Rabin (1990) calls expulsive zoning: the placing of negative uses in minority neighborhoods. Kruse (2005) explains that as neighborhoods transitioned from white to black, city officials would assume that property values would fall and the area would become a slum. "Accordingly, planners and zoning committees lowered their standards for the region and began approving projects they would have routinely rejected if the residents were still white" (Kruse 2005, p74). A 1932 analysis of housing in one New Orleans neighborhood reported that, "The superintendent of the public school system used to live in this area but the white residents began to move out and then the city built a garbage incinerator over here, and all of the best whites moved out and the Negroes moved in with the poor whites," (Johnson 1932, p19). In Birmingham, city planners zoned black neighborhoods in flood plains and in industrial areas (Connerly 2005). Myrdal

(1944) reports that it was common to ignore criminal activity in black areas. As Muhammad (2010) explains, municipal authorities allowed crime to flourish in black neighborhoods as a service to white politicians and constituents. Doing so allowed whites access to prostitution, gambling, illicit alcohol and drugs while protecting white neighborhoods from the criminality. Because such operations were, "mostly owned, partially operated, and unofficially regulated by a largely white power structure" (Muhammad 2010 p.227), the benefits were captured by whites, while the negative externalities of vice were borne nearly exclusively by blacks. These strategies created conditions that lead later generations of planners to denote black areas as blighted slums, thus enabling the expulsion of blacks from these neighborhoods in redevelopment projects.

The historical record indicates that lower levels of segregation and more political power in the hands of blacks and the poor could mitigate such inequalities. Throughout the late 1880s, blacks held significant bargaining power in Atlanta city politics. Blacks were appointed to the nominating committees for city elected offices, and black votes were courted with promises of a black fire company, schools for black children, and street paving (Bacote 1955). After the white primary was struck down in 1946, blacks gained even more leverage in Atlanta politics. Black leaders had been pressing the city government for years to hire black police officers, "hoping to solve the problems caused by both the absence and the presence of white policemen" (Kruse 2005, p33), but their requests were ignored until they could marshal votes in city elections. In 1948, eight black patrolmen were hired (although they were only allowed to patrol black neighborhoods and could not arrest whites).

In Birmingham, many black neighborhoods formed active, dues-paying, civic leagues to lobby the city government for improved services. While they won a few small victories (the first city-owned park for blacks, some street paving and lighting, fire hydrant installation, sewer

extensions, and gas lines), they were mostly met with staunch resistance from the all-white government. One organization, the Harriman Park Civic League waited for four months to get an appointment with the public safety commissioner, Bull Connor. When the meeting finally occurred, Connor literally turned his back on the presentation (Connerly 2005, p221). In the late 1960s and early 1970s, as political power began to shift toward black residents, many of the requests brought by the civic leagues were finally addressed.

In Boston, Progressive Reformers attracted public support and won a series of institutional reforms between 1903 and 1913. Nonpartisan neighborhood organizations arose as powerful voices in municipal politics. The result was the consolidation of political power in the hands of middle-class homeowners (Connolly 2009) at the expense of working-class white ethnic immigrant constituencies like the Irish. However, the city was fairly integrated residentially along both ethnic and class lines during these years – and so, while political power shifted hands and the agenda changed, when neighborhoods won improvements like street cleaning and repair, playgrounds, libraries, or improved police protection, they benefitted all residents in the community, not just those with political power.[80]

Between 1914 and 1950, Boston was governed (on and off) by a staunch advocate of the poor and working classes – James Michael Curley. Curley was a machine-style politician, who was never able to consolidate a dominant citywide organization (Erie 1988). Many histories of this period note Curley's lavish attention to the city's, "working-class, ethnic neighborhoods" (Connolly 2009, p146). But the Census data from the period reveal that even the most heavily ethnic wards were actually fairly mixed. In 1930 for instance, wards ranged from 21% foreign

[80] Connolly (2009) argues that this shift in political power altered the agenda of city politics toward neighborhood improvement and away from issues that the working class prioritized like union protections and wage and pension increases (see pages 115-120) and also decreased participation among working-class voters.

born to 42%, and no ward housed more than 11% of the total foreign born population. So when Curley "ordered loans to clean and pave local streets, build a playground and bathhouse, and improve sewer and water serves" (Connolly 2009, p166) in the North End in order to woo Italian votes, non-Italian residents also benefitted.[81]

Yet, in many cities, even when residents and activists mobilized to lessen inequalities, "segregation [became] the cornerstone of the elaborate structure of discrimination against some American citizens," (Wilson 1947). Hayward (2013) explains that the, "black ghetto [was] subjected to systematic disinvestment, while collective investments in new residential and commercial structures, and in 'public amenities', such as parks and athletic facilities and well-built and well-equipped schools, disproportionately [were] channeled to places that were, first legally, then practically, restricted to those constructed as white" (p63). These inequalities contributed to a growing collective sense of whiteness and homeowner identity on the one hand (Sugrue 1996, Hayward 2013), and on the other hand, the hardening of stereotypes about the suitability of poor and nonwhite residents as neighbors. White homeowners believed that individuals who shared demographic characteristics with those who lived in disinvested neighborhoods would bring slum conditions with them wherever they lived. In 1951 and 1953, Rose Helper conducted 40 interviews with real estate agents in New York City and Chicago to learn about the, "reasons for excluding Negroes from white residential areas" (Helper 1969 p18). She reported that the agents believed that, "[white people] fear that their neighborhood will deteriorate if Negroes come because of their manner of living in other areas: they associate Negroes with the undesirable slum (dirt, noise, squalor, stealing, vice), something to be avoided

[81] One scholar (Puleo 1994) estimates that in 1920, 95% of the North End population was Italian (p116). Without detailed data regarding the exact location of Curley's benefits, it is impossible to know the degree to which they served other populations.

if possible" (p79). In response, white homeowners sought continued governmental protection of their neighborhoods. Over the next several decades they succeeded in this fight.

Conclusion

Between 1900 and 1940, America's cities became increasingly segregated along race and class lines. While renters and homeowners both became more concentrated, the most dramatic changes in segregation occurred between blacks and whites. These changes in residential living patterns changed the distribution of public goods. As cities became modern service providers, the allocation of public goods was intensely political. In the earliest years when no neighborhoods benefitted from paved streets or clean water, health and cleanliness did not differ dramatically from place to place. But as streets became sewered, paved, and lit, and as inspectors enforced building, sanitation, and health codes, some neighborhoods reaped the benefits while others, "continued to contend with dirt roads and open cesspools" (Torres-Rouff 2013, p227). As Torres-Rouff (2013) explains, "these decisions produced a city that physically imposed inequality on its citizens" (p227). Such choices would be consequential for the future as inhabitants of these neighborhoods came to be associated with poor living conditions. Today, evidence indicates that segregation is maintained by white homeowners' willingness and ability to pay a premium to live among white, educated neighbors (Cutler, Glaeser, and Vigdor 1999).

Chapter 4: City policy maintains/deepens segregation, 1940-1970

By 1940, segregation patterns in cities were well-established. The boundaries of minority neighborhoods were clearly defined and white prejudice against nonwhite neighbors was entrenched. As one Chicago realtor explained, our "firm has a policy where they won't sell to a Negro in an area where Negroes are not resident…the general public…is not willing to accept the Negro as a neighbor. That's the basis for our not selling to Negroes in this type of an area unless one Negro family is already in the block. You can't be censured then. A silly idea but that's life" (Helper 1969, p41).

The maintenance of property values was the typical explanation offered for these practices; a belief that had been cultivated by policies enacted by local governments and which quickly became a self-fulfilling prophecy. Blacks were seen as undesirable *neighbors* because the features of their *neighborhoods* became associated with individual members of the racial group. Whites came to similar conclusions about Chinese residents in San Francisco (Shah 2001, McWilliams 1964) and Latinos throughout the Southwest (Abrams 1955, Torres-Rouff 2013, McWilliams 1964). This was the case despite the fact that minorities and renters experienced poor neighborhood quality because of paltry municipal services, neglectful landlords, and the overcrowding that resulted from segregation, not from their own doing.

During the build-up of the war effort in the early 1940s, massive demographic changes rippled through the nation. African Americans moved to the North and West, and the war and agricultural industries attracted Latinos to cities and farms in the Southwest (Weaver 1948, McWilliams 1964). In the post-war period, city governments utilized policy instruments like urban renewal and the placement of public housing to prevent minority and poor neighborhoods from expanding into white areas, and to protect property values for white homeowners. At the

same time, tumultuous battles over racial integration (of neighborhoods, schools, busses, lunch counters, unions, etc.), the rising Civil Rights movement, and the passage of the Voting Rights Act, threatened to undermine white homeowners' control of the political system, distribution of city services, and ability to police the borders of their neighborhoods (Sugrue 1996, Kruse 2005, Self 2003).

A great deal of insightful, detailed historical research studying the Civil Rights movement, segregation, and suburbanization has been written about the postwar period and this chapter does not attempt to retell what we already know. Instead, here and also in Chapter 5, I focus on the role of city policy in the generation of neighborhood segregation and suburbanization. An important contribution of these chapters is to explore why, if the drivers of segregation and suburbanization are similar, do white homeowners choose one avenue of separation over another? I argue that policy control plays an essential role. When white homeowners lost the power to adequately guard their neighborhoods and dictate municipal policy and public goods distribution, suburbanization became attractive. First, I show that urban renewal was linked to increased race and class segregation in the postwar period. Then, I demonstrate that whites in racially segregated cities witnessed increasing threats to their political power, both electorally and more specifically, with regard to housing policy.

Urban Renewal and Segregation

In 1932, more than 80% of local revenues came from property taxes (Census of Governments Finance File). By the end of that year, nearly 750 homes were foreclosed every day (Gotham 2000). City government revenue plummeted. Mayors sought relief from Congress; organizing as the National Conference of Mayors and testifying in hearing after hearing about the dire need for federal subsidy (Ogorzalek, forthcoming). As part of its

response, Congress enacted housing legislation. With its first foray into this area, the 1934 Housing Act and establishment of the Federal Housing Administration (FHA), Congress had multiple goals –the reemployment of the construction industry, the shoring up of the financial sector, and the stimulation of home ownership. But these policies were *also* spurred by a commitment to residential segregation. As Gotham (2000) details, the major authors of the proposals under consideration were, "leading officials in the real estate and lending industries" (p303), most of whom, by this time, had come to view race and class segregation as a stabilizer of property values and therefore, made them a conscious goal of these policies. Thus, it should not be surprising that the FHA played a major role in the institutionalization of suburban segregation (Gelfand 1975, Jackson 1985, Massey and Denton 1993).

However, the next piece of housing legislation, enacted in 1937 as the Wagner-Steagall Housing Act, was a conscious turn *away* from these forces. The Wagner Act sought to, "provide financial assistance to the States and political subdivisions thereof for the elimination of unsafe and insanitary housing conditions, for the eradication of slums, for the provision of decent, safe, and sanitary dwellings for families of low income, and for the reduction of unemployment and the stimulation of business activity" (Wagner-Steagall Act 1937). To achieve these goals, the act established the United States Housing Authority (USHA) to, "make grants and loans to local public housing authorities, to enable them to build, own, and operate housing projects for families of low income," and importantly, to clear slums (Robbins 1937, p4). As such, the Wagner Act served as the first Congressional effort to assist in what is now commonly referred to as "urban renewal" – local efforts to address the ravages of time, revitalizing the "urban built environment" (Avila and Rose 2009, p339).

Whereas the establishment of the FHA and passage of the 1934 Housing Act were aimed at assisting those who *could* afford housing in the private market, the Wagner-Stegall Act sought to, "provide decent, safe and sanitary housing for that large group of our population who [could not] afford to pay enough to cause private capital to supply their housing needs" (Brabner-Smith 1937, p681). In addition to focusing on low-income residents, the Wagner Act also understood that, "any realistic approach to clearing slums and rehousing low income families would necessarily include a large number of Negroes as tenants" (Weaver 1940, p150). Thus, the USHA included an Office of Race Relations directed by an African American, Harvard-trained economist, Dr. Robert C. Weaver (Meyer 2000).[82] Weaver's office was charged with reviewing applications for federal funds to ensure that, "sound racial policy may be reflected in all projects" (Weaver 1940, p155). In a 1968 interview, Weaver recalled:

> The Public Housing Program was perhaps one of the outstanding examples of equity of treatment as between white and black Americans….In public housing we not only got approximately a third, as I recall, at one time of the units available to nonwhites--most of them were Negroes--we also got Negro managers, which was unheard of in places like Atlanta and Memphis and Jacksonville and in Miami. We were able in the North to get projects which were open to both Negroes and whites. This required some doing as early as 1937 to '38. These were the exceptions rather than the rules but they did occur. (Weaver Oral History 1968, p9)[83]

Reviewing Dr. Weaver's tenure, *The Crisis* (the official publication of the NAACP) reported, "As a result of his efforts and the support of USHA officials, a more fair and equitable racial policy now exists in USHA than in any other branch of the Federal Government. On the basis of need, Negroes are enjoying equitable benefits from public housing…" (October 1940, p319).

[82] Dr. Weaver was the first African American to earn an Economics PhD at Harvard. He went on to serve as the first black cabinet member as the Secretary of Housing and Urban Development.
[83] Available at http://transition.lbjlibrary.org/files/original/6404ca478ed6c3848eedaaf380acdb45.pdf

However, despite the fact that, "The United States Housing Authority…tried to set…desirable precedents in the field of practical racial relations" (Weaver 1940, p155), the seeds of segregation were embedded in the design of urban renewal; planted by the coalition that brought it to fruition.

The first of these seeds was local control. J. W. Brabner-Smith, Counsel for the Federal Housing Administration explained in 1937 that the, "problem is essentially local and should be decentralized as far as possible" (p.681). Allowing local governments to decide which land would be cleared and where new housing would be built virtually guaranteed the continuation and exacerbation of race and class segregation because white homeowners and land-oriented businesses controlled city governments and opposed residential integration along either race or class lines. Further, these interests quickly moved to ensure control of the new housing and renewal authorities created to direct and manage the process (Hirsch 1983, Sugrue 1996, Gotham 2001). Sugrue (1996) explains, "local governments had the final say over the expenditure of federal funds, the location of projects, and the type constructed" (p60).

In Chapter 3, I provided evidence that city governments underprovided city services and practiced expulsive zoning – the placement of negative uses (like garbage incinerators) in poor and minority neighborhoods. The land values in these areas were low; the environment was degraded. As a result, they were considered blighted. In the early 1930s, local realtors and bankers assisted the federal Home Owners' Loan Corporation (HOLC) in mapping property values of every block of every city in the nation (Gotham 2000). The HOLC's low appraisal of neighborhoods of color and large numbers of renters is well known (Jackson 1985, Weaver 1948). These areas too, were considered slums. In San Antonio, 82,000 Mexican Americans populated a 4-square mile neighborhood west of downtown. Many of the homes were wooden

shacks or converted horse stalls. Tellingly, the neighborhood lacked paved and lit streets, parks, and sufficient sewer capacity (obviously the doing of the local government). Annual flooding created a breeding ground for mosquitos (Fairbanks 2000). Neighborhoods like this *barrio* – predominately populated with people of color and renters – particularly those close to downtowns or homogenous white neighborhoods, were the first to be cleared (Hirsch 1983, Sugrue 1996).

At the same time, in order to preserve property values and access to FHA loans (which required racial homogeneity), white homeowners vigorously blocked the building of low-income and multi-unit housing in their neighborhoods (Weaver 1948, Sugrue 1996, Hirsch 1983). Weaver (1948) reports that even whites living miles away from proposed projects objected to their development on the grounds that their property values would be threatened. Nearly all new housing was provided on a segregated basis – that is, whites and nonwhites were not to live in the same projects (Weaver 1946). In order to provide enough units for racial minorities, and given the few sites that were available for building, many of the public housing projects were constructed as high-rise buildings – which, even at the time, were understood to be less desirable for the successful integration of people in need (Weaver 1946). Thus, as neighborhoods with large populations of renters and people of color were razed, these residents were displaced into even more densely segregated communities. In both the decisions regarding clearance and the decisions regarding the building of replacement housing, local control generated increased segregation.

The second important feature linking urban renewal to segregation was underfunding. Basil Stockbridge, Executive Assistant to the United States Building and Loan League, complained that, “it can readily be seen that the Authority’s activities will hardly scratch the

surface of the real needs of the country in eliminating urban slums and blighted areas" (Stockbridge 1938, p329). The Act required that the development of any new housing be accompanied by the razing of unsafe or insanitary dwellings, "substantially equal in number to the newly constructed dwellings provided by the project" (Wagner-Steagall Act, 1937, p5). But the new housing did not need to be located where the old housing had stood. Additionally, it was possible to raze more housing than was actually built. The lack of adequate funds meant first, that many slums remained, and second, that the number of new, affordable units was generally lower than the number cleared. Because of this, overcrowding in existing poor and minority neighborhoods worsened.

Furthermore, the receipt of federal funds required the local community to contribute funds for construction, typically in the form of land donation and property tax exemption, as well as funds for ongoing operation of the project (Levine 1941). Many cities eagerly accepted the federal dollars, but budgeted vastly insufficient amounts for the maintenance of public housing. So, even though by the 1950s most housing authorities stopped the explicit segregation of public housing tenants, and in some cases promoted peaceful race relations (Weaver 1946, 1956, Collins 2004), the degradation of the units meant that they had already become housing of last resort. Those who could avoid public housing did and preexisting segregation meant that it was whites who could most easily find housing in the private market.

As is true of all large government endeavors, the coalition in support of the Wagner Act and its later revisions was a collection of diverse, conflictual interests. These interests can be roughly categorized as those who emphasized slum clearance versus those who sought "public low-rent" housing (Ickes 1935, p109).[84] The former included business interests who held

[84] Although of course, there was diversity within these broad groups, see Marcuse 1995.

property in and/or relied on a healthy economic market in the downtown of cities, real estate elites, urban planners, homeowners, and local politicians hoping to increase the tax base (Zipp 2012, Ringelstein 2015, Avila and Rose 2009, Gotham 2001, Sugrue 1996). As one journalist representing this set of interests explained, "the housing problem is not merely one of replacing insanitary or unhealthful dwellings for large numbers of our people. More importantly, it involves the whole problem of progressive neighborhood decay, which for years has been eating like a cancer at the heart of every great city in America. The victims of this cancer are not only slum dwellers. In greater number these victims are taxpaying, home-owning families in neighborhoods from humble to well-to-do in all parts of the country" (Lewis 1937, p189).

On the other side were those concerned about the extreme housing shortages among lower-income residents, severe overcrowding plaguing minority neighborhoods, and the influence of slums on lax moral standards and community disorder (Dean 1949, Zipp 2012, Meyer 2000, Hirsch 1983). This group included many low-income and working class residents, people of color, organizations like the NAACP, institutions like the Chicago Defender, unions, and social workers (Meyer 2000, Gotham 2001, Compass 1936).

From the outset, slum clearance supporters, like the National Association of Real Estate Boards, were opposed to direct government provision of housing (Gotham 2001). However, much of the land that local elites viewed as blighted and sought to redevelop was residential, and the areas were often physically quite large. Razing the houses and assembling parcels required eminent domain, which required a clear public purpose. Public housing offered this justification, but only when *local* authorities engaged in the taking – thus necessitating local control.[85] Public

[85] In *United States v. Certain Lands in the City of Louisville* (1935) the 6th Circuit Court ruled that the condemnation of land for slum clearance by the *federal* government was unconstitutional because it did not constitute a use necessary to carry out the powers delegated to Congress. The Housing Act of 1937 thus moved to decentralize

housing advocates worried that local control over site selection and construction would exacerbate segregation (Meyer 2000), but without support from the slum clearance interests, public housing would have collapsed nearly as soon as it started for lack of funding (Marcuse 1995).

When the Wagner-Stegall Housing Act was revised and expanded in 1949 and 1954, power shifted toward the interests favoring slum clearance and segregation. Because the crisis of the Great Depression had abated, slum clearance was much more popular with voters and elites than was public housing (Fairbanks 2000, Zipp 2012).[86] As Gotham (2001) explains, these revisions, "represented the culmination of real estate industry lobbying efforts to curtail the production of public housing, create local redevelopment authorities with broad powers of eminent domain, and provide generous public subsidies for private redevelopment" (p297). By the time the last funds were allocated to local governments in 1974, the program had operated for more than 25 years as a mechanism to maintain and deepen segregation; it was termed the, "successor-weapon to the restrictive covenant and the racial zoning ordinance" (Abrams 1950). According to Collins and Shester (2013), urban renewal cumulatively resulted in the clearance of 400,000 housing units and 57,000 total acres; 300,000 families were displaced, about 54% of whom were nonwhite.[87] But, as we saw with racial zoning in Chapter 2, there was great variation in the local pursuit of urban renewal funds, and thus its effect on segregation.

To provide evidence of the relationship between urban renewal and segregation, I rely on a dataset gathered by Collins and Shester (2013). In their article, Collins and Shester (2013)

housing administration – requiring local housing authorities to be established to receive loans and grants from the federal government and engage in slum clearance and public housing construction (Freedenberg 1941).

[86] The Housing Acts were not the only mechanism cities used to engage in urban renewal, but patterns were similar with regard to other programs. For instance, Barrett and Rose (1999) provide evidence that local business, politicians, and real estate interests utilized highway construction to produce similar outcomes.

[87] Collins and Shester (2013) provide significant evidence that these measures accurately capture urban renewal activity undertaken by cities.

show that slum clearance and urban development programs had quantifiable *positive* benefits on city-level measures of income, property values, employment, and poverty rates. I seek to determine whether or not the program also increased race and class segregation. Collins and Shester's data represent all funds approved and disbursed under Title 1 of the 1949 Housing Act between 1950 and 1974. The data were gathered from the Department of Housing and Urban Development's Urban Renewal Directory. Cities applied for federal grants for particular urban renewal projects, and the directory listed the value of total approved and disbursed grants as of the date of publication. I add to these data each city's level of white/nonwhite and renter/owner segregation in 1980, measured using the *H* Index described in Chapter 1:

$$H = \sum_{n=1}^{N} \frac{P_n}{P_c}\left(\frac{E_c - E_n}{E_c}\right)$$

Where *P* represents total population of neighborhood *n* or city *c* and E is the entropy (diversity) of *n* or *c*. *H* varies between 0, where all neighborhoods have the same composition as the entire city (no segregation), and 1 where all neighborhoods contain only one group (high segregation).

First, I regress *Total Approved Urban Renewal Funds* (in hundreds of millions of dollars) as of 1974, on the *H* Index of *Segregation in 1950*. We should expect that cities with a strong preexisting propensity for segregation should have been the most eager applicants for federal funds. I add a series of city characteristics also measured in 1950 to account for the many demographic and environmental conditions that might have both led cities to seek urban renewal funding and be correlated with segregation. These controls include the proportion of housing units that were *Owner* occupied, *Median Home Value*, the share of housing units that were *Dilapidated*, the share that were *Built Prior to 1920*, and the share that lacked *Indoor Plumbing*. I include *Total Population*, the share of the population that was *Nonwhite*, median *Educational Attainment* of the population over age 24, the log of *Median Family Income*, the *Employment*

Rate, the share employed in *Manufacturing*, and the percentage of families with *Income Below $2,000* in 1949. These variables were all provided by Collins and Shester (2013). I add fixed effects for region, and report robust standard errors clustered by state. Collins and Shester provide data for all cities with more than 25,000 residents in 1950 and 1980 (482 in total), but I only have segregation measures for 172 observations. Tables 4.1 presents the results (summary statistics are in appendix Table A4.1).

Table 4.1: Relationship between Preexisting Racial Segregation and Approved Urban Renewal Funds

	Model 1			Model 2		
	β	Std. Err.	P>|t|	β	Std. Err.	P>|t|

Table 4.1 reveals that the application for urban renewal funds is strongly correlated with preexisting segregation. Those places that had a propensity for segregation were the most likely to apply for federal funding – even accounting for all of the physical factors that would have generated such applications. Topeka, Kansas, with a segregation index of 0.26 in 1950, applied for about $17.5 million in urban renewal funds over the course of the program. Kansas City, Kansas, where the segregation index was 0.54, applied for nearly $53 million. Atlanta, Georgia, with a segregation index of 0.67, applied for more than $100 million. In Richamond, VA, where

the segregation index was 0.51, city leaders only asked for $37 million. Salt Lake City, Utah with a segregation index of 0.18 applied for less than $5 million compared to Denver, Colorado's application of $83 million with a segregation index of 0.49.

Next, I analyze the effect of urban renewal funding on future levels of *Segregation* (*H* Index measured in 1980), conditional on preexisting segregation (*H* Index measured in 1950). The independent variable in these analyses is *Total Disbursed Urban Renewal Funding* (in hundreds of millions of dollars) as of 1974. I do not have data on renter segregation in 1950, so these analyses use the 1950 level of racial segregation as the control. Again, I present the models with and without demographic and environmental controls measured in 1950. Table 4.2 shows the results for racial segregation and 4.3 shows renter segregation.

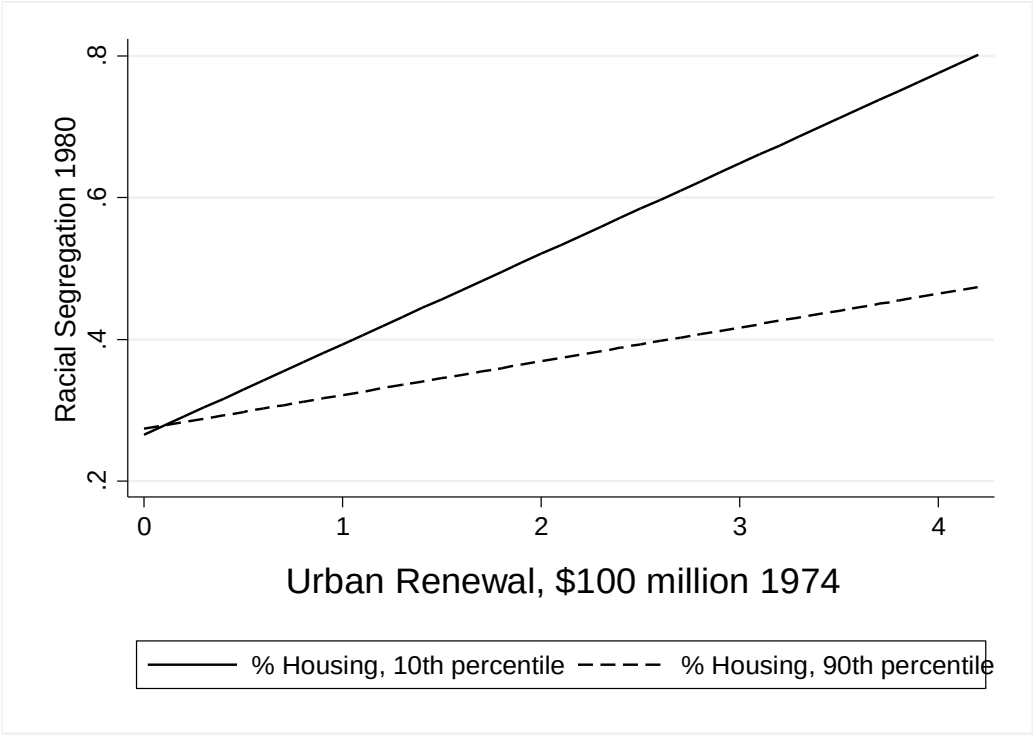
Tables 4.2 and 4.3 reveal that the vigorousness with which a city pursued urban renewal affected the level of segregation after the completion of the program (conditional on starting levels of segregation). The results are much more powerful for racial segregation than for renter segregation. Every additional $100 million in urban renewal funds is associated with a 7% increase in racial segregation, compared to a 2% increase in renter segregation.[88] As was the case for the effects of zoning shown in Chapter 2, local policy implementation is more tightly linked to racial housing patterns than class housing patterns.

This historical evidence indicates that cities varied not only with respect to their participation in the urban renewal program, but also in their investment in the ongoing maintenance of public housing. To investigate this possibility, I add to the data a measure of the

[88] Collins and Shester (2013) use an instrumental variable approach in their analysis. They estimate urban renewal funds with the number of years the city had access to the program as a result of state enabling legislation. Even more powerful results are evident when I replicate their strategy.

share of total expenditures each city spent on *Housing and Community Development Operations*[89] in 1972. I interact this variable with the measure of *Total Urban Renewal Funding* in Model 2 from Table 4.2 above.[90] I also add a control for the number of *Public Housing Units Per Capita* built under the Housing Act (from Collins and Shester) to account for differences in the need for maintenance spending.[91] Figure 4.1 reveals how urban renewal funding operated differently when cities invested in ongoing maintenance and when they did not.

Figure 4.1: Urban Renewal Interacted with Housing Operations



[89] This variable was constructed using the finance data described in Chapter 1. It is calculated as the total dollar amount spent on housing and community development minus housing and community development capital outlays, divided by total expenditure.

[90] Adding the interaction to Model 2, Table 4.3 (analyzing renter segregation) produces a similar effect that is smaller in size than the effect on racial segregation.

[91] Interestingly, the coefficient on this variable is negative – meaning that cities that had more public housing overall were less segregated. However, interacting the number of public housing units with urban renewal funding results in a positive coefficient. This indicates that slum clearance and public housing were both factors in the increase in segregation that urban renewal produced.

In cities that accepted urban renewal funds, but budgeted nothing for operations in 1972, urban renewal had a steep positive effect on racial segregation. In places that provided municipal funds for the maintenance of renewal sites, increasingly vigorous renewal expenditures had a much smaller effect on segregation. Of course, this analysis does not offer causal leverage. It is entirely plausible that the cities that were inclined to invest in maintenance had a social/political culture that led to a smaller increase in residential segregation for other reasons. Whatever the underlying cause was – cities that accepted federal funds without ongoing budget provision for housing operations segregated the most rapidly. This variation aside, generally speaking, where slums were cleared and public housing was built, segregation increased.

Yet, even while urban renewal was largely carried out to the benefit of white homeowners and land-oriented businesses, their control over public policy was not absolute; the rising Civil Rights movement threatened it significantly. As of 1960, not a single large city in the United States had elected a black mayor. By 2010, more than a third had (Vogl 2014). Changes to voter eligibility brought by the 24th amendment and the 1965 Voting Rights Act increased turnout of racial minorities and the poor during this period as well (Filer, Kenny, and Morton 1991).

I use data collected by Vogl (2014) to investigate the relationship between levels of segregation and interracial electoral competition. Vogl (2014) analyzes mayoral election returns between 1965 and 2010 for all cities that had 1960 populations that were at least 50,000 and 4% black (194 cities). His data record the race of the top two candidates (either black or not black) and their vote totals. I add segregation measures to Vogl's data resulting in complete data for

122 cities.[92] During the 1960s, only 13 black candidates sought the mayor's seat in Vogl's dataset; this number rose to 57 in the 1970s, and 84 in the 1980s. Interracial electoral competition was much more likely in more segregated cities. To show this, I regress a dummy variable coded 1 if the election was *Interracial* (e.g. featured a black candidate running against a non-black candidate) on the city's *H* Index of *Segregation* for the election year (interpolated between Censuses). I add the share of the city's residents that were *White* and the share *Renting* their homes, as well as the natural log of total *Population*, and a trend variable for the *Year* as controls. I use a random-effects logit model with errors clustered by city. I restrict the analysis to elections that occurred between 1965 and 1990 in order to focus on the post-war period. The regression includes 731 elections from 117 cities. Figure 4.2 shows the marginal effect of segregation on the probability of witnessing an interracial election, holding all other variables at their mean values.

[92] I am missing pre-1970 segregation measures for 20 cities in Vogl's dataset. I use 1970 segregation for the 36 elections between 1965 and 1970 for these places. Results are robust to the exclusion of these observations.

Figure 4.2: Segregated Cities Saw More Interracial Elections in the Post-War Period

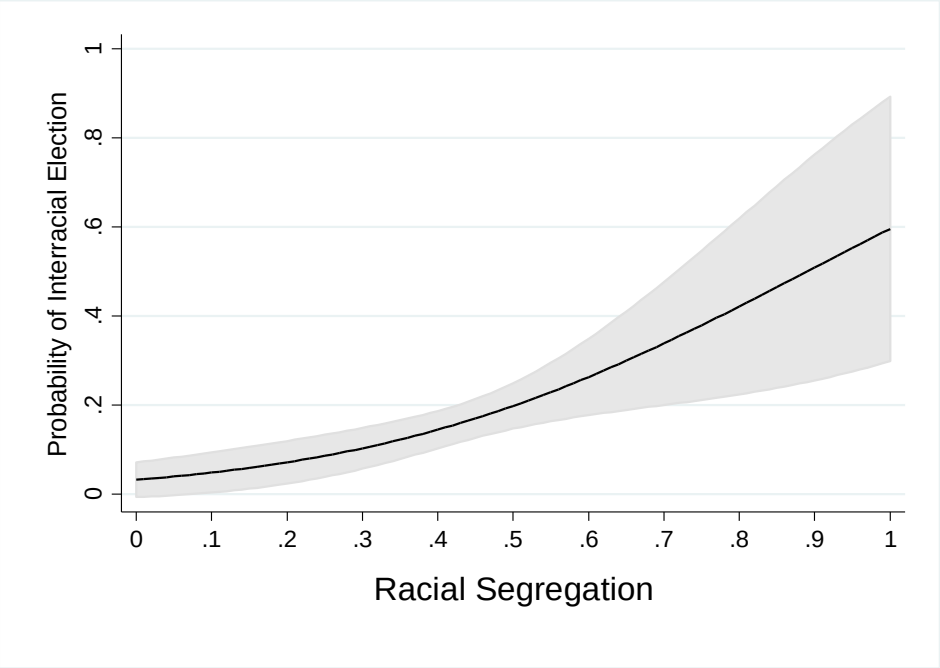


Figure 4.2 makes clear that racially segregated cities were much more likely to experience interracial elections – even controlling for the share of the population that was nonwhite. As will be shown in Chapters 6 and 7, segregated cities are also more likely to have racially divisive politics. Although the dividing lines were in place long before the 1960s, they became much more visible in electoral politics during the postwar period. Elections featuring black candidates (and white contenders) were contentious – driving up turnout among both blacks and whites, and decreasing margins of victory (Vogl 2014, Lublin and Tate 1995, Washington 2006). However, the vast majority of elections were still won by whites. Blacks only won 13% of the 731 contests reflected in Figure 4.2; moreover, these wins were concentrated in places with majority black populations. Although whites maintained power in

most cities throughout the 1960s and 70s, their hold was tenuous. This weakness became increasingly clear through the successes of the open housing movement.

In 1942, only 36% of whites said that they would not be bothered if a black person with their same income and education moved into their block (Schuman and Bobo 1988); the majority of whites, "expect[ed] a vigilant government to protect their segregated neighborhoods" (Sugrue 1996, p63). These beliefs were intimately intertwined with opposition to public housing, which was viewed as "Socialist housing" (Los Angeles Times, March 23, 1952 p E1); specifically, public housing was viewed as, "a taxpayer-subsidized handout for the feckless" (Sugrue 1996, p63). Although a majority of the poor in central cities were white, racial minorities were disproportionately poor and poorly housed.[93] Many whites opposed public housing because they feared, "a change in the racial character of the neighborhood" (New York Times, April 13, 1952, p28). Efforts to locate low-income housing in home-owner neighborhoods and/or integrate white areas was viewed as a government assault on owners', "right to protect one's own property" (Thomas, William P., Letter to the Editor, Washington Post, February 27, 1949).

In order to prevent integration in housing, white homeowners organized neighborhood associations, encouraged vigilant city inspectors to fine overcrowded minority homes, sent hundreds of letters to city governments, turned out in droves at public hearings, and engaged in violent assaults on black residents (Sugrue 1996, Hirsch 1983). But defending white, home-owner neighborhoods was a zero-sum game. For every area that successfully halted integration or low-income housing, another had to absorb (or block) it. This led to a lack of unity among segregationist forces. At the same time, support for scientific racial categorization plummeted

[93] About 62% of persons below the poverty line in central cities were white in 1959. Approximately 14% of whites were poor compared to 41% of blacks (https://www2.census.gov/prod2/popscan/p60-068a.pdf, p7).

(Hayward 2013), and outright, public expressions of racism were, "placed on the defensive" (Hirsch 1983, p175, Schuman et al. 1985).

Advocates of open housing began to win concessions from the government. By 1945, in more than 200 cities, municipal authorities dedicated to maintaining peaceful race relations, established interracial commissions, committees, or agencies that advocated for civil rights reform (Hirsch 1983, p42). These often appeared in the wake of violent riots (Meyer 2000). The racial restrictive covenant, long used by real estate developers and homeowners' organizations to keep minorities out of white neighborhoods, became unenforceable with a Supreme Court decision in 1948 (Abrams 1955). Even before this decision, some municipal judges were refusing to enforce covenants (Hirsch 1983).

Because the government owned and operated public housing, it was an obvious target for constitutional claims of unequal treatment. As early as 1944, New York City enacted an ordinance prohibiting tax-exempt status for housing projects that denied access to tenants on the basis of race. The ordinance had been spearheaded by the city's interracial relations commission. In other places, civil rights organizations pressured municipal housing authorities to integrate public housing; the NAACP brought this matter before the court (Meyer 2000, Sugrue 1996). In 1953, the California Court of Appeals ruled in *Banks* v. *Housing Authority of San Francisco* that San Francisco's Housing Authority must assign residents to public housing without regard to race or color. When the Supreme Court declined to hear the appeal (thereby allowing California's ruling to stand), the case became precedent-setting. By 1954, 21 cities had passed some form of anti-discrimination law (Meyer 2000) and in 1962, President Kennedy signed an executive order,

> directing Federal departments and agencies to take every proper and legal action to prevent discrimination in the sale or lease of housing facilities owned or operated by the

> Federal Government; housing constructed or sold as a result of loans or grants to be made by the Federal Government; and housing to be available through the development or redevelopment of property under Federal slum clearance or urban renewal programs (Papers of Burke Marshall, Assistant Attorney General for Civil Rights).

Not only did cities and states pass anti-discrimination laws covering public housing, some also enacted open housing legislation that sought to prevent discrimination in the private housing market. The leader of the movement was again New York City, passing an ordinance prohibiting, "race, creed or national origin" discrimination in rental housing in 1957 (Bennett 1957b, p9). The ordinance was, "bitterly fought by property owners and real estate representatives" (Bennett 1957a, p7) and explicitly exempted room rentals in single-family homes or duplexes unless they were located in large housing developments (Bennett 1957b). Still, the passage of open housing laws represented clear policy change, largely emerging from the bottom-up. By 1968, 22 states had enacted fair housing laws that covered nearly all sales and rentals (Collins 2006). Such laws were passed in response to vocal, mobilized advocates in black and liberal white communities (Collins 2006). The 1968 Federal Fair Housing Act extended this coverage nationwide.

Despite such policy progress, even as of 1973, the General Social Survey found 64% of white respondents believed that a homeowner should be able to, "decide for himself whom to sell his house to, even if he prefers not to sell to Negroes" (GSS 1973), and a homeowners' rights movement arose in response to the open housing laws. In Detroit, a collection of neighborhood organizations gathered more than 44,000 signatures in support of a homeowners' right initiative (Chicago Tribune, July 13, 1963). The ordinance passed but was declared unconstitutional by the Wayne County Circuit Court in a suit brought by the NAACP (Chicago Defender, December 23, 1964, Sugrue 1996).

In California, after the state legislature passed a fair housing law known as the Rumford Act in 1963, a statewide campaign for its repeal was led by the California Real Estate Association and the California Apartment Owners Association who combined to form the Committee for Home Protection (Self 2003, Duscha 1964, Turner 1964). Proposition 14, confusingly referred to as "The California Fair Housing Initiative," prohibited the state from, "denying, limiting, or abridging the right of any person to decline to sell, lease, or rent residential real property to any person as he chooses."[94] In an analysis of the campaign for Proposition 14, Self (2003) and Brilliant (2010) show that supporters rarely invoked race in their arguments, focusing instead on freedom and property rights. Reporting on the initiative battle, the Washington Post quoted a pamphlet issued by the Committee for Home Protection that stated, "Those who stand for the preservation of individual property rights today are in direct line of descent from the patriots who endured the hardships of the long winter at Valley Forge with George Washington" (Duscha 1964, pA2). Prominent Democrats including Governor Edmund Brown opposed the initiative, and a number of "right-wing Republicans" including Ronald Reagan and Barry Goldwater were "extremely active" in support of the initiative (Duscha 1964, pA2). In the end, the initiative passed with more than 65 percent of the vote, even as Johnson won the presidential race decisively (Greenberg 1964, p1).

Scholars have identified varying patterns of opposition to open housing in different places. For instance, Sugrue (1996) shows that in Detroit, the staunchest integration resisters were working-class white ethnics who owned modest, single-family homes (see pp236-237). In Oakland, Self (2003) finds that it was *not* solely, "an anti-liberal white working class engaged in direct struggle with African American," but rather middle and upper-class whites who,

[94] SALES AND RENTALS OF RESIDENTIAL REAL PROPERTY California Proposition 14 (1964). http://repository.uchastings.edu/ca_ballot_props/672

"understood property rights as sacrosanct expressions of their personal freedom" (p168). Collins (2004) shows that states with higher union membership rates were more likely to pass fair housing legislation and Self (2003) provides evidence that the UAW campaigned against Proposition 14, although Brilliant (2010) argues that rank and file union members were staunchly opposed.

To better understand the individual correlates of opposition to open housing, I gathered data from the 1964 Field Poll in California.[95] Carried out in seven waves between January and October, the poll asked respondents about their support for the Rumford Act and Proposition 14. I recoded these questions to into a variable coded 1 if the respondent *Opposed Open Housing*.[96] I use logistic regression to regress this variable on several demographics including whether or not the respondent *Owns* (vs. rents) her home, her *Race* (coded 1 for white and 0 for nonwhite or other), her *Age*, her level of *Education*, whether or not the respondent or her spouse belongs to a *Union*, and her *Economic Level* (with higher values representing lower classes).[97] In addition, I include a measure indicating whether or not the respondent planned to vote for the *Democratic*

[95] Ideally, I would have analyzed the relationship between community segregation and public opinion on open housing. Unfortunately, the Field Poll recorded no geographic identifiers other than the very broad categories of Northern and Southern California.

[96] For waves 2, 3, and 5, I used the question about the Rumford Act. In waves 1 and 7, no Rumford Act question was asked, so I used a question about Proposition 14 instead. Waves 4 and 6 did not include open housing questions. The text of the questions are as follows: (Rumford Act) Well, as you know the Rumford Act is a Law which makes it illegal for apartment house owners, owners of publicly assisted housing, and real estate brokers to discriminate against anyone because of race, color, religion, national origin or ancestry in the renting or selling of housing accommodations. From what you know of it, do you approve or disapprove of the Rumford Act?" (Proposition 14) "If you were voting today, would you approve or disapprove of this addition to the state constitution? (the amendment reads as follows – prohibits state, subdivision, or agency thereof from denying, limiting, or abridging right of any person to decline to sell, lease, or rent residential real property to any person as he chooses. Prohibition not applicable to property owned by state or its subdivisions, property acquired by eminent domain, or transient lodging accommodations by hotels, motels, and similar public places." Where possible, I use the question about the Rumford Act instead of Proposition 14, because the waves included very different wording of the Proposition question (adding more and less detail about the content).

[97] The coding of this variable is obscure. The codebook suggests that 10 categories were used and lists the following labels "upper," "upper middle," "upper middle," "middle," "middle," "middle," "lower middle," "lower middle," "lower," and "lower." One can only assume that the coders were instructed in some way to make distinctions across categories.

Presidential ticket (Johnson/Humphrey). I cluster the standard errors by poll wave. The results, presented in Table 4.4 paint a clear picture confirming and undermining various aspects of the historical accounts. Summary statistics are presented in Table A4.2.

Note: Logistic regression with errors clustered by poll wave.

White homeowners were clearly in opposition to open housing, as were less educated respondents, Republicans, and union members. After controlling for these characteristics, economic status and age played no role in the determination of political opinions on open housing. Since the earliest years of the century, the most consistent opponents of integration have been white homeowners who came to view the protection of their neighborhoods as a right to be protected by government. These residents understood the "very essence" of Proposition 14 to be the avoidance of, "state involvement in private decisions in the sale of rental of privately owned residential property" (Blake 1964, pK1).

In 1966, the California Supreme Court declared Proposition 14 in violation of the Constitution, and the Rumford Act was allowed to stand. However, the lack of support for open housing among whites and owners would prove to be a formidable barrier for integrationists. Collins (2004) reveals that fair housing policy had little effect on black housing market outcomes

and did nothing to affect levels of segregation. The changes local communities experienced during post-war period would have other long lasting effects. When California voters overwhelmingly supported Proposition 14, they also overwhelmingly supported Johnson (over Goldwater) for president. Many contemporaries and scholars would explain this apparent inconsistency as Mark Brilliant (2010) does:

> Californians who voted *for* Prop 14 but *against* Goldwater were not so much signaling a wholesale rejection of civil rights…They were, however, hoisting a 'no trespassing' sign. They drew a line that cordoned off a more public sphere where the state could and should protect against discrimination from a more private sphere where no such state laws could tread (p206).

As Kruse (2005) so forcefully demonstrates, and I quantify in Chapter 7, this turn toward understanding neighborhood protection as a right (rather than a racist act), did not, in fact, represent an expression of newly discovered profound principles. It was, rather, a means to a segregationist end, and would serve as the rhetorical foundation for a rising conservative movement. More immediately, the rise of black candidacies, the advancements of the Black Power and Civil Rights movements, and the changes to public policy encompassed in the Voting Rights and Fair Housing Acts all threatened white control over central cities. At the same time, numerous federal and local policies made suburban living an attractive option – one that would offer white homeowners more complete control over the political arena. The next chapters offer evidence of these patterns.

Chapter 5: The Rise of Suburban Segregation, 1970-2011

In 2012, the Manhattan Institute issued a report entitled "The End of the Segregated Century," declaring that, "all-white neighborhoods are effectively extinct," (Glaeser and Vigdor 2012). Though not all demographers shared the optimism of Glaeser and Vigdor, many trumpeted the decline of neighborhood segregation in America following the release of the 2010 Census (Frey 2014). While segregation *between neighborhoods* has declined, another type of segregation has remained remarkably stable, even rising in the post-war period. Segregation *between cities* is persistent along both race and economic lines (Fischer et al 2004, Massey and Hajnal 1995). This means that while integration within cities has increased, cities as a whole have become less racially and economically diverse over time. As a result, a greater share of total segregation in metropolitan areas is now accounted for across cities rather than within them (see Chapter 1). This is what is commonly understood as the process of suburbanization.

While we have substantial evidence on the role federal policies have played in generating suburbanization (Jackson 1985, Massey and Denton 1993, Hayward 2013), our understanding of the ways in which local politics affects suburbanization has been limited. In previous chapters, I argued that segregation was pursued by local governments in order to enhance property values and make it possible to target local public goods towards white homeowners and land-oriented businesses. Such strategies, combined with political control of city councils and mayors' offices, ensured that local governments operated to protect the homogeneity of white homeowner neighborhoods and provide them with disproportionate benefits. In the post-war period, this control was threatened by increasing minority electoral participation and policy achievements. Here, I demonstrate that these changes contributed to suburbanization.

The analyses in this chapter rely on a measure of segregation that incorporates patterns of sorting both within cities and between cities and suburbs. This strategy offers an advancement over previous scholarship because it allows for a consideration of residential sorting at multiple geographic levels at the same time. Most scholars focus either on metropolitan level segregation (e.g. Dreier et al. 2004, Jackson 1985) or neighborhood segregation (e.g. Massey and Denton 1993) – but these types of sorting are intricately linked. By drawing on a nested measure of segregation for all metropolitan areas over a long time span (1980-2011), I am able to show that residents traded one type of homogeneity for another in response to political outcomes. I utilize time lags and metro area fixed effects to handle the problem of endogeneity, as race and class sorting can, in turn, generate different political outcomes (Massey and Hajnal 1995, Friesema 1969, Nelson 1992). In this chapter, I analyze the relationships between cities within metropolitan areas. I concentrate on the ways in which the politics of the central city (the city with the largest population in the metro area) affects demographic residential patterns in the suburbs. I find that when central cities elect minority mayors, when central city expenditures are higher and favor policing, a greater share of metropolitan area segregation is accounted for between cities rather than within them. I also show that in metropolitan areas where land use regulations are stricter in the suburbs than in central cities, more segregation is accounted for across cities. In short, when central city politics do not favor their interests, white and upper class residents are more likely to reside in different cities rather than in different neighborhoods and they lock in these sorting patterns through public policy. In the final section of the chapter, I show that communities with more whites and homeowners receive a disproportionate share of municipal spending.

Understanding the Link Between Segregation and Suburbanization

People choose where they live based, in part, on the types and quality of public goods and services provided in a community, as well as the taxes required to provide those goods and services (Tiebout 1956, Ely and Teske 2015, Banzhaf and Walsh 2008). However, not all residents are equally able to match these preferences with housing location. Low-income households have less choice than do high-income households because amenities (including schools, parks, and public safety) are capitalized into housing prices and rents. Racial and ethnic minority households have also been severely limited in their ability to live where they choose. In part, this is the due to the fact that minorities have lower average levels of income and wealth. But, as previous chapters have shown, it is also the result of concerted efforts by white homeowners to segregate them.

The long history of enforced racial segregation in America has been well documented. Between 1900 and 1940, neighborhood-level residential segregation expanded dramatically throughout the United States (Cutler, Glaeser, and Vigdor 1999). A variety of mechanisms ghettoized racial and ethnic minorities including violence and intimidation perpetrated by white residents, restrictive covenants written into housing deeds, and racial steering by real estate agents (McWilliams 1964, Sugrue 1996, Kruse 2005, Lassiter 2006). As previous chapters have shown, local, state, and federal policies also worked to establish and perpetuate segregation along race and class lines. Through actions like the passage of racial zoning ordinances (Chapter 2), the generation of neighborhood investment ratings through the Home Owners Loan Corporation (Hillier 2005), and official acquiescence to violent activity in protection of homes and neighborhoods (Hirsch 1983), governments pursued policies that limited the mobility of minority households (Ross 2008) between 1900 and 1940.

Around the time of the Second World War, patterns and strategies of segregation began to change. Segregation levels within cities leveled off, but ghettos grew much larger when minority populations increased in cities outside of the South (Cutler, Glaeser, and Vigdor 1999). Similar to previous decades, white homeowners utilized a variety of mechanisms to bar minorities and renters from moving to their communities. Organizing collectively through homeowners' associations, white homeowners controlled government decision making on matters such as the razing of slums, the rebuilding of downtowns, the placement of public housing, and zoning decisions that concentrated negative externalities in poor and minority neighborhoods.

However, as Chapter 4 revealed, starting slowly during the 1940s and then more rapidly during the 1950s and 1960s, white homeowners began to see their exclusive political control chipped away. The massive influx of wartime workers dramatically changed the racial and socioeconomic makeup of many large cities. In the 157 cities that had populations of at least 50,000 in 1940, the white population share declined about eight percentage points between 1940 and 1970 (from 90 to 82). By 2011, the white share of these cities decreased drastically to 52%. However, the share of renters *also* declined during this period, as homeownership rates expanded.[98] At the same time, black and Latino Americans' sustained battle for civil, economic, and political rights gained ground. As racial minorities began to contest and even win political representation, the open housing movement brought the possibility of neighborhood integration, and civil unrest coursed through many large cities. This period became fraught with uncertainty

[98] I only have time series data on homeownership rates for 60 cities. In these places, the share of homeowners rose from 35% in 1940 to 48% in 1970. Nationwide, the homeownership rate expanded from 43.6% to 63% during this period (Bureau of the Census, Historical Statistics of the United States, Colonial Times to 1970). http://www.census.gov/library/publications/1975/compendia/hist_stats_colonial-1970.html

and fear for many whites placed an increasingly high value on segregation as they joined the ranks of homeowners.

Cutler, Glaeser, and Vigdor (1999) provide evidence that since the 1990s, white homebuyers' willingness to pay a premium for homogenous neighborhoods is the central factor perpetuating segregation. Overt racism has decreased dramatically over the last several decades (Schuman et al., 1997), but whites continue to express a preference for same race neighbors (Charles 2003) and minority neighborhoods continue to be perceived as having poor-quality amenities (Bobo, Kluegel, and Smith 1997, Ellen 2000, Emerson, Chai, and Yancey 2001, Krysan 2002, Bayer, Ferreira, and McMillian 2007). Ellen (2000) shows that a growing black population leads whites to leave neighborhoods and/or be unwilling to enter them. Card, Mas, and Rothstein (2008) report a distribution of tipping points (the size of the minority population that affects white population flows) ranging from 5% to 20%. Once a neighborhood reaches the tipping point, it quickly becomes predominantly inhabited by racial and ethnic minorities. White preferences for homogeneity are undoubtedly enhanced by persistent discrimination in the real estate and mortgage industries which limit minority access to some neighborhoods (Pager and Shepherd 2008, Gaslter and Godfrey 2005, Bobo 2001, Farley et al. 1994, Bobo and Zubrinski 1996).

However, while white preferences for white neighbors help to make sense of the fact that whites live in different *neighborhoods* than nonwhites, they do not help to clarify why whites live in different *cities*. Why, even as neighborhoods have grown more integrated, have cities become less so? The answer is politics and political control. Boustan (2010) finds that residents are willing to pay a 7% premium on housing in order to live in a higher-income suburb, in part, to gain access to higher school quality and lower property tax rates. Baum-Snow and Lutz

(2011) and Lassiter (2006) provide evidence that court-ordered integration of city schools led some white parents to seek out homogenous, suburban school districts. Kruse (2005) shows that when Atlanta's whites lost segregation battles and political control, many chose suburban homes. I build on the findings of these scholars to show that suburban sorting along race and class lines is also linked to central city elections of minority mayors, larger city budgets and a greater share of spending on police.

The rapid increase in the population of the suburbs during the post-war period was mostly not the result of white flight. Rather, rising incomes, low-cost federally-backed mortgages, the lucrative federal mortgage deduction, new housing construction in suburban tracts, and an extensive highway system all worked to bring residents to the periphery (Gotham 2000, Nall forthcoming). Yet, in the early decades of the post-war period, suburban living was much more accessible to whites and homeowners than to people of color and renters (Kruse and Sugrue 2006, Jackson 1985). This pattern eventually changed, allowing many racial minorities and renters live in suburban communities today (Frasure-Yokely 2016). However, as Briffault (1990) explains, "the increased heterogeneity of suburbia as a whole is usually not matched by a greater diversification *within* particular suburbs. There are now more poor and working-class people, more minorities and more industrial and commercial sites in suburbia. But poorer, working-class or black suburbanites are likely to live in different jurisdictions separate from those inhabited by affluent or white suburbanites" (p353). These trends have converged to increase divisions along race and class lines across city lines (C.S. Fischer et al. 2004, M.J. Fischer 2008).

In previous decades, processes of consolidation and annexation made city boundaries malleable so that those moving away from the center of the city would have resided within city

limits (Teaford 1979). However, in the post-war period, state annexation laws changed and political boundaries ceased to keep pace with residential spread (Briffault 1990). As a result, the number of incorporated municipalities in metropolitan areas grew and suburbs gained population, economic activity, and political power (Danielson 1976, Miller 1981, Burns 1994).

As independent municipalities, suburbs have the power to regulate land use for all parcels within their borders. Local governments employ land use regulations to manage the character of their community. Consequently, regulatory environments vary significantly from place to place. Cities are capable of enacting minimum lot sizes so that all development must be located on a certain acreage of land, requiring developers to preserve open space in their development, determining the number of multi-family units that will be allowed within city limits, requiring developers to pay a share of infrastructure improvements associated with new development, offering short/long review periods for zoning changes and building permits, and involving few or many local actors in the approval and planning process. Gyourko et al. (2008) find that there is a strong, positive correlation between different regulations. Specifically, if a city regulates in one area, it is significantly more likely to regulate in other areas as well. Einstein et al (2017) provide evidence that the accumulation of regulations reduces the supply of multi-family housing by allowing residents opposed to development to delay the process and file lawsuits. Gyourko et al (2008) also find that community wealth is positively related to regulatory environments. Places with high median home values, more college-educated residents, and higher incomes are most likely to police land use.

Public Opinion on Local Spending

In order for political preferences to be related to population sorting, it must be the case that different groups have different orientations toward government spending and different

policy priorities. At the national level, the gap between white and nonwhite support for government programs like social services, education, and assistance to the poor, as well as beliefs about the optimal size of government is persistent, systematic, and substantively large (Kinder and Winter 2001, Winter 2006, Jackman 1994, Tate 1994, Kinder and Sanders 1996, Dawson 1994, Bowler and Segura 2011). A related, but distinct gap between high and low socioeconomic status individuals also exists (Gilens 2005, Bartels 2008). Whites and the affluent tend to favor limited government while people of color and those of lower socioeconomic status are more supportive of spending and intervention. In an overview of this large literature, Hutchings and Valentino (2004) explain that the black/white opinion gap typically ranges from 35-50 points on matters dealing with race (like affirmative action and government aid to minorities), and more than 20 points on policies that are not explicitly racial, like government spending on welfare, social services, and education (see also Winter 2006, Federico and Luks 2005, Sears, Hensler, and Speer 1979, Kinder and Sears 1981).

There is less research on these questions at the local level, but scholars have found large racial and socioeconomic status divides with regard to candidate choice (Hajnal and Trounstine 2013b, Hajnal 2009), satisfaction with city services (Hajnal and Trounstine 2013a, Van Ryzin et al. 2004, Durand 1976), and trust in government (Rahn and Rudolph 2005, Marschall and Shah 2007). Hajnal and Trounstine (2013b) find that the largest divide in support for mayoral candidates is black versus white residents, with the divide between Latinos and whites close behind. The divide between Asians and whites is smaller, but persistent, as is the divide between high and low socioeconomic status individuals. In an analysis of the determinants of service evaluations among local residents, Hajnal and Trounstine (2013a) find that race stands out as the most powerful predictor. Again, the largest divides are between black and white and Latino and

white respondents, but class divides are also significant. In sum, white and wealthy residents tend to have more conservative spending preferences and support different candidates than do minorities and the poor at both the local and national levels. When political patterns favor nonwhite and poor interests, white and upper-class residents are inclined to select different localities. In the next sections, I provide evidence of these political contributors to segregation.

Measuring Suburbanization, A New Approach

In order to show that political outcomes affect segregation across city lines, I use a segregation measure that can be decomposed into within-city and across-city components. This measure allows me to take advantage of different predictions depending on the level at which segregation occurs and to control for aggregate preferences for homogeneity. In some metropolitan areas, whites and homeowners tend to be segregated from nonwhites and renters in different neighborhoods (indicating segregation at a low level of geography). In others, race and class sorting is more prevalent across city lines (indicating segregation at a higher level of geography). If a city increases its budget, there is no reason to believe that this would induce residents to sort into different *neighborhoods* but, I argue, it could lead to sorting into a different *city*.

While households may choose residential locations that result in more homogenous neighborhoods for a variety of reasons, only cross-city segregation ought to be affected by the *total* bundle of public goods provided by the city and the election of city officials. Because different racial and economic groups have different preferences for local representatives and policies, when budgets or election outcomes are less favorable to white and homeowner preferences, these residents should be more likely to sort into residential locations outside of city

boundaries.[99] We most commonly think of segregation across city lines as a process of suburbanization, but sorting between suburbs is another version of the same pattern. The result should be an increase in the share of metropolitan segregation across cities as opposed to within them.

To determine whether or not city political patterns favoring nonwhite and renter interests affect metropolitan segregation, I constructed a dataset measuring segregation in primary metropolitan statistical areas from 1980-2011 GeoLytics' Neighborhood Change Database (NCDB) and the 2007-2011 American Community Survey. These data allowed me to create a panel dataset measuring segregation at the census-tract level for each metropolitan area. To measure segregation, I use the *H* Index described in Chapter 1. The *H* Index allows for decomposition of within-city and across-city components.[100] It measures the evenness of dispersal of groups across geographic units (in this case, Census tracts, cities, and metropolitan areas).

The groups I use to calculate the *H* Index here are white/nonwhite, renter/homeowner, and wealthy/non-wealthy. Since 1980, the Census has tabulated the number of residents in each Census tract that self-identify as racially white and ethnically not-Latino; these individuals are classified as whites in my analysis. All other racial/ethnic combinations are classified as

[99] There is no evidence that the inverse is true. When budgets favor white/wealthy preferences, poor and minority residents have not been found to move to communities that prioritize their demands and needs. For instance, Levine and Zimmerman (1999) investigate the potential for states' welfare programs to act as magnets for the poor. They find little support for this hypothesis. The process of gentrification – where affluent residents return to the central city – is another scenario that could lead to movement among poor residents. Here too, scholars have found no evidence that gentrification leads poor households to leave their housing units (Vigdor, Massey, Rivlin 2002). The most likely explanation, of course, is that it is whites and the wealthy who have had the greater ability to choose where they live. Beyond this, political outcomes are typically much more responsive to the preferences of whites and the wealthy (Hajnal 2009; Gilens 2014).

[100] The approach is similar to the one taken by C.S. Fischer et al. (2004) who analyze trends over time in the level at which segregation occurs. In contrast to C.S. Fischer et al. (2004), I seek to determine whether such patterns are related to city policy choices, not just time.

nonwhites. The Census gathers tenure information on all occupied housing units, noting whether they are rented or owned. The share of units rented versus owned comprises my measure of segregation. Finally, the Census reports income categorically, not continuously, so wealthy refers to the share of families in each census tract with incomes above particular thresholds for each census year. [101] These thresholds were determined by calculating the average family income for all Census tracts in the United States for each Census year. The wealthy threshold represents the income bin with its starting point closest to the 90th percentile of the distribution. The thresholds for each census year are: $35,000 for 1980, $75,000 for 1990, $100,000 for 2000, and $150,000 for 2011. All families with this amount of income or more are included as wealthy.[102]

As explained in Chapter 1, the *H* Index measures the degree to which the diversity of subunits differs from the diversity of the larger unit, expressed as a fraction of the larger unit's total diversity and weighted by the subunit's share of the total population. For each census year, I calculate an *H* Index for all cities within a metropolitan area, denoted H_{m_c} and all tracts within each city, denoted H_{c_t}.[103] These *H* Indices reveal how diverse each census tract is given the diversity of the city and how diverse each city is given the diversity of the metropolitan area.

$$H_{m_c} = \sum_{c=1}^{C} \frac{P_c}{P_m}\left(\frac{E_m - E_c}{E_m}\right)$$

[101] I use family as opposed to household income because the NCDB does not report household income at the tract level.

[102] Census tracts range from 0 to 100% wealthy, with a mean of 18%, a median of 13%, and a standard deviation of 16%.

[103] Census tracts are perfectly nested within states and counties. However, in some cases tracts cross city lines. In these cases, GeoLytics assigned the tract to the city containing the largest share of the tract population. In 2011, tracts are weighted by the share of population contained in each city. Observations are unique when defined by year, tract, city, county, and metropolitan area. Tracts located in unincorporated areas within a metropolitan area are combined as a single unincorporated unit. Tracts outside of metropolitan areas are not included in the analysis. I use Metropolitan Statistical Areas and where possible, Primary Metropolitan Statistical Areas as the highest level of aggregation (not Consolidated Metropolitan Statistical Areas which are much larger).

$$H_{c_t} = \sum_{t=1}^{T} \frac{P_t}{P_c}\left(\frac{E_c - E_t}{E_c}\right)$$

P represents total population of the geography *t*, *c*, or *m*.

These two indices can be combined produce a total *H* Index for the metropolitan area which is equal to the *H* Index calculated for the metropolitan area at the tract level, H_{m_t}.

$$H_{m_t} = \sum_{t=1}^{T} \frac{P_t}{P_m}\left(\frac{E_m - E_t}{E_m}\right) = H_{m_c} + \sum_{c=1}^{C} \left(\frac{P_c}{P_m}\right)\left(\frac{E_c}{E_m}\right) H_{c_t}$$

I analyze the percentage of total metropolitan area segregation that can be attributed to cross-city segregation as opposed to within-city segregation. I have one observation per metropolitan area in 1980, 1990, 2000, and 2011. The dependent variable in my analyses is the share of total segregation in a metropolitan area that is determined by segregation across cities versus within them:

$$share_across = \frac{H_{m_c}}{H_{m_t}}$$

My argument is that city politics affects segregation patterns. Because I only have one measure of segregation for each metropolitan area, I analyze the effect on segregation of city politics in the city with the largest population in the metropolitan area. For example, in the Detroit-Warren-Livonia metropolitan area, I estimate the relationship between Detroit's city expenditures and the share of metropolitan segregation that is attributed to whites living in different cities than nonwhites (which happens to rise from 51% to 88% between 1970 and 2011). Table 5.1 provides aggregate descriptive statistics for the central cities versus non-central cities in my analysis as of 2011.

Table 5.1: Central vs. Non-Central Cities, 2011

	Central Cities	Suburbs
% White	58%	73%
% Black	19%	9%
% Latino	16%	12%
% Asian	4%	4%
% in Poverty	21%	12%
% Renters	47%	32%
Median HH Income	$42,796	$61,670
% Wealthy	9%	13%
N	323	4,145

The table reveals that suburbs are whiter, wealthier, and filled with more homeowners than central cities.

In Chapter 4, I argued that in the postwar period, white homeowner neighborhoods felt threatened by increasing electoral contestation by minority candidates and the successes of the open housing movement. Public opinion surveys reveal that racial and income groups are divided over the proper size of government. Further, studies have shown that white opinion on government spending is powerfully shaped by attitudes toward the group perceived to be the beneficiaries of the spending (Nelson and Kinder 1996). During the 1960s and 1970s many central cities became associated with rising crime rates (Wilson 1987). Today, whites link crime and criminality with blackness (Peffley Shields, and Williams 1994; Gilliam and Iyengar 2000, Gilliam et al 1996). For wealthy, white, homeowners with the ability to choose suburban living, it is plausible that the election of minority mayors, increases in the municipal budget, and shares of the budget going toward policing in central cities all may have played a role in encouraging segregation across city lines.

To analyze these relationships, I regress the share of metropolitan area segregation determined across cities on independent variables capturing political and policy control in the

central city. The first is a variable noting whether or not the central city had a *Minority Mayor* (African American, Hispanic, or Asian) at any point in the decade prior to the year in which segregation is measured. These data are from a number of different sources, including Vogl (2014), Hopkins and McCabe (2012), and my own research using websites and newspaper accounts of elections. The variable is a dummy variable coded 1 if the central city had a minority mayor and coded 0 if the mayor was white in all years of the prior decade. Next I add two spending measures: inflation-adjusted *Direct General Expenditure Per Capita* and the proportion of the city budget spent on *Policing.*[104] These variables come from the Census of Governments State and Local Government Finance files from 1977 to 2012.[105] The data are collected in years that end with 2 and 7 and I used linear interpolation to generate estimates of city expenditures in 1980, 1990, 2000, and 2011 to match the Census population data. I add the natural log of the *Population* as a control because large cities have different spending patterns than small cities and size may affect segregation patterns by offering residents greater ability to sort themselves into like neighborhoods. Finally, I add a measure of the *Violent Crime Rate* in the central city to capture local conditions to which both policy and movers might have reacted.[106] These data represent 209 metropolitan areas and include a total of 618 observations. Summary statistics are included in appendix Table A5.1.

There is an obvious endogeneity problem with the assertion that city elections and budgets can affect residential locations. That is, we know that as home-owning whites choose to

[104] Police protection expenditures include, "expenditures for general police, sheriff, state police, and other governmental departments that preserve law and order, protect persons and property from illegal acts, and work to prevent, control, investigate, and reduce crime" Pages 5-58 in The U.S. Bureau of the Census Government Finance and Employment Classification Manual available at: http://www2.census.gov/govs/pubs/classification/2006_classification_manual.pdf

[106] These data are from the Department of Justice Uniform Crime Reporting Program: Offenses Known and Clearances by Arrest reports for 1980, 1990, 2000, and 2011.

locate in the suburbs as opposed to central cities, the remaining central city population will have different policy and candidate preferences. The success of black mayoral candidates in this scenario is what Friesema (1969) called the "Hollow Prize." To attempt to mitigate problems this pattern might cause for the analysis, the mayoral data are measured in the decade prior to the segregation data and all of the remaining measures are lagged 10 years. Additionally, my analyses include fixed effects for metropolitan area, so that the estimated effects of politics are within, rather than across areas.

Is it the case that politics favoring nonwhite and poor preferences in central cities is associated with additional cross-city segregation? In short, yes. Table 5.2 presents the results.

Table 5.2: Effect of City Spending Patterns on Share of Metropolitan Segregation Attributed to Cross-City Segregation

	Racial Segregation			Renter Segregation			Wealth Segregation		
	β	SE	P>|t|	β	SE	P>|t|	β	SE	P>|t|
Politics favoring minorities & renters									
Minority Mayor	0.032	0.01	0.01	0.019	0.01	0.08	0.027	0.01	0.01
Direct General Expenditure Per Cap	0.052	0.01	0.00	-0.004	0.01	0.58	0.013	0.01	0.07
% Policing	0.723	0.14	0.00	-0.223	0.12	0.06	0.458	0.12	0.00
Controls									
Population (logged)	0.046	0.03	0.12	-0.057	0.03	0.03	-0.013	0.03	0.60
Crime Rate	0.566	0.13	0.00	0.134	0.11	0.24	0.159	0.11	0.15

Number of observations	618			618			618		
Number of MSAs	209			209			209		
R^2 (within)	0.211			0.035			0.078		

Note: OLS Regressions, fixed effects for metro area included in all models
Minority mayor refers to previous decade, all other measures lagged 10 years

Table 5.2 tells a consistent story. When central cities elect minority mayors, when the spend more money, and when a larger proportion of their budget is spent on policing a larger proportion of the metropolitan area's total segregation along race and class lines is accounted for across cities rather than within them. In short, more liberal policy in the central city leads to more segregation across city lines while more conservative spending patterns in center cities lead to less. As Table 5.1 makes clear, non-central cities are whiter, wealthier, and more heavily populated with homeowners than central cities. This suggests that it is wealthy whites who make the choice to reside outside of the central city when policies favoring poor and minority interests are enacted. Conversely, wealthy white residents choose to remain in the central city when budgets are more austere. Overall, the results are strongest and most consistent for racial segregation. As has been true throughout this book, race is the clearer dividing line.

With regard to racial segregation in particular, the results are powerful. If we compare, on the one hand, a city with a white mayor in the 25th percentile of the distribution on per capita spending and police expenditure, to one with a minority mayor and in the 75th percentile on the

spending measures, the metro-area racial segregation accounted for across cities increases from 35% to 46%. This is equivalent to the difference between the patterns of segregation in the Wichita, Kansas area (*share_across_race* = 0.355), and the Waco, Texas area (*share_across_race* = 0.468) or the Charlotte, North Carolina area (*share_across_race* = 0.358) and the Portland, Oregon area (*share_across_race* = 0.465).[107]

Land Use Regulation and Suburban Segregation

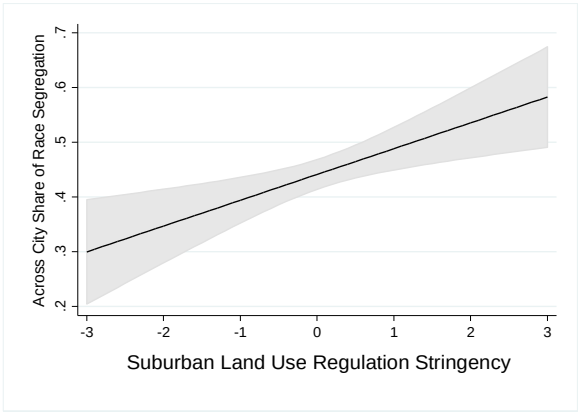
A number of scholars have emphasized the increasing role of land use regulation in the maintenance of segregation (Rothwell 2011, Pendall 2000, Orfield 2002). Scholars have often argued (although not demonstrated), that this tendency has generated a shift from the predominance of racial segregation toward class segregation (Mieszkowski and Mills 1993, Fischel 2004). The work that empirically investigates the relationship between land use regulation and segregation (e.g. Rothwell and Massey 2009, Glaeser and Ward 2006, Berry 2001) has not made a distinction between segregation within cities and segregation across them. This is an important omission, because homogenous suburban municipalities ought to be able to utilize land use regulation much more effectively than homogenous neighborhoods within cities, as municipalities wield more political power. If my argument is correct, that whites and homeowners seek to use local policy to protect home values and control the distribution of public goods, then metropolitan areas with more intense land use regulation in the suburbs should also have greater race and class segregation across cities. This is exactly what I find.

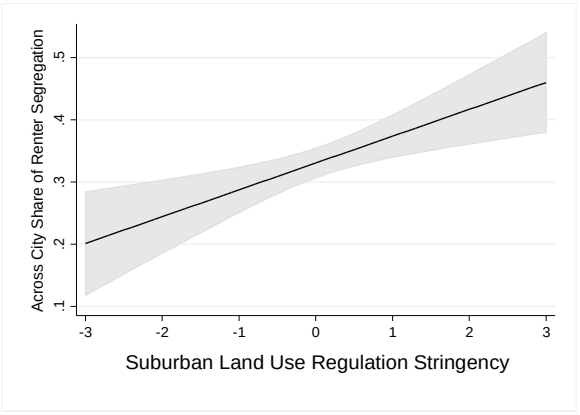
To provide evidence of this link, I use the Wharton Residential Land Use Regulatory Index (WRLURI) developed by Gyourko, Saiz, and Summers (2008). This index is built from a 2006 survey of local governments regarding the characteristics of the regulatory process, rules of

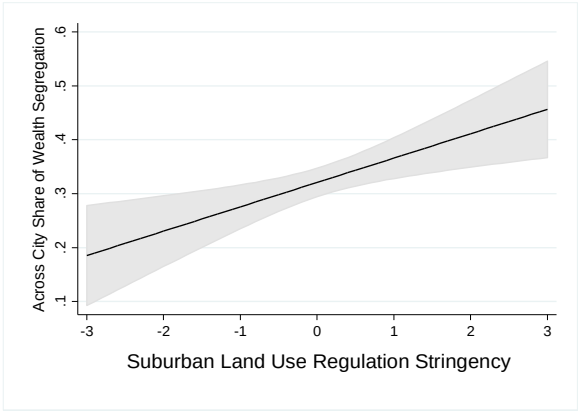
[107] These statistics are for the year 2011.

local residential land use regulation, and regulatory outcomes. These data were combined to measure the, "stringency of the local regulatory environment in each community" (Gyourko et al. 2008, p3). The survey contains data for more than 2,700 municipalities. For each metropolitan area, I determined the average WRLURI for all suburban communities. I then calculated the difference between the center city WRLURI and suburban WRLURI. This difference measure provides an estimate of the degree to which suburban municipalities have more stringent land use regulations than the central city for each metro area. I combined these data with the segregation measures described in the previous analyses – the share of the metropolitan area segregation accounted for across cities rather than within them. The WRLURI data are only available at one point in time, so I analyze the correlation between each region's *Share Across* and the *WRLURI Difference* in 2011 using OLS regression. Figure 5.3 displays the marginal effect of suburban land use regulation stringency on race, renter, and wealth segregation across cities.

Figure 5.1: Correlation Between Suburban Land Use Regulation Stringency & Segregation Across Cities







Suburban land use controls are significantly related to the degree to which segregation is accounted for across rather than within cities in metropolitan areas. The graphs also make clear that there is no difference between the effects of land use regulation on race versus class segregation. They are equally effected.

I've argued that white homeowners institutionalized segregation in order to protect their public goods and property values. The result of these policies in the post-war period has been to increase the disparity in service provision across cities. To show this, I draw on the same spending and segregation data described in the previous section. First, I aggregate all inflation-adjusted expenditures per capita by metropolitan area, for each year. This total expenditures per capita variable represents the collective dollars spent by municipal governments in a metropolitan area. I divide each municipality's expenditure by this total to generate the share of metropolitan spending accounted for by each city. I calculate a similar measure for population, generating the share of metropolitan population accounted for by each city. The ratio of these two quantities, the *Spending Equity Ratio*, is my first dependent variable.

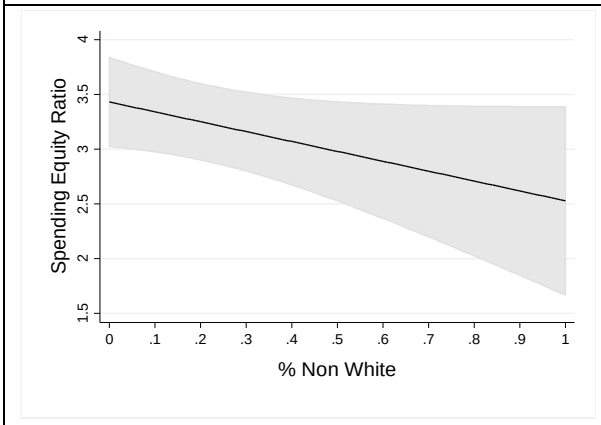
$$Spending\ Equity\ Ratio_j = \frac{E_j/E}{P_j}$$

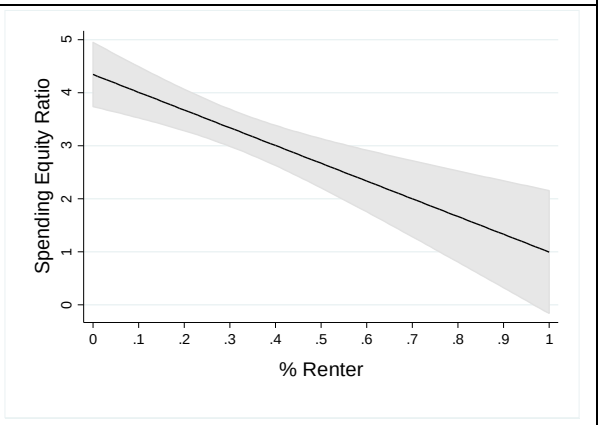
Where E_j is the per capita expenditure by city j, E is the total expenditures in the metropolitan area, and P_j is the share of the metropolitan population represented by city j.

This ratio measures the disparity between the percentage of the population represented by a city and the percentage of total resources received by that population. If resources are distributed exactly equally across the population, the ratio takes a value of 1; values less than 1 indicate that the community receives fewer resources than its population size would predict, and values greater than 1 indicate an abundance of resources. Between 1972 and 2012, this measure averaged 0.4 for central cities and 2.5 for suburbs.[108] Suburban residents receive two and a half times the resources that their population share justifies, while central city residents receive less than half of the amount of resources that their population share justifies. This is the case despite the fact that central cities spend more, on average, per resident than do suburbs. Unsurprisingly, communities with larger populations of racial and ethnic minorities and more renters have a lower *Spending Equity Ratio*. Regressing the *Spending Equity Ratio* on the share of the city that is *Nonwhite* and the share that *Rents* their homes, including fixed effects for years and errors clustered by metropolitan area, yields Figure 5.2.

[108] Calculated for all cities with more than 1,000 residents and all metropolitan areas in which I have data on more than one city.

Figure 5.2: Effect of Race and Class on Spending Equity





Given that cities with more homeowners and more white residents are more likely to garner a larger share of total resources spent in metropolitan areas, we should also expect that metropolitan areas with more segregation along race and class lines will witness more variation in spending from city to city. This is exactly what I find. My dependent variable in this analysis is a measure developed by Rhode and Strumpf (2003) called the coefficient of variation (CV). The CV captures the degree of heterogeneity in spending for a metropolitan area. It is calculated as the ratio of the standard deviation of spending to the mean of spending.

$$CV_{msa} = \frac{\sqrt{\sum_j P_j \left(E_j - M\right)^2}}{M}$$

Where E_j is the per capita expenditure of city j, M is the mean per capita expenditure for all cities in the metropolitan area, and P_j is the share of the total metro area population in city j. Rhode and Strumpf (2003) use this measure (calculated for the entire nation, not by metropolitan area) to show that over time, governments across the United States have grown more alike in their spending. I find the same – the mean CV declined about 17.5% between 1972 and 2012, from

1.32 to 1.09. However, more segregated metropolitan areas changed more slowly than less segregated areas. To see this, I regress the CV on racial, renter, and wealth segregation across cities (H_{m_c}). I add fixed effects for year to account for the declining time trend. Table 5.3 presents the results.

Table 5.3: Correlation Between Spending Heterogeneity and Segregation

	Column 1		
	β	Std. Err	P>|t|
Racial Segregation Across Cities	1.02	0.321	0.001
Renter Segregation Across Cities	1.83	0.661	0.006
Wealth Segregation Across Cities	-0.086	0.917	0.925
Constant	1.295	0.066	0.000
N	3149		
R^2	0.031		

Note: Fixed effects for year included but not presented.

The data reveal that metropolitan areas with more racial and renter segregation across cities – that is, where whites/ nonwhites, renters, and owners tend to live in different municipalities, we see more heterogeneity in municipal budgets. Combined with the results presented in Figure 5.2, we can see that communities with large populations of renters and racial minorities in segregated metropolitan areas have access to a much smaller share of the total dollars spent by local governments. Segregation is correlated with inequality; exactly as its architects intended.

Conclusion

Even after decades of progressive change in racial attitudes and growing concern over income inequality, America remains a segregated nation. Increasingly, segregation along race and class lines has occurred among cities rather than within them. I have argued that city politics has played a role in this change. Overall, whites and the wealthy individuals seek smaller, less

active local governments. When city policy does not favor their interests, these types of residents are more likely to trade homogenous neighborhoods within cities for homogenous cities instead. When central cities in metropolitan areas have more active policy agendas, when they spend more on community development, and when property taxes are higher, we see greater segregation across city lines. Whether this is because white homeowners leave central cities or never move in, the result is a higher degree of separation between cities in metropolitan areas. These patterns become fixed by suburban land use regulations that shape the character and structure of these communities.

Chapter 6: Segregation and Public Goods Provision, 1982-2012

Chapter 5 revealed that suburbanization has produced inequalities in spending patterns from city-to-city and I have argued that this was precisely the goal segregations' proponents. But segregation has another set of consequences that we might say were unintended; consequences for the polarization of politics at both the local and national levels. This chapter and the next make a case for this claim.

Many United States cities function without regular problems. They have well-kept roads, sewers that never overflow, and public parks with swing sets and restrooms. Others, however, struggle to maintain balanced budgets, fail to adequately equip or staff their police forces, and offer little assistance to residents of limited means. What explains these differences? One obvious answer is simply wealth. The history of suburbanization detailed in previous chapters suggests that whites and homeowners have ensconced themselves in homogenous municipalities. Given the strong correlation between race, property ownership, and wealth, income differences across communities could explain much of this variation. Except they don't. Although the relationship is statistically significant, the correlation between city level median income and per capita direct general expenditure is only about 0.037 in my data.

At a very basic level, the generation of public goods requires cooperation. Why is it then that some cities find it more difficult to cooperate than others? Scholars have identified racial/ethnic diversity and changes in diversity as prime suspects in determining under-provision of public goods (e.g. Alesina et al. 1999, Hopkin 2009). Nonetheless, diversity alone does not generate a lack of cooperation in city politics. It is only when cities are also segregated along racial lines that we see lower public goods provision. Segregated places are politically-polarized places. The gulf between whites and minorities in segregated places makes it less likely that

they will find common ground in support of a bundle of taxation and expenditures, driving down collective investment. It is segregation, not diversity that contributes to inequality.

I provide evidence for this argument using election data from 25 large cities between 1990 and 2010 and demographic data matched to city finance data from 1982 to 2012 in more than 3,000 cities. To handle the problem of endogeneity in the finance analysis, I instrument for segregation using the number of waterways in a city. I find that segregated municipalities spend less on a wide range of public goods. This lower spending has consequences. In the final section of the chapter, I find that racially segregated cities also have more sewer overflows per capita.

I focus here (and in the next chapter) on racial segregation alone. A series of tests revealed that renter and wealth division do not produce similar results. These findings are bolstered by the historical evidence which indicates that it is race and not class division that generates the starkest conflicts in city politics. Throughout, I control for indicators of wealth and homeownership to ensure that the results are not conflating race and class.

Literature and Hypotheses

Local politics, more so than national or state politics, concerns battles over space. This is because local governments control the location of negative and positive externalities (like pollution-producing factories or public parks) and also because many of the functions that local governments provide are allocational in nature (e.g. where police officers will be deployed and which roads will be repaved). One of the few powers that is reserved nearly exclusively by local government is that of zoning or planning. As a result, geographic areas within cities (e.g. neighborhoods) are frequently important actors in municipal politics.

At the same time, neighborhoods in America remain highly segregated along racial lines (see Chapter 1). Although neighborhood racial segregation has lessened in recent decades, today, the typical white American lives in a neighborhood that is overwhelmingly white, while Black, Latino, and Asian Americans live in substantially more integrated places (Logan and Stults 2011).[109] These patterns have created stark divides between white and nonwhite communities (Enos 2011). When a city is residentially segregated by race, issues cleave along racial and not just spatial lines (Massey and Denton 1993).

Furthermore, in segregated cities, divisions across racial groups are likely to be exacerbated because the political priorities and opinions of racial groups are likely to be more divergent than they are in integrated places. Neighborhood racial isolation is associated with a high degree of racial intolerance, resentment, and competition among all racial groups (Oliver 2010, Chapter 7). This correlation is due to both self-selection and interpersonal interactions (Rodden 2010). When deciding where to live, people with racially intolerant attitudes often seek same race neighbors (Charles 2003, Boustan 2012) either because they want to minimize contact with other race individuals (Massey and Denton 1993) or because they associate other race neighborhoods with poor neighborhood quality on dimensions such as schools, crime, and property values (Helper 1969, Ellen 2000, Bayer, Ferreira, and McMillian 2007, Krysan et al. 2008). However, living in different types of neighborhoods may also change individuals' perspectives. In integrated neighborhoods, regular, casual interaction may work to counteract dominant, negative stereotypes (Allport 1954, Oliver and Wong 2003). The result of both population sorting and/or neighbors' influence is that individuals who live in homogeneous

[109] African Americans, Latinos, and Asians live in neighborhoods that are comprised of 22%-46% of their own group.

neighborhoods are more likely to harbor negative stereotypes about other groups (Oliver 2010, Oliver and Wong 2003).

Yet, at higher levels of geography (e.g. in cities, counties, and metropolitan areas) it is integration or diversity that correlates with intolerance, prejudicial attitudes, increased racial tension, less cooperative behavior, and lower spending on public goods (Key 1949, Glaser 1994, Branton and Jones 2005, Taylor 1998, Campbell et al. 2006, Alesina et al. 1999, Vigdor 2004, Hopkins 2009, Poterba 1997). As a result, racial competition, racial resentment, and racial conservatism are positively correlated with homogeneity at the neighborhood level, but negatively correlated with homogeneity at the city level (see Oliver 2010 for a detailed account of these conflicting patterns).[110] A severely segregated city is one that is diverse overall and has many homogeneous neighborhoods – both characteristics which point towards a high degree of racial conflict.

This higher degree of racial conflict in segregated cities has obvious political implications. Levine (2014) has found that racial segregation is strongly predictive of partisan political divisions in metropolitan areas and that these political divides result in an unwillingness to cooperate on metropolitan-wide policy solutions. We can expect a similar pattern at the city level. First, in segregated cities, racial groups should be more divided with respect to political priorities. Second, diverse but divided cities may be less able to come to a consensus about the production of basic government services, and thus, will be less supportive of public goods provision. This second hypothesis speaks directly to the claim that diversity drives down

[110] There are a few exceptions to this pattern. A handful of scholars have *not* found that diversity increases tolerance at the neighborhood level. Gay (2006) and Oliver and Mendelberg (2000) find no relationship between neighborhood racial context and racial attitudes. Enos (2016) shows that that homogeneity decreases voter turnout among whites and also decreases support for conservative candidates. Cho, Gimpel and Dyck 2006 find that homogeneity decreases turnout among Asian Americans in some cases, but increases it (or has no effect) in others. Leighly and Vedlitz (1999) find that homogeneity correlates positively with turnout for whites.

collective investment (Alesina et al. 1999). As Benoy Jacob (2013) has persuasively argued, not all diversity is equivalent. When whites and nonwhites live in the same city, the pattern of residential integration ought to factor into expectations about public goods expenditures. White and nonwhites may live as next door neighbors, but they also may not. If segregation represents preferences or attitudes that are incompatible with collective investment, then uneven distribution of groups, not diversity per se, ought to correlate with lower public goods spending.

Segregation and Political Polarization

In municipal politics, vote patterns and policy priorities are shaped by racial cleavages more so than *any* other demographic division (Hajnal and Trounstine 2013a, Hajnal and Trounstine 2013b, Hajnal and Trounstine 2014). While ideology, partisanship, and class all play important roles in determining vote choice and support for municipal administrations, conflicts among racial groups are predominant. If segregated cities are more politically polarized, these racial divides should be most pronounced in places with a high degree of residential segregation. To determine whether or not this is the case, I analyze the relationship between residential segregation patterns and racial divisions in mayoral elections in the nation's largest cities between 1990 and 2010.

To estimate the effect of segregation on racial polarization, I use a dataset compiled by Hajnal and Trounstine (2014) that measures support for winning mayoral candidates across different racial groups in primary and general elections in large cities. The data include 91 separate contests from 25 cities. Vote by race data were compiled from a combination of exit polls, pre-election surveys, homogenous precinct analyses, and ecological inference.[111]

[111] These data are described completely in Hajnal and Trounstine (2014).

Summary statistics and a list of cities included in the analysis are provided in appendix Tables A6.1 and A6.2.

For each election, I calculated the difference in support for the winning candidate between black and white voters, Latino and white voters, and black and Latino voters. The dependent variable in this analysis is the absolute value of the largest difference in support for the winning candidate between any two racial groups. For instance, in Philadelphia in 2003, exit polls reported that 24% of white voters supported the winner, John Street, compared to 88% of black voters, and 47% of Latino voters. In this election the black-white divide was 0.64, the Latino-white divide was 0.23, and the black-Latino divide was 0.41. Therefore, the dependent variable takes the value of the black-white divide, 0.64. In 62 of the 91 contests, the largest divide was between black and white voters, in 13 contests it was the divide between Latino and white voters, and in 16 contests the largest divide was between black and Latino voters.[112] The distribution of racial divides across cases is listed in appendix Table A6.2.

As described in Chapter 1, my primary independent variable is a measure of segregation called Theil's *H* Index. The *H* Index measures the degree to which the diversity in each neighborhood differs from the diversity of the city as a whole, expressed as a fraction of the city's total diversity and weighted by the neighborhood's share of the total population.

$$H = \sum_{n=1}^{N} \frac{P_n}{P_c}\left(\frac{E_c - E_n}{E_c}\right)$$

Where *P* represents the total population of neighborhood *n* or city *c* and E is the entropy of *n* or *c*. *H* varies between 0, where all neighborhoods have the same composition as the entire city, and 1 where all neighborhoods contain only one group.

[112] As an alternate measure of division, I took the difference in support between white voters and the average of support among black and Latino voters. The results are extremely similar.

I calculated the *H* Index for all United States cities using Census-tract level demographic data from the 1980, 1990, and 2000 Censuses of Population and Housing and from the 2011 American Community Survey.[113] To start, I use four groups in the calculation of entropy: white (non-Hispanic), black (non-Hispanic), other (non-Hispanic), and Hispanic/Latino.[114] I then combine Blacks, Hispanics, and Other races into a single nonwhite group for comparison. For reference, the mean *H* Indices for each city in the analysis are shown in appendix Table A6.2.

I include a number of control variables in addition to the *H* Index. One of the primary arguments in the literature is that racially and ethnically diverse populations will have heterogeneous political preferences which then drives low spending on public goods. If this is the case, we should see more racial polarization in the vote as diversity rises. Thus, I include the proportion of *Blacks*, *Latinos*, and *Asian Americans* in the city and a measure of *Diversity* known as the Herfindahl Index[115]:

$$Diversity = 1 - \sum_{r=1}^{R} \pi_r^2$$

I also include control variables that are shown by Hajnal and Trounstine (2014) to affect racial polarization in voting and which may also be correlated with segregation. I account for the *Median Household Income*, proportion of the population *Renting* their homes, proportion of the population with a *College Degree*, the race of the candidates in the election (a dummy variable coded 1 if the election featured *Biracial* candidates), a measure noting whether or not the

[113] Tract-level data for 1980, 1990, and 2000 come from a proprietary product developed by GeoLytics called the Neighborhood Change Database (NCDB), which matches and normalizes Census tracts over time. The data from the 2011 American Community Survey (ACS) are available for download through the Census ftp server located at http://www2.census.gov/.

[114] The 1980 tract-level data only disaggregate the non-Hispanic population into Whites, Blacks, and Others, so I am unable to include Asians as a separate group.

[115] This calculation includes five racial groups: white (non-Hispanic), black (non-Hispanic), Asian (non-Hispanic), Hispanic, and other.

election was *Non-partisan*, an indicator for *Primary* elections, and the size of the total *Population* (logged). Finally, I include fixed effects for year and region and random effects for cities.

In Model 3, I also add a measure of the average *Ideology* among the city's white residents to determine whether or not segregation is merely a proxy for a conservative white population. This measure was constructed using General Social Survey (GSS) data from 1998, 2000, 2002, 2004, 2006, and 2008. Using restricted access data, I geo-coded each respondent in the GSS to his/her city of residence. I then took the mean ideology score for each city's white respondents for each year (higher values indicate more conservative respondents).[116] I interpolated ideology for odd years and then merged these data to the racial polarization data set. In order to preserve as many observations as possible, I matched GSS data from the most recent year for each election.

The results presented in Table 6.1 offer strong support for the hypothesis that more segregated cities are also more politically polarized.

[116] I dropped city/years from the GSS that only contained a single respondent.

Table 6.1: Racial Polarization in Segregated Cities

Note: Multi-level mixed-effects linear regressions with fixed effects for region and year, and random effects for cities.

The relationship between segregation and political polarization is powerful. A city in the 10th percentile of the segregation distribution can be expected to have a 35 percentage point divide between different racial groups' support for the winning candidate, while a city in the 90th percentile of segregation has a predicted racial divide of 63 percentage points.[117] These results hold even with the inclusion of racial demographics. Segregation, not just diversity, matters for polarization. The data also indicate (comparing columns 1 and 2) that there is no significant difference in accounting for segregation among multiple racial groups as opposed to accounting

[117] Estimates were generated from the regression presented in column 1 with all other variables held at their mean values. Predicted effects were generated using the "margin" command in Stata 12.

for segregation of whites from nonwhites.[118] This makes sense given that whites are much more likely to live in homogenous neighborhoods than are other racial and ethnic groups and given that the most pronounced political division is typically between whites and one or more minority groups, rather than among minority groups. These results suggest that political polarization depends on the degree to which *white* residents live in exclusively white neighborhoods.

I have argued that segregation generates political divisions because the politics of space become intertwined with race. It is possible though, that segregation is simply correlated with a more ideologically conservative white population which then generates divides in support for candidates. As the third column reveals, the relationship between segregation and polarization appears to be unaffected by the conservatism of the white population. In fact, the relationship between ideology and polarization is such that cities with more conservative white populations have smaller racial divides, underscoring the conclusion that racial polarization is not driven by ideological divisions. In the next section, I ask whether or not this polarization extends beyond support for candidates to a lack of consensus over policy. In short, I find that it does.

Diversity and Segregation in the Aggregate

Scholars have provided evidence that racially diverse places and those that are becoming increasingly diverse spend fewer public dollars on productive public goods (Alesina et al. 1999, Hopkins 2009). I have argued that segregation, not just diversity, should matter in municipal politics. In the first section of this chapter, I showed that segregation is related to political polarization, even after accounting for racial demographics. If it is the case that segregated populations are less able to come to a consensus over citywide policy decisions, we should also

[118] The 95% confidence intervals for these coefficients are nearly completely overlapping. Additionally, adding both coefficients to the same equation and running a post-estimation Wald test of equality indicates no significant difference.

see less support for government spending in segregated cities after accounting for racial demographics.

In order to analyze this hypothesis, I draw on the Census of Governments city and township expenditure data from 1982, 1987, 1992, 1997, 2002, 2007, and 2012.[119] To these data, I merged interpolated data from the 1980, 1990, 2000, and 2010 Census of Population and Housing, and from the 2007-2011 American Community Survey (ACS). In the broadest sample, I have data for 3,113 cities, which range in size from about 750 residents to more than 8 million.[120] To capture overall spending on public goods, I analyze the effect of segregation on per-capita *Direct General Expenditures.*[121] I follow this with analyses of operations expenditures on specific budgetary categories including *Roads and Highways, Police, Parks, Sewers*, and a combined category of *Welfare, Health, and Housing and Community Development.*[122] I also analyze per capita *Revenues* coming from the city's own residents (as opposed to intergovernmental revenues) as an indication of the burden of funding the populous is willing to bear.[123] All spending data are in thousands of 2012 dollars. Summary statistics are shown in appendix Table A6.3. As above, the primary independent variable is the *H* Index to measure segregation. In the tables and figures below, I present results using the two-group (white and nonwhite) index; results from the multi-group index and isolation index are very similar.

---

119 Available at http://www2.census.gov/pub/outgoing/govs/special60/. Filename is "_IndFin_1967-2012.zip".
120 Data are available for many more cities in 2012 than in prior years (largely because I have Census data for more places in 2011). I only use observations from 2012 that are also included in 2007 to create a consistent panel.
121 All analyses are restricted to cities with non-zero expenditures in the category in question because the data do not distinguish between zero expenditures and missing data.
122 Operations expenditure totals were generated by taking the total spending in each category less any capital expenditures in that particular year. The category of welfare, health, and housing/community development represents the primary expenditures by cities used to directly support people in economic need.
123 In contrast, the categorical expenditure variables include all spending on a certain target regardless of the source of the funds.

To account for the alternative explanation that diversity drives down spending, the analyses include the proportion of the population that is *Black*, *Asian*, and *Latino* as well as a measure of overall *Diversity*. Controlling for demographics also helps account for the fact that white and minority preferences for government spending differ. Racial and ethnic minorities support more government spending than whites on a large number of programs at all levels of government (Hutchings and Valentino 2004). In the aggregate then, we might expect cities with larger populations of racial and ethnic minorities to support more per capita expenditure, just as Boustan et al. (2013) find. But if my theory is right, cities with more segregation and similar shares of minority residents ought to witness smaller budgets and lower spending on public goods compared to cities with less segregation because the likelihood of cooperation ought to be fundamentally different in these types of places.

The analyses below also control for the total *Population* (logged), the proportion of the population *Over Age 65*, the proportion of the population with a *College Degree*, the proportion of each 100 residents *Employed as Local Government* workers, the proportion of households that *Rent* their home, and the *Median Household Income*. These controls are meant to capture demographic dimensions that affect both segregation and expenditures (through both preferences and need). For instance, we might expect cities with large populations of government workers to have higher levels of spending, while the reverse might be the case in cities with older populations. An important alternative explanation for a negative relationship between segregation and spending could be city wealth. Segregated cities might be poorer cities for some reason, and may simply have fewer resources to spend on public goods. Controlling for the proportion of the city that rents and the median household income are intended to account for

this possibility.[124] Finally, I include fixed effects for cities. This allows me to analyze the effect of segregation within the same location over time and controls for the many factors (such as age of the city, differentials in costs for service provision, taxation powers and limits, etc.) that might lead cities to differ in expenditure patterns cross-sectionally. I cluster standard errors by city. I exclude from the analyses cities with only a single Census tract because the measure of evenness is constant (by definition).

I begin, in Table 6.2, by regressing per capita *Direct General Expenditure* on *Segregation* with the controls described above. Then, in the second column, I replace *Diversity* with *5 Year Changes* in racial group shares (following Hopkins 2009) to determine whether or not changes in diversity could be the driving factor.[125] In the third column, I add the mean *Ideology* of city residents (calculated from the GSS for all city residents as described above) to account for the possibility that segregated cities are more ideologically conservative. In alternate models (not shown), I add a control for renter segregation. The coefficient is insignificant and does not affect the results presented below.

[124] In alternative analyses I tested the inclusion of proportion of the city in poverty and median home values with no change to the pattern of results.
[125] Hopkins (2009) uses 10 year changes in racial group shares. I chose 5 years in order to preserve more observations in the time-series. The results are similar with 10 year changes.

Table 6.2 provides strong evidence that segregation and public goods spending are negatively related, even in the presence of changing demographics, diverse populations, and conservative residents. The effects of segregation are substantively meaningful and statistically significant. Increasing the segregation index from the 25th to 75th percentile (from .01 to .10) in the base model lowers per capita direct general expenditure from $1,413 to $1,299. A difference in total spending of more than $100 per resident could dramatically affect the quality of public goods that individuals experience given that the average per capita operating expenditure on police is about $190 and about $51 on parks. In Table 6.3, I show that the depressive effect of segregation extends to individual categories of public goods spending as well.

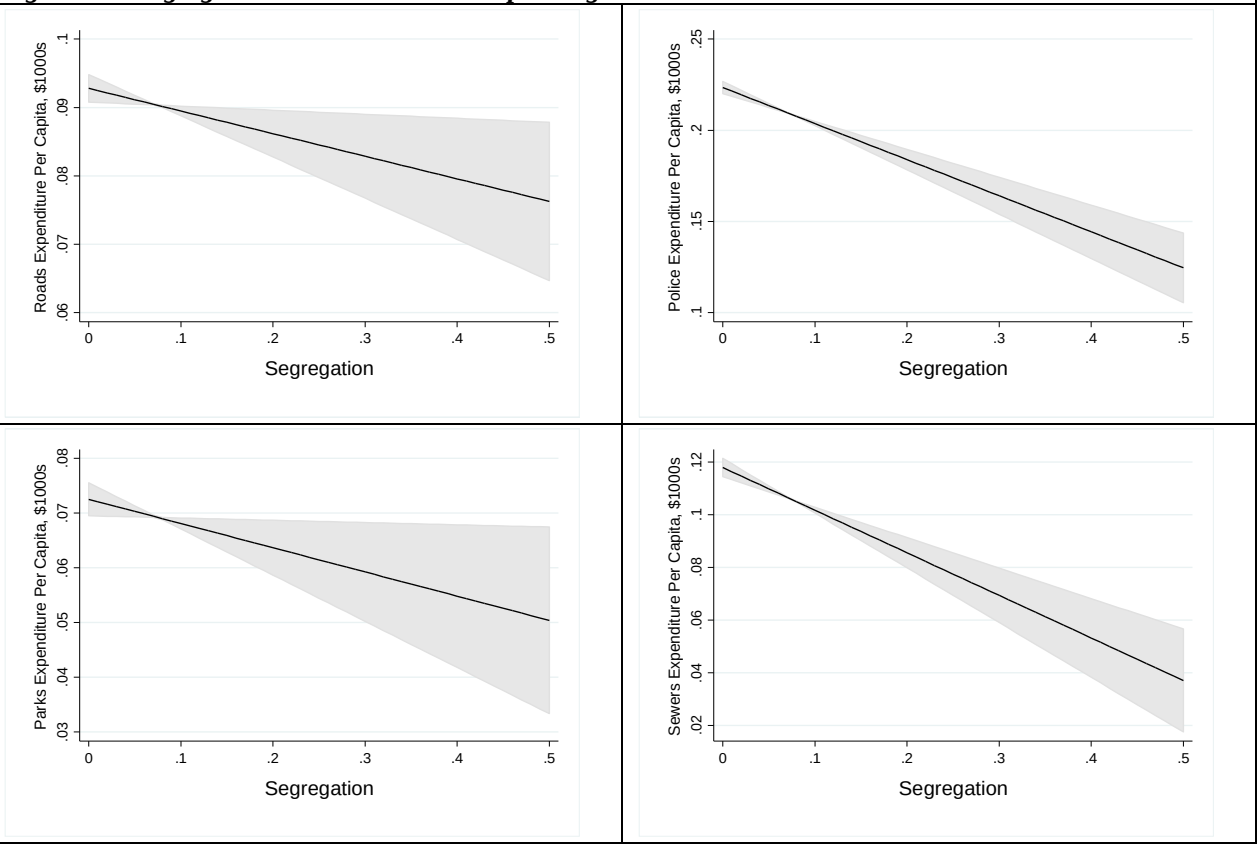
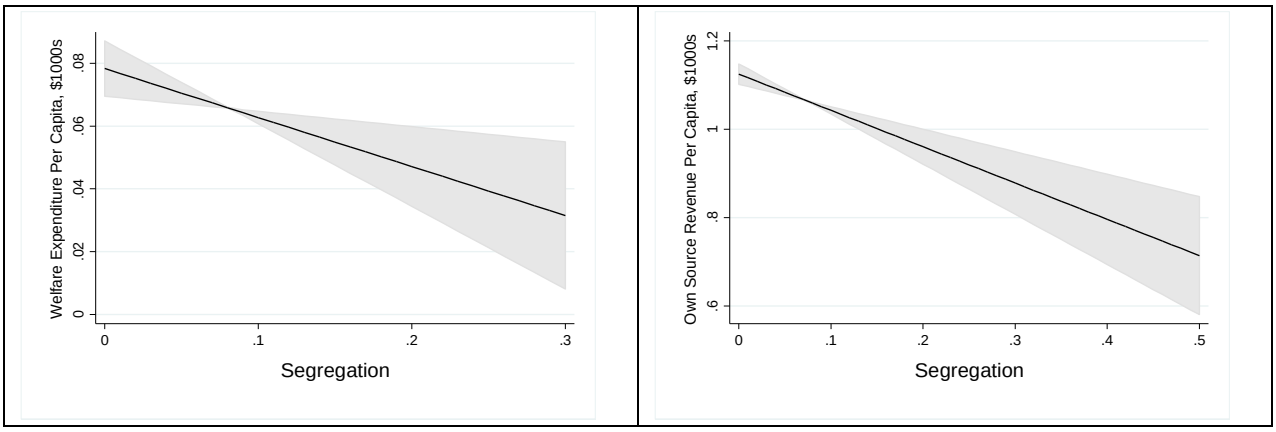
Clearly, spending on public goods is lower in cities with greater segregation. Across all six categories displayed in Table 6.3, segregation exerts a significant negative effect. Figure 6.1 presents these results graphically.

Figure 6.1: Segregation and Public Goods Spending





Note: Figures show the predicted relationship between Theil's H segregation index and per capita spending on public goods in constant 2012 dollars. Gray shading represents 95% confidence intervals.

Tables 6.2 and 6.3 also reveal that while segregation is negatively related to public goods investment, more diverse communities are mostly associated with higher levels of spending as the positive coefficients on diversity and on percent black and Latino indicate. Given that racial and ethnic minorities are both more supportive of public goods spending and more likely to live in segregated places (which see less support for public goods), it is important to ask what the overall impact of these countervailing effects is. Table 6.4 shows how segregation affects public goods provision across the range of values of diversity. I divide the sample of cities into quintiles of percent nonwhite (with 3,366 city-years in each quintile) and then, after estimating the model displayed in column 1 of Table 6.2, I predict Direct General Expenditure per capita at the minimum and maximum values of segregation for each quintile, holding all other variables at their mean values given the quintile. Table 6.4 shows the difference in these predicted values for each quintile of percent nonwhite.

Table 6.4: Change in Direct General Expenditure Per Capita by % Nonwhite at Minimum and Maximum Levels of Segregation

Quintile of % Nonwhite	Average % Nonwhite	Average Segregation Level	Change in Predicted Direct General Expenditure Per Capita*	95% Confidence Interval

2	10%	0.041	-$870	(-$1163, -$576)
3	19%	0.066	-$970	(-$1298, -$643)
4	33%	0.108	-$930	(-$1244, -$616)
5	65%	0.125	-$846	(-$1132, -$561)

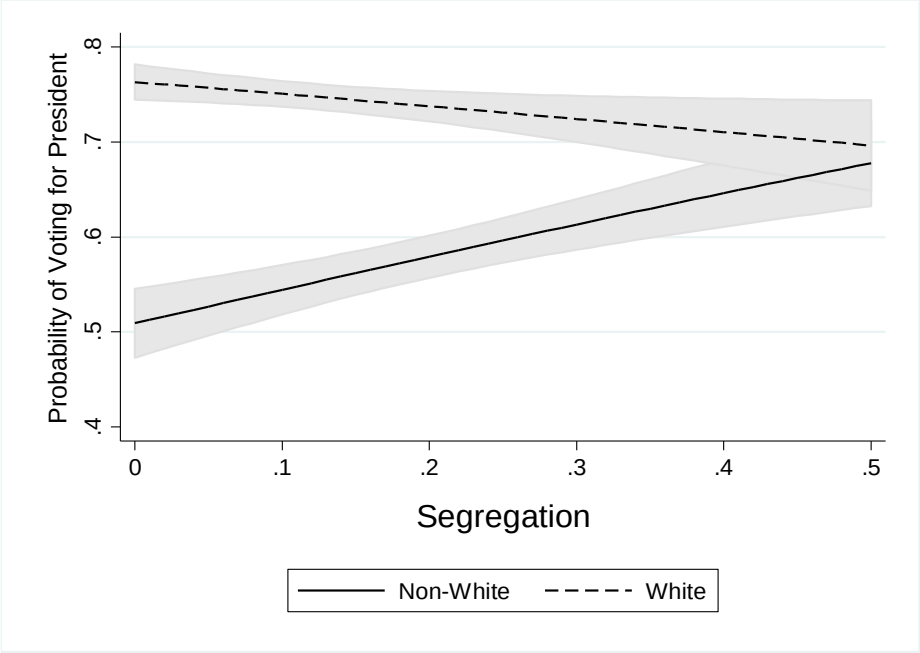
*Predicted values generated from regression displayed in column 1, Table 7.2. Change is from the minimum to maximum level of segregation within a quintile of percent nonwhite.

Table 6.4 reveals substantial declines in direct general expenditure as segregation increases, regardless of the size of the minority population. Segregation has the largest effect in cities with moderately sized minority populations (where minorities comprise 19-33% of the population), but even in majority-minority cities (where minorities make up more than 50% of the population) and cities that are overwhelmingly white, increasing segregation decreases investment in public spending. The fact that segregation has the most pronounced effect in the middle quintiles offers indirect evidence that it is white residents responding to significant minority concentrations driving the negative relationship between segregation and public goods spending. An alternative possibility is that low turnout among minority residents drives this pattern. As Figure 6.2 shows, this case is extremely unlikely, given that turnout among minority residents is actually higher in more segregated cities while turnout among whites is lower.

To test this possibility, I draw on data from the General Social Surveys conducted between 1998 and 2008; years for which I was able to determine respondents' city of residence

(see Chapter 7 for additional details on this dataset). I estimate the probability that a respondent *Voted* in the most recent presidential election. Using logistic regression, I regress this variable on the level of *Segregation* in the respondent's city. To understand how segregation operates differently for different groups, I interact the level of segregation with a dummy variable coded 1 if the respondent is *White and Non-Hispanic*, and 0 otherwise. I control for the respondent's level of *Education*, whether or not they have *Kids at home*, their *Gender*, whether or not they are *Married*, their *Income*, and whether or not they are a *Government Employee*.

Figure 6.2: Correlation between Segregation and Turnout by Race



At low levels of segregation, white turnout is much higher than minority turnout, but the lines converge as segregation increases. Furthermore, using the racial polarization dataset described in the first section of this chapter, I find that turnout and segregation are positively

correlated in the aggregate. These patterns strongly suggest that politics is more contentious in more segregated communities. Thus, a lack of participation by residents who support high spending is not likely to be the cause of lower public goods investment.

However, even with controls, one might still worry about the causal relationship between segregation and spending. I have argued that segregation should suppress public goods spending. However, it is entirely possible, perhaps quite likely, that some unmeasured set of factors affect both spending and segregation (or that the reverse is true, and spending levels affect segregation patterns). Since we cannot randomly assign segregation to determine its effect on city spending, I use an instrumental variable approach to study the relationships.

A great many factors affect residential location and the distribution of different types of residents across neighborhoods. One set of factors that affects both property values and the ability for communities to maintain a preferred degree of homogeneity are natural and manmade barriers. For instance, freeways and railroad tracks frequently divide more desirable and less desirable parts of town (Ananat 2011). But railways and freeways are often built with the intent to segregate racial communities (Bayor 1996). Instead, I focus on waterways (including large streams and rivers), which vary in number across cities and are arguably exogenous to segregation and spending given that they are not man-made. The use of waterways as an instrumental variable was introduced by Hoxby (2000) who used streams to estimate the governmental fragmentation of metropolitan areas. Cutler and Glaeser (1997) rely on Hoxby's waterways data as an instrument for metropolitan area racial segregation. My instrument differs in two ways. First, and most importantly, my data capture waterway counts and segregation patterns at the *city* level rather than at the metropolitan-area level. Secondly, I use a different source file for the waterways data and a different method for determining whether a waterway

ought to be counted within the boundaries of a community.[126] In order to use waterways as an instrument for segregation, I gathered the "rivers and streams" geographic information system map file from the National Hydrologic Remote Sensing Center which is part of the National Oceanic and Atmospheric Administration (an agency in the US Department of Commerce).[127] I added Census TIGER Line boundary files for all places in the United States as of 2000.[128] I then generated counts of waterways for each place and added these counts to the finance data described previously. Overall, the correlation between the number of waterways and the H Index is a powerful 0.37, and the F-statistic on the excluded instrument is 3,999, which is considerably higher than the typical target of 10.[129]

The current analyses use the same dependent variables as were presented in Tables 6.2 and 6.3 (per capita spending on various public goods). The number of waterways is used as an instrument for the *H* Index. Waterways are also correlated with other characteristics that are important to both segregation and spending patterns. The most important of these characteristics is the size of the population which is correlated with both the number of waterways and the level of segregation. People have settled near waterways since antiquity, and larger cities are also much more likely to be segregated than smaller cities (perhaps because there are more neighborhoods from which to choose). To account for this, I include logged population

[126] Hoxby (2000) uses a hand count of streams that are 3.5 miles in length and "of a certain width" supplemented with data from the Geographic Names Information System which lists the latitude and longitude of smaller streams. Instead, I use geographic information system maps as described in the main text and include all large streams and rivers regardless of length and width. Hoxby (2000) attributes a stream to a Metropolitan Statistical Area (MSA) if it terminates in the MSA (Rothstein 2007), whereas my analysis attributes a waterway to a community if it flows through the community at all (not just at its origin or destination).

[127] The "rivers and streams" shape file is available at: http://www.nohrsc.noaa.gov/gisdatasets/. It was most recently updated in 2008.

[128] Boundary files are available for download by state here: http://www2.census.gov/geo/tiger/TIGER2010/PLACE/2000/

[129] This F-statistic is drawn from a simple two-stage regression instrumenting segregation with waterways and including no additional controls.

as an instrument in the first stage.[130] In both the first and second stage regressions, I include the same control variables as presented in Table 6.2, with two changes. Because the number of waterways is constant in my dataset, I do not add fixed effects at the city level.[131] Instead, I include fixed effects for region and year. Secondly, I add a lagged version of the dependent variable to account for the high correlation between observations over time for the same city and the fact that local budgets are typically changed incrementally from prior years. The results from this instrumental variable approach are displayed in Table 6.5. For presentation purposes, the first stage results are relegated to appendix Table A6.4.

[130] In alternative specifications, I use the number of waterways per capita as the instrument. The pattern of the results is exactly the same.
[131] The omission of fixed effects allows for the inclusion of all cities regardless of the number of Census tracts.

Note: Two stage least squares regressions with fixed effects for regions and year (not shown); Instrumented: Two-group H Index of segregation; Excluded Instruments: # of Waterways, Population logged.

Regardless of the statistical approach used, segregation appears to have a powerful, depressive effect on public goods provision in cities. The pattern of results in Table 6.5 reflects the OLS regression findings presented in Table 6.2. After accounting for demographic differences, cities with more segregation tend to have smaller budgets, they tend to extract fewer resources from their residents, and spend less on roads, policing, parks, sewers, and support for the poor.

But perhaps lower spending is what residents prefer. After all, many elections have been won on platforms promising austerity and frugality. In the final section of this chapter, I explore what the consequences of low spending might be by analyzing a universally disliked event: sewer overflows.

Segregation and Sewer Overflows

The federal Environmental Protection Agency (EPA) monitors municipal sewer systems for overflow events. According to a 2004 EPA report to Congress, approximately 860 billion gallons of untreated wastewater were released into communities between 2001 and 2003 when sewer systems' capacities were exceeded. Any single overflow might occur for many reasons – excessive wet weather, pipe blockages, equipment failure, or insufficient capacity. However, generally, as Tessin (2009) explains:

> The performance of a sewer system is strongly related to capital fund-raising….Without adequate investment, excessive groundwater can enter sewers through cracked pipes and ingrown tree roots. Aging pipes can break and send sewage to the surface. Growing populations can cause wastewater flow to exceed the system's design capacity….For these reasons, local governments that do not invest enough capital typically experience more sewer overflows and other system failures…(p168).

Some federal and state grants are available for sewer system maintenance, but the vast majority of funding to reduce overflows comes from local sources (EPA 2004). According to

my data, the most segregated cities spend about $200 less per capita each year on their sewer systems. In the aggregate, this translates to an average of about $60,000 less per year spent on sewers (after controlling for all of the other demographic variables included in the regressions above). When city engineers plan, build, extend, and repair sewer systems, they take into account variables like population growth and average precipitation, as well as potential deviations from those estimates.

Analyses of effective or responsive governmental policy typically needs to take into account variation in constituent preferences. For instance, a community that spends very little on protection of open space or on recycling may be accurately representing the views of its residents. Sewer overflows are different. No one wants a river of fecal matter running down their street or flooding their basement. Thus, it seems reasonable to assume that more frequent overflows are, without qualification, worse than fewer overflows. That said, voters and sewer engineers may not agree on the level of resources needed to prevent overflows and therefore, raising funds for capital improvements may be challenging. If it is the case, as I have asserted above, that more segregated cities will have more trouble coming to political consensus about public goods provision, then we ought to expect more segregated cities to witness more sewer overflows – all else equal. In order to determine whether or not this is the case, I utilize data collected by the Environmental Protection Agency in 2004.

In this data collection, the EPA gathered information on overflows from 25 state environmental agencies between 2001 and 2003.[132] In total, the EPA reported about 35,000 different overflow events from several thousand sewer agencies. The EPA data do not include any geographic identifiers other than the name of the sewer agency, and so, I matched these

[132] The data were generously provided to me by Jeff Tessin who had secured the data from an EPA staff member for his PhD dissertation.

names to cities by hand. After dropping cases in which the sewer operator was not a municipal government (e.g. metropolitan water districts or county governments), and cases in which the EPA data provided insufficient detail to identify the municipality, I determined the location of 19,817 overflow events. I aggregated these events to the city level and was able to match these data to segregation measures and Census data for 1,417 cities.

The median number of overflows during this period was 2, while the mode was 1. A few cities with enormously high numbers of overflow events pull the mean to 50. For this reason, I take the natural log of the number of overflow events for each city and standardize it by the city's population. This *Logged Overflows Per 1000 Persons* measure serves as my dependent variable. My main independent variable is the city's *H* Index of racial segregation measured in 2000 if available and 2010 if not. I control for the natural log of the *Total Population* to account for the possibility that cities serving more people are likely to have more advanced engineering for their sewer systems by necessity. I add fixed effects for states for two reasons. The first is that the EPA data collection gathered statistics form state agencies which may have had different reporting standards. The second reason is to account for the different environmental, regulatory, and funding environments cities in different states face. In a second regression, I add controls for other city demographics. I add the share that *Rents* their homes to account for the possibility that homeowners may be more likely to act politically to prevent overflows. I include the share of the population that is *Urban* to capture the difficulties rural areas may face in providing sewer systems to a dispersed population. I include the share of the population that is *Black*, *Asian*, and *Latino* to determine whether or not diversity alone can account for poor performance. I add the city's *Median Household Income* and *Per Capita Subventions* to measure the city's capacity to

raise funds for sewer maintenance and expansion. The results of these OLS regressions with robust standard errors are shown in Table 6.6 (summary statistics are in appendix Table A6.5).

Note: Linear regressions with fixed effects for states, robust standard errors presented.

The data reveal a significant correlation between segregation and sewer overflows. Living in a city with very little segregation, one can expect about 1.5 overflows per year on average. This increases to nearly 2.5 overflows in cities at the 95th percentile of the segregation distribution. Not only do segregated cities see lower spending on public goods, but they also witness worse performance as well.

Conclusion

The evidence presented here indicates that racial segregation plays a significant role in access to public goods. Segregated cities are comprised of homogeneous neighborhoods embedded in larger diverse communities. While African Americans, Latinos, and Asians are today, fairly likely to live as neighbors, whites remain in isolated enclaves. Because local governmental decisions often concern spatial allocation, neighborhoods are important municipal

actors in local politics. In more segregated places, neighborhood interests become overlaid with racial division. Segregated cities are more racially polarized in elections and may be less likely to generate policy consensus. The result is that cities with more segregation have smaller public goods budgets. Segregated cities raise fewer dollars from their residents and spend less money on roads, law enforcement, parks, sewers, welfare, housing, and community development. This low spending may have significant consequences. For example, segregated cities also see more sewer overflows.

Patterns of residential location reveal that white residents are more likely than people of color to live in cities with low levels of segregation. In my dataset, nearly 74% of nonwhite residents live in cities in the top quintile of the segregation distribution, compared to only 48% of whites. What this means is that compared to whites, nonwhites are much more likely to live in communities that struggle to generate adequate public goods for their residents. Not only are whites segregated from racial and ethnic minorities within cities, but they are also segregated from people of color across city lines. This fact means that access to public goods is segregated along racial lines as well. As the nation has become more diverse, it has also become more unequal. Segregation and public goods play important roles in linking these phenomena.

Chapter 7: The Local Roots of Modern Conservatism

Between the late 1940s and mid-1960s, fights over racial integration pervaded the politics of America's cities. Throughout the United States, residents battled over the integration of public schools, public transportation, pools, parks, golf courses, and of course – neighborhoods. In detailed case studies, historians have shown that white resistance to desegregation in urban centers across the country, gave rise to a new rhetoric that emphasized the protection of private property and homeowners' rights (Kruse 2005, Lassiter 2006, Self 2003, Sugrue 1996). These historical studies argue that the rise of conservatism and Republican allegiance associated with suburban America today was actually rooted in the conflictual racial politics of central cities. In this chapter, I provide evidence that these patterns were widespread. I show that battles over the control of public space and public goods in postwar urban America contributed to the transformation of the demographic landscape and affected public opinion. People who would come to live in segregated neighborhoods, either by choice, compulsion, or happenstance, developed political attitudes and loyalties that differed significantly from similarly situated residents in more integrated places.

First, I show that federal school desegregation orders generated increases in the number of segregated neighborhoods in metropolitan areas. In this analysis, I take advantage of the randomness desegregation order timing to substantiate the link. Then, I provide evidence that the relative whiteness of a neighborhood in 1970 is a powerful predictor of political attitudes and loyalties today. People who live in places that were whiter than their metropolitan area in 1970 were more likely to vote for the Republican presidential candidate in 2008 and are more conservative than their individual attributes (e.g. race, gender, marital status, age, education, income, presence of children) would otherwise predict. Conversely, those who live in places that

were more diverse in 1970 are more liberal today. However, even with a set of individual-level controls, it is difficult to convincingly estimate the effect of neighborhoods on public opinion. Some unmeasured characteristic might cause certain neighborhoods to be more or less diverse than the larger metropolitan area in 1970, and for individuals who live there to be more or less liberal. Given existing evidence that racial attitudes became a more important predictor of vote choice and public opinion during this same period (Carmines and Stimson 1989), it is important ensure that these relationships are being driven by the attributes of neighborhoods and not omitted individual-level variables. To do this, I instrument for the relative whiteness of neighborhoods using two geographic features: land elevation (controlling for waterfront areas) and distance from the nearest big city.

The consequences of segregation on individuals' life chances are well known; and as Thomas Sugrue (2015) writes, "the effects…are devastating."[133] Segregation increases inequality on many different socio-economic dimensions (Cutler and Glaeser 1997, Ananat 2011). The results presented here indicate that segregation also has powerful political consequences - increasing divisions in both public opinion and voting behavior.

Entanglements of Ideology and Integration

At the onset of the Second World War, the United States was already a very segregated nation. All large cities had clearly defined neighborhoods inhabited by people of color and others inhabited by whites – a pattern generated by both private choices and public policies (Massey and Denton 1988). [134] As a result of the economic collapse during the Great Depression

133 https://www.washingtonpost.com/opinions/its-not-dixies-fault/2015/07/17/7bf77a2e-2bd6-11e5-bd33-395c05608059_story.html

134 However, on the whole, the United States, both rural and urban, was still overwhelmingly white in 1940. About 10% of the population was black, about 1.7% of the population could be considered Hispanic/Latino, and about

and then material scarcity during the war, the nation faced a severe housing shortage during the 1940s. When increasing numbers of blacks moved from rural areas into cities and from the South to the North and West, the boundaries of existing black neighborhoods were pushed to their limits. In the Southwest, the Latino population also swelled with wartime employment.[135] These pressures resulted in explosive social and policy conflicts along racial lines. Because city governments had the power to zone, to permit development and locate nuisances, and thus to determine the value of property, these fights were central to city politics. As Self (2003) argues, "the effects of property [valuation] are far-reaching…They structure all kinds of interactions - from where one can buy a home to where politics is organized, from how police interact with neighborhoods to where children go to school. The struggle for the postwar city was over no less than the power to control and organize space…" (p18).

In response to postwar demographic changes, white homeowners sought to protect their neighborhoods (which they considered to be the reward for their hard work and frugality) from disruption and disorder. In the minds of many, pursuit of these goals required racial exclusivity. Sugrue (1996) reports that in Detroit, as elsewhere, "a majority of whites looked to increased segregation as the solution to [the] 'colored problem'" (p215). Whites, particularly those who owned their homes, believed that they had a right to certain neighborhoods and the public benefits (e.g. schools, safety) associated with those spaces. They understood minority demands for integration and court ordered desegregation plans as undermining this entitlement (Kruse 2005, p126). Whites justified exclusion with fiscal arguments; claiming that, "since Negroes are

0.1% Asian. http://www.latinamericanstudies.org/immigration/Hispanics-US-1850-1990.pdf; https://www.census.gov/population/www/documentation/twps0076/twps0076.pdf

[135] http://www-bcf.usc.edu/~philipje/Segregation/Haynes_Reports/Contours_PRR_2001-04e.pdf. Hundreds of thousands of Mexican descendants were deported during the Great Depression, so the overall Latino share of the population changed little.

so poor and pay virtually no taxes, they are actually not entitled to get more public services than the whites care to give them…" (Myrdal 1944, p336). When blacks *did* receive benefits, it was believed that whites unfairly bore the financial burden of their support. To illustrate this point, Kruse (2005) quotes a segregationist poem that made rounds in Atlanta in 1957:

> Po' white folks must labor, 'tween sun and sun,
> To pay welfare taxes whilst we has de fun,
> We doan pay no taxes, we doan make no goods,
> We just raise little niggers, way back in the woods.... (p127).

Above all else, whites feared that integration would jeopardize their single largest investment – the value of their home (Helper 1969), as well as the quality of their neighborhood (Kruse 2005). The tight coupling between property values, public goods, and racial exclusivity was inexorably tied to the racism embedded in the real estate market (Hayward 2013) and the poor public goods that cities had provided to neighborhoods of color in decades past (Myrdal 1944, Torres-Rouff 2013). Kruse (2005) explains that, "by the time white homeowners confronted racial transition at their neighborhood's borders, the American real-estate industry had completely embraced the idea that such racial transition would, without doubt, lead to a devastating decline in property values" (p60). Public policies like redlining and expulsive zoning[136] and private actions like racial steering and white flight would make this relationship true over the long run.[137]

[136] Expulsive zoning is the practice of siting industrial, semi-industrial, or other nuisances in neighborhoods of color in order to both preserve white neighborhoods and induce black movement into particular parts of the city.
[137] In the short run, blacks paid much higher prices than whites for comparable housing (Cutler and Glaser 1997). This fact was what made it so lucrative for individual whites to abandon neighborhood protection and move to the suburbs. In Atlanta, Kruse (2005) analyzes the property values in a neighborhood that transitioned from white to black between 1950 and 1960, and finds that the property values rose 27 percent over this decade.

Although many whites agreed on the desirability of residential segregation,[138] they were stymied by various hurdles. The Supreme Court had ruled racial zoning (the designation of certain neighborhoods as being inhabitable only by whites) unconstitutional in 1917, so a perfectly direct policy approach to residential segregation was not an option.[139] Instead, the preservation of white communities required collective action to prevent individual homeowners from selling or leasing to minority residents. As minority populations expanded and white homeownership rates skyrocketed, hundreds of white homeowners' organizations arose in the 1940s, 50s, and 60s (Sugrue 1996, Kruse 2005).[140] Such organizations were often created by real estate developers to protect the value of their investment. This was a charge taken seriously by property owners. These (typically all white) "civic associations, productive associations, improvement associations, and homeowners' associations" (Sugrue 1996, p211) fought the building of public housing in their neighborhoods, sought representation on planning boards, and battled open housing laws (Self 2003).[141] Importantly, they relied on racial restrictions in housing deeds (and racism in the real estate market) to maintain neighborhood exclusivity. But the Supreme Court ruled restrictive covenants unenforceable in 1948 (*Shelley v. Kraemer*), and an open housing movement swept the nation. Then, in the 1950s, other tools of segregation came under fire as the court struck down separate-but-equal accommodations in a series of cases.[142]

---

[138] In 1964 only 27% of white Americans supported general integration (Schuman et al 1985).
[139] Many white neighborhoods also utilized violence to defend their borders (Meyer 2000, Hirsch 1983). Although tolerated (even encouraged) by the police and political establishment of some cities, murders and arson were technically illegal as well.
[140] In some cases, the link between segregationists and homeowners' groups was direct. For example, the head of Atlanta's West End Cooperative Corporation had gotten his start in community organizing as the head of Klavern No 297's Housing Kommittee (Kruse 2005 p54).
[141] They also served as social organizations welcoming new neighbors and organizing block parties (Sugrue 1996).
[142] e.g. *Muir v. Louisville Park* 1953, *Brown v. Board of Education* 1954 & 1955, *Holmes v. Atlanta* 1955, *Dawson v. Baltimore* 1955, *Rice v. Sioux City Memorial Park Cemetery* 1955, *Browder v. Gayle* 1956, *Burton v. Wilmington* 1961, *Johnson v. Virginia* 1963, *Simkins v. Cone Memorial Hospital* 1963, *Watson v. City of Memphis* 1963.

By this time, nearly all cities utilized zoning in some fashion and many invoked the power of eminent domain to shape development through, for example, the permitting of multi-family housing, the razing of slums, and the placement of highways, public housing, and industry. In the past, white homeowners had successfully used these tools to configure residential demography (Nightingale 2006) – but they became even more important in the face of new court decisions and the rising Civil Rights Movement.[143] At the same time, racial violence continued to erupt. However, local elites were committed to maintaining peace in their cities (Ogorzalek 2017). So, in order to convince city governments to defend their turf, white neighborhoods needed to change their approach.

In city after city, white middle class, homeowners turned away from claims based on racial exclusivity and began to press their demands in terms of rights; a tactic Sugrue (1996) terms "defensive localism" (p210). White residents fought for the, "'right' to select their neighbors…the 'right' to do as they pleased with their private property…and the 'right' to remain free from what they saw as dangerous encroachments by the federal government," (Kruse 2005, p9). Local governments responded with neighborhood protection by pursuing "racial stability through spatial apartheid" (Lassiter 2006, p52). In the South, these arguments were the moderate path – a response to violent white supremacy on the right and integrationists on the left (Lassiter 2006, Kruse 2005). The fact that rights-based language gained ground in all regions of the United States meant that it offered a powerful basis for the rise of a national movement.

[143] Throughout this period, neighborhood organizations also sought to maintain the color line using private mechanisms as well. For instance, some organizations raised funds to repurchase homes sold to black families in order to sell them back to whites. They also pressured real estate agencies and lenders to refuse to sell to black buyers. Additionally, they set fire to homes on the black market and newly purchased homes by black owners (Kruse 2005, Sugrue 1996). The problem with such tactics is that they were always susceptible to a sort of prisoner's dilemma. It was incredibly lucrative for a single white homeowner to sell her home to a black family and this idea made individual white owners skittish about neighborhood transition. Neighborhood organizations constantly urged owners to think of the common good rather than their bottom line, but frequently failed.

The discourse had several facets. Subscribers claimed support for racial integration in theory (so as to distinguish themselves from the ugliness of Jim Crow), but angrily opposed government intervention in racial uplift or equalization (Lassiter 2006, p137). In fact, integration was typically viewed in zero-sum terms – gains for blacks equated to losses for whites. Government attempts to produce equal outcomes were understood to be an elevation of minority rights above those of the majority (Sugrue 1996, p227), a form of "reverse discrimination" (Lassiter 2006, p123). Policy solutions to redress inequality were cast as the work of an insidious, "'liberal elite' made up of judges, intellectuals, and government bureaucrats" (Hall 2005, p5).

Further drawing on racialized beliefs about the distribution of tax burdens, neighborhood defenders argued that they should not have to pay for public benefits or welfare for those who did not contribute to the public pool. So when people of color demanded, and then the court ordered, desegregation of public spaces and residential communities, these views culminated in all out tax-revolts among white residents. In cities like Atlanta, whites urged the city government to eviscerate the public budget, eliminate bus lines, as well as close pools and public parks (Kruse 2005). Whites voted down bonds for civic improvements, abandoned public schools, and railed against an activist government. In the end, many of these residents would leave the city altogether – packing up their belongings and their newly appropriated ideology and moving to the suburbs (Nall 2015, Boustan 2010).

Yet, suburban growth largely happened for market reasons that were unrelated (or at least, only tangentially related) to racial conflict in cities (Jackson 1985). As Chapter 1 revealed, by 1970, a plurality of the population lived in suburbs and more than 60% of Americans owned their homes. As the pace of suburbanization and homeownership picked up, arguments

surrounding neighborhood defense lost explicit racial designations of who contributed and who did not and who had a right to high property values and good services and who did not. As Self (2003) explains, the move away from making overt racial claims was, "intended to inoculate segregation and white privilege against charges of racism" (p268). This new language offered a "color-blind" approach to the maintenance of neighborhood boundaries. This rhetoric perpetuated the myth that residential segregation was a matter of economics and individual choice. White homeowners came to see segregation as the consequence of "meritocratic individualism" – not fostered by public policy or law (Lassiter 2006, p1). Those who lived in segregated minority neighborhoods could thus be blamed for their condition, making them undeserving of social assistance.

Maintaining exclusively white neighborhoods in the central city was possible with the help of cooperative city governments. But it was much easier in the suburbs, where a combination of public policies and private actions made homeownership only available to white residents (Jackson 1985, Hayward 2013). By 1970, neighborhoods (both within central cities and outside of them) that had maintained their whiteness despite the massive demographic shifts over the preceding 30 years had developed a distinctive, conservative approach to politics throughout the nation. Homeowners in these places expected low taxes, they rationalized racial segregation and inequality as the product of meritocracy, and they conflated white exclusivity with high property values (Self 2003, Lassiter 2006). They couched their demands in terms of protection of individual property rights. In so doing, they drew on a long tradition of American conservative principles emphasizing economic individualism, limited government, and equality of opportunity, but not outcomes (Feldman 1988, McClosky and Zaller 1984, Kinder 1998).

Nearly forty years later, these neighborhoods continued to foster distinctive politics. Whether or not new arrivals to defended neighborhoods had been involved in the earlier battles, they came to, "accept the politics born out of white flight all the same. They embraced a new middle class rhetoric of rights and responsibilities" (Kruse 2005, p245). The Republican Party came to embrace the neighborhood defenders. Starting in the 1960s and throughout the 1970s, Republicans positioned themselves as the party that would help whites to resist social change and impose order in their environments (Hetherington and Weiler 2009, Carmines and Stimson 1989). These ideals held sway in defended neighborhoods and residents dutifully sorted themselves into the Republican Party.

The arguments appropriated in support of neighborhood defense in the 1950s and 60s are still visible in politics today. In the 2012 presidential election, Republican nominee Mitt Romney proclaimed:

> There are 47 percent of the people who will vote for [the Democratic incumbent] no matter what…who are dependent upon government, who believe that they are victims, who believe the government has a responsibility to care for them, who believe that they are entitled to health care, to food, to housing, to you-name-it. That that's an entitlement. And the government should give it to them….These are people who pay no income tax…My job is not to worry about those people. I'll never convince them they should take personal responsibility and care for their lives (Corn 2013).[144]

Like the homeowners' organizations of the mid-century, Romney's statement invoked a class (not race)-centered view of deservingness. Forty-seven percent of the American public, Romney implies, "doan pay no taxes," and rely on government benefits for subsistence. Romney's claim

[144] More boldly, 2016 Republican nominee Donald Trump's first wife explained, "I have nothing against Mexicans, but they [come] here — like this 19-year-old, she's pregnant, she crossed over a wall ….She gives the birth in American hospital, which is for free. The child becomes American automatically. She brings the whole family, she doesn't pay the taxes, she doesn't have a job, she gets the housing, she gets the food stamps. Who's paying? You and me." http://nypost.com/2016/04/03/ivana-trump-opens-up-about-how-she-advises-donald-his-hands/

that these non-contributors do not take personal responsibility for their lives recalls the meritocratic arguments white homeowners made in the past about their success and their neighborhoods. It is unsurprising then, that defended neighborhoods have offered disproportionate support to Republican candidates and conservative policies in recent years.

The Effect of Context

To say that neighborhoods condition political views and actions is not novel. A great deal of research investigates contextual effects on public opinion and political behavior. A significant portion of this literature focuses (as I do here) on the community's racial composition.[145] Some scholars find that diversity produces tolerance (e.g. racial contact theory; Allport 1954, Oliver 2010, Sigelman et al. 1996). Others find the reverse - that large minority populations are related to racial intolerance and lack of support for spending on race-focused or race-coded policies (e.g. racial threat theory; Key 1949, Gay 2006, Huckfeldt 1986, Orey 2001, Taylor 1998, Bobo and Hutchings 1996, Blalock 1967, Alesina and Glaeser 2004, Tolbert and Hero 1996, Plotnick and Winters 1985, Enos 2016, Baybeck 2006). Scholars also find a negative relationship between diversity and support for taxation, spending, and public goods provision more generally (Alesina et al. 1999; Glaser 2002; Alesina and Spolaore 1997; Easterly and Levine 1997; Poterba 1997; Habyarimana et al. 2007, 2009; Putnam 2007; Cutler et al. 1993; Goldin and Katz 1999, Hopkins 2009, Vigdor 2004). My argument draws on both of these frames to argue that rights-oriented conservatism was fueled in an environment of racial threat (integration in the 1940s, 50s, and 60s), but became entrenched in an environment of racial isolation (whiteness of the neighborhood in the 1970s). Today, white conservatism at the

[145] Other work on context analyzes social networks (Eulau and Rothenberg 1986, Zuckerman 2005), partisan contexts (Ceaser 2013 and DiSalvo 2006) and economic contexts (Gay 2006, Books and Prysby 1999, Oliver 1999, Oliver and Mendelberg 2000)

individual level is associated with homogeneity *not* diversity in neighborhoods. The whiteness of a neighborhood could produce individual-level conservatism through two different mechanisms: the nonrandom migration of individuals into or out of whiter neighborhoods (i.e. sorting/selection), or by directly affecting the ideology of residents (i.e. treatment). The sorting mechanism is supported by research demonstrating the existence of white flight (Boustan 2010, Nall 2015) and work that offers evidence of residential choice based on differing preferences for integration and other community features (Mummolo and Nall 2016, Cho, Gimpel and Hui 2013, Bishop and Cushing 2008, Card, Mas, and Rothstein 2008, Charles 2006). A treatment effect is consistent with work showing that particular types of places generate distinctive preferences as a result of features like population density or community size (Rodden 2011, Gainsborough 2001, Ogorzalek 2017, Oliver 2001).

Treatment is also consistent with work revealing differences across places that magnify the individual attributes of inhabitants – such as when minority neighborhoods lack elite networks (Wilson 1987, Widestrom 2015). A treatment effect is further predicted by scholarship that finds that neighborhood homogeneity breeds racial hostility and intolerance due to a lack of exposure to or contact with neighbors of different backgrounds (Oliver and Mendelberg 2000, Oliver and Wong 2003). Finally, a treatment effect is indicated by scholarship demonstrating what Acharya, Blackwell, and Sen (2016) refer to as the "historical persistence of political attitudes" (p2). Patterns of race relations developed during early periods of American history generated opinions and behaviors among whites in particular places that were transmitted over time and remain detectable in modern politics (see also Hersh and Nall 2016). My argument is similar: battles over integration that occurred mid-century imbued defended neighborhoods with distinctive political attitudes that are communicated through processes like neighborhood social

interaction (Huckfeldt and Sprague 1995) and/or "low-intensity cues" - the casual observation of ones' neighbors (Cho and Rudolph 2008).

Very likely, both selection and treatment processes are at work here. Some residents of defended white neighborhoods brought their conservatism with them; others adopted it after arriving. Today, defended neighborhoods are also likely to continue to attract movers with conservative preferences. Without detailed panel survey data, I cannot discern which is the more powerful factor. What I am able to demonstrate is that neighborhood traits from the 1970s predict conservatism at aggregate and individual levels above and beyond the mobility of the population and the demographic makeup of the neighborhood today.

Conservatism and Race

Just as it is not novel to propose that neighborhoods affect political behavior, it is also not novel to propose that modern conservatism and Republican voting are rooted in racial conflict (see Hutchings and Valentino 2004 for a thorough review). Indeed, it is uncontroversial to state that the Civil Rights movement was a catalyst for partisan realignment, as Southern Democrats abandoned the party championing the rights of Black Americans (Frymer 1999, Carmine and Stimson 1989, Miller and Shanks 1996).

Since the 1970s, scholars have argued that white public opinion shifted mid-century, from a willingness to endorse Jim Crow style race prejudice/biological racism to subtler/symbolic expressions of racial resentment (see for example, Sears and Kinder 1971, Kinder and Sears 1981, McConahay 1982, Sears 1988, Kinder and Sanders 1996, Sears et al. 1997, Bobo 1983, Bobo, Kluegel, and Smith 1997, Schuman et al. 1997).

Additionally, a sophisticated literature on public opinion and political behavior reveals that racial attitudes are strongly predictive of views toward redistributive spending (Bobo and Kluegel 1997, Sears 1988, Kinder and Sanders 1996, Rabinowitz et al. 2009, Federico 2005, Gilens 1999, Quadagno 1994, Luttmer 2001) and government policies that have become racially coded (Winter 2006, Valentino, Hutchings, and White 2002, Mendelberg 2001, Hurwitz and Peffley 1997). If an individual holds negative stereotypes of racial minorities, he or she is likely to oppose expenditures on functions like welfare, and even all government spending in some settings (Sears and Citrin 1982).

What I add to these debates is not a link between racial politics, public opinion, ideology, and party identification, but a new perspective on location. The marriage between rights-based conservatism and white perspectives on race was amplified in the crucible of *city* politics throughout the postwar period not just at the state and national levels. And neighborhood defense appears to have played a causal role in the development of a host of conservative political opinions that appear to be "nonracial" (Hutchings and Valentino 2004, p6).

Empirical Evidence

I've argued that local battles over integration of public spaces in the postwar period led some whites to pursue exclusively white neighborhoods. To generate government support for segregation, neighborhood defenders turned to a set of conservative arguments that highlighted their meritocratic success. Because the Republican Party protected defenders' rights to choose their neighbors, it won their allegiance. If my argument is correct, we should find 1) that integration pressures are related to a higher incidence of exclusively white neighborhoods and 2) that residents of homogeneous white neighborhoods are more conservative and more Republican.

Testing these claims requires that I measure the presence of exclusively white neighborhoods (as the dependent variable in the first hypothesis, and as the independent variable in the second). To do this, I constructed a dataset using a proprietary product developed by GeoLytics called the Neighborhood Change Database (NCDB). The NCDB matches and normalizes census tracts between 1970 and 2000, allowing for a direct comparison of neighborhoods over time. To this, I add census tract data from the 2011 American Community Survey, matched to 2000 boundaries. I refer to neighborhoods that have a greater share of white residents than the metropolitan area as a whole as white defended neighborhoods; conversely, neighborhoods that have a greater share of residents of color than the metro area are called minority dominated neighborhoods. I use this relative conception because many residents are constrained to a particular metropolitan area by preferences or needs (Mummolo and Nall 2016), but the choice of neighborhood within that metro area may be more flexible. I capture this dynamic by measuring the demographic makeup of neighborhoods *compared to* the demographic makeup of their larger metropolitan area. This variable is the *Tract-Metro Difference in Percent White Residents.*[146] Neighborhoods that are whiter than the metro area as a whole have a positive value and those that have more people of color take on a negative value. In 1970, the average neighborhood was only very slightly whiter than the metro area (Mean= 0.018), but the distribution has a long left tail, indicating many neighborhoods that were overwhelmingly populated by people of color; by 2011, the distribution was more normally distributed, with a mean just slightly less than zero. This difference in distributions reflects the diversification of the nation and the well-documented finding that neighborhood level segregation between whites

[146] The census did not tabulate whites separately from Hispanics in 1970, but did in 1980, 1990, 2000, and 2011. Where possible I use non-Hispanic whites

and people of color has declined substantially since the 1970s (Vigdor and Glaeser 2012, Frey 2014).

In order to determine the effect that pressures for integration had on neighborhood demographics, I take advantage of a dataset compiled by Nathaniel Baum-Snow and Byron Lutz (2011) that records the timing of federal court orders for desegregation of public schools in central cities.[147] Although *Brown v Board of Education of Topeka* determined the unconstitutionality of segregated schools, a specific court order was nearly always required for large, central city districts to pursue desegregation plans. The data include court orders implemented between 1960 and 1990 for 92 central school districts in metropolitan statistical areas. Of these 92 orders, 48 are in the South, 9 are in the Northeast, 20 are in the Midwest, and 15 are in the West.

My examination does not include metropolitan areas that never faced a desegregation order. The factors that led some metro areas to receive court-ordered school desegregation plans and others not to receive such plans are most certainly not random, and are likely related to the outcome of interest here (the presence of white defended and minority dominated neighborhoods). Inclusion of the districts with no court order would thus be likely to violate the identifying assumption on the desegregation parameter. However, for those central cities in metropolitan areas that *did* receive an order, the timing of that order is plausibly exogenous to unobserved time-varying factors *within* metropolitan areas that might affect segregation due to the vagaries of the judicial process. The precise date at which court orders took effect was

[147] The data are described completely in the statistical appendix to Baum-Snow and Lutz (2011)'s paper. The appendix is available at: https://www.aeaweb.org/aer/data/dec2011/20080918_app.pdf

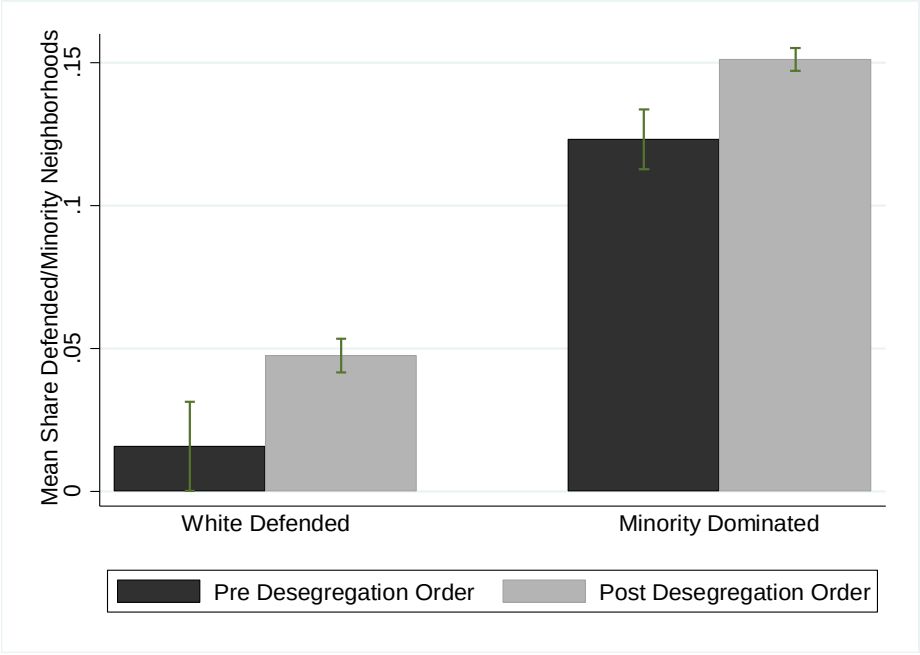
related to differences in the length of the appeals process for otherwise similar metropolitan areas (Baum-Snow and Lutz 2011).

Including Metropolitan Statistical Area (MSA) fixed effects ensures that the analysis compares the presence of defended/minority neighborhoods before and after the implementation of the court order in each metro area, while accounting for variation across MSAs. For each metropolitan area, in each of four census years (1970, 1980, 1990, and 2000), I calculated the mean *Tract-Metro Difference in Percent White* and the standard deviation of this measure. I then generated a count of census tracts that were either greater than or less than one standard deviation away from the mean racial difference for each census year in each MSA. These counts form the numerator for the share of all neighborhoods that are *White Defended* or *Minority Dominated*. These shares serve as dependent variables in my analyses. The key independent variable in my analysis, *Desegregation Order*, is a dummy indicator coded from the Baum-Snow and Lutz (2011) data noting whether or not a desegregation order was in place in the MSA's central city for a given census year. The analysis compares the number of defended/minority neighborhoods before and after the implementation of desegregation by the federal government in each MSA.[148] As controls, I add the log of the *Total Population* in the MSA, the share of MSA households *Renting* their homes, the *Wealthy* share of households (households with incomes above the 90th percentile), and the population *Density* of the MSA. While it is unlikely that these factors are related to desegregation order timing, directly, it is possible that they reflect an underlying time trend that influenced implementation as well as the propensity for

[148] Of the 92 metro areas in the dataset, 64 had orders implemented between 1970 and 1990. Because tract-level data was not available for most areas in 1960, I am unable to estimate change for 28 metro areas. These MSAs are still included in the regressions – just with no change on the desegregation order variable.

segregation. Figure 7.1 displays the marginal effects of desegregation orders, holding the control variables at their mean values.

Figure 7.1: Federal Desegregation Orders Increase Residential Segregation



The figure shows that desegregation orders significantly increased the share of neighborhoods that were both white defended and minority dominated. On average, desegregation orders generated about 30 new homogeneous neighborhoods in metropolitan areas. Homogeneity was achieved when **whites** moved within cities to new neighborhoods and to the suburbs.[149] Approximately two-thirds of the exclusive white neighborhoods in this dataset

[149] Baum-Snow and Lutz (2011) provide evidence that Black families responded to desegregation orders by moving into newly integrated central school districts suggesting that changes in homogeneity of neighborhoods would have been driven by white not black movers.

are located in suburban places and about three-fourths of the homogeneous neighborhoods of color are located in central cities.

Did these homogeneous neighborhoods produce identifiably different politics? In short, yes. To provide evidence of this claim, I measure the homogeneity of neighborhoods continuously for a single year - 1970. I use 1970 because this year marked the height of residential segregation in America and the end of the post-war period of massive demographic change (Cutler, Glaeser, and Vigdor 1999). First, I analyze the effect of neighborhood homogeneity on the aggregate 2008 presidential vote. Then, I turn to individual-level data. I find that homogeneity in 1970 predicts conservatism today.

My first dependent variable is the 2008 *Democratic Share* of the two-party presidential vote aggregated to the census tract level for the 49 states that collect vote data by precinct.[150] Precinct-level vote returns are available from the Harvard Elections Database Archive.[151] Using ArcGIS, I combined the precinct vote data with 2000 census tract boundaries available from the National Historic Geographic Information System archive.[152] I aggregated precinct-level votes to the census tract level.

My independent variable is the *Tract-Metro Difference in Percent White, 1970*. This measure captures the difference between the tract-level share of residents who were white and the metro area-level share of residents who were white in 1970. I control for the 2000 tract-level *Percent White*, the share of the tract that *Rents* their home, and the share of the tract's households

150 Oregon conducts all elections by mail, so geographically allocated votes are not available.
151 A combined, projected polygon shapefile was very generously provided to me by Clayton Nall.
152 Because precinct boundaries sometimes cross-tract boundaries, I calculated the land-area share of each precinct falling within each census tract. I used this geographic share as a weight on the total votes for the Democratic and Republican candidates before aggregating precinct vote totals to the tract level.

that are *Wealthy* (incomes above the 90th percentile). These variables account for the possibility that whiter tracts in 1970 are simply populated by more whites and homeowners today, and so, are more conservative only as a result of their current demographics. I also add the *Density* of the census tract (total population divided by total area) to account for Rodden's (2011) argument that the source of modern liberalism is housing density. To investigate the role of selection, I add a measure of the share of the tract's residents who lived in the same house in 1995. In a third analysis, I add fixed effects for region. In all analyses, I use ordinary least squares regression and cluster errors by MSA. Table 7.1 presents the results of these regressions. Summary statistics are shown in appendix Table A7.1.

Table 7.1: Effect of 1970 Relative Whiteness on 2008 Democratic Vote Share

A neighborhood of color in 1970 (*tract-metro difference* = -0.5), delivered about 84% of its votes to Barack Obama in 2008. A neighborhood that was white defended in 1970 (*tract-metro difference* = 0.5) offered Obama only 42% of its votes in 2008.[153] Obviously,

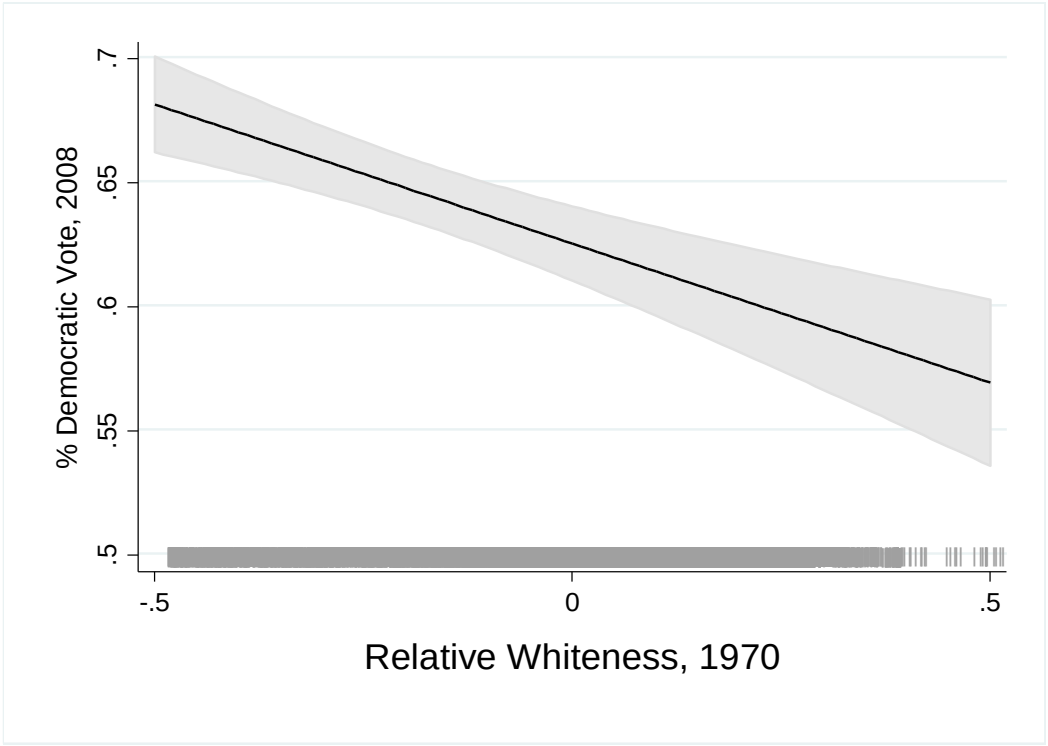
[153] Estimates generated following the regression presented in Column 1, using the margins command in Stata 14.

demographic patterns are persistent – one explanation for this outcome is that these neighborhoods that were white defended and minority dominated in 1970 are still populated with whites and people of color today. But as Column 2 shows, even accounting for contemporary demographics, neighborhoods that were relatively whiter in 1970 were about 11 percentage points less likely to support Obama relative to McCain. The difference between the least white and most white neighborhoods in 1970 is 22 percentage points – even controlling for whiteness in 2000.

Contrary to a pure selection story, census tracts with more stable populations were more (not less) likely to support Obama and there is no interaction effect between stability of the population in 1995 and the whiteness of the neighborhood in 1970. That is, if selection were entirely driving these results, we would expect that tracts that were both white in 1970 and had a large share of movers would be most likely to support the Republican candidate. This is not what we see. Holding all other variables at their mean values, Figure 7.2 presents the results from Column 2 graphically for the densest portion of the distribution on the independent variable.[154]

[154] This portion of the distribution reflects the concepts of white defended and minority dominated neighborhoods. The mean value of the 1970 tract-metro difference in percent white for minority dominated neighborhoods was -0.5 and 0.25 for defended neighborhoods.

Figure 7.2: Effect of 1970 Neighborhood Characteristics on 2008 Presidential Election Votes, Controlling for Demographics in 2000



The third column of Table 7.1 reveals that the relationship holds even when accounting for differences in mean levels of Democratic support across regions. Despite the robustness of the effect of 1970 demographics on 2008 presidential votes, it is possible that some set of uncontrolled factors affect the relative whiteness of neighborhoods in 1970 and Republican support in 2008. In an effort to determine a causal neighborhood effect, I instrument for relative whiteness in 1970 with topographical features measured at the census tract level - relative elevation of the census tract (accounting for waterfront neighborhoods) and the tract's distance from the nearest large city.

Starting perhaps with Burgess's concentric zone model of urban social structure (1925), scholars have noted that metropolitan areas often develop such that the most desirable residential neighborhoods are those that are as far as possible from the central business district, but still within commutable distance. From early on, distance from the center denoted privilege; and the historical record indicates that movement to outer lying areas was more available to whites than people of color for many decades (Jackson 1985).[155]

To measure distance from the nearest central city, I used 2010 place boundaries available from the National Historic Geographic Information System. Using data from the 2011 American Community Survey, I determined the largest population center in each metropolitan area. I converted these central cities and 2000 census tracts to centroids in ArcGIS. I measured the Euclidean distance between the closest central city and each census tract (using a near table with only one match). To generate a normal distribution, I took the natural log of this distance. The resulting measure, *Distance to Center City* (logged), is my instrumental variable.

To be useful, an instrumental variable must predict the primary independent variable, but not directly affect the dependent variable. As explained above, there is good reason to believe that a neighborhood's distance from the nearest central city positively affects the share of residents who are white in that community. There is no reason to believe that neighborhoods that are far from the city center will house Republican supporters *aside* from their demographic characteristics. However, race is not the only relevant demographic trait. Living outside of the city center also requires residents to be able to afford housing and commuting costs and

[155] That said, at no point in American history has it been the case that black central cities have been ringed by heavily populated white suburbs. This is because when suburbs WERE all white (in the 1920s), they were not heavily populated and central cities were majority white as well. By the time some central cities became majority minority, suburbs had also become more integrated. This fact is further evidence that the correct measure of residential racial context is the racial makeup of the neighborhood as compared to the metropolitan area as a whole.

obviously, race is correlated with socio-economic status. I account for this by adding the share of households in the tract that *Rents* their homes, and the share of households that are *Wealthy* as of 1970 in the first stage of the instrumental analysis.

As in the regressions presented in Table 7.1, my instrumental analysis controls for the share of the population that is white in 2000, the share of the tract that lived in the same house in 1995, and the tract's population density. My dependent variable is again the tract-level aggregate measure of the two-party *Democratic Vote Share* in 2008. I use a two stage least squares regression, with errors clustered by MSA. Table 7.2 presents the results of this estimation.

Table 7.2: Effect of 1970 Relative Whiteness on 2008 Democratic Vote Share, Instrumental Variable Analysis

The results of the instrumental variable analysis offer strong additional support for my argument that the defended/minority status of a neighborhood in 1970 continues to exert a powerful, independent, causal effect on partisanship in modern elections. The political identity of neighborhoods appears persistent. In the next section, I provide individual-level evidence of the conservatism of defended neighborhoods.

Individual Level Conservatism

Obtaining individual-level survey data that is representative of city populations is notoriously difficult (Tausanovitch and Warshaw 2014). The costs of sampling across many localities, in addition to the complexity of designing specific surveys for each community, are typically prohibitive for scholars. Instead, I take advantage of the long time series and consistent battery of questions asked by the General Social Survey (GSS). The GSS administers a survey

to an average of 2,000 respondents representing adults living in non-institutional arrangements in the United States on a biennial basis. I create a new dataset built from restricted access GSS data from the 1998, 2000, 2002, 2004, 2006, and 2008 surveys.[156] To the GSS data set, I merge tract and MSA level census data from 1970. To measure contemporary neighborhood demographics, I add linearly interpolated data from the 1990 and 2000 Census of Population and Housing and the 2007-2011 American Community Survey. For tracts not included in the American Community Survey, I use 2000 census data for all years of the GSS. The combined dataset includes tract-level data for 12,188 respondents from 117 metropolitan areas with an average of about 100 respondents per metro area.[157] Although the GSS asks an enormous range of questions each year, only a subset of the survey questions is repeated. This repetition is crucial for my ability to estimate neighborhood effects because I rely on pooling across years to gain a large enough sample size. As a result, I restrict my analyses to questions that include at least 5,000 usable responses. At this threshold, the analyses include an average of 50 responses from each MSA. For the most part, my analyses only include white respondents, as this is the relevant population for my theory.[158] I begin by determining the demographic characteristics of individuals who live in neighborhoods that were defended/segregated in 1970. In this analysis, my dependent variable is the 1970 *Tract-Metro Difference in Percent White* described above. My independent variables include several demographic traits that are known to correlate with vote choice and ideology (Miller and Shanks 1996, Carmines and Stimson 1986, Green, Palmquist and Schickler 2002): the respondent's race (a dummy variable coded 1 for *White, non-*

156 These are the years for which the GSS was able to provide census tract level information for every respondent, which is essential to my analysis. The tract-level information was provided in response to a sensitive data request submitted to the National Opinion Research Center at the University of Chicago.
157 Respondents who live outside of metro areas are excluded from these analyses.
158 It is interesting to note that the results hold for non-white respondents as well. This adds further evidence to my claim that neighborhood context is associated with political conservatism above and beyond the aggregation of residents' demographic traits.

Hispanic)[159], *Age*, *Education* (where 0 is less than high school and 4 is a graduate degree), sex (coded 1 for *Female*), the total number of *Kids* under the age of 18 living at home, marital status (coded 1 for *Married*), and inflation adjusted *Income.*[160] I also add the variable *Mover*, that is coded 1 if the respondent lived in a different city or state when she was 16 years old and 0 if she has lived in the same city.[161] To account for the hierarchical structure of the data, I estimate a multilevel mixed-effects linear regression via maximum restricted likelihood, with random effects at the MSA level. This strategy adjusts the estimates and their errors for place-based correlations in attitudes. Table 7.3 presents the results (summary statistics are shown in appendix Table A7.2).

[159] The GSS has a relatively small sample of non-Black racial and ethnic minorities, so I combine all nonwhite racial/ethnic categories.

[160] Approximately 10% of the observations are missing income data. I imputed observations by regressing income on age, education, gender, race, work status, marital status, the number of people in the household, the size of the city, the presence of children at home, and dummy indicators for year for the non-missing observations, generating predicted values, and replacing the missing observations with the predictions.

[161] Ideally, we would like to know whether or not the respondent moved neighborhoods as well, but the GSS does not ask this question.

The estimation reveals few surprises. For example, holding all other variables at their mean values, white respondents live in neighborhoods that were whiter than the metro area in 1970 (0.06), while respondents of color live in neighborhoods that were less white (-0.04). More educated respondents live in neighborhoods that were whiter, as do married, and higher income respondents. Respondents who had moved cities or states since they were 16 chose neighborhoods that were about 4 percentage points whiter than the metro area. Respondents who live in the same city tend to live in neighborhoods that mirrored the metro area. Those with children living at home tend to live in neighborhoods that were less white in 1970, but among middle and high-income respondents this effect reverses. That is, middle and high-income families with kids at home live in significantly whiter neighborhoods.[162] A similar interactive effect occurs with age. Among the poor, older residents live in neighborhoods that were significantly less white in 1970, but among middle and high-income residents, there is no relationship between age and neighborhood characteristics. These results point to several interesting conclusions. First, the results appear to indicate that neighborhoods that were whiter than the metro area in 1970 are more expensive and more desirable. They also suggest that sorting is likely to have played a role in the development of ideology and partisanship of particular places. Finally, these results indicate that it is necessary to control for all of these individual demographic characteristics in any estimation seeking to identify neighborhood effects. I turn to this task next.

I begin with an overview of individual-level partisan affiliation and ideology. I use the 1970 *Tract-Metro Difference in Percent White* as my independent variable in all analyses. My

[162] This interactive relationship is available upon request.

first dependent variable is the respondent's *Partisan Identification*. Respondents were asked, "generally speaking, do you usually think of yourself as a Republican, Democrat, Independent, or what?" Follow up questions asked for the strength of partisanship and pushed independents to identify as leaners. The resulting measure is a seven-point scale running from strong Democrat to strong Republican. Next, I analyze *Ideology* (where 1 is extremely liberal and 7 is extremely conservative), and finally *Republican Presidential Vote*, coded 1 if the respondent voted for the Republican candidate in the most recent election and 0 otherwise.[163] I control for all of the demographic traits included in Table 6.3 except one – *Mover*. I omit this variable because it is missing for a large share of the total observations. Its inclusion does not affect the results presented (and the coefficient is not significant in any of the estimations). In a second set of analyses, I add controls for current neighborhood attributes to provide additional evidence that the political character of neighborhoods was developed historically. These neighborhood variables are the *Percent White* and *Percent Homeowners* in the tract, linearly interpolated for each year of the survey. Both sets of analyses are presented in Table 7.4.

[163] For this last analysis, I use a multi-level mixed effects logistic regression to account for the binary dependent variable.

As was true in the aggregate, at the individual level, the historical persistence of neighborhoods is clear. Places that had defended their exclusive white character as of 1970 are home to significantly more Republican and conservative residents today. This is the case even when we account for both individual and aggregate demographic traits that predict partisanship and ideology.

The same pattern holds when I replace the dependent variable with particular policy items.[164] Respondents who live in neighborhoods that were whiter in 1970 are more likely to view government spending as adequate or too high on categories like social security, parks, and mass transit, and they are more likely to believe that individuals, not the government, should be responsible for health, wealth, and the standard of living.[165] For instance, respondents were asked to place themselves on a five-point scale where at one end the government should do more to solve our country's problems and at the other end the government should leave things to individuals and private businesses. Comparing whites who live in neighborhoods that were minority dominated in the 1970s to those who live in neighborhoods that were white defended moves responses in a conservative direction by about a half of a standard deviation on this scale (from an average of 2.8 to 3.3).

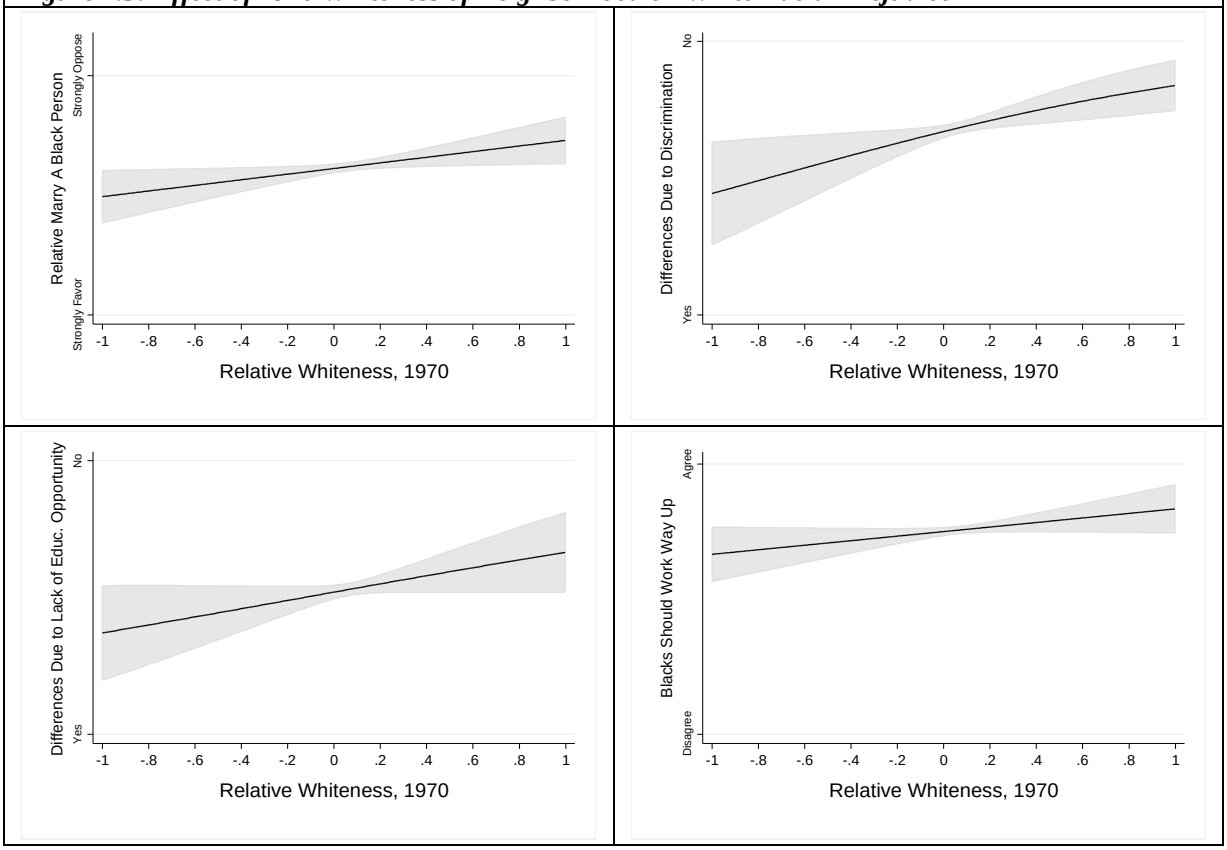
[164] These questions were not asked of all respondents in all years. As a result, in some of the specific policy areas discussed below the total number of respondents falls below 5,000. However, it never falls below 3,000.
[165] One question on which 1970 neighborhood whiteness was not associated with support for lower spending was education. When asked whether or not the government was spending the right amount "improving the nation's education system", there was no difference in the responses of individuals who live in neighborhoods that were whiter in 1970. Although this is obviously circumstantial evidence, it is plausible that the defended neighborhoods have higher quality schools and this is a feature that attracts certain residents who are supportive of higher educational expenditures.

Prejudice and Policy

If integration battles are linked to the ideology of defended neighborhoods, then we would expect residents of these places to have particularly conservative views when it comes to race. I find strong support for this contention. There are many different questions that tap racial views included in the GSS. I use several as dependent variables that are both common in the literature and have a long enough time span to generate sufficient respondents. I begin with an analysis of racial affect and prejudice. The first question asks respondents whether or not they would be in favor of having a family member marry a black person. The second question probes views on inequality. It states "On the average (Negroes/Blacks/African-Americans) have worse jobs, income, and housing than white people." Then it asks: "Do you think these differences are mainly due to discrimination?" and/or "Because most (Negroes/Blacks/African-Americans) don't have the chance for education that it takes to rise out of poverty?" Finally, I analyze responses to the question, "Do you agree strongly, agree somewhat, neither agree nor disagree, disagree somewhat, or disagree strongly with the following statement: Irish, Italians, Jewish and many other minorities overcame prejudice and worked their way up. Blacks should do the same without special favors."

All dependent variables are coded so that higher values equate to a more conservative position. The structure of these analyses is the same as those included in the top panel of Table 7.4 (mixed effects maximum likelihood estimation with random effects for MSAs and controls for individual demographic characteristics). Rather than present regression tables, Figure 7.3 graphically display the marginal effects on *Tract-Metro Difference in Percent White, 1970* holding all other variables at their mean values.

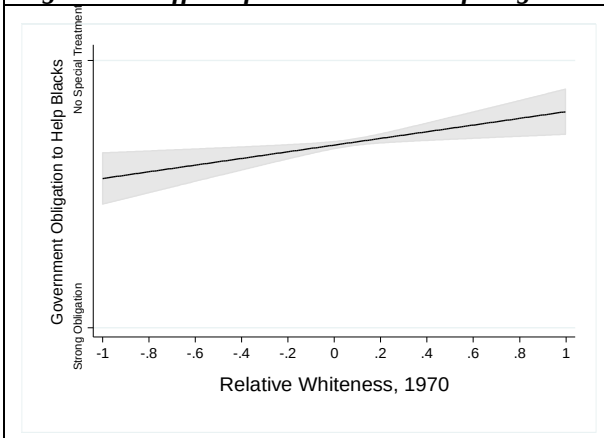
Figure 7.3: Effect of 1970 Whiteness of Neighborhood on White Racial Prejudice



The results presented in Figure 6.3 offer a consistent picture of white residents who live in neighborhoods that were whiter than the metro area in 1970. They are more strongly opposed to having a relative marry a black person, they are less likely to see persistent racial inequality in jobs, income, and housing as the result or discrimination or educational opportunities, and they are more likely to agree that blacks should have to work their way up like white ethnic groups In sum, residents of whiter neighborhoods are more likely to want to avoid close contact with blacks, to blame blacks for conditions of inequality, and put the onus on individuals to advance their position.

These attitudes translate into conservative views on race-targeted policies. To show this, I analyze two questions. The first question reads "Some people think that (Blacks/Negroes/African Americans) have been discriminated against for so long that the government has a special obligation to help improve their living standards. Others believe that the government should not be giving special treatment to (Blacks/Negroes/African Americans). Where would you place yourself on this scale?" Responses were coded on a five-point scale ranging from strong obligation to no special treatment. The second question focuses on affirmative action and asks whether or not respondents are "for or against preferential hiring and promotion of blacks." The responses are coded on a five-point scale ranging from strongly favoring to strongly opposing. Figure 7.4 presents the marginal effects of the regression of these policy responses on *Tract-Metro Difference in Percent White, 1970* holding all other variables at their mean values.

Figure 7.4: Effect of 1970 Whiteness of Neighborhood on Support for Race-Targeted Policy



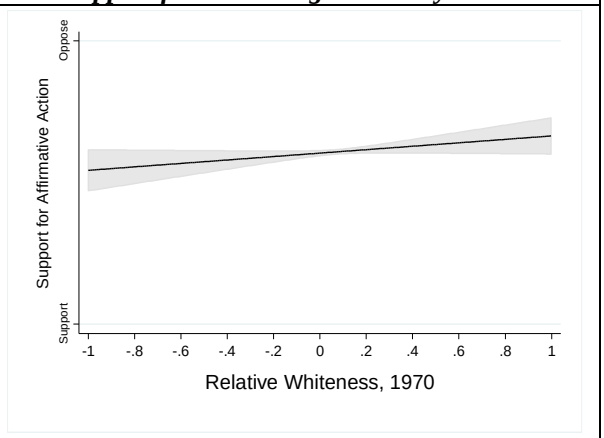


Figure 7.4 reveals that residents who live in neighborhoods that were whiter in 1970 are more likely to hold conservative views on race-targeted policy. They are less likely to feel that the

government has an obligation to make right discrimination against blacks and less likely to support affirmative action.

Conclusion

In sum, there is strong evidence that the language and ideology developed around integration battles in post-war urban America persists. During the tumultuous 1940s, 50s, and 60s, faced with changing legal and rhetorical regimes, white homeowners seeking to keep minorities out of their neighborhoods began to shed the language of racial exclusivity. They understood the defense of their homes and spaces as a defense of their rights as homeowners and freedoms as individuals. Hayward (2013) describes this as the development of an "identity story," a story about "who 'we Americans' are: about what we value, what we want and deserve, and what it is that serves our good" (p119). Hayward is clear though – the Americans included in this vision were not all Americans, but rather all *white* Americans.[166] Yet, the privileged residents of defended neighborhoods promulgated the argument that "race doesn't matter" (Hayward 2013, p176). Instead, they relied on a frame that emphasized their hard work, frugality, and investment in their children's education. This perspective persists in these places. This chapter links 1970s neighborhood demographics to feelings of distance from African Americans, a belief that racial inequality is the result of lack of individual motivation, opposition to policies that redress disparities in outcomes across racial groups, and commitment to conservatism more generally. Residents who live in defended neighborhoods today are more

[166] Hayward (2013) situates the genesis of this identity story earlier in the 20th century than I do here. She argues that it was borne of economic need among developers seeking land use planning and financial support from the government. My narrative is not incompatible with her view. It makes sense that the language adopted by rights-oriented white neighborhoods was readily available when they needed to use it. Hayward argues that the narrative of Americans as a homeowning people developed by real estate interests functioned as a "frame to many ordinary stories" (p167).

likely to identify as Republicans and more likely to vote for Republican presidential candidates.

The local roots of modern conservatism are deep.

Chapter 8: Conclusion

In the early decades of the 20th Century, homeownership rates in the United States were already much higher than in many other advanced democracies. As of 1914, in the United Kingdom 10% of households owned their homes (House of Commons Research Paper, 1999). In the United States the figure was about 45%.[167] During the late 1940s homeownership rates for France and Germany were about 31% and 27% respectively (Kohl 2014). For most families, the home was (and is) the single largest component of household wealth (Knoll et al 2014). Not only homeowners, but all property owners, land-oriented businesses (like real estate agencies), and local governments reliant on property taxes, had a strong incentive to protect and enhance the value of property. In a world of limited resources, they also had a strong incentive to politically control the distribution of public goods increasingly offered to city dwellers.

Yet, homeownership and political power were not equally available to all urban residents. In 1900, the homeownership rate among whites was more than double the rate among blacks (Collins and Margo 1999). Chinese and Japanese immigrants were barred from owning property completely in many states, and everywhere the vast majority of blacks, Asians, and Latinos were prohibited from voting (Keyssar 2000). Thus, as America became an urban nation, it was white property owners who dictated the policies of local governments. They used their power to pursue segregation. By invoking the power of land use regulation and zoning, city governments institutionalized prevailing race and class hierarchies.

In cities across the country, "Chinatowns" (McWilliams 1964, p105), Sonoratowns (Torres-Rouff 2013, p139) and "Niggertowns (Litwack 2004, p9) were walled-off by a combination of public policy, violence, and custom. Local governments then proceeded to

[167] https://www.census.gov/hhes/www/housing/census/historic/owner.html

systematically underinvest in these neighborhoods, denying them adequate sewers, paved roads, garbage collection, or public health initiatives. By the onset of the Second World War, city governments had become proficient segregators. When millions of dollars were spent renewing and rebuilding urban communities, segregation was reinforced and deepened.

By the hands of local governments the foundation of Sampson's (2012) powerful 21st century neighborhood effects, was laid. Using Chicago as a lens with which to view large, diverse cities, Sampson shows that today, neighborhoods differ significantly with respect to "crime, poverty, child health, protest, leadership networks, civic engagement, home foreclosures, teen births, altruism, mobility flows, collective efficacy, [and] immigration" (p6). These differences, Patrick Sharkey (2013) explains, are "*not* attributable primarily to factors that lie within the home or within the individual," but rather to the place itself, passed down from generation to generation (p21). Sampson (2012) argues that, as a result of racial segregation, neighborhood disadvantage is "most pronounced in the black community." These inequalities, Sampson tells us are, "durable and multiplex but not inevitable or natural" (p99).

The consequences are irrefutable. Scholars have persuasively demonstrated that segregation causes higher poverty rates for blacks and lower poverty rates for whites (Ananat 2011), lower high school and college graduation rates among blacks (Cutler and Glaeser 1997), higher imprisonment rates (Burch 2014), and higher rates of single-motherhood among blacks (Cutler and Glaeser 1997). Neighborhood disadvantage is also related to black/white income inequality, lack of employment stability among blacks, and larger gaps in cognitive skills between blacks and whites (Sharkey 2013). Cohen and Dawson (1993) show that neighborhood poverty undermines blacks' attachment to and involvement in the political system. I've shown that segregation leads to racial political polarization and underfunding of public goods.

Cumulatively, these results suggest that both growing up and living in disadvantaged places, while not wholly determining one's fate (e.g. Vance 2016), does leave little margin for error. "Mobility out of the poorest neighborhoods," Sharkey (2013) says "may be even less common than mobility out of individual poverty" (p35). Perversely, home ownership in this environment serves to limit mobility rather than enhance it.

In the first half of the 20th century, advantaged and disadvantaged neighborhoods resided within the political boundaries of large central cities. In the second half of the century, when the suburbs captured most of the population growth, the physical, and more importantly political, distance between advantage and disadvantage widened. Today, the most advantaged places are located outside of central cities altogether so that the most disadvantaged residents have no direct role to play in decisions about building affordable housing, expanding public transportation, or diversifying schools. In these places residents are more politically conservative; they vote at higher rates for Republican presidential candidates, support low taxes, want limited spending, and see inequality as the result of individual failings. Recent research suggests that privatization of public services is the most recent response to integration. Trounstine (2015) finds that a greater share of communities' security and educational needs are met through private provision in more diverse communities. Similarly, Betts and Fairlie (2003) show that native-born American families are more likely to send their children to private high school in response to increased immigration. Given this distribution of preferences and opinions, proposals to reduce inequality through mechanisms like regional governments or tax-base sharing (e.g. Orfield 2002, Katz 1999) are simply politically infeasible.

However, moving the policy debate to the state or federal level, could be more workable. Given that property owners' anxiety about protecting their investment is the driver of the many

patterns I reveal in this text, one solution would be to address this concern directly. William Fischel (2015), has argued that reducing federal tax-subsidies for owner-occupied housing would curtail homeowner demands for exclusivity.

State governments may also be able to make significant progress in generating outcomes that approach equality. There are lessons to be learned from the history of public school provision and finance. In a detailed historical analysis comparing the Charlotte and Atlanta metropolitan areas, Lassiter (2006), finds that the large geographic footprint of Charlotte's school system ensured that school integration would be successful. Conversely, Atlanta's fragmentation ensured that it failed. This indicates that states could analyze school district and municipality incorporation with an eye toward integration; limiting fragmentation and opportunities for segregation. Lafortune, Rothstein, and Schanzenbach (2015) show that recent school finance equalization policies have focused not on the gap in funding between advantaged and disadvantaged districts, but rather on ensuring a minimum adequate level of funding for all districts. They find that these reforms significantly reduce inequalities in student achievement outcomes between districts.

School finance reform has been possible because state constitutions guarantee the provision of public schooling and lawsuits (and threats of lawsuits), have forced the hand of state legislatures. Education is not the only public good guaranteed in state constitutions though. In fact, state constitutions are the locus of many positive rights. As Zackin (2013) details, they also obligate state governments to "care the poor, aged, and mentally ill, preserve the natural environment…and protect debtors' homes and dignity" (p3). Bridges (2015) demonstrates that state constitutions provide state governments substantial authority in the regulation of water provision and the protection of labor. Leonard (2010) outlines state constitutional requirements

mandating provision of health care and public health. Thus, the centralization of public goods financing, or at least the provision of a minimum level of public goods support through state governments is possible, though obviously politically contentious. At the end of the day, what is clear is that much is at stake in the local provision of public goods and the politics of segregation.

Data Appendix

Chapter 1

Coding of Foreign Born Populations 1900-1940

The Census of Population and Housing collected detailed breakdowns regarding the origin of immigrant populations for large cities between 1900 and 1940. However, the categories of origin changed from Census to Census. I created similar categories by combining subcategories (e.g. I created a Poland variable by combining Austrian Poland, German Poland, and Russian Poland). Using the table available at: http://www.census.gov/population/www/documentation/twps0029/tab04.html, I created a category of immigrants from Southern and Eastern Europe, Asia, and Latin America. Because immigrants from Turkey in Asia were only separately categorized in some Census years, all Turkish immigrants are coded as being Southern and Eastern European, regardless of continent. The category foreign born nonwhite was created by adding the foreign born populations from countries that the 1930 Census designated as sending a majority of immigrants who were classified as nonwhite (China, Japan, India, Mexico, and West Indies).[168] To generate a measure of foreign born diversity, I calculated a Herfindahl Index:

$$Diversity = 1 - \sum_{f=1}^{F} \pi_f^2$$

where, π_f is the population share of the foreign-born group f and F is the total number of foreign-born groups (52). The following foreign born groups were listed in Censuses 1900-1940. The table presents summary statistics for all 291 cities included in these data.

Country of Origin	Mean	Std. Dev.	Min	Max
Africa	0.01%	0.04%	0.00%	1.20%
Albania	0.00%	0.03%	0.00%	0.86%

ATTACHMENT TO LETTER 65

ORDINANCE NO. 1 (NCFPWIA)

AN ORDINANCE OF THE NAPA COUNTY FLOOD PROTECTION AND WATERSHED IMPROVEMENT AUTHORITY, IMPOSING A 1/2% NAPA COUNTY FLOOD PROTECTION TRANSACTIONS (SALES) AND USE TAX PURSUANT TO THE PROVISIONS OF REVENUE AND TAXATION CODE SECTION 7285.5, ESTABLISHING A NAPA FLOOD PROTECTION AND WATERSHED IMPROVEMENT EXPENDITURE PLAN, ESTABLISHING A FINANCIAL OVERSIGHT COMMITTEE AND TECHNICAL ADVISORY PANEL, REQUIRING ANY FUNDS GENERATED AS A RESULT OF THE IMPOSITION OF THE NAPA COUNTY FLOOD PROTECTION TRANSACTIONS (SALES) AND USE TAX TO BE SPENT ON THE PROJECTS IDENTIFIED IN THE EXPENDITURE PLAN, AUTHORIZING THE ISSUANCE OF BONDS OR OTHER OBLIGATIONS TO FINANCE THE PROJECTS IDENTIFIED IN THE EXPENDITURE PLAN PAYABLE FROM THE REVENUES GENERATED BY THE TRANSACTIONS (SALES) AND USE TAX AND ESTABLISHING AN APPROPRIATIONS LIMIT.

The Napa County Flood Protection and Watershed Improvement Authority (hereafter "Authority") does ordain as follows:

SECTION 1. Title

This Ordinance shall be known as the "Napa County Flood Protection Sales Tax Ordinance" (the "Ordinance") which establishes and implements a transactions and use tax (hereafter "Flood Protection Sales Tax") and establishes a Napa County Flood Protection and Watershed Improvement Expenditure Plan (hereafter "Plan") describing the specific projects for which the revenues received as a result of the imposition of the tax may be expended, all pursuant to Revenue and Taxation Code Section 7285.5. The transactions and use tax provisions of this Ordinance shall be applicable in the incorporated and unincorporated territory of the County of Napa. The County of Napa shall hereinafter be referred to as "District".

SECTION 2. Findings

The Authority finds that:

A. Since 1862, more than 27 major floods have plagued the Napa Valley, resulting in a significant loss of life and damage to property. Among the most damaging was the flood of 1986 which caused more than $140 million in damage and led to the evacuation of 7,000 residents. The 1995 flood damaged an estimated 227 businesses and residences at a cost of over $100 million.

B. In addition to these major and extremely serious floods, damage from the more common annual flooding—like the recent floods of January 1997—cost an annual average of $6 million in repairs and cleanup.

C. A Plan has been developed and is designed to protect the residents and businesses of Napa County from all floods up to and including a 100–year storm event.

D. The Plan is an integrated approach which applies to all the Napa County watersheds.

E. The Plan was developed by a unique and broad–based coalition of Napa County residents, including local community water experts, engineers, architects, environmentalists, business owners, government officials and other leaders.

F. The Plan relies on natural processes to protect Napa County residents and their properties, takes into account the Napa River's overall watershed, and envisions wetlands, open space, bypass channels, set–back levees, river widening by establishing flood plain terracing, elevation and relocation of homes and bridge replacements as its main weapons against flooding.

G. None of the projects in the Plan are intended or designed to encourage population growth in Napa County. All of the projects are for flood protection, preserving ground water integrity, reducing sediment in the Napa River system, and for maintaining the reliability of the water supply for the existing Napa County populationas of the effective date of this Ordinance.

H. The majority of the Plan will be paid for by federal money as well as state and existing local resources.

I. The ultimate goal of the Plan is to provide flood protection, save lives, protect property, restore the Napa River, Napa Creek, and other tributaries, maintain Napa County's economic vitality, and enhance riparian environments.

J. The allocation of the Flood Protection Sales Tax revenues that will be generated as a result of the passage of this 1/2% transactions and use tax by the Authority and the subsequent approval by the People with a 2/3rds vote, shall be based on the amount of Flood Protection Sales Tax revenue generated by the various geographic areas within the County, subject to Section 20 of this Ordinance.

SECTION 3. Purpose and Intent

The Authority declares that, in passing this Ordinance, it is its intent to fund a Plan which will:

A. Minimize the County's vulnerability to major floods that have plagued Napa County, resulting in a significant loss of life and substantial damage to property;

B. Manage flood waters throughout Napa County, thereby providing benefits to Napa, Calistoga, St. Helena, Yountville, American Canyon, Angwin/Deer Park, and the unincorporated County areas;

C. Provide flood protection from all floods up to and including the 100–year storm event while avoiding environmentally damaging channelization and excessive dredging, and utilizing environmentally beneficial methods such as wetlands and open space, as well as bypass channels, set–back levees and floodwalls, river widening by establishing flood plain terracing, elevation and/or relocation of homes, floodproofing of businesses, and bridge replacements;

D. Minimize flood damage, save lives, protect property, safeguard the environment, maintain the economic viability of Napa County and avoid to the greatest extent possible the need for flood insurance;

E. Provide for water reliability and wastewater treatment, using accepted watershed management practices, to maintain water quality in the Napa River;

F. Ensure ongoing community input in the finalization of all projects necessary for flood protection and water supply reliability for the existing Napa County population as of the effective date of this Ordinance.; and

G. Ensure ongoing involvement of all municipalities of Napa County in the implementation of the Plan by execution of a Joint Powers Agreement (JPA) between the Authority, Napa County, the Flood Control and Water Conservation District, and the incorporated Cities and Towns of Napa County. This agreement shall contain specific allocations and methods of distribution of the Flood Protection Sales Tax revenues based on the tax revenues generated by each of the incorporated and unincorporated areas in Napa County subject to section 20 of this Ordinance.

SECTION 4. Use of Flood Protection Sales Tax Revenues

A. The revenues generated by the Flood Protection Sales Tax shall be used to fund the projects included in the Plan. The revenues shall also be utilized to fund reasonable costs incurred in the administration of the Napa County Financial Oversight Committee and the Technical Advisory Panel which are established by this Ordinance.

B. The Napa County Auditor–Controller shall deposit all revenues received from the Flood Protection Sales Tax and all earnings thereon into the general fund of the Authority and the proceeds shall be used only for the projects identified in Sections 7 and 8 of this Ordinance, the administration costs identified in subparagraph (A) of this section, and the payment of bonds or other obligations issued to finance such projects and related financing costs.

SECTION 5. Equitable Distribution of the Flood Protection Sales Tax Revenues to County-Wide Projects

The distribution of the Flood Protection Sales Tax revenues to fund the projects described in this Ordinance, over the life of the tax, shall occur in a manner which is proportional to the Flood Protection Sales Tax revenues generated by each of the incorporated and unincorporated areas in Napa County. The portion of the distributions representing the share of the revenues allocated to the unincorporated area may be used to assist in paying for the flood protection projects involving incorporated areas that are described in this Ordinance.

Specific allocations and methods of distribution based on the amount of Flood Protection Sales Tax revenues generated by each of the incorporated and unincorporated areas in Napa County shall be specified in a Joint Powers Agreement which shall be developed following the enactment of the Flood Protection Sales Tax.

SECTION 6. Napa County Flood Protection and Watershed Improvement Expenditure Plan

The Plan involves the following two interrelated components which are described in greater detail in Sections 7 and 8 of this Ordinance:

A. The Napa River and Napa Creek Project for the City of Napa which will provide the City of Napa with flood protection from all floods up to and including a 100 year storm event; and

B. Countywide flood protection and watershed improvement projects for the communities of Calistoga, Yountville, St. Helena, Angwin/Deer Park, American Canyon, and the unincorporated areas

of Napa County.

SECTION 7. Approved Projects: City of Napa: Napa River and Napa Creek Flood Protection Project

The following component of the Plan involves the City of Napa:

The Napa River and Napa Creek Project as detailed and designed by the Community Coalition for Napa Flood Management and the Army Corps of Engineers. This project, approximately 50% of which is expected to be paid for by the Army Corps of Engineers, is designed to protect the City of Napa against all floods up to and including a 100–year storm event such as the floods of February, 1986 and January 1997. This environmentally restorative project includes the following components:

A. A dry bypass channel with a weir will be constructed to divert flood waters around the Oxbow (the extreme bend in the Napa River near First Street);
B. A tidal and floodplain terrace will be created;
C. Wetlands will be created on the east and west banks of the Napa River;
D. Toxics throughout the project area, including the Oil Company Road area, will be cleaned up and excavated to improve flood water conveyance and improve the water quality of the Napa River;
E. New bridges will be constructed so they do not act as obstructions during flooding;
F. Maintenance roads/recreation trails will be extended from Kennedy Park through downtown Napa to Trancas Street;
G. Set-back levees and floodwalls will be constructed;
H. Properties will be purchased and/or relocated if necessary to implement the Plan; and
I. Capital improvement maintenance of the project.

SECTION 8. Approved Projects: County–Wide Flood Protection and Watershed Improvement Projects Not Involving the City of Napa

The component of the Plan that involves the rest of the County must include the following projects which are designed to protect against flooding, improve water quality, preserve the integrity of ground water resources and/or stabilize water supply reliability for the existing Napa County population as of the effective date of this Ordinance. None of these projects are intended or designed to expand water capacity for growth and new development.

All of these projects shall be planned in accordance with the "Living River Guidelines" contained in the Community Coalition's Flood Management Plan and the Napa River Watershed Owners Manual of the Napa County Resource Conservation District.

The Technical Advisory Panel, which is established by Section 9(B) of this Ordinance, will be available to assist each municipality in project planning, upon request by the municipality or jurisdiction.

A. Community of Angwin/Deer Park
   1. Stabilization and enhancement of existing water reservoirs which shall be for the purpose of flood protection and water reliability; and

2. Stabilize water quality.

B. City of American Canyon
   1. Implement the adopted Flood Control and Storm Drain Master Plan to protect existing development; and
   2. Restore wetlands by replacing the existing wastewater treatment facility.

C. City of Calistoga
   1. Stabilization and enhancement of Kimball Reservoir which shall be for the purpose of flood protection and water supply reliability; and
   2. Flood protection and drainage improvements in the Grant Street area and other critical areas to protect residents and businesses from flooding.

D. City of St. Helena
   1. Flood management measures for the Napa River, Sulpher Creek, York Creek, and other tributaries to prevent flooding; and
   2. Construct urban stormwater run–off facilities at Fulton, McCorkle, Mills and other areas; and
   3. Stabilization and enhancement of Bell Canyon Reservoir, or other existing reservoirs, which shall be for the purpose of flood protection and water supply reliability.

E. Unincorporated Areas of Napa County:
   1. County unincorporated area flood damage reduction projects including elevating/relocating structures, including bridges, in the floodway and floodplain; and
   2. Agricultural watershed and stormwater runoff management improvements planned jointly by the agricultural industry, the County, the Napa County Resource Conservation District and the Department of Fish and Game, including projects which will:
      - Reduce the amount of storm runoff and sediment in the Napa River System from agricultural lands; and
      - Increase flood storage of the River system by the setback of active land uses from river and tributary banks.

F. Town of Yountville
   1. Flood protection for the Town's mobilehome parks and surrounding areas; and
   2. Hopper Creek and Beard Ditch improvements and restoration for flood protection.

In the event any project described in this Section is not economically or environmentally feasible, the legislative body having jurisdiction over the lands involved shall recommend to the Napa County Flood Control and Water Conservation District a replacement project. Only replacement projects that meet the criteria set forth in the first two paragraphs of this Section shall qualify and may be approvedprovided, however, that facilities for, or purchase of, North Bay Aqueduct or other water imported from outside Napa County shall not qualify as replacement projects. The Napa County Flood Control and Water Conservation District shall consider recommending approval of a replacement project to the Authority

only after obtaining the recommendation of the Financial Oversight Committee and the Technical Review Committee. Approval by the Authority shall be in the form of an amendment to this Ordinance. Changes meeting the above criteria, to the extent permitted by law, shall not need a vote of the People ratifying the amendment.

SECTION 9. Napa County Financial Oversight Committee and the Technical Advisory Panel

A. Financial Oversight Committee.

1. Establishment. A Napa County Financial Oversight Committee is hereby established and shall remain in existence for as long as the Flood Protection Sales Tax is in effect. The Financial Oversight Committee's purpose and charge is to inform the public regarding the expenditure of the Flood Protection Sales Tax proceeds that will be generated as a result of the approval of this Ordinance by the Authority and the electorate.

2. Responsibilities.

The Financial Oversight Committee shall be responsible for:

a. Providing the public with information regarding the manner in which the expenditure of the Flood Protection Sales Tax proceeds that will be generated as a result of the approval of this Ordinance by the Authority and the electorate has occurred;

b. Reviewing the expenditure of the Flood Protection Sales Tax proceeds that will be generated as a result of the approval of this Ordinance by the Authority and the electorate, and the proceeds received as a result of the issuance of any bonds or other obligations payable from the Flood Protection Sales Tax proceeds, and causing to be prepared an annual audit regarding the use of these proceeds;

c. Reviewing the financial impact of all projects, planned and approved, utilizing the Flood Protection Sales Tax proceeds that will be generated as a result of the approval of this Ordinance by the Authority and the electorate, and advising the public whether such projects are consistent with the purpose, spirit, intent and language of this Ordinance;

d. Informing the public if there is an expenditure of the Flood Protection Sales Taxes that will be generated as a result of the approval of this Ordinance by the Authority and the electorate which is inconsistent with the purpose and intent of this Ordinance.

e. Meet not less than once each calendar quarter, pursuant to the Ralph M. Brown Open Meeting Act and invite public participation and comment with respect to any expenditure or the implementation of any project envisioned by this Ordinance.

3. Membership.

a. The Financial Oversight Committee shall consist of the following individuals:

i. One representative recommended by each of the five Napa County City/Town Councils, and one representative recommended by the Board of Supervisors of the County of Napa. However, the representatives shall not be officers, agents, employees, or elected officials of any City in Napa County or the County;

ii. Two representatives each of whom must be recommended by the business community;

iii. One representative who must be recommended by the local media;

iv. One representative who must be recommended by the Napa County Taxpayers Association;

v. Two representatives each of whom must be recommended by the environmental community;

vi. One representative who must be recommended by the Friends of the Napa River; and

vii. Two representatives who must be recommended by the agricultural industry; and

viii. A certified public accountant, whose practice includes auditing public agencies, but who is

not currently acting as an independent auditor in the case of any incorporated area within the County of Napa or the County of Napa, who must be recommended by the representatives and appointees identified in subparagraphs (i) through (vii).

b. All representatives shall be appointed by the Board of Supervisors. However, no appointments shall be made by the Board of Supervisors other than from the recommended list of the public agencies or organizations identified in subdivision (A)(3)(a) above.

c. In addition to the sixteen members described above, the Financial Oversight Committee may recommend to the Board of Supervisors that it appoint up to two additional members if in the opinion of the Committee additional representation of individuals and groups located in Napa County is necessary.

d. No member of the Committee shall receive any salary or compensation for serving on the Committee. However, the Committee may, in the case of the Certified Public Accountant, upon the unanimous vote of the other members of the Committee, compensate said individual in an amount not to exceed the rate of compensation commonly charged by Certified Public Accountants in the City of Napa.

e. All members of the Committee, except for the Certified Public Accountant, shall be individuals who live in the incorporated or unincorporated areas of Napa County. The panel shall have resources sufficient to carry out their duties.

B. Technical Advisory Panel

1. Establishment. A Technical Advisory Panel is established and shall remain in existence for as long as the Flood Protection Sales Tax is in effect.

2. Membership. The Napa County Flood Control and Water Conservation District Board of Directors shall appoint the Technical Advisory Panel whose purpose and charge is to provide technical expertise in reviewing the Corps of Engineers proposed project which is located within the City of Napa to ensure consistency with the Community Coalition Project Plan. The Panel shall consist of no more than nine members. Members of the Panel shall have expertise in one or more of the following disciplines: (1) architecture, (2) landscape architecture, (3) civil engineering, (4) hydrology/hydraulics, (5) urban planning or design, (6) water and wastewater engineering (7) geotechnical engineering and/or (8) environmental sciences/natural resource management. All members shall demonstrate a thorough knowledge of and commitment to the "Living River Guidelines" and the "Urban Design Criteria" of the Community Coalition Flood Management Plan and the watershed management guidelines contained in the Napa River Watershed Owner's Manual of the Napa County Resource Conservation District, as well as sound engineering flood protection principles.

3. The Panel may provide technical expertise to review and comment on the planning of other Countywide projects.

4. The Panel is advisory to the Napa County Flood Control and Water Conservation District.

5. The Napa County Flood Control and Water Conservation District Board of Directors shall appoint the Panel to ensure its ongoing input and recommendations regarding the following Army Corps of Engineers documents prior to executing same:

a. The General Design Memorandum and related Environmental Impact Statement (EIS);

b. The Project Cooperation Agreement;

c. All preliminary plans and construction contracts, final plans and specifications related to the City of Napa Corps of Engineers project.

6. All members of the Panel shall be individuals whose domicile is in Napa County.

7. The panel shall have resources sufficient to ensure continuous onsite review of Army Corps of Engineers construction activities.

SECTION 10. Expiration of Tax; Extension of Tax.

A. The transactions and use tax imposed by this Ordinance shall expire June 30, 2018; provided, that if the Authority shall not have contracted with the State Board of Equalization on or before July 1, 1998, and as a result the operative date is the beginning of a calendar quarter subsequent to July 1, 1998, the expiration date shall be extended, for a period of time equal to the delay. Notwithstanding the preceding sentence, this tax may be extended beyond the twenty–year period if the question of extending the tax is placed on the ballot and approved by the legally required percentage of qualified voters voting on the extension.

B. This transactions and use tax may be reduced or rescinded by a majority vote of the Governing Board of the Authority; provided, however that such modification or rescission shall not occur if to do so would violate any law, including but not limited to Article I, §10 of the United States Constitution and Article I, §16 of the California Constitution or if prohibited by any covenant made with the holders of any bonds or obligations payable from this transactions and use tax. The Governing Board of the Authority shall take such action only after receiving a recommendation regarding such rescission or modification from the Financial Oversight Committee and, subsequent to such receipt, conducting a noticed public hearing. Such action shall be subject to California law pertaining to the cancellation of prior contractual obligations and the rules and regulations of the State Board of Equalization.

SECTION 11. Purpose.

This Ordinance is adopted to achieve the following, among other purposes, and directs that the provisions hereof be interpreted in order to accomplish those purposes:

A. To impose a one half of one percent retail transactions and use tax in accordance with the provisions of Part 1.6 (commencing with Section 7251) of Division 2 of the Revenue and Taxation Code and Section 7285.5 of Part 1.7 of Division 2 which authorizes the Authority to adopt this tax Ordinance which shall be operative only if two–thirds of the electors voting on this Ordinance approve same at an election called for that purpose.

B. To adopt a retail transactions and use tax Ordinance which incorporates provisions identical to those of the Sales and Use Tax Law of the State of California insofar as those provisions are not inconsistent with the requirements and limitations contained in Part 1.6 of Division 2 of the Revenue and Taxation Code.

C. To adopt a retail transactions and use tax Ordinance which imposes a tax and provides a measure therefor that can be administered and collected by the State Board of Equalization in a manner that adapts itself as fully as practicable to, and requires the least possible deviation from, the existing statutory and administrative procedures followed by the State Board of Equalization in administering and collecting the California Sales and Use Taxes.

D. To adopt a retail transactions and use tax Ordinance which can be administered in a manner which will be, to the greatest degree possible, consistent with the provisions of Part 1.6 of Division 2 of the Revenue and Taxation Code, minimize the cost of collecting the transactions and use taxes, and at the same time, minimize the burden of recordkeeping upon persons subject to taxation under the provisions of this Ordinance.

E. To establish an expenditure limit for the Authority as required by Article XIIIB of the California Constitution.

F. To authorize bonds and other obligations to be issued for the purpose of financing projects in the expenditure plan with said bonds or other obligations to be payable from the transaction and use tax proceeds.

SECTION 12. Operative Date; Contract with the State.

The operative date of this Ordinance, at which time collection of the tax imposed by this Ordinance shall commence, is July 1, 1998. Prior to July 1, 1998, the Authority shall contract with the State Board of Equalization to perform all functions incident to the administration and operation of this Transactions and Use Tax Ordinance; provided, that if the Authority shall not have contracted with the State Board of Equalization prior to the operative date, it shall nevertheless so contract and in such a case the operative date shall be the first day of the first calendar quarter following the execution of such contract.

SECTION 13 Transactions Tax Rate.

For the privilege of selling tangible personal property at retail, a tax is hereby imposed upon all retailers in the incorporated and unincorporated territory of the District at the rate of one–half of one percent of the gross receipts of any retailer from the sale of all tangible personal property sold at retail in said territory on and after the operative date of this Ordinance. The tax shall be imposed for a period of twenty years.

SECTION 14. Place of Sale.

For the purposes of this Ordinance, all retail sales are consummated at the place of business of the retailer unless the tangible personal property sold is delivered by the retailer or his agent to an out–of–state destination or to a common carrier for delivery to an out–of–state destination. The gross receipts from such sales shall include delivery charges, when such charges are subject to the state sales and use tax, regardless of the place to which delivery is made. In the event a retailer has no permanent place of business in the State or has more than one place of business, the place or places at which the retail sales are consummated shall be determined under the rules and regulations to be prescribed and adopted by the State Board of Equalization.

SECTION 15. Use Tax Rate.

An excise tax is hereby imposed on the storage, use or other consumption in the incorporated and unincorporated area of the District of tangible personal property purchased from any retailer on and after the operative date of this Ordinance for storage, use or other consumption in said territory at the rate of one–half of one percent of the sales price of the property. The sales price shall include delivery charges when such charges are subject to state sales or use tax regardless of the place to which delivery is made. The tax shall be imposed for a period of twenty years.

SECTION 16. Adoption of Provisions of State Law.

Except as otherwise provided in this Ordinance, and except insofar as they are inconsistent with the provisions of Part 1.6 of Division 2 of the Revenue and Taxation Code, all of the provisions of Part 1 (commencing with Section 6001) of Division 2 of the Revenue and Taxation Code are hereby adopted and made a part of this Ordinance as though fully set forth herein.

SECTION 17. Limitations On Adoption of State Law and Collections of Use Taxes.

In adopting this provisions of Part 1 of Division 2 of the Revenue and Taxation Code:

A. Wherever the State of California is named or referred to as the taxing agency, the name of this Authority shall be substituted therefor. However, the substitution shall not be made when:

1. The word "State" is used as a part of the title of the State Controller, State Treasurer, State Board of Control, State Board of Equalization, State Treasury, or the Constitution of the State of California;

2. The result of that substitution would require action to be taken by or against this Authority or any agency, officer, or employee thereof rather than by or against the State Board of Equalization, in performing the functions incident to the administration or operation of this Ordinance.

3. In those sections, including, but not necessarily limited to, sections referring to the exterior boundaries of the State of California, where the result of the substitution would be to:

a. Provide an exemption from this tax with respect to certain sales, storage, use or other consumption of tangible personal property which would not otherwise be exempt from this tax while such sales, storage, use or other consumption remain subject to tax by the State under the provisions of Part 1 of Division 2 of the Revenue and Taxation Code; or

b. Impose this tax with respect to certain sales, storage, use or other consumption of tangible personal property which would not be subject to tax by the state under the said provision of that code.

4. In Sections 6701, 6702 (except the last sentence thereof), 6711, 6715, 6737, 6797 or 6828 of the Revenue and Taxation Code.

B. The word "District" shall be substituted for the word "State" in the phrase "retailer engaged in business in this State" in Section 6203 and in the definition of that phrase in Section 6203.

SECTION 18. Permit Not Required.

If a seller's permit has been issued to a retailer under Section 6067 of the Revenue and Taxation Code, an additional transactor's permit shall not be required by this Ordinance.

SECTION 19. Exemptions and Exclusions.

A. There shall be excluded from the measure of the transactions tax and the use tax the amount of any sales tax or use tax imposed by the State of California or by any city, city and county,

or county pursuant to the Bradley–Burns Uniform Local Sales and Use Tax Law or the amount of any state–administered transactions or use tax.

B. There are exempted from the computation of the amount of transactions tax the gross receipts from:

1. Sales of tangible personal property, other than fuel or petroleum products, to operators of aircraft to be used or consumed principally outside the County in which the sale is made and directly and exclusively in the use of such aircraft as common carriers of persons or property under the authority of the laws of this State, the United States, or any foreign government.

2. Sales of property to be used outside the District which is shipped to a point outside the District, pursuant to the contract of sale, by delivery to such point by the retailer or his agent, or by delivery by the retailer to a carrier for shipment to a consignee at such point. For the purposes of this paragraph, delivery to a point outside the district shall be satisfied:

a. With respect to vehicles (other than commercial vehicles) subject to registration pursuant to Chapter 1 (commencing with Section 4000) of Division 3 of the Vehicle Code, aircraft licensed in compliance with Section 21411 of the Public Utilities Code, and undocumented vessels registered under Chapter 2 of Division 3.5 (commencing with section 9840) of the Vehicle Code by registration to an out–of–District address and by a declaration under penalty of perjury, signed by the buyer, stating that such address is, in fact, his or her principal place of residence; and

b. With respect to commercial vehicles, by registration to a place of business out–of–District and declaration under penalty of perjury, signed by the buyer, that the vehicle will be operated from that address.

3. The sale of tangible personal property if the seller is obligated to furnish the property for a fixed price pursuant to a contract entered into prior to the operative date of this Ordinance.

4. A lease of tangible personal property which is a continuing sale of such property, for any period of time for which the lessor is obligated to lease the property for an amount fixed by the lease prior to the operative date of this Ordinance.

5. For the purposes of subsections (3) and (4) of this section, the sale or lease of tangible personal property shall be deemed not to be obligated pursuant to a contract or lease for any period of time for which any party to the contract or lease has the unconditional right to terminate the contract or lease upon notice, whether or not such right is exercised.

C. There are exempted from the use tax imposed by this Ordinance, the storage, use or other consumption in this district of tangible personal property:

1. The gross receipts from the sale of which have been subject to a transactions tax under any state–administrered transactions and use tax Ordinance.

2. Other than fuel or petroleum products purchased by operators of aircraft and used or consumed by such operators directly and exclusively in the use of such aircraft as common carriers of persons or property for hire or compensation under a certificate of public convenience and necessity issued pursuant to the laws of this State, the United States, or any foreign government. This exemption is in addition to the exemptions provided in Sections 6366 and 6366.1 of the Revenue and Taxation Code of the State of California.

3. If the purchaser is obligated to purchase the property for a fixed price pursuant to a contract entered into prior to the operative date of this Ordinance.

4. If the possession of, or the exercise of any right or power over, the tangible personal property arises under a lease which is a continuing purchase of such property for any period of time

for which the lessee is obligated to lease the property for an amount fixed by a lease prior to the operative date of this Ordinance.

5. For the purposes of subsections (3) and (4) of this section, storage, use, or other consumption, or possession of, or exercise of any right or power over, tangible personal property shall be deemed not to be obligated pursuant to a contract or lease for any period of time for which any party to the contract or lease has the unconditional right to terminate the contract or lease upon notice, whether or not such right is exercised.

6. Except as provided in subparagraph (7), a retailer engaged in business in the District shall not be required to collect use tax from the purchaser of tangible personal property, unless the retailer ships or delivers the property into the District, or participates within the District in making the sale of the property, including, but not limited to, soliciting or receiving the order either directly or indirectly, at a place of business of the retailer in the district or through any representative, agent, canvasser, solicitor, subsidiary or person in the District under the authority of the retailer.

7. "A retailer engaged in business in the District" shall also include any retailer of any of the following: vehicles subject to registration pursuant to Chapter 1 (commencing with Section 4000) of Division 3 of the Vehicle Code, aircraft licensed in compliance with Section 21411 of the Public Utilities Code, or undocumented vessels registered under Chapter 2 of Division 3.5 (commencing with Section 9840) of the Vehicle Code. That retailer shall be required to collect use tax from any purchaser who registers or licenses the vehicle, vessel, or aircraft at an address in the District.

D. Any person subject to use tax under this Ordinance may credit against that tax any transactions tax or reimbursement for transactions tax paid to a district imposing, or retailer liable for, a transactions tax pursuant to Part 1.6 of Division 2 of the Revenue and Taxation Code, with respect to the sale to the person of the property the storage, use or other consumption of which is subject to the use tax.

SECTION 20. Bonds and Other Obligations.

Upon voter approval of this Ordinance, the Authority shall have the authority to issue bonds or other obligations (including, without limitation, lease or installment sales agreements) to finance any of the projects included in the Plan as it may be amended from time to time (including reserves and other financing costs), which bonds or other obligations shall be payable from the revenues of the Flood Protection Sales Tax. In allocating Flood Protection Sales Tax revenues all debt service requirements and other financing costs of such bonds and other obligations shall be met prior to allocating funds for any other purposes or projects.

SECTION 21. Amendments.

All amendments subsequent to the effective date of this Ordinance to Part 1 of Division 2 of the Revenue and Taxation Code relating to transactions and use taxes and which are not inconsistent with Part 1.6 of Division 2 of the Revenue and Taxation Code, and all amendments to Part 1.6 of Division 2 of the Revenue and Taxation Code, shall automatically become part of this Ordinance, provided, however, that no such amendment shall operate so as to increase the rate of tax imposed by this Ordinance or extend the period of time the tax will remain in effect.

SECTION 22. Enjoining Collection Forbidden.

No injunction or writ of mandate or other legal or equitable process shall issue in any suit, action or proceeding in any court against the State or the Authority, or against any officer of the State or the Authority, to prevent or enjoin the collection under this Ordinance, or Part 1.6 of Division 2 of the Revenue and Taxation Code, of any tax or any amount of tax required to be collected.

SECTION 23. Napa County Auditor-Controller Audit.

In addition to the audit required pursuant to Section 9(A)(2)(b), the Napa County Auditor–Controller shall annually conduct an audit of how the new transactions and use tax revenues are spent by the County of Napa. The audit shall be published in at least two County newspapers and copies of the audit shall be provided to, and must be available at, every public library located in the County.

SECTION 24. Severability.

If any provision of this Ordinance or the application thereof to any person or circumstances is held invalid or unconstitutional, such invalidity or unconstitutionality shall not affect other provisions or applications of this Ordinance which can be given effect without the invalid or unconstitutional provision or application, and to this end the provisions of this Ordinance are severable.

SECTION 25. Effective Date; Approval of the Voters.

This Ordinance shall take effect on March 3, 1998, but only if 2/3rds of the electors voting on the Ordinance at an election held on March 3, 1998, vote to approve this Ordinance.

SECTION 26. Annual Appropriation Limit.

The maximum annual appropriation limit for the Authority is $20,000,000.00, subject to such adjustments or increases as are provided for by law.

SECTION 27. Implementation Subsequent to Vote.

Upon approval of this Ordinance by 2/3rds of the voters, the Authority may adopt policies and take such actions as may be necessary for the implementation of the one–half of one percent (1/2%) transactions and use tax authorized by this Ordinance. Such actions shall include, but not be limited to, the Authority amending this Ordinance without being required to secure a ratification by the electorate to provide for use of additional federal, state or local funds, to account for unexpected revenues, or to take into consideration unforeseen circumstances, or if such amendments are deemed necessary and recommended by the Authority's general counsel, bond counsel, or legal counsel for the State Board of Equalization; provided, however, that no amendments that will increase the rate of the transactions and use tax rate or extend the term beyond twenty years may be

made without securing the approval of the amendment by the legally required percentage of qualified voters voting on the amendment.

SECTION 28. Publication of Ordinance.

This Ordinance shall be published at least once before the expiration of 15 days after its passage in the Napa Valley Register, a newspaper of general circulation published in the County of Napa, together with the names of the Directors voting for and against the same.

The foregoing Ordinance was introduced and read at a special meeting of the Napa County Flood Protection and Watershed Improvement Authority, held on the 28th day of October, 1997 and passed at a special meeting of the Napa County Flood Protection and Watershed Improvement Authority, held on the 4th day of November, 1997, by the following vote:

AYES:	**DIRECTORS**	VARRELMAN, LUCE, FERRIOLE, WINTER and RIPPEY
NOES:	**DIRECTORS**	NONE
ABSTAIN:	**DIRECTORS**	NONE
ABSENT:	**DIRECTORS**	NONE

MIKE RIPPEY, Chairman

Potential Issues Related to the Adams Street Extension to the Silverado Trail

The Adams Street extension to the Silverado Trail could potentially create problems for the City's largest-ever public project, namely the St Helena Comprehensive Flood Control Project. While that street extension appears in the 1993 General Plan and the 2040 General Plan Update, it did not appear as part of any of the county, state or federal funding agreements, which were the funding sources for nearly all of the money used to build the flood control project. Nor did the street extension appear as part of permit applications or approvals required to build the levee or flood wall. While the original design of the Flood Control Project, which was done right after Measure A passed, showed a discretionary extension of the Adams Street to the Silverado Trail, it was not part of the project by the time the EIR was finalized, the RFP was let for the flood control project and all permitting, funding and approvals were done after 2006. There is, unfortunately, a common misconception in St Helena that the extension of Adams Street to the Silverado Trail was somehow approved as part of the Flood Control Project and because it appears in the 2040 GPU. There are, however, a number of other important issues related to this particular project.

1. There were at least six different funding sources for the Flood Control Project, almost all of which had specific requirements in order to obtain funding and some of those requirements extend into perpetuity. Two of the funding sources were federal, two were from the state, one was from the county and the last was from the City's own general fund. With the exception of the funds from the City's general fund, none of the five other funding sources considered the extension of the Adams Street to the Silverado Trail and its impact on the Flood Control Project in their approval of their funds for the levee and floodwall project.

   For example, the "Maintenance and Property Improved" section of one of the state funding sources states:

   "Grantee agrees to use, manage and maintain the property developed, rehabilitated or restored with the grant funds provided in this Agreement consistent with the purposes of the program and is required to continue into perpetuity or until deemed no longer necessary by the State."

At the very least it appears the City would need to get the state's approval to build the extension of Adams Street, since the road extension was not considered when the project was approved and funded and, therefore, would not be considered "consistent with the purpose of the program," which was entirely a flood control project and not in any way a road project.

In seeking the State's approval, however, the issue of whether or not the levee and flood wall have been maintained according to the Army Corp of Engineers standards (which is required by the Flood Control Project's operational and maintenance manual) will likely be examined. From documentation about the maintenance of the levee for the first five years from its completion through 2015, it is absolutely clear it had not been maintained according to the Army Corp of Engineer standards and, in fact, has had barely any maintenance. The documentation of the maintenance of the Flood Control Project from 2016 to the present has not been available, but it is clear from the hundreds of gopher holes appearing every year in both the levee and foundation of the flood wall, no other conclusion could be reached other than the maintenance of our largest project has not been robust, let alone up to acceptable standards. Residents have been taking pictures of the gopher holes appearing each year in the levee and flood wall, just in case it ever becomes an issue. According to Dr. Nicholas Pinter, a national levee expert currently at UCD, who has spent time examining the St Helena levee and the issues related to it, has said that burrowing animals on any levee is one of the signs that a levee is not being maintained appropriately. Keeping burrowing animals away from the levee is one of the first issues raised in the Flood Control Project's own operation and maintenance manual.

2. There were also at least eight state and federal permits or approvals required in order to build the levee, flood wall, terraces, etc. Many of these permits involved specific requirements and were issued without any consideration of the extension of Adams Street. While the 1993 General Plan Circulation Element showed Adams Street as a potential street extension to the Silverado Trail, it was not a factor considered in any decision to either issue required permits or in providing funding for the Flood Control Project. To now attempt to extend Adams Street to the Trail may jeopardize some of those permits and approvals. Examples of some of the unique permits and approvals required include:

    California Endangered Species Act Incidental Take Permit;

California Fish and Game Streambed Alteration Agreement;
US Army Corp of Engineers 404 Permit;
State Water Resources Control Board Section 401Water Quality Certification;
State Historic Preservation Office;
Bay Area Regional Water Quality Control Board National Pollution Discharge Elimination System permit; and
US Fish and Wildlife Service and Atmospheric Administration Fisheries Section 7 approval.

As an example, according to the staff report to the City Council dated May 24, 2016, the California Endangered Species Act Incidental Take Permit (ITP) No. 2081-2009-004-03 through the California Department of Fish and Wildlife (DFW) required, as a mitigation measure, that a deed restriction into perpetuity be placed over a portion of the city-owned land consisting of two parcels totaling approximately 10 acres. In addition to this requirement, the funding from the Department of Water Resources (DWR) required the creation of a conservation easement deeded into perpetuity over the same area of city-owned land. This staff report goes onto explain that in 2016 the City worked with the state to develop a specific deed restriction acceptable to the state, which was discussed at that City Council meeting. The state approved the Land Trust of Napa County (Land Trust) as the third-party easement holder. To avoid a duplication of efforts, both DWR and DFW mutually agreed upon a single conservation easement and the Land Trust as the conservation easement holder.

According to the staff report, during an on-site meeting with the Land Trust staff in 2016, the subject of the extension of Adams Street extension was discussed. The conservation easement would only permit the maintenance of existing infrastructure, flood control measures and habitat. It would prohibit the construction of a street, pedestrian path or bicycle lane on that portion of the City-owned property. The staff report concluded that Adams Street could not be extended to the Silverado Trail.

To ensure that there were no other alternatives available at that time (in 2016), City staff reached out to both DWR and DFW about the conflict between the 1993 General Plan (and the proposed GPU) regarding the extension of Adams St. DWR told the City staff that it would not approve a change to the conservation easement area or possible alternative mitigation to satisfy the requirements for the grant funds. This grant was scored and

awarded partially as a reflection of the proposed mitigation measures. If the conservation easement approved by the state in 2016 was not approved, then it is possible that the basis for the grant application approval would no longer be supported and all funds would have to be returned. In order to close out that grant it would be necessary to approve the road-restricted conservation easement and record it.

The staff report goes on to explain that if the City decided to return the grant money to the DWR, it would still be necessary to work with DFW before any consideration could be given to extending Adams Street. An alignment study would be necessary to satisfy the original Endangers Species Incidental Take Permit to look at what portion would be taken out of the conservation easement to make room for the street extension. After this is done the City would have to submit a request describing the proposed area to be removed from the deed restriction for the road. DFW would then review the proposal and, either recommend alternative-mitigation measures to satisfy the original permit or to deny it. The staff report concluded that if alternative mitigation measures were approved, they would be significantly more expensive and any alternative mitigation within the existing permit area would likely cause higher mitigation requirements on other projects when future permits are issued. If DFW denies the request, then there could be some significant financial consequences ($173,000) and the complete conservation easement would be required.

At the City Council meeting in May 2016 there was much discussion of the effect of the conservation easement discussed with DWR, DFW and the Land Trust on the extension of Adams Street to the Silverado Trail. The conclusion at the City Council meeting was clear, namely the approval of the conservation easement that the state was seeking would foreclose the extension of Adams Street to the Trail. The City Council approved the proposal.

Three months after the City Council approved the conservation easement that would foreclose the extension of Adams Street to the Silverado Trail, the Land Trust Board of Trustees approved the project on July 28, 2016 at their Board meeting.

Nearly two years after the City Council approved the conservation easement that would not allow the extension of Adams Street to the Silverado Trail, the issue again was raised at the March 13, 2018 City Council meeting. At

that meeting the Council approved a contract with 'the Land Trust of Napa County for a conservation easement as required by the terms of the Department of Water Resources grant contract No. 4600009016 for an amount not to exceed $65,000." The staff report explains that staff would work with both the Land Trust and DWR on the deed restriction. Nowhere in the staff report does it mention any of the following: (1) the prior City Council's approval on May 24, 2016 of a conservation easement, which would effectively restrict a roadway through the 10-acre site; (2) the prior conversations in 2016 on the conservation easement with both the Land Trust, DWR and DFW; and (3) the conservation easement into perpetuity requirement resulting from the granting of the Endangered Species Act Incidental Take Permit.

On October 23, 2018 (or two and a half years after the City Council approved the conservation easement, which effectively restricted the extension of Adams Street to the Trail), the City Council approved a second conservation easement giving the City the ability to approve a roadway through the 10-acre site required for a conservation easement. Once again, the staff report does not mention the May 24, 2016 City Council approval of a conservation easement effectively foreclosing the extension of Adams Street to the Trail, nor does it mention the Department of Fish and Wildlife's requirement for the very same restricted conservation easement because of the ITP granted to the City when it built the Flood Control Project. Also, of some importance, is the statement in the staff report that the City had been working with the Land Trust since March 2018, when, in fact, the staff had worked with the Trust well before May 2016. By not including the information about the prior City Council approval of the road-restricted conservation easement and the information about City's prior conversations with DWR, DFW and the Land Trust, it might call into question the appropriateness of the October 23, 2018 conservation easement approved by the Council. Both the City Council and the public were not furnished accurate or complete information before the Council took action.

It is unknown if the City has recorded any easement as required by the ITP and DWR grant. Also unknown is, whether or not, the second conservation easement approved by the City Council was prefaced by any conversation with any state agency confirming the change in the previously approved deed restriction concept. It is also unknown how the City closed out the DWR grant without proof of the conservation easement being passed and recorded, which was the key item preventing the grant close out. The

conservation easement was also the final item preventing the City from getting the final $237,000 for eligible project costs. If the grant has not been closed out, both DWR and DFW would have the ability to further audit the project, including the appropriate maintenance of the project and all required mitigation measures. A logical assumption is that the DWR grant has not been paid off because there has been no appropriation by the City Council for that amount of money.

If the City attempts to extend Adams Street to the Trail, it will again be necessary to get an Endangered Species Act Incidental Take Permit from DFW for that project. Unfortunately, this will put the City in the position of asking for approval of a new permit just after the City finished ignoring the mitigation measures agreed to by the City's in its prior ITP for the Flood Project. The likelihood of getting a second ITP would not be strong after ignoring the mitigation measures required in the first ITP.

It is also unclear what position DWR would take, if the City elects to extend Adams Street. Apparently, they were adamant they would not approve it the first time the City asked DWR about it in 2016. It has been nearly a decade since the flood control project was funded and completed and it is now approaching four years since the prior City staff conversations with both DWR and DFW on the issue of the conservation easement and the ability of the City to build a road through it. It probably would be prudent to acknowledge those prior conversation to both DWR and DFW in any of the City's current round of discussions. If the City doesn't do that and the state later finds out about those conversations, then the City may well jeopardize future grants or permits from these same agencies.

There is also another significant potential conservation easement issue. The DWR grant requires a conservation easement into perpetuity basically on any city-owned property on which DWR funds were used for the Flood Control Project. The only area the City originally determined to be included in any easement is 10-acre site of the city-owned land nearest the river. The expense payment reimbursement requests by the City to the DWR under the grant during the construction of the Flood Control Project, however, also appear to include costs used on the project's access road and pedestrian path. This area is also city-owned land and is not included in the 10-acre conservation easement. This is the city-owned property furthest from the river and which connects the access road and pedestrian path adjacent to the current terminus of Adams St to the original 10-acre conservation easement

site closest to the river. If that is correct, then the part of the project closest to the current Adams Street terminus would also have to be placed into the conservation easement into perpetuity in order to satisfy the grant agreement. Even a cursory look at some obvious items appearing on and/or making up the pedestrian path and the access road were itemized by the City as having been reimbursed under the DWR grant. This issue has been previously raised with the city a couple of times, but the staff has chosen to ignore it.

3. Shortly after Measure A was passed by the voters in 1998, St Helena began working on a Comprehensive Flood Control Project. In the original design was a levee, which cut the historic flood plain in half. The reason for the location of the levee became apparent, when the City proposed to combine the placement of the levee (to be paid for with Measure A funds) with an all-weather extension of Adams Street to the Silverado Trail, which was called the Adams Street Causeway and Bridge. Glossy brochures were produced by the City and distributed to residents in order to gather public support for the project that specific alignment of the levee to help provide a roadway.

   The 2004 EIR showed the Adams Street extension as a discretionary addition to the Flood Control Project (requiring a separate environmental review) using the levee as the primary vehicle to extend Adams Street to the Trail. On June 23, 2005 the Napa County Flood Protection and Conservation District notified St Helena that the Napa County Flood Protection and Watershed Improvement Authority had made inquiries regarding the levee because <u>any portion of the levee used for a component of a future transportation facility would thereby be ineligible to be constructed using Measure A funds</u>.

   As a result, Jonathon Goldman, the Director of Public Works and City Engineer for St Helena, wrote a letter to Robert J. Peterson, Napa County Flood Control and Water Conservation District Engineer, answering the question as to whether the levee is, in fact, intended to support a road rather than simply to provide flood protection. Goldman's July 12, 2005 letter says the "levee element serves two functions in the Project, (1) provide a barrier against inundation, and (2) provide an onsite location for disposition of soils to be removed from the planned terraces. The planned levee is wider than what would be necessary if only inundation-prevention were the objective. The levee is wider in order to accommodate the disposition of soils to be removed from the terraces. If the soils to be excavated were to be trucked to

offsite disposition, traffic and other potential impacts, as well as the cost of the Project, would increase."

The rest of Goldman's letter to Peterson goes on at great length to try to convince him that the real reason for the wider levee is the volume of soils to be replaced and not the placement of a road on the levee. Assuming that Goldman's information is correct, then there is no assurance that the levee can now sufficiently serve as the foundation for an all-weather road to the Trail, since the only requirement for the wider levee was not to support a transportation facility, but simply to provide a dumpsite for extra soil. Goldman makes clear the levee is wider than necessary to provide inundation-prevention only because it was needed as a dumpsite. The implication here is that the dumpsite was not engineered to support a roadway, because that would have foreclosed Measure A funding. To now claim that additional costs were, in fact, incurred to widen the levee to provide an appropriately engineered infrastructure for a roadway, could put our Measure A funding in jeopardy.

In the 2005 and 2006 Addendums to the 2004-approved EIR, any mention of the Adam Street extension was limited to the fact that it said there was no change from the 2004 EIR because the City was not considering approval of the Adams Street Causeway/Bridge and this issue required no further consideration or analysis.

After the 2005 and 2006 Addendums to the prior-approved 2004 Flood Control Project FEIR, no Flood Control funding applications, permits, etc. likely could go forward with an Adams Street extension to the Silverado Trail as part of it because there was no EIR done on that specific project.

4. Whether the extension of Adams Street is on, adjacent to or near the levee, the levee itself would not be benefited and likely the viability of the levee and Flood Control Project would be negatively impacted. The levee itself has not been maintained appropriately and the City has already told the County that the levee was not constructed in a manor to build a future road, but rather just a "dumping" point for excess soil removed from the project terraces. The levee operational and maintenance manual already requires that a gate be placed on the access to the levee to limit the use of cars on the levee. This only supports the concept that building a public road on the levee was not anticipated in the construction of the levee.

If the roadway is built alongside the levee, then any actual construction of the extended roadway and the bridge to the Trail and any ongoing use of the roadway would not be helpful in maintaining the viability of the levee. The safety and financial risks from a levee failure far outweigh any benefit from an extension of Adams Street to the Trail. Vineyard Valley and Hunts Grove residents are the most vulnerable of our population if the levee fails or its viability is threatened. If the levee fails, particularly because the City failed to maintain it adequately or because the City threatened the viability of it because of building a roadway on top of or adjacent to the levee, then the City would likely bare the financial liability for any damages resulting from the failure. The City assumed that liability once it accepted money from the State as explained in AB 1898 and CA Water Code §12748.3, which basically indemnified the state.

5. The St Helena Comprehensive Flood Control Project was a financial disaster for the City. Not only was the project way over the projected costs, but FEMA clawed-back $1.9M for disallowed expenses (such as the cost of crushing Merlot grapes in Mendocino County). DWR also required the repayment of $2.1M for disallowed expenses and double billing the same expenses to two different state funding sources. It is unclear if that repayment has been completed. As a result of the completely inadequate handling of the financial activities involved in the project, the City hired a forensic accountant. After months of review, the forensic accountant basically gave up. If the City decides to extend Adams St to the Silverado Trail, issues related to the repayment of grants, etc. will once again raise issues concerning the mishandling of the financial accounting of the monies spent on the project. The fact the City has not been able to close out a state grant on a project that was completed in 2010 will not help the City's case.

6. If the City elects to extend Adams Street to the Silverado Trail they will likely need the approval of both DWR and DFW for the reasons explained above. In addition, the City may also need the approval of the Napa County Flood Protection and Watershed Improvement Authority (Measure A authority) since the City previously said the design of the levee was not to facilitate a future transportation facility. Other approvals would possibly need to come from the Army Corp of Engineers, who approved its permit without information pertaining to a potential future roadway on or near the levee. The Army Corp of Engineers would also likely review the maintenance of the levee if their approval is necessary. FEMA, who approved funding for two grants based on flood control needs and then

approved the revised the flood zone after the project was built without any information pertinent to a roadway on or near the levee and its potential impact on the viability of the levee would also likely seek review.

Less problematic options for any additional access to the Silverado Trail from Highway 29 would be Mills Avenue to the south or Fulton Avenue just to the north of Adams Street. Neither of these options would run into any of the financial, administrative or safety problems that as Adams Street extension poses for the City.

HUNTER SUBDIVISION TRAFFIC ANALYSIS SUMMARY

The following is a summary of the results of the traffic analysis is Appendix K to the Draft EIR. For detailed information, please refer to the traffic analysis.

Existing Conditions

- Under existing conditions (without project traffic), the City's current level of service (LOS) standards for traffic congestion are exceeded on weekdays at three locations:
    - Main Street/Pope Street-Mitchell Drive: LOS F in the morning peak hour, LOS F in the evening peak hour
    - Paseo Grand Drive – College Avenue/Pope Street: LOS D in the morning peak hour
    - Silverado Trail/Pope Street: LOS D in the evening peak hour

    At ten other locations examined in the study, the City's LOS standards are not exceeded on weekdays.

- On Saturdays, the City's current LOS standards are exceeded at one location:
    - Main Street/Pope Street – Mitchell Drive: LOS F in the evening peak hour

Project Impacts

- The proposed project would add traffic to the local roadway system:
    - A total of 798 trips on a typical weekday
    - 62 weekday morning peak hour trips
    - 82 weekday evening peak hour trips
    - 815 total trips on a weekend day (Saturday)
    - 80 weekend evening peak hour trips
- The addition of traffic from the proposed project to existing traffic would add trips to the local roadway system, and would affect the intersections already exceeding the City's desired LOS standards on weekdays:
    - Main Street/Pope Street – Mitchell Drive: Continues to operate with unsatisfactory LOS at LOS F during both the AM and PM peak hours. However, the increase in delay is less than 5.0 seconds in the AM peak hour (4.8 seconds), while the increase in delay is greater than 5.0 seconds in the PM peak hour (11.4 seconds). This constitutes a deficiency with the City's LOS impact criteria for the PM peak hour.
    - Paseo Grand Drive – College Avenue/Pope Street: Continues to operate with unsatisfactory LOS at LOS D in AM peak hour. This intersection is unsignalized and does not satisfy peak hour signal warrants (traffic signal), and the increase in delay is less than 5.0 seconds (1.1 seconds). Therefore, the project would not exceed the City's impact criteria and would be consistent with the City's LOS policies.
    - Silverado Trail/Pope Street: Continues to operate with unsatisfactory LOS at LOS D in the PM peak hour. This intersection is unsignalized and satisfies the peak hour signal warrant (traffic signal) for the PM peak hour, however the increase in delay is

less than 5.0 seconds (1.3 seconds). Therefore, the project would not exceed the City's impact criteria and would be consistent with the City's LOS policies.

- Adding traffic from the proposed project to existing traffic would have the following impact on the existing location where weekend LOS standards are exceeded:
    - Main Street/Pope Street – Mitchell Drive: Continues to operate with unsatisfactory LOS at LOS F, however, the increase in delay is less than 5.0 seconds (3.7 seconds). Therefore, the project would not exceed the City's impact criteria and would be consistent with the City's LOS policies.
- Based on the LOS results of the Existing plus Project weekday and Saturday peak hour traffic analysis, and the City's impact criteria, the proposed project would be inconsistent with the City's LOS policies, and would require an improvement:
    - Main Street/Pope Street – Mitchell Drive: LOS F during the weekday PM peak hour.
- Adding project traffic to projected future (2040) traffic on local roadways would affect the intersections which already operate below the City's LOS standards on weekdays:
    - Main Street/Pope Street – Mitchell Drive: LOS F in AM and PM peak hours. The proposed project would contribute traffic to this LOS deficiency.
    - Paseo Grand Drive – College Avenue/Pope Street: LOS E in AM peak hour. This intersection would remain unsignalized in the Buildout condition, and would not satisfy the peak hour signal warrant in the AM peak hour. Therefore, this would be consistent with the City's LOS policies.
    - Silverado Trail/Pope Street: LOS E in AM peak hour, and LOS F in the PM peak hour. This intersection would remain unsignalized in the Buildout condition. However, the AM and PM peak hour traffic volumes would satisfy the peak hour signal warrant. The proposed project would contribute traffic to this LOS deficiency.
- Under Saturday Buildout (2040) conditions, the project would add to the following intersections where weekend LOS exceeds City standards:
    - Main Street/Pope Street – Mitchell Drive: LOS F in the weekday and Saturday peak hours. The proposed project would contribute traffic to this LOS deficiency.
    - Silverado Trail/Pope Street: LOS F. This intersection would remain unsignalized in the Buildout condition. However, its Saturday peak hour volume would satisfy the peak hour signal warrant. The proposed project would contribute traffic to this LOS deficiency.
- Based on the LOS results of the Buildout (2040) weekday and Saturday peak hour traffic analysis, and the City's impact criteria, the proposed project would create an LOS deficiency at the following intersections, and would require improvements:
    - Main Street/Pope Street – Mitchell Drive: LOS F during the weekday and Saturday peak hours.
    - Silverado Trail/Pope Street: LOS E during the weekday AM peak hour, LOS F during the weekday PM peak hour and Saturday peak hours. The weekday and Saturday peak hours volumes satisfy peak hour signal warrants.

Recommended Improvements and Conclusion

- The traffic study recommends several improvements to address existing+project and future (2040) traffic impacts:
    - Implement the following improvement to the intersection of Main Street/Pope Street – Mitchell Drive:

      • Westbound right turn phase to allow for overlapping turns. This will allow for permitted right turns occurring during a red light and also a protected right-turn phase occurring turning a non-conflicting movement, such as the southbound left-turn protected phase.
    - Implement the following improvement to the intersection of Main Street/Pope Street – Mitchell Drive:
        - Construction of one or more of the various roadway connections recommended in the St. Helena General Plan Update EIR (discussed in detail in Section 3.13 – Transportation and Traffic). These connections would improve overall LOS in the Buildout (2040) scenario:
        - Connection 2A: College Avenue extension to Mills Lane (may require realignment of Mills Lane to meet Main Street/Grayson Avenue intersection).
        - Connection 3: Oak Avenue extension from Mitchell Drive to Grayson Avenue.
        - Connection 2B, Connection 2C, Connection 5B, or a combination of Connections 1, 4 and 5A may provide congestion relief to Main Street/Pope Street-Mitchell Drive, but these improvements have additional considerations related to neighborhood traffic volumes and costs related to crossings of the Napa River.
    - Implement the following improvement to the intersection of Silverado Trail/Pope Street:
        - Installation of a traffic signal at the intersection, as well as, at the adjacent, closely-spaced intersection Silverado Trail/Howell Mountain Road. This intersection is recommended for signalization according to the analysis in the St. Helena General Plan Update EIR. With a traffic signal in-place, this intersection would operate with satisfactory LOS.
- If these improvements are implemented, the intersections would operate at acceptable levels.

Subject: [External] Hunter Project DEIR responses - were they made public?

Good morning,
I'm writing in response to item 5.1 on the Planning Commission agenda for November 1 regarding the Hunter Project.

There were many questions and concerns brought up in Fall 2021 during the public comment period on the Hunter Project DEIR. I don't recall seeing any responses from the City answering the myriad questions/concerns to the Hunter DEIR, and I thought that was required under CEQA before certification of the final EIR. Given the apparent lack of public response to questions and concerns regarding the Hunter DEIR, how can City staff now

1. "Recommend that the City Council adopt the attached Resolution recommending certification of the Final EIR, approval of the Mitigation Monitoring Program, Findings of Fact and Statement of Overriding Considerations; and
2. Recommend that the City Council adopt the attached Resolution recommending approval the requested Tentative Map No. 2022-001, File #PL10-040 for the Hunter Subdivision project."

Please let me know where and when questions and concerns about the Hunter DEIR will be formally addressed. For your reference, I have attached a letter that I submitted in Fall 2021 in response to the DEIR listing several concerns regarding ***threats to the health, safety and civil rights of existing and future St. Helena residents***, should the Hunter Project be developed as proposed.

In a related issue, when I attempted to access the attachment to the Hunter item on the Planning Commission agenda, it appears to be password protected. It seems to me that the public is entitled to adequate time to access and review these important documents.

I look forward to your response, and thank you for your help on this matter.

Subject: [External] Extension

Hi Maya,

I have pulled up the FEIR on the Proposed Hunter Project and there is no way I can possibly read the 2849 pages even cursorily by the November 1 meeting. As you know from the numerous comments submitted when the DEIR was made public, many residents of SH are really interested in this project. I am therefore respectfully requesting an extension to be able to fully digest the responses to our comments.

Thank you,

Isobel Luria

Subject: [External] Hunter Project

Hello Maya.

I am one of the individuals who spoke at both comment zoom meetings last fall, and also turned in written comments. I only learned of the Final EIR yesterday, and was able to access the report late last night. I want time to review the document and consult with other neighbors and interested parties, to be prepared before the public meeting to vote on the project. November 1st is way too soon for that vote.

In a brief look, I can quickly see responses to the issues that were raised that seem inaccurate. If the reasoning in the final EIR is sound, then a delay to get give us a chance to understand the document should not be a problem.

Kind regards-

Marina Lavagnino

To: Public Comment
Subject: [External] Hunter Project

We live in Vineyard Valley and we are very concerned about this housing development. It is right behind
the end of our park. These are just a few of the concerns we have.

Major concerns:

*WATER: We don't have enough now for current residents.

*all the additional cars from new residents

*all the additional traffic

*evacuation issues: Vineyard Valley is supposed to use the road up on the levee as an additional
evacuation route, but this would be eliminated. And *where* would all the additional residents
living there use as an evacuate route? On Main St., south on 29? All of St. Helena will be using that ONE
and ONLY way out in the event of a wildfire.

*2+ years of dump trucks, lumber trucks, and all other types of construction trucks going up and
down Main St. and turning right on Adams. Dirt, noise, etc., due to ongoing construction.

*Major concerns about the safety of the levee and building on top of it.

*A major flood in the future and the safety of Vineyard Valley.

PLEASE STOP THIS PROJECT FROM GOING FORWARD. IT HAS MAJOR RAMIFICATIONS FOR ALL OF ST. HELENA.

Respectively,

Rodney & Elizabeth Green

Subject: [External] Request to continue PC item 5.1

Good morning Maya,
Thanks for your prompt assistance on making the attachment to item 5.1 for the upcoming 11/1/22 Planning Commission meeting accessible. I saw the password protection was removed and was able to open the link to access the file.

I now see that the document is 2849 pages long. I believe it is important for the public to have time to thoroughly read and process the information in order to submit well informed and timely responses during the public comment period prior to the 11/1 meeting. The Planning Commission meeting is a week away at this point. Please accept this message as my formal request for a continuance on agenda item 5.1 to allow members of the public to have adequate opportunity to read and respond to the information in the agenda attachment file number PL10-040 and TM 2022-001 and the Hunter Project Final EIR incorporated therein.

Thanks for your help on this.

Subject: [External] Hunter project

To Whom it May Concern,
This project should NOT be considered for many reasons, but the primary reason is fire and evacuation concerns. There is a water shortage in St. Helena for residents without building more dwellings and the evacuation routes are already stretched with the residents and housing on Pope and adjoining streets. Please do not allow this application process to go any further.
Thank you for your consideration.

To whom it may concern-

May we kindly request an extended time to review the EIR and submit comment for the Hunter Subdivision project?

We were disappointed to have only a little over a week's notice from receiving the letter regarding the public hearing on Nov 1. As members of the local wine industry we are still in the height of busy season and will not be able to attend. Nor do we have enough time to review the EIR in the given timeframe.

Thank you for your consideration,
Nicole & Scott Dale

Ms. DeRosa,
I was dismayed to see the Hunter Project Reports length at 2849 pages was being decided next Tuesday. I urge you to move the meeting to a future date so that the community can read and evaluate the latest plan. It sounds like a large project with many implications to the west side of St. Helena.
Thank you,
Dawn Leininger

Hi Cindy,

I'd like to request that this item gets an extension. The EIR is way too long to expect people to read through it in such a short time.
That includes trying to track down the maintenance records I've been asking for and reviewing those before the Planning Commission. All of this takes time and we have been given little of it to perform an adequate review of such an important decision.

Thanks,
Tim

Madams,

As a Vineyard Valley home owner I urgently request an extension of time to review the Final EIR for this proposed project. Recently released, this document which is over 2800 pages long, will require additional time to explore before the November 1st public hearing. The potential adverse impacts on the residents of Vineyard Valley and surrounding communities of Saint Helena need to be seriously considered.

Dear Maya and Cindy,

We are formally requesting a time extension in order to review the final **Hunter Subdivision EIR 2800 page report** before the Nov.1st deadline to comment on the Hunter Subdivision.

My husband and I own a home in Vineyard Valley Senior mobile home park and are directly effected by the Hunter Subdivision development.

There is not enough time to review this 2800-page report by November 1, 2022 and, as such, that date is a ridiculously unattainable/unreachable reading goal not to mention time to process and organize our thoughts!

Thank you,

Subject: [External] Hunter Project EIR and Staff report for November Planning Commission meeting

Dear Planning Director DeRosa, You have asked of the residents of the city of St. Helena an herculean effort in reading and understanding both the PC Staff report for November 1st and the Hunter project EIR. The City sent these documents out on Tuesday October 25th. That allows people barely 7 days to read and critique these voluminous documents. That is just simply not fair. I am asking for an extension of at least three weeks to allow people to read and intelligently comment on the EIR as well as read and understand the Staff report. Sincerely, Pat Dell.

Att: Maya DeRosa, Community Development Director and Cindy Tzafopoulos, City Clerk

Dear Maya and Cindy.

I refer to the information submitted by the city a few days ago with regard to the above project.

The document is very long, with material repeated in some areas and is difficult to read in other areas.

I respectfully request that due to the significance of this project, the city grants an extension of time to allow everybody a reasonable amount of time to review the Final EIR (FEIR)

Thank you for your assistance.

Best regards.

Subject: [External] Hunter Subdivision Urgent Request

Dear Maya and Cindy,

We are formally requesting an time extension in order to review the the final **Hunter Subdivision EIR 2800 page report** before the Nov. 1st deadline to comment on the Hunter Subdivision.

My husband and I live in Vineyard Valley Senior mobile home park and are directly effected by the development.

There is not enough time to review the report!

Thank you,

Mary and John West

PRESS RELEASE | Hunter Subdivision Tentative Map application and Final EIR to be Considered bu Planning Commission November 1st

PRESS RELEASE

TODAY'S DATE: October 24, 2022

RELEASE DATE: Immediate

TITLE: Hunter Subdivision Tentative Map application and Final EIR

(Press Release 2022-36)

CONTACT: **Maya DeRosa, Community Development Director**

mderosa@cityofsthelena.org **(707) 967-2783**

ST. HELENA, CA –

The City of St. Helena Community Development Department announces that the Hunter Subdivision Tentative Map application and Final EIR will be considered by the Planning Commission at a public hearing on November 1, 2022 at 6 pm. The public is welcome to attend the meeting at Vintage Hall (465 Main Street) or submit a public comment via email to publiccomment@cityofsthelena.org. To be considered at the Planning Commission meeting, written public comment should be submitted no later than 1 pm on November 1, 2022.

The agenda materials including the staff report and Final EIR may be viewed at the following link:

https://sthelena.civicweb.net/Portal/MeetingInformation.aspx?Org=Cal&Id=1010

A public viewing copy of the Final EIR may be found at City Hall (1572 Railroad Avenue) or the St. Helena Library starting on October 26th.

The original application to subdivide the 16.9 acre property located at the eastern terminus of Adams Avenue was filed in 2010 and over the years there has been public meetings to consider the residential subdivision project and Environmental Impact Report. Most recently, the updated Draft EIR that studied the impact of the 87 unit development at the minimum density of 5.1 dwelling units per acre was released for public review between September 23, 2021 and November 30, 2021 and the City conducted two public meetings to receive comments on the Draft EIR during that period. Responses have been prepared to all comment letters in the Final EIR.

The Planning Commission may only make a recommendation on the Tentative Map and Final EIR to the City Council. The City Council is the final decision-making body on the Tentative Map and Final EIR. At this point, a City Council date for action on this application has not been identified.

Subject: [External] Requesting more time!

I'm requesting more time to read and understand the Hunter Subdivision information. This much information can't be digested prior to the approval meeting on November 1, 2022.

Life safety is my greatest concern. Where will the water that would fill the retention pond go once it is filled with houses?

Please consider giving use more time,
Thank you,

To: Maya DeRosa <MDeRosa@cityofsthelena.org>; Cindy Tzafopoulos <ctzafopoulos@cityofsthelena.org>
Subject: [External] Hunter Project EIR Report

Dear Director DeRosa and Clerk Tzafopoulos,

My name is Denise Lloreda. I live at 14 San Lucas Court in Vineyard Valley Mobile Home Park.

While not diametrically opposed to the Hunter Project, I have some concerns. As such, I am writing to request an extension of time to review the recently released Final EIR (FEIR) currently on the City website. This document which is over 2800 pages long, will require additional time for the Vineyard Valley leadership, and others, to explore.

I understand the Tentative Map application and Final EIR will be considered by the Planning Commission at a public hearing on November 1, 2022 at 6 pm. And that public comment is welcome at that time. In order to provide relevant and pertinent questions a thorough review must first be performed.

Your consideration is appreciated.

Thank you,
Denise Lloreda

Dear Ms. DeRosa,

My husband and I are requesting an extension of time in order to thoroughly review the 2800 page Final EIR document for the Hunter project. The project will have a huge impact on surrounding communities and St. Helena resources, so it needs more time than was given to us citizens to carefully assess the content.

Sincerely,

Tom and Rhondda Grimm

Hi Maya,

I would like to ask you to consider a continuance of the proposed Hunter project that is scheduled for review by the Planning Commission on November 1st. The public needs time to review the EIR and other documents including the 1993 and current General Plans. In view of the time required to review these documents I believe a continuance is definitely necessary.

Thank,

Subject: [External] The citizens of St Helena request and deserve an extension for the Hunter EIR

Hi Cindy,

Please forward my email to the Planning Director, City Manager, PC and CC. Thank you for your assistance as always.

As a citizen of St Helena, I am requesting that an extension to review the extensive 2,000+ page FEIR report and Response to Comments (by St Helenans to the DRAFT EIR) be provided – a few reasons for this very fair and basic request are as follows:

1) The Hunter FEIR document is over 2,000 pages in length. St Helenans are residents that work, have families and need more than a few days to review such a lengthy document. The EIR authors had months and months to review our comments – are we not allowed to have the courtesy of more than a few days to review this extremely important document that will add 10% to our population and add significant risk behind our taxpayer-owned levee?

2) The City's email of the PC Agenda had a broken link to the FEIR, and citizens were unable to access the FEIR. The Planning Director fixed the link this weekend after being notified by a citizen who was able to get through, but time to read the document was lost.

3) The document is now on the website, but it is Tuesday, which has again limited the time to review this document

4) There is no time to request public information that the FEIR refers to – for example, the EIR states that "the City has maintained the levee since the beginning", but we know that is not true, because from a previous public records request, the City showed that they had indeed not maintained the levee, and still there are no records showing that on the website – please check for yourselves. We have requested access to the levee maintenance records since 2011 from the City Clerk but the link she provided has NO RECORDS ON THE PUBLIC WEBSITE SHOWING MAINTENANCE SINCE 2011 DESPITE THE CLAIM BY THE FEIR THAT RECORDS EXIST. How are citizens to verify this FEIR claim is true if we cannot access public information?

5) A general issue is in this request for this needed additional time is that Citizens have to be able to request proof of the FEIR claims when none has been provided, and cannot do that in a few days time, because the city cannot provide them. Citizens had no idea that the EIR would make claims this without demonstrating the validity, so the public has the right to request the documentation to support these unsupported claims.

Thank you for your attention to this matter and we hope the city of St Helena will ensure that citizens have sufficient time to review this document and time to get responses for records to verify FEIR claims, especially since St Helena city officials continue to stand on the principle of transparency in government. Many of us are also questioning why the name of the project that has been in place for over a decade "The Hunter Project" was not referenced in the city's PC Agenda notice – people did not know it was this project, which as you know has been of great concern to many people. We certainly hope the Applicant did not request that it not be listed as such in an effort to make it unclear to the public, because it certainly did make it unclear to many. We appreciate your ongoing efforts to ensure transparency.

Thank you City Council, Planning Commission and City Staff for your service to St Helena,
Ann Nevero

Cindy,
The public review period for the Hunter project is entirely too short for a project of this magnitude. Please extend the review period for 30 days to allow for proper public review.

Subject: [External] please extend time to review St Helena housing project

Hi there,
I don't know how quickly you ready, or if you have other obligations in your day to day life, but, for the majority of people, understanding dense text slows reading speed down to around 20 pages an hour.
Given this is a 3000 page document, and it needs careful attention to what is being proposed, an adequate amount of time to review it would be approximately 150 hours.

Seeing as people sleep, eat, and have other jobs or obligations throughout their day, asking someone to spend 4-5 solid hours/day reading this text seems doable. this would break down to around 33 days to just get through the text.

I would ask that we are given at least that much time to review this document.

thank you,
Lisa Goldfarb

Dear City Clerk,

I'm a 20+ year resident of St Helena so I've follow this project form the beginning. With that in mine I would like the time to review the 3000 page document posted to the website. However one I wasn't able to get it downloaded and two you have not given enough time with the Nov 1 meeting, for a complete review.

Therefore I firmly believe an extension should be given to give all residents a chance to review this important document.

Respectfully,

Dyan Beito

Subject: [External] We need a time extension!!!

I am a primary homeowner here in St. Helena. Giving the people of SH just 10 days to review this huge EIR for the Hunter Subdivision is RIDICULOUS. We all need more time. I request that the city grant at least a 60 day extension before the next hearing on this project.

Subject: [External] Hunter Project Comment and Request for delay

Request for delay so that The EIR can be properly vetted.

Dear Staff, Mayor Ellsworth, Councilmembers, Planning Commissioners and Consultants,

Aside from the fallacious water offsets to achieve miraculous water neutrality, it is obvious that no one has calculated the increased liability to the City of St Helena should the levee ever fail.

Please read this study by UC Davis before making any decisions. https://www.ucdavis.edu/news/behind-levee "People living behind levees on floodplains may not be as immune to flood damage as they think, according to results

of a study led by the University of California, Davis. Levees often prevent costly flood damages and even loss of life. However, when those levees overtop or fail, and water spills onto the floodplain, the long-term damage can be far worse than if those levees were not there, the study found."

Having a levee does not miraculously turn a floodplain into a safe building site. I am happy for Vineyard Valley residents that the levee has made them safer in the short term. However, putting more residences behind a levee increases St Helena's risk should there be a catastrophic failure. From what I have been able to read the EIR does not adequately address this from the standpoint of the City's risk.

Sincerely,
Kelly Wheaton

I'm writing to request for an extension to Hunter EIR, so we as citizens of city of St. Helena have reasonable chance to read and better understand the nearly 3000 page document regarding the Hunter project.

I feel that it is a risky project for the city to take, specially when the city and the taxpayers are fully liable for the levee and any damages to the homes proposed to be build behind it caused by levee failure.

I don't believe giving 10 days window to read all nearly 3000 pages of documents with problems that encountered with the online tech issues is enough time to consider the liability for this very risky project.

Thank you for your attention to my request.

Dear Ms. De Rosa,

I am a resident of Vineyard Valley and am concerned with the possible development of the Hunter Property which could have a serious impact on Vineyard Valley in the event of a disaster requiring us to evcuate. There is only ONE, count them, ONE exit from Vineyard Valley for over 200 people and that is through the front, exiting onto Pope.

Meanwhile, we could, God forbid if we had to, evacuate not only through the Pope Street exit, but also through the back of the Park at the Hunter Property.

Therefore, I would ask that you would delay the coming meetings to allow all involved to go over the hundreds of pages in the proposals in order to come up with a solution which would work for all parties concerned, thank you.

Sincerely,

Jean Martin

FROM RECENT HEADLINES

Drought Watch

St. Helena Star October 27, 2022

Bell Canyon Reservoir at 64.1%

Urgent need to save water-Pump failure reduces water supply

St. Helena Star October 27, 2022

St. Helenans were notified Thursday of an urgent need to curtail water use after the failure of one of the City's two groundwater wells.

Our water system continues to pose challenges," Public Works Director Joe Leach said. "**With significant deferred maintenance (emphasis added),** we experienced a pump failure at one of our two wells and are currently operating at significantly reduced capacity……The pump failure is the latest in a string of mishaps that have highlighted the **vulnerability of St Helena's aging water system (emphasis added)**…….. St Helena's long neglected infrastructure-including **water, sewer and storm drains (emphasis added)** has dominated the current city council campaign.

AND THIS HAS BEEN THE CASE FOR YEARS

St. Helena tallies $58 million in infrastructure projects

St. Helena Star Jun 7. 2021, updated July 19, 2021

"It's a familiar story in St. Helena: Too many infrastructure projects, not enough money."

St. Helena Star Mar 2, 2021, updated April 28. 2021

"St. Helena's water system is drawing more water from the City of Napa...to conserve water in St. Helena's Ball Canyon Reservoir, which is down to 40% capacity."

City of St. Helena Fails Drinking Water Standard

Patch.com April 8, 2021

"The city did not meet treatment requirements while working to disinfect the Louis Water Treatment Plant after the Glass Fire."

St. Helena approves plans for $16.2 million sewer plant upgrade

St. Helena Star Feb 23. 2021, updated Jun 9, 2021

"It's a necessary move for the city....the plant isn't capable of complying..."

These headlines tell a story about the current state of critical infrastructure in the City of St. Helena. The consistent theme is that substantial investment in St. Helena's critical infrastructure is needed for the **current** residential footprint and the City doesn't have enough money!

The City is currently lacking adequate critical infrastructure including in particular the following:

- Water
- Sewer/Wastewater
- Storm drainage and flooding
- Roads
- Sidewalks
- Utilities
- Police
- Fire, and
- Schools

We believe approval of the proposed project which adds 51 single family homes, 25 multifamily units, and the corresponding increase in population would constitute gross negligence in that it would further strain and likely break our infrastructure.

Water Supply and Sewer/Wastewater. How could any proposal of this size not cause serious water and wastewater issues for the City? How could this project be water neutral? This project will literally require millions of gallons of water annually. Where is this water going to come from? Commissioners were recently quite skeptical (appropriately) of a report that a single-family home would be water neutral. One commissioner said it didn't stand the commonsense test. It didn't. So how can this project with 75 times the water requirements be water neutral. The project also proposes to activate abandoned wells for landscaping. How do we know that is going to work? And, if it does, is it done at the expense of well usage by current residents? Then there is the other side of water usage-wastewater. Millions more gallons of wastewater per year to a sewer system that can't handle today's current needs.

Storm drainage and Flooding. The City's current drainage system is inadequate. It is difficult to believe that building inside the levee on the floor of the basin is not going to add to these problems. We are also concerned that if the levee is compromised the drainage ditches that flow from Fulton Lane through our property will be overwhelmed and back up on our property and onto Fulton Lane. This already occurs with heavy rains. The ditches that handle this drainage are on our property and while apparently it is the City's responsibility to maintain the ditches in the 6+ years we have owned our property the City has not once maintained the ditches. We were told that this was due to the lack of budget at the City. Again, how is it possible that this project doesn't exacerbate the already existing problem.

Roads, sidewalks, traffic, parking. We believe the proposed project will cause the existing and already problematic traffic, congestion, and parking situation in St. Helena to become much worse. The roads (and sidewalks) in St. Helena are awful. Drive on Railroad from Fulton to Hunt. You think you are in a third world country. More traffic means more road repairs and apparently the City doesn't have the money to repair the roads today. The congestion entering and exiting St. Helena via Highway 29 is brutal. People familiar with the area (or using apps such as Waze) find ways around this downtown traffic and congestion. The most common "detour" is using Silverado Trail and turning on Pope Street.

Given the configuration of the Pope Street bridge and the location of the Pope Street and Silverado Trail intersection near the proposed project, traffic will most certainly back up on Pope Street and on Silverado Trail, which creates not just congestion but real risk of accidents. In addition to increased traffic the lack of adequate parking will cause further congestion.

Police, Fire, Schools, etc. The many other essential services that the City provides to its current residents will also be further strained as a result of the proposed project.

Quality of life for current residents. All of the above detracts from the quality of life of current St. Helena residents. Open spaces and access to pedestrian walking paths enrich and enhance the lives of all current residents and particularly those most closely located near the proposed project. Taking land that is agricultural and has a rural feel and building more dense housing, particularly in this part of the City makes us all lose a part of the reason we want live in St. Helena. We watch all kinds of people (families, adults, children, and dogwalkers) enjoying the open space and vineyards on the walking path from town to the river. Often adults and children bike along the path. Families stop and picnics near the path. People walk their dogs enjoying the beautiful open space. Undeniably, the loss of open space and vineyards and safe access to the walking paths will negatively impact residents.

Construction. By the way has anyone looked at the disruption and impacts of construction on the City and its residents?

We are not anti-growth. In fact, we favor thoughtful growth in the City of St. Helena. For example, we believe the City needs to consider development such as hotels which could provide revenue to make improvements in our current flawed infrastructure. However, the above headlines strongly suggest that City doesn't' have sufficient infrastructure for its current footprint let alone a project of the scope proposed. We believe that growth needs to be thoughtful and provide a means to improve (not cause further deterioration) of the City's financial condition and infrastructure.

We believe most St. Helena residents and nearly all those directly impacted because they live nearby are opposed to the proposed project. We are also aware of potential litigation. The City doesn’t need to spend money on lawyers when that money could go to improving critical infrastructure and the quality of life of its current residents.

We respectfully urge the Planning Commission to not proceed with the proposed project.

Patrick and Laura Pohlen

601 Fulton Lane

October 29, 2022

Our Town St. Helena
It all begins at home.

October 30, 2022

TO: City of St Helena Planning Commission

FROM: Our Town St. Helena Board of Directors

SUBJECT: Hunter Project: Proposed Subdivision Tentative Map

Background

Our Town St Helena (OTSH) indicated in previous public testimony concerns related to the proposed Hunter Project. In summary: 1) the single-family lots are sized to support large homes that will likely sell in the $2.0-$3.0 million range in today's market and will not be affordable for our community's working people, young families and seniors; and 2) the parcel designated for "affordable housing" is segregated from the remainder of the homes, and, as such, is in direct conflict with the City's inclusionary housing ordinance that requires integration of the affordable homes and similar bedroom/bathroom counts as the single-family homes. The subdivision as proposed misses the extremely rare opportunity to address St. Helena's acute housing need.

Given the constraints on public comments for environmental impact reports and subdivision maps imposed by governing laws, OTSH will limit this additional testimony to the parameters described in the staff report related to the proposed tentative map, noting that our previous written comments are included with the Final EIR and provide context.

Proposed Tentative Map: Consistency with 1993 General Plan

We thank staff for the evaluation of the proposed tentative map's consistency with the 1993 and 2019 general plans. However, we take exception to the conclusion that the proposed development is consistent with the 1993 General Plan's Guiding Policy 2.6.19 which states:

> "Permit higher density housing in single family neighborhoods as long as the development character of the single family area is maintained (i.e., lot widths, orientation to street, building heights, etc.)."

Objectively, the proposed tentative map is inconsistent with 2.6.19 because the lot where higher-density housing (25 units) would be developed is sized insufficiently to maintain the development character of the single-family homes in the manner the language describes.

Other guiding policies in the 1993 General Plan, while more difficult to evaluate objectively, also suggest the proposed subdivision falls short of fully complying with the General Plan:

P.O. Box 94, St Helena, CA 94574 (707) 302-5111 www.OurTownStHelena.org

2.6.14 Encourage a mix of housing types and price ranges to allow choice for current and future generations of St. Helenans.

2.6.16 Encourage the development of higher density housing in areas near the center of town and close to recreation and services.

The policies are encouraging higher density, urban housing solutions near the city center, so current and future generations can walk or bicycle to town and afford to live close to where they work. The proposed subdivision achieves the lowest density allowed for the single-family lots within the zoning designation.

2019 General Plan Consistency

While the proposed subdivision's consistency with the 2019 General Plan is not as relevant for the decisionmakers to determine whether to approve or deny the proposed tentative map, it is important for leaders and the general public to be cautious about the use of terms like "market rate" and "more affordable".

Staff's analysis concluded the proposed subdivision is consistent with the 2019 General Plan and more specifically policies LU2.1 and ES1.4 (below) because *"The proposed project includes market-rate single family homes and two types of units intended to be more affordable: accessory dwelling units and multi-family units."*

Land Use (LU2.1): Promote a mix of housing types and price ranges that are consistent with the Housing Element RHNA categories of housing affordability.

Economic Sustainability (ES1.4): Encourage the creation of workforce housing to support the local employment base in keeping with small town smart growth.

The use of the term "market rate" to imply the single-family homes will somehow meet RHNA categories should be considered more closely. "Market rate" is simply what the market will support, where RHNA relies on Area Median Income (AMI) to establish categories of affordability for varying income levels and household sizes. Using today's housing market data, the "market rate" for a single-family home with a similar lot size and configuration as what is being proposed is approximately $2 million, while a St. Helena moderate-income household earning $95,000-$143,000 can afford to buy a home in the $285,000-$420,000 range.

To truly encourage housing that would both serve our community and utilize the 'highest and best use of the land, the subdivision should be made up of smaller lots to promote higher density and allow for homes the "missing middle" working professionals and younger families in our area will be able afford.

As has been stated in prior public meetings regarding the Housing Element update and the Hunter Subdivision, counting accessory dwelling units (ADUs) as "more affordable" only works if the ADUs are truly serving as housing at affordable prices. There is no way to guarantee this

unless the City creates a policy / program to incentivize developers to regulate the ADUs. While this is not something that can be considered for the tentative map approval, it should be part of the future affordable housing agreement.

State Housing Law
The staff report cites Government Code Section 65589.5(j)(1) as limiting the City's discretion to deny a proposed housing development, yet the citation is an excerpt of the greater law. The preambles in the code describe California's severe and urgent affordable housing crisis and the intent of the law, which is to limit arbitrary or discretionary review to ensure affordable and higher density projects can get approved and not derailed by bureaucracy and NIMBYism.

Closing
In conclusion, Our Town St Helena submits the proposed tentative map is objectively inconsistent with the 1993 General Plan Guiding Policy 2. 6.19 and should not be recommended for approval by the Planning Commission to the City Council. Further, we encourage the developer and City to work together to create a plan that provides the vital housing our community needs right now and into the future to ensure St Helena is a sustainable, economically thriving city with small-town character.

We understand this project has momentum and the developer has invested a significant amount of time and money into the proposal to date. OTSH would be supportive if the project had smaller lots and more units and would strongly encourage some portion of the units have affordability restrictions (e.g., up to 200% area median income) to ensure they remain affordable to the local workforce and first-time homebuyers. The proposed tentative map is supporting the minimum density allowed. OTSH recommends a supportable density would be around 128 (nowhere near the maximum allowed 270).

OTSH believes it is possible to attain this goal for our community while still giving the developer the support to complete a viable and profitable project. It is imperative that we support housing development that meets the realistic needs of our community. We see this as a positive opportunity for the city and the developer to harmoniously work together to achieve great mutual success. We ask the City to provide the leadership and the developer the cooperation to go beyond just meeting bare minimum code standards so that an innovative, inclusive neighborhood can be created. Our Town St. Helena stands ready to help make this happen in any way we can.

Subject: [External] Extension request Hunter Subdivision

Good morning Miss Maya DeRosa,

Might I politely request an extension of time to review the Final EIR (FEIR) currently on the City website regarding the Hunter Subdivision? As this recently released document is over 2800 pages long, it will require additional time to explore. Might you consider providing a reasonable window for review of this important document? It would be greatly appreciated by me as well as others that will be greatly affected by the decisions about the proposed Hunter Subdivision.
Thank you for your consideration.

A concerned citizen of Saint Helena residing in Vibeyard Valley.

Ms. DeRosa,

Please forward to the Planning Commission this request for a rescheduled hearing date on the Hunter Subdivision.

Thank you,

Michael Mills

———————————

To: City of St. Helena Planning Commission

On Monday October 24 the City announced by press release that the Final EIR and subdivision map are to be

considered by the Commission on Tuesday November 1, just eight days after the announcement. The Staff Report is 2,849 single-spaced pages.

Responsible review of such a document in eight days is obviously impossible. Therefore, on behalf of all residents who may wish to study this project—the largest single development in the City's history, I believe—I ask that you defer the hearing for 90 days. (Less than 90 days will land in the middle of the holiday season.)

The applicant, consultant, and staff have had **one full year**, since the Commission's meeting on November 2, 2021, to consider the comments submitted then and, one assumes, all other relevant issues. At that time, public hearings were scheduled for **Q1 2022**.

Evidently, the applicant, consultant, and staff needed six months more than they had expected to prepare the Final EIR. Suddenly disclosing their work and demanding that the community respond in eight days is, in effect, to deny an opportunity for informed comment.

Thank you,

Michael Mills

Subject: [External] Hunter Subdivision

Planning Commission,

I live in Vineyard Valley as do many other seniors. The issues I see against Hunter Subdivision are scarcity of water, necessary emergency exits, and irreparable damage on open land and to downtown businesses already struggling to comeback from fires and COVID.

Living here with the severe climate change increased heat, everyone has received many messages from the City of St. Helena regarding the dire water situation. The city being aware of future warming of the area, and less rainfall expected, puts building a large subdivision in direct conflict with the continuing climate change the area is experiencing.

Vineyard Valley VV has many aged and handicap occupants needing a safe and immediate area for evacuation. There are 2 escape routes for the already existing 200 + homes. Half exit onto Pope and the other half exit onto the area where the subdivision is being proposed. Using the one entrance area to VV for shared exiting is dangerous as Silverado Trail would be unavailable for use. The fire dept. and police hold emergency exit practices using the Adams space aware that evacuation at a single exit would create a backlog putting senior lives in danger.

The environmental impact to subdivide the area would cause irreparable repercussions for the city and for the people who live near it. Property value is high in St.Helena because of the open area and fulfills a smaller town need. Adding a subdivision in this remaining open area, depreciates the homes already here, and brings a city affect minimizing the desires of both citizens and tourists alike who often use it to access downtown shops.

Please contemplate the irreversible negative impact the Hunter Subdivision will create with severe climate change water unavailability, safety issues already in place for hundreds of seniors who have first hand knowledge of the fire danger, and the removal of an environmental area well used by locals and tourists with Adams being a direct path to businesses downtown.

To St Helena Planning Commission Hearing November 1st, 2022

Re Hunter Housing Project near eastern terminus of Adams St. St Helena

Building 87 housing units of various configurations on the property behind the Napa River levee without serious consideration for traffic access does not make sense. Extending the street to Starr Avenue with traffic exiting on to Pope St will create further woes for the Pope St Bridge and turning north and south on Silverado Trail.

Unless serious consideration is give to a new bridge across the Napa River at the end of Adams St. with better visibility for turning on to the Trail, a project of this scale should be rejected.

There are many reasons for denying this planning application - potential flooding issues (Vineyard Valley should never have been built in the flood plain for example), sewer plant upgrades and water shortages, infrastructure problems. We will just start with the traffic issue.

Subject: [External] Hunter Project concerns

Hello,
My name is Jenna Lavagnino and I live at 15 Del Rio Court in Saint Helena. I utilize and enjoy the levee and all aspects of the open space where the hunter project is proposed. I have so many concerns and have voiced them in prior discussions.
- WATER - we are dangerously low on water now in the town. So much so that all of us at Vineyard Valley or on severe water rationing's. I don't understand how we can be on severe water rationing's yet the city is contemplating the hunter project? I need someone to explain to me where the water will be coming from to house hundreds of more people. What is the plan for the water?
- TRAFFIC - what is the plan for the added traffic congestion? For every house that is built we are looking at at least two cars for every property. Everyone coming and going all day long.
- SEWER SYSTEM- i've been told our infrastructure and sewer system is extremely old and can barely accommodate current levels of usage. How are we going to accommodate 80+ homes?
If the hunter project goes through as planned, I truly believe this will be a travesty and will be devastating!
I could go on and on and on - I will just say please please please reconsider!

Sincerely,
Jenna Lavagnino

City of St. Helena Planning Commission
Re: Hunter Subdivision and Application

Dear Members of the Commission:

We are writing in support of housing at the Hunter property. While there are many challenges in a proposal of this size, we believe it is time for St. Helena to address years of inadequate housing planning and development.

For a little perspective, the first decade we lived here, the plans for Harvest Inn and the Wine Train were under discussion and, of course, contention. As neighbors of one of these projects, we paid attention. Change was hard then, and it still is.

A few years later, one of us joined the first Board of Directors of Stonebridge Apartments and served for 13 years. It's an exemplary property; our children's classmates lived there and it continues to serve the city well over 30 years later.

The Hunter project is needed not only to address our RHNA numbers but, more importantly, to address the urgent need to provide housing for wine industry staff, our city and school district employees, and hospitality and Main Street employees as well.

We would encourage the project to include a broader spectrum of housing types to attract residents from more income levels. In addition to single-family houses and affordable apartments, it's important to include middle-price duplexes and condominiums. Those types of units should replace some planned single-family houses. Since they require less landscaping, water usage would lessen.

Forty-four years ago the Ag Preserve was created to protect agriculture and wildlands in the unincorporated areas, both for Napa's valuable wine industry and its environment. The concept then was that development would occur within the city limits, and it is still. (One of us spent his career in the wine industry and served on the Land Trust of Napa County board of directors, working to protect the countryside.)

We both believe the human, economic and environmental reasons for providing more housing in St. Helena outweigh the desire we all have for nothing to change or for our town to be the way it was at whatever point in time we romanticize.

Thank you for your time and attention.

Loraine and Jack Stuart

RE: Hunter Subdivision Project Environmental Impact Report, File #PL10-040

Dear Chair Ponte, Commissioners, City Manager Comelo, Community Development Director DeRosa:

We represent the Saint Helena Citizens for a Sustainable Future, a diverse group of City residents who are extremely concerned by the City's actions with respect to the referenced project. Numerous members of the Citizens group have individually commented on the project in the past. They write now collectively due to what appears to be an imminent failure of the City to recognize and adhere to recent groundwater requirements.

Before the Planning Commission is a request to certify the Final EIR and approve a Tentative Map for the Hunter Subdivision project. There have been extensive comments on the failures of the EIR to consider basic detrimental aspect of the project. The Final EIR responses have failed to provide a good-faith effort at full disclosure by ignoring, distorting, or giving short-shrift to those comments. As a reminder, this project was tabled nearly a decade ago, in part due to a determined need to improve the Pope Street/Silverado Trail intersection as a result of the project. Obviously, the applicant hopes that has simply been forgotten, or that the City will ignore its level of service (LOS) analysis.

Though VMT analysis is indeed the latest requirement, the project is reviewed under the 1993 General Plan. LOS must be considered per General Plan policies 5.4.1 and 5.4.2. And while there is also an analysis of some portions of the current general plan for comparison, some of the most relevant plan

policies are omitted, such as LU2.6[1] and CR1.4[2] The traffic study acknowledges the significant impact on traffic at Main and Pope Street, but ignores the worsening traffic at Pope/Silverado.[3]

That said, we will not restate all the issues with the EIR here, as they have been raised by more than 100 commenters and are too numerous to list. We do note now however one glaring problem in the proposed findings that requires, at the very least, additional analysis of a significant environmental issue facing all of California, sustainable groundwater management.

The project is for the subdivision of a 16.92 acre property. The EIR analyzed its proposed groundwater use of an on-site well of up to 17.16 acre-feet (AF) per year to provide for all on-site irrigation of public and private landscaping, as well as a small remnant of an existing vineyard. (DEIR 3.9-40.) (The EIR also fancifully suggests that the remainder of the project will be water neutral, despite its demand for nearly 20 AFY beyond that produced by the onsite well. But that fantasy is not even the instant problem.)

The proposed finding regarding the project's consistency with the Napa Valley Subbasin Groundwater Sustainability Plan (GSP) is contrary to the evidence. Proposed Hydrology and Water Quality finding I. 7. states:

> The Project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan. The County works with local jurisdictions, including the City, to sustainably manage the Napa Valley Groundwater Subbasin in compliance with SGMA. **In its most recent assessment of conditions, the County, through its technical consultant, determined that the Subbasin is not exhibiting significant impacts with regard to the applicable sustainability indicators defined by SGMA, including lowering of groundwater levels, depletion of groundwater in storage, degradation of groundwater quality, and depletion of interconnected surface waters**.

(Staff Report p. 50-51 (emphasis added.))

This is inconsistent with the Napa Valley Subbasin Groundwater Sustainability Plan's (GSP) recent assessment, published in January 2022:

> Groundwater levels reflect the amount [of] groundwater in storage and the movement of groundwater. Monitoring data exhibit generally stable long-term trends, although conditions are largely dependent on seasonal precipitation input. **Several wells** located near the Napa Valley Subbasin margin in the northeastern Napa area, southwestern Yountville area, **and southeastern St. Helena** area show

[1] "LU2.6 Allow residential density at the higher end of the permitted range for single family development within Medium and High Density Residential Land Use designations as long as the development character of the single family area is maintained, including lot widths, orientation to street, building heights, onsite parking, traffic, and noise, among other considerations." (2019 General Plan.)

[2] "CR1.4 Develop and use, in addition to intersection level of service standards, performance measures that consider all road users to determine transportation impacts of new development." (2019 General Plan.)

[3] DEIR Appendix K, p. 36 Table 7 (emphasizing worsening delay at Main Street/Pope Street - Mitchell Drive, but ignoring change in AM Peak LOS at Silverado Trail/Pope Street from LOS C to LOS E.)

> periods of **groundwater decline** during times of drought. Continued monitoring of groundwater levels will be important to evaluate future hydrologic and climatic influences.

(Napa Valley Subbasin Groundwater Sustainability Plan Summary, Executive Summary (Jan. 2022) p. 2, *available at* https://www.countyofnapa.org/DocumentCenter/View/23549/GSP_Executive-Summary-Abstract?bidId=.)

Indeed, while the GSP consists of a dozen separate sections, plus an Executive Summary and an Executive Summary Abstract, this critical contradictory information is found on the top of the second page of the Executive Summary Abstract –the simplest and first document of the GSP. (See https://www.countyofnapa.org/3218/GSP-Sections.) It is indeed one of the most prominent findings of the GSP that wells in southeastern Saint Helena are showing evidence of groundwater decline during this ongoing drought.

Thus, the proposed contrary finding on this critical matter not only is not supported by substantial evidence, it is directly contrary to the most recent information.

As a result of these findings, Napa County has recently substantially revised downward the allocation of groundwater to subbasin, valley-floor properties. Although such properties were previously allocated 1 acre-foot of water per acre, per year, going forward all uses will be limited to 0.3 AF/acre/year. This includes both existing and proposed wells. Any existing well usage above that level is prohibited to increase above its current net usage. (See Napa County Well Permit Standards FAQ, available at https://www.countyofnapa.org/DocumentCenter/View/25906/Well-Permit-Standards-FAQs---15-July-2022.) New domestic wells outside the subbasin may use 2 AF/year total (not per acre), and new public water supply wells may use their parcel specific recharge.4 But the well proposed to deliver the 17+ AF is not a new well.

Although the project is conditioned to require offsetting its Municipal water demand of 19.8 AF/year, no recognition of the GSP Subbasin limitations of groundwater use is made for the additional 17.16 AF/year to be pumped from the onsite well. The EIR does disclose that the well is currently inoperable meaning that the existing baseline for groundwater use is zero (DEIR 3.9-42 (Staff Report p. 594). As such the new water use proposed would be required to be limited to no greater than 0.3 AF/AC per year to comply with the GSP sustainable groundwater limitations.

However, there is no discussion of this GSP limitation and its potential impacts on rural residences and agriculture let alone any mitigation proposed or required. Instead, DEIR Appendix L, the September 9, 2021 Well Capacity Study Memorandum, referenced the prior 1 AF/AC allotment that has been reduced by 70%. Yet that memorandum emphasizes that "It is recommended that the annual groundwater use conform with County policy." (DEIR Appx. L, p.1 (emphasis in original.) (No well interference analysis appears to have been conducted either, despite the well being within 1,500 feet of the Stonebridge wells.)

[4] WAA Tier 1: Water Use for Napa County, *available at* https://www.countyofnapa.org/DocumentCenter/View/25905/Well-Permit-Standards-Applicability-Tables---15-July-2022

In sum, while the project and its EIR focused on water neutrality for its municipal use, it failed to adequately evaluate onsite groundwater pumping, the GSP current basin conditions, pumping limitations and the resulting significant impact on the environment.

Very truly yours,
DICKENSON, PEATMAN & FOGARTY

RE: Hunter Subdivision Project Tentative Map No. 2022-001, File #PL10-040

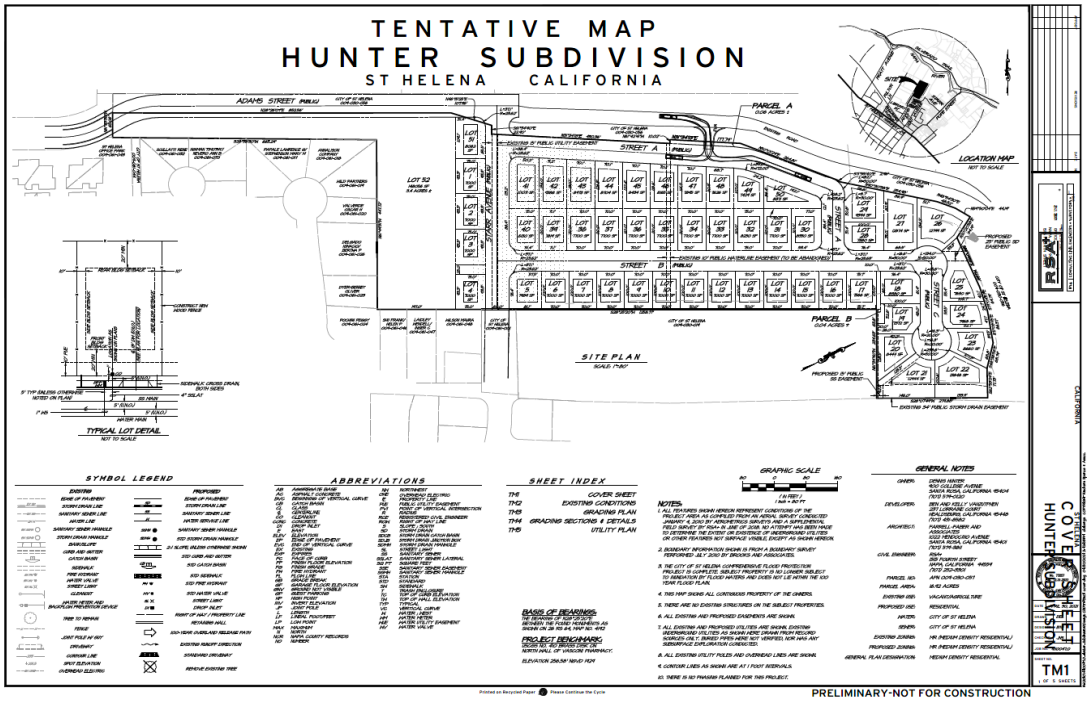
Dear: Chair Ponte, Commissioners, City Manager Comelo, Community Development Director DeRosa:

We represent the Saint Helena Citizens for a Sustainable Future, a diverse group of City residents who are extremely concerned by the City's actions with respect to the referenced project. Numerous members of the Citizens group have individually commented on the project in the past. They write now collectively due to their concern with what appears to be an imminent basic failure of the City to follow its own law.

Before the Planning Commission is a request to certify the EIR and approve a Tentative Map for the Hunter Subdivision project. This letter addresses the latter, the requested approval of the Tentative Map.

The presented Tentative Map, Attachment 3 to the Staff Report (TM 2022-01), does not comply with either the City's Subdivision Ordinance, Zoning Code nor the General Plan. It is important to note that the Planning Commission is **not** acting on any conceptual map that was presented in the EIR. Rather, as far as consideration of the approval of the Tentative Map, TM 2022-001, Attachment 3 is the actual Map the Commission is to act upon.[1]

[1] We also note that it appears from public records that the property was sold to White Fang Properties, LLC in June 2021, but such sale was not recorded until earlier this month. (Napa Recorder Doc. 2022-0018523, June 2, 2021 Grant Deed from Dennis R. Hunter to White Fang Properties, LLC, a South Dakota LLC, recorded October 10, 2022.) It is thus not clear who the proper applicant is, and whether the property owner is a party to the application. There is no reference to White Fang Properties anywhere in the nearly 3,000-page agenda packet. It appears at least that the Owner information on the proposed Map is incorrect.



This Tentative Map is fatally defective and must be rejected.

Violation of Subdivision Ordinance Section 16.04.120

> The Staff Report describes the project for consideration as follows:
>
> The proposed project being considered by the Planning Commission at this time is a Tentative Subdivision Map to subdivide an approximately 17-acre parcel of land in the eastern area of the city, east of the existing terminus of Adams Street. The proposed subdivision would create lots for 51 single family homes, and a separate parcel (lot 52) on which multi-family attached housing units would be built. The proposed Tentative Subdivision Map is included as Attachment 3 to this report.
>
> The applicant proposes to include Accessory Dwelling Units (ADUs) with 11 of the 51 single family homes. The Commission should note that the applicant has not yet filed an application for any specific development project; this would be done after the approval of the tentative map and recordation of the Final Map (following approval of an Affordable Housing Agreement and compliance with other relevant tentative map conditions). **Approval of the tentative subdivision map would only provide for the subdividing of the property; future applications would define the exact development that would take place on the lots created by the subdivision**.

(Staff Report, p. 19, emphasis added).

This is expressly illegal.

Title 16 of the Saint Helena Municipal Code, the City's Subdivision Ordinance, provides unambiguously that:

> All applicants for tentative maps and tentative parcel maps **shall concurrently submit applications for all other discretionary approvals**, including but not limited to, conditional use permits, variances, rezonings, and general plan amendments.

(Subdivision Ord., § 16.04.120 (emphasis added.))

The recognition by staff that "future applications" are required renders the submission incomplete, and directly contrary to Section 16.04.120's mandate that the requests be made "concurrently." Such a system makes perfect sense, as otherwise it is impossible to consider the whole of the project.

In short, Applicant's proposal that 'we will figure out the rest later' is expressly counter to the City's Subdivision Ordinance, and requires rejection.

Violation of Subdivision Ordinance Section 16.16.020

As a result of what appears to be a 'get one foot in the door' tactic, the submitted Map is objectively deficient, and fails to comply with the City's Tentative Map requirements. Section 16.16.020 of the Subdivision Ordinance dictates the requirements for a Tentative Map. It requires that numerous specific "proposed design elements and improvements shall be shown on the tentative map or described on an attached written statement,[2]" including that:

> The proposed **use of each** lot, lot layout and dimensions and area of **each** lot. Engineering data shall show the approximate **finished grading of each lot**, the preliminary design of **all grading**, the **elevation of proposed building pads**, the top and toe of cut and fill slopes to scale and number of each lot.

(Subdivision Ord., § 16.16.020 C.3.) However, the Map presented for approval shows nothing in Lot 52. No usage of Lot 52 is shown (*See* Map Sheets TM1, TM3.) No finished grading of Lot 52 is shown. (*See* Map Sheet TM3.) No elevation of Lot 52 building pads is shown. (*Id.*) While these details are included for the remaining lots, Lot 52 is blank. As such, the Map does not comply with the Subdivision Ordinance's requirements to detail **each** lot, unless Lot 52 is actually proposed to have no development.

Indeed, the presented Map Sheet TM2 shows the current use of Lot 52 as vineyard. As no changes to Lot 52 are proposed, assuming that the Map presented actually complied with Section 16.16.020, it would designate Lot 52 as open space. (Subdivision Ord. § 16.16.020 C.6.) Nothing on the Map, nor any attachments or plan notes that are actually presented for approval, designates any other usage, grading, elevation or other change to Lot 52.

[2] There is no "attached written statement;" only a suggestion of a future submission detailing the actual development to be proposed.

While the Staff Report suggests that there may be a **future** specific description of 25 units of attached multi-family housing presented, no description has been provided for consideration or approval. To the extent different usage and grading of Lot 52 is proposed, it "shall" be included on the Tentative Map. Given the conflict between the Staff Report, Applicant's apparent future plans, and the Map presented, it is plain that the Map presented for approval does not comply with Section 16.16.020 and must be rejected.

Violation of General Plan and Zoning Code

As such, the Map under consideration details a subdivision containing the required details only for 51 developed lots, and one open space lot. Those lots are proposed to consist of 51 Single Family Homes, and 11 Accessory Dwelling Units (ADUs). The Map under consideration thus provides plans for 62 units on the 16.92-acre parcel.

The parcel is zoned Medium Density Residential (MR) and designated as MDR in the General Plan. As correctly noted in the Staff Report:

> The MDR designation provides for single-family detached and attached homes, secondary residential units, public and semi-public uses, and similar and compatible uses. Residential densities shall be in the range of 5.1 to 12.0 dwelling units per gross acre.

(Staff Report pp. 15-16.) The Map that is actually presented for consideration provides for a density of only 3.66 units per acre (62/16.92). It must be rejected as not complying with the Zoning Code or General Plan.

While Applicant appears intent to have the Planning Commission bless a future, unsubmitted project, that is not within the Commission's power. The Planning Commission can act only on what is actually presented to it for consideration, and what has been presented does not comply with the Zoning Code or General Plan. Because the Planning Commission's function is to evaluate the projects' conformance with the Zoning Code and General Plan, it is required to reject the Map as presented.

There appears to be a suggestion that the Commission could provide Conditions that the Applicant must demonstrate by future actions that the project satisfies the General Plan. (*Compare* Proposed Condition of Approval (CoA) 14 ("The primary purpose of this review is for compliance with the General Plan and Zoning Ordinance.") *with* CoA 27 (a future "Affordable Housing Agreement shall demonstrate how the project satisfies the minimum density requirement of the General Plan.") (Staff Report pp. 143-144.)

But the Planning Commission is required to make a finding that "the proposed subdivision, together with the provisions for its design and improvement, **is** consistent with the general plan, any applicable specific plan, and other applicable provisions of this code." (Subdivision Ordinance § 16.16.080 (emphasis added.)) At its most generous, the record suggests only that the subdivision **could** be compliant with the minimum density if future actions are taken.

Indeed, the very first element of the General Plan Consistency Analysis provides that "Conformance with the required General Plan density **will** be confirmed at the time an Affordable Housing Agreement and development plans are submitted for review and approval." (Staff Report Attachment 4, p. 165 (emphasis added.)) That is not sufficient to make the finding required for approval that the project **is** compliant now.

Most concerningly, that same analysis element cryptically states that "If constructed with these types and numbers of units, the project would conform with the minimum density required by the General Plan. **There are other alternative scenarios which would achieve the minimum density; the proposed subdivision map does not preclude achieving the minimum residential density required by the General Plan**." (*Id.* (emphasis added.)) That analysis is based on a hypothetical scenario of 51 single family homes, 11 ADUs, and 25 multi-family units. But as no multi-family development on Lot 52 is actually shown on the tentative map (but all of the other lots are described), the analysis apparently suggests that perhaps the applicant could instead build 51 single family homes with 36 ADUs using the proposed map. But there is no way to know, because the submission does not comply with City Subdivision Ordinance.

Certainly, a finding merely that the project is not precluded from meeting the General Plan is not what the City code envisions. The Commission must make a finding that the project **is** compliant. As the Map that is before the Commission does not, as currently presented, meet the General Plan or Zoning Code requirements, it must be rejected.

Conclusion

The Saint Helena Citizens for a Sustainable Future are not anti-growth. They are in favor of responsible City management, informed decision making, and adherence to law. They are concerned with the environment, and equity in development. The proposed project that has been presented is for large lots for single family homes. A number of those lots would have income-producing ADUs, for the single-family homeowners to profit by.

The members of the Citizens group are unable to fully consider the project however, as no actual proposal for low-income or multi-family housing units has been presented. But it appears the Applicant will relegate such development to a corner of the property, rather than fairly disperse them throughout a development that evenly complies with the General Plan and Zoning Code density requirements. The project's proposal appears to destroy an existing vineyard with the (unspecified future) multifamily units to bulk up the unit count on a development that does not comply with the General Plan or Zoning Code density requirements.

This is directly contrast to 1993 General Plan Policy 4.3.5:

> Require future residential development to conform to the pattern and density of older, neighboring areas of town in order to complement existing town character **and ensure that densities are high enough to protect against unnecessary incursion into vineyard agricultural areas**.

(1993 General Plan Policy, Staff Report p. 166 (emphasis added.)) Current General Plan Policy 3.1 is functionally identical. ("Require future development to conform to the pattern and density of the neighboring areas. In order to complement existing town character and protect against incursion into vineyard agricultural areas." (Staff Report p. 180.))

Thus, the project – a large non-conforming subdivision with a potential future, dense multifamily parcel to compensate – should not simply be deferred for further consideration of the missing multi-family elements, but it should be rejected in its entirety.

Very truly yours,
DICKENSON, PEATMAN & FOGARTY

Dear Members of the City Planning Commission of St. Helena,

I am writing regarding the Hunter Project Final Environmental Impact Report (FEIR). I am writing to express serious concerns about the findings of the report and, more importantly, all of the considerations that are **missing from the report**. In particular I am **extremely concerned** about the **lack of consideration of the environmental impacts with regard to climate change**. Instead of taking into account the changing landscape of future impacts on such issues as water, infrastructure, and natural disasters, **this EIR uses old data, outdated reports, and irrelevant projections** based on assumptions about the climate staying the same as it always was, of water availability staying predictable, of flood risks fitting outdated "100-year flood plain" approaches that are no longer being used by the Federal Emergency Management Agency (FEMA), and sewage capacity and other reports based on outdated materials such as reports from as long ago as 2008 and 2011. I expressed my concerns about these issues one year ago when the draft EIR was being reviewed. **The city has failed to address these concerns** and greenlighted the process through to the Final EIR without consideration of the impact of these issues on our community.

*I reiterate my concerns here and request that the city planning commission and city council address these issues forthwith as it appears to me that **failure to address these concerns constitutes grounds for legal action***. I would like to bring to the city's attention recent advancements with regard to the **legal liability of ignoring climate change in development projects** and point the city council and planning commission members to a report prepared by the Conservation Law Foundation entitled "Climate Adaptation and Liability" https://www.clf.org/wp-content/uploads/2018/01/GRC_CLF_Report_R8.pdf. I urge the city council to carefully consider the consequences of ignoring and dismissing the issues that have been raised here with regard to the failure of the Hunter Project FEIR to take into account changing climate-related impacts on the city's ability to provide adequate, safe water supplies, to ensure safe evacuation during wildfire events, especially on the East side of St. Helena, and to account for the financial liability that would occur if the levy should fail in a catastrophic flooding event.

I am aware that the city is obligated to comply with the Housing Accountability Act (Government Code Section 65589.5), which states that a housing development project that

complies with the objective standards of the General Plan and Zoning Ordinance must be approved by the City, unless the City is able to make written findings based on the preponderance of the evidence in the record that either: (1) the City has already met its Regional Housing Needs Assessment (RHNA) requirement; (2) there is an impact to the public health and safety and this impact cannot be mitigated; (3) the property is agricultural land; (4) approval of the project would violate State or Federal law and this violation cannot be mitigated; or (5) the project is inconsistent with the zoning and land use designation and not identified in the General Plan Housing Element RHNA inventory. I believe that it is clear given the concerns raised below that **there is an impact to the public health and safety of the proposed development project that cannot be mitigated given the current city infrastructure limitations, and the increased and unaccounted for impacts of climate change.**

Here I address several specific comments in response to the Planning Commission Report (file number PL10-040 and TM 2022-001) Section 1 "Findings regarding less than significant impacts not requiring mitigation."

1) Regarding section H5: Emergency Access
    a. The "less-than-significant impact" finding explanation does not address the actual concerns regarding emergency evacuation. The project would most definitely have an impact on the ability of all current residents of the East Side of St. Helena to evacuate in an emergency situation such as a catastrophic flood or wildland fire. The explanation that the city fire department will evaluate the width of the roads to be constructed inside the development has nothing to do with actual evacuation out of the city of St. Helena itself. The question is not whether the development would adequately provide access for the development residents out of the development area, but how the project will impact those residents once they leave the development, and the rest of the citizens of St. Helena who all need to evacuate via the same limited routes out of the city and out of the valley. Once the hundreds of additional residents occupying hundreds of additional cars actually drive out of the development, they are going to have to funnel into the existing roadways, which are already impacted and cannot adequately handle evacuation in an emergency situation such as a quickly occurring wildland fires or catastrophic floods. They will all have to drive down Starr Avenue, make a left turn onto Pope Street, and then try to evacuate across the Pope Street Bridge, a historic bridge which is not capable of handling even the current number of cars that need to be able to evacuate out of the area. If they choose to turn right to try to evacuate out via Main Street, they will be competing with all of the West side traffic that is also trying to evacuate out of the city. An even worse scenario is what would happen if only one of those two routes was available for some reason. Additionally, **the FEIR does not in any way address the increased urgency and frequency at which these types of catastrophic events are occurring and are going to be occurring with the increasing effects of climate change**. The East side of town already houses the most vulnerable citizens in our city, encompassing multiple low-income housing

units and homes for the elderly. These are individuals who are not only at higher risk from injury but who are also less likely to be able to "evacuate early" as opposed to at the last minute once emergency shelters have been established, making the impact of urgent, las-minute evacuations even more important.

b. Please also see additional text in points 8) and 9) below, highlighting that the estimated increase in number of residents due to the development is laughably unrealistic, and apparently assumes that only about 200 additional residents will result from a development containing 87 units, when a much more realistic calculation is that instead there will be >400 new residents. With more than 2 times higher impacts on the ability of St. Helena residents to safely evacuate in an emergency situation.

2) Regarding section H6: Wildland fires
   a. The finding of "less-than-significant impact" explanation here is also missing the main point. As above, the question is not whether the construction or operation of the project will impact the ability of the development residents to egress out of the development itself, but how these residents will evacuate out of town once they have left the development itself, and how these additional numbers of individuals and cars will impact the ability of the rest of the citizens of St. Helena to evacuate in the case of a wildland fire emergency. Again, we have examples of recent wildland fires, which were all fast-moving, and which can occur in the middle of the night, for example, that raise concerns about the ability of hundreds of residents to evacuate out via our currently inadequate infrastructure. Again, this finding **ignores the increasing risks of wildland fires due to climate change**.
   b. Please see additional text under section B below.
   c. Please also see additional text in points 8) and 9) below, highlighting that the estimated increase in number of residents due to the development is laughably unrealistic, and apparently assumes that only about 200 additional residents will result from a development containing 87 units, when a much more realistic calculation is that instead there will be >400 new residents. With more than 2 times higher impacts on ability to safely evacuate during a wildland fire event.
3) Regarding section I2: Groundwater supplies
   a. Again, the "less-than-significant impact" finding **ignores the effects of climate change**. Instead, the assessment relies on historical data and outdated processes of evaluation based on the past. Climate change is the present and the future. We are currently in a water shortage, with water restrictions mandated by the city, due to our inadequate water infrastructure but also due to the simple fact that groundwater is running out everywhere in the state of California.
   b. Please see additional text under section C below, with particular attention to the impact of climate change on groundwater supplies throughout the state of California and the decreasing water supplies to replenish those groundwater supplies due to decreasing snowpack in the Sierras.
   c. Please also see additional text in points 8) and 9) below, highlighting that the estimated increase in number of residents due to the development is laughably

unrealistic, and apparently assumes that only about 200 additional residents will result from a development containing 87 units, when a much more realistic calculation is that instead there will be >400 new residents. With more than 2 times higher impacts on groundwater supplies than estimated by the FEIR.

4) Regarding section I4: Surface runoff and flooding
    a. Again, the FEIR **ignores the impact of climate change**. Please see text below under section A. Please note that the Federal Emergency Management Agency (FEMA) is no longer using the concept of "100-year flood zones" because climate change has rendered these calculations based on historical data meaningless. The new Risk Rating 2.0 system has been in effect since October 2021.
5) Regarding section I5: Stormwater drainage system capacity and polluted runoff
    a. Again, the FEIR **ignores the impact of climate change**. Please see text below under section A. Please note that the Federal Emergency Management Agency (FEMA) is no longer using the concept of "10-year flood zones" because climate change has rendered these calculations based on historical data meaningless. The new Risk Rating 2.0 system has been in effect since October 2021.
6) Regarding section I6: Flood flows
    a. Again, the FEIR **ignores the impact of climate change**. Please see text below under section A. Please note that the Federal Emergency Management Agency (FEMA) is no longer using outdated maps and terminology regarding flood areas because climate change has rendered calculations based on historical data meaningless. The new Risk Rating 2.0 system has been in effect since October 2021. Moreover, recent flooding events around the country have raised awareness about the growing, unprecedented impacts of climate change. For example, in this article published in Scientific American: https://www.scientificamerican.com/article/studies-sound-alarm-on-badly-out-of-date-fema-flood-maps/ attention has been focused on the fact that **FEMA maps are out of date** and do not fully account for the dangers of flooding in the new era of climate change. Movements are under way around the country to curtail development in flood zones. It is irresponsible to use assessments based on historical data and rating systems which are no longer valid.
7) Regarding section I7: Conflict with water quality control plan or sustainable groundwater management plan
    a. Again, the "less-than-significant impact" finding **ignores the effects of climate change**. Please see additional text under section C below, with particular attention to the impact of climate change on groundwater supplies throughout the state of California and the decreasing water supplies to replenish those groundwater supplies due to decreasing snowpack in the Sierras.
    b. Please also see additional text in points 8) and 9) below, highlighting that the estimated increase in number of residents due to the development is laughably unrealistic, and apparently assumes that only about 200 additional residents will result from a development containing 87 units, when a much more realistic calculation is that instead there will be >400 new residents. With more than 2 times higher impacts on groundwater supplies than estimated by the FEIR.

8) Regarding section N3: Education
    a. It is unclear how a project that will produce 87 housing units is supposedly only going to include 28 students. The calculation does not make sense and clearly assumes for unexplained reasons that only a third of the housing units will have any child in them, and those units that do have children will only have one child. This is not realistic nor is there are rationale for why such low numbers of children are expected to be part of the housing development. Is the proposal for an adult community? A more realistic calculation is that 80% of the household will have children and that of those, there will be an average of 2 children per household, bringing the likely number of children that would need to be accommodated in the school district up to 140. In fact, given the high cost of living in the Napa Valley and in the city of St. Helena itself, families often live at much higher density than even this more realistic calculation. In fact, an even more realistic calculation is that closer to 90% of the households will have 5-6 people per house, with 3 of those being children, bringing the potential increase in students in the school district up to 234, 10 times more than suggested by the FEIR.
9) Regarding section N5: Other public facilities
    a. Again, it is unclear how the estimate of 213 residents within the 87 housing units has been calculated. This very unrealistic, low number assumes that most of the households will be occupied by only 2 people, with only less than half (39) of the households having one child residing with the two other individuals. First of all, this calculation already demonstrates that the estimate of the number of children in section N3 of 28 is lower than expected, even by the extremely unrealistic calculations of a total of 213 residents across 87 units. A more realistic and still fairly conservative estimate is that 80% of the households will have 4 people in them, with the rest having 2-3 individuals, for a total of closer to >300 residents. An even more realistic calculation, as explained above under point 8) is that households will in fact be much more densely inhabited at occupancy rates of 5-6 individuals per household, bringing the total number of residents up to >400.
10) Regarding section O1: Existing facilities
    a. Please see above under point 9): the estimate of 213 residents is unrealistic. There are likely to be upwards of >400 new residents in the city due to the development.
11) Regarding section P1: Consistency with circulation performance plans
    a. The finding of “less-than-significant impact” is unsubstantiated by any kind of accounting for the actual increase in the number of residents and therefore also cars that would result from this development. Please see points 8) and 9) above, pointing out that the estimated number of approximately 200 new residents is laughably low and a more realistic number is >400 new residents, with as many as 300 new cars on the roads in the city of St. Helena.
12) Regarding section P2: Transportation hazards

a. The finding of “less-than-significant impact” is unsubstantiated by any kind of accounting for the actual increase in the number of residents and therefore also cars that would result from this development. Please see points 8) and 9) above, pointing out that the estimated number of approximately 200 new residents is laughably low and a more realistic number is >400 new residents, with as many as 300 new cars on the roads in the city of St. Helena.
b. Again, as discussed in point 1) above, the main concern is not simply whether the roads within the new housing development will be wide enough for the new residents to be able to safely drive out of during an emergency, but what happens to all those new additional people and cars once they get onto the current city streets, which can barely accommodate even the current number of cars driving on them, with potholes and street maintenance severely behind a normal maintenance schedule. Many of our streets, including Hunt Ave., are so severely rutted as to be like driving on a dirt road, with the unfortunate effect that cars must drive slowly to avoid damage, further complicating evacuation during an emergency situation, especially with as many as 300 additional cars needing to evacuate on already congested roadways.
c. One needs only look at the current street parking situation on the stretch of Starr Ave. between Pope St. and Hunt Ave. to realize that of course the parking situation with this new development will be a major problem. Again, the EIR assumes a laughably low number of additional residents and cars from this development. All one has to do is look at how many additional cars beyond what was planned for the Hunt’s Grove apartment complex are currently being parked on Starr Ave. A similarly much higher density of vehicles needing to overflow onto street parking would occur with this new development, increasing the risks and hazards of collision, and increasing impacts on current street and traffic flows. Again, the biggest concern is what happens under the increasing threat of catastrophic natural disasters and the ability of all St. Helena residents, current and future, to safely evacuate in an emergency.

13) Regarding section P3: Emergency access
a. As discussed previously under points 1), 2), 11) and 12) this “less-than-significant impact” finding **ignores the effects of climate change** on the increased likelihood, severity, and urgency of natural disasters and the ability to safely evacuate out of the city on currently inadequate road infrastructure which is not capable of accommodating even the current residents, and it also severely **underestimates the number of new residents and cars that would result from the development**.

14) Regarding section Q1: Utilities and infrastructure
a. Please see points 3)-7) above detailing the failure of the EIR to account for the effects of climate change on the calculations for effects on water supplies, as well as points 8) and 9) regarding the obvious micalculation of the realistic number of additional residents that would result from the housing development, and the potentially 2 times higher impact on water, wastewater, and other utilities and infrastructure.

15) Regarding section Q2: Sufficient water supplies
    a. The finding of "less-than-significant impact" on the water supplies, again, completely **ignores the effects of climate change**. All of the estimates put forth in the document simply state that there will be sufficient water supplies in the future to accommodate the new development, citing data from 2013 and 2016, which we all know are now completely meaningless and outdated. The city is currently in an emergency water shortage due to failing infrastructure. Beyond that, climate change is permanently and irreversibly changing the groundwater and reservoir supplies that we rely on. The calculations of water needs and Safe Yield are all based on outdated, historical information which does not account for actual decreases in water yields and replenishment of both reservors and groundwater due to climate change. Please see section C below detailing new information about the dwindling water supply from shrinking Sierra snowpack over the last several years and increased demand for water from growing populations.
    b. In addition, please see points 8) and 9) above, highlighting the inadequacy of the calculations pertaining to the increase in the number of residents that would result from the new development. It is likely that instead of about 200 more residents there will in fact be more like 400 new residents, thereby increasing the water demand to double what was projected, **since water demand is, rightly so, based on number of people per household rather than number of households**.
16) Regarding section Q3: Wastewater treatment capacity
    a. Please see points 8)-9) above regarding the miscalculation of the real number of residents that would result from the development (i.e. double the estimate). The finding of "less-than-significant impact" does not account for this miscalculation in the actual increase in the number of residents that would occur with the development, and instead uses an extremely unlikely and very low estimate of the number of people per household that would result.
17) Regarding section R1: Impairment of adopted emergency response plan or emergency evacuation plan
    a. Please see points 1), 2), 11), 12) and 13) above: the finding of "less-than-significant impact" **ignores the impacts of climate change** and does not account for the current inadequacy of city infrastructure on the ability of both the new residents and current residents to safely evacuate out of the city during an emergency.
    b. Please also see points 8) and 9) above: the "less-than-significant impact" relies on a flawed underestimate of the actual increase in number of residents that would result from the development.
18) Regarding section R3: Infrastructure-related wildfire risks
    a. Please see points 1), 2), 11), 12) and 13) above: the finding of "less-than-significant impact" **ignores the impacts of climate change** and does not account for the current inadequacy of city infrastructure on the ability of both the new

residents and current residents to safely evacuate out of the city during an emergency.

b. Please also see points 8) and 9) above: the "less-than-significant impact" relies on a flawed underestimate of the actual increase in number of residents that would result from the development.

19) Regarding section 3A1: Air quality management plan consistency

a. The finding that there will be an unavoidable impact on vehicle miles traveled (VMT) is still underestimating the full scope of that impact given the underestimate of the number of residents and vehicles that would actually result from the development, as pointed out in 8) and 9) above.

Climate change is happening. We all know it and have lived it and seen it over the last several years. Each fire season is worse than the last, each winter is warmer than the last, each year the weather patterns become more unpredictable. The recent conclusion from the United Nations Glasgow Climate Change Conference (COP26) meeting is that even if all countries that pledged to fully implement changes needed to meet agreed upon greenhouse gas reduction goals are actually able to meet those goals, we are still on a trajectory to see increases in the earth's temperature of at least 1.8 degrees Celsius (https://www.washingtonpost.com/climate-environment/2021/11/09/cop26-un-emissions-gap/). This means that the recently experienced natural disasters in our area including wildfires, flooding, mud slides, and droughts, are only going to be more frequent and exacerbated over the next 10-20 years and beyond.

What were once "100-year flood areas" will now effectively need to be renamed "it could flood any time" areas, highlighting the issue of the levy and the fact that **the Hunter project is in a high-risk flood zone**, which is inadequately addressed in the EIR. Furthermore, more frequent wildfires, as we have seen recently, will require more frequent evacuations, thus **public safety and transportation during emergencies and natural disasters** is another area that was not adequately addressed by the EIR. Finally, we are currently and in all likelihood will continue to experience droughts of unknown severity and duration and **we barely have enough water for the current citizens of St. Helena**, and this threat to our future water supply is inadequately addressed in the EIR. I have addressed each of these issues, as well as several additional issues in my comments below.

A. The Hunter Project is in a flood zone behind a levy that is NOT supported by federal funds, and when the levy fails and the homes within the project are flooded the residents of the city of St. Helena will be fully responsible for paying for repair of the levy and all the damage to the homes.

For the first time in 50 years the Federal Emergency Management Agency (FEMA) is changing its flood insurance program to better reflect the real risks associated with flooding in certain high-risk zones, and that take into account climate change. **The entire idea of "100-year flood" zones is now outdated and no longer being used** because it uses outdated projections about yearly percentage risk of flooding based on irrelevant, old information about weather patterns over the last 100 years. The new Risk Rating 2.0 is instead tailored to each individual property, and is designed to "adapt and re-adjust rates based on a changing, unpredictable climate,"

clearly highlighting the fact that **the risk of catastrophic floods and failing levies in certain high-risk areas is so volatile as to be unpredictable** (https://www.houstonpublicmedia.org/articles/news/energy-environment/2021/06/24/401402/femas-changing-its-flood-insurance-program-heres-how-it-will-impact-texans/). The new approach also takes into account more causes and types of flooding, including storm surge, river overflow and heavy rainfall, because **climate change is increasingly and unpredictably leading to flooding due to heavier rain falls, sea-level rise, and stronger wind and storm weather patterns**. The new risk rating policy is in effect starting October 1, 2021 for any new projects (https://www.fema.gov/flood-insurance/risk-rating). This is **brand new information that is not in any way reflected in the EIR** and in fact, all of the material in the EIR with regard to the fact that this project is in a high-risk flood zone, behind a levy that is city-managed and maintained rather than being maintained by the Army Corps of Engineers, is completely ignored by the EIR.

According to the official FEMA map of the city of St. Helena, the Hunter Subdivision project is clearly within a flood zone (https://map1.msc.fema.gov/firm?id=06055C0264E). Although the city paid for consultants to try to mitigate this risk by providing independent evaluations that take into account the mitigation of the flood risk due to the existence of the levy, as I pointed out above, this all goes out the window **with the current increased risks we are facing due to climate change**. How does the city plan to provide and pay for the rescue of hundreds of additional citizens in this high-risk area, repair the failed levy and all the damaged homes WHEN (not if) there is a catastrophic flooding event, possibly as early as within the next 5-10 years? The unfortunate truth is that this parcel of land is in a flood zone. The entire parcel was purchased for a laughably low amount that currently cannot get you an average 2-bedroom, 1-bathroom home in this town. **This parcel was sold cheap, because it should never be built on. A levy was constructed against the recommendation of the Federal government**, which walked away from the project because it is not a good idea to build homes in a flood zone, and **the city of St. Helena and its residents are entirely financially responsible for the maintenance, repair, and when needed, re-building of the levy when it fails.** Where is the accounting on the financial implications of such an undertaking and the environmental impact of such a financial burden on the city and its citizens? Not to mention the financial toll on the people who will have bought these houses falsely deluded into thinking that they were “safe” behind the levy? The simple truth is that levies fail. Even a brand new, world-class levy built by the Army Corps of Engineers to protect the city of New Orleans failed a *second time*, after it was professionally rebuilt.

It was only last year, as we all remember so vividly, that we experienced an “atmospheric river.” Anyone who lives near the Napa River here and walked out to take a look over the bridge saw for themselves that the water rose well beyond the riverbed, and in some places flooded over the river banks. And this was, even in comparison to the atmospheric storm that we experienced last year, actually a fairly modest event. What will the next one look like? We simply do not know. But one thing is for sure: there will be a catastrophic weather event, and the levy will fail. The only question is when. The likely NEW answer, given the accelerating rate of climate change, is that it will be in significantly less than 100 years.

B. Climate change is drastically and unpredictably altering weather patterns, and the incidence of wildfires and all of their consequences, both acute and long-term, is increasing to unprecedented rates that are surpassing all predictions based on historical data.

According to the National Interagency Fire Center the state of California faced over 8,000 fires that burned over 500,000 acres of land in 2002 (https://www.predictiveservices.nifc.gov/intelligence/2002_statssumm/fires_acres.pdf). In 2020 those numbers jumped to nearly 10,000 fires that burned over 4 million acres of land (https://www.predictiveservices.nifc.gov/intelligence/2020_statssumm/fires_acres20.pdf)! The state of California is facing unprecedented increases in wildfire incidences just in the last 20 years, at a time when the earth's temperature has increased by less than 1 degree Celsius (https://www.climate.gov/news-features/understanding-climate/climate-change-global-temperature), while **the *best-case* scenario projections for temperature change, as pointed out above, are on the order of 1.8 degrees Celsius over the next 20 years, strongly suggesting that the incidence of wildfires is only going to increase**. The current EIR does not account for these increases in risk due to wildfire. This is a problem in two specific ways: 1) more fires means more evacuations and more people that need to be able to leave in a short amount of time in a limited geographic area with limited evacuation routes, and 2) more fires also means more mud slides due to deforestation and loss of vegetation, which makes our beautiful hills more susceptible to slides when heavy rains hit.

The recent wildfires in Napa Valley and Sonoma Valley are a sobering reminder of what happens when wild, unpredictable winds coincide with extreme dry conditions and ignition sources. Sometimes those ignition sources are dry lightning, other times sparking generators, other times, devastatingly, even arson. Regardless of the ignition source, which in and of itself is growing in incidence (dry lightning storms in the Napa Valley in August?), the cold, hard truth is that **due to climate change the "wildfire season" in California is increasing. More and more days out of more and more months of the year, from as early as April to as late as December, there are days when the combined conditions of extremely low humidity and high winds make this area ripe for fires to start** (https://www.latimes.com/projects/wine-country-fires-california-sonoma-napa/). The fact is that there are only two ways out of town. Highway 29 and Silverado Trail. These are both narrow, 2-lane highways that can only move so many cars out per minute, and that is if all goes well and there are no accidents from people panicking and driving recklessly.

I remember very vividly driving in the middle of the night and listening to the radio with the announcer imploring people to please drive carefully so that our only arteries out of danger are not blocked by overturned vehicles, effectively trapping everyone trying to evacuate to safety. We have no right to endanger the people who already live in this town by building a large development that would add as much as 10% to our overall population in the city, with **an even higher impact on the residents on the East side of town, where the population density is already higher and the population is already more vulnerable, with multiple apartment complexes and low-income housing areas housing our town's low income residents and seniors**, including Hunt's Grove apartments, Stonebridge apartments, the Silverado Orchards Retirement apartments, and the Vineyard Valley Mobile Home Park 55+ community.

This is not the part of town where half of the homes are second homes that sit unoccupied most of the year. **The East side of St. Helena where the Hunter parcel is located is the part of town where there are more people per square mile that need to be able to evacuate in an emergency.** The **EIR already concedes that the one environmental impact that cannot simply "be mitigated"** as has so conveniently been done with all of the other potential impacts, **is the unavoidable impact on traffic.** Phrasing it as a simple "traffic problem" makes it seem like just a minor nuisance. This is not about us having to wait a few extra minutes to make a left turn onto Pope Street when we are trying to get to work on a Monday morning. **This could mean the difference between a family being able to evacuate to safety in time, or not being able to do so** because they are stuck in traffic with 500 more people than should be living here all trying to leave their homes at the same time. And make no mistake this is also an equity issue: the very people who are the most likely to have to wait until the last minute to evacuate and thus be in danger when traffic is backed up and they cannot evacuate from fire, are those who do not have the funds to evacuate earlier than "necessary" because they cannot afford to simply pay for a hotel for days on end.

It is also critical to consider that the only way out, on one of only two roads out of town via the Silverado Trail for residents of the East side of town, is **the Pope Street bridge. A historic, narrow, completely inadequate bridge** that if even one car failed, crashed or overturned while trying to drive across, would completely cut off this evacuation route, and **redirect all traffic from the East side of town onto Highway 29**. It is difficult to envision how such an accident could even be remedied in a situation such as this, given that the bridge is barely wide enough for two vehicles to drive across, with no shoulder at all for emergency vehicles to be able to approach. **It is easy to see how very quickly this very real danger of too many vehicles on the road all trying to go the same way out in a nightmare, yet very real, and recently experienced emergency wildfire evacuation scenario, becomes not just an East side problem, but also a problem for those trying to evacuate from the West side of town.**

Just as the recent "atmospheric river" weather event increased our awareness of the high risk of flooding on the Hunter parcel, perhaps even more convincingly it reminded us of the extreme vulnerability of recent burn areas to heavy rainfall, the resulting mud slides, and the further impacts on our roads. I am sure that I do not need to remind anyone of the nightmare traffic that we experienced for nearly 3 weeks following the October 22 weather event that caused a mud slide that resulted in the closing of Silverado Trail (https://patch.com/california/napavalley/storm-takes-out-part-silverado-trail). Traffic on Highway 29, from vehicles being redirected from Silverado Trail north and south of town, was atrocious. Many residents who either needed to drive north or south out of town were dealing with traffic delays of up to 2 hours. On a normal day this is very frustrating and disruptive to work and school schedules. In an emergency situation where fast-moving wildfires necessitate immediate evacuations, a situation such as this is a devastating problem for a town that has only two roads out of town.

C. **The severe drought and water shortages we are currently experiencing in the city of St. Helena are a harbinger of even worse times to come. We simply cannot support a large development which will drastically increase water demands on an already**

strained and inadequate system that can barely supply enough water to our current residents.

Unfortunately, our water shortage problems here in St. Helena are happening all over the state. **Wells are running dry** (https://calmatters.org/environment/2021/08/california-groundwater-dry/). Despite changes to California ground water laws in 2014 to enact sustainable practices that protect ground water, seven years later wells around the state continue to run dry. Current climate change projections, as outlined already above, are dire, and suggest that drought severity, intensity, and duration will only worsen over the coming decades. We simply cannot rely on old projections about water availability because we are in uncharted territory. Our ground water sources are not being normally replenished. The normal water cycles are not operating the way they used to. And it is not just wells that are running dry.

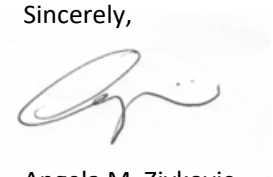
Snowpack in the Sierras normally "supplies about 30% of water statewide when the spring melt comes and water runs off to be captured in the state's system of reservoirs" (https://www.sfgate.com/bayarea/article/Sierra-snowpack-satellite-image-atmospheric-river-16568005.php). But last year's snowpack was only 59% of average, and even more disturbing and unexpected was the fact that 80% of the already lower than normal, predicted water runoff was simply soaked up or evaporated because the soils were so hot and dry, severely impacting water levels in reservoirs across the state. Even after the "atmospheric weather" event in October which brought heavy rains and a rise of over 20 feet to Lake Oroville, for example, according to the Department of Water Resources, this reservoir is at only 27% capacity. So it is **not just our ground water and wells that are drying up, our Sierra snowpack, and thus reservoirs and rivers are also drying up.** As mentioned earlier, climate change means that we are experiencing more and more warmer and warmer days, and this means that **even if we do get big storms the snowpack does not stick around, and even when we do get runoff from the snowpack, the earth is so parched that the water simply disappears on its way to our reservoirs.**

Our own reservoirs and water sources are not doing so well. Bothe last summer and currently, as I am sure we are all quite vividly aware of given the astronomical water bills, we entered severe drought restrictions (Phase II Water Regulations), with water use limited per household, and very unpopular and extreme fines being put in place in an attempt to mitigate the very real risk that we could run out of water before the reservoir was replenished by winter storms. We were lucky last year, since we did happen to get the big storm in October that saved us from imminent disaster, but next time we may not be so lucky. What is our city's plan for dealing with these new, unexpected, unpredicted risks of severe and sustained drought conditions due to climate change? How do we plan to supply water to even the current residents, much less to 500 more residents if the Hunter parcel were to be developed? The current EIR does not adequately address these issues. Laughably simplistic solutions like the use of "low flow toilets" as a mitigation solution for our real water shortage issues that are only going to worsen over time, are so inadequate as to be insulting. **We cannot rely on water supplies staying what they were even in the recent past, or being predictable based on what we used to know about how much water we might expect any given year based on old weather patterns.** In fact, it is quite clear that this year's severe drought and water shortages are likely to occur with much greater frequency in the coming years and decades, as our ground

water supplies, snowpack, river flows, and reservoir levels continue to be severely impacted by climate change. The EIR does not address these very real water issues in any real way.

I request that the city planning commission address the concerns related to climate change expressed above about the inadequacy of the EIR for the Hunter parcel, and the resulting threat to public health and safety of the development project.

Sincerely,



Angela M. Zivkovic

Subject: [External] Hunter Subdivision FEIR

To Whom It May Concern,

We received a letter last week stating that the City Planning Commission would be considering the Final Environmental Impact Report today, November 1, 2022. We have not yet had enough time to read through the FEIR and this is a huge project that could change the city dramatically. The city has just asked its residents to conserve water as we lost a pump a few weeks ago. We cannot allow this to move forward until the residents of St Helena have had enough time to review the FEIR and comment on it. I don't believe the potential effects of the proposed project have been reduced to less than significant levels. There is absolutely no way, without changing the plan entirely, for this to happen. The residents of St Helena need more time to read through this new report and were not given any time to do that. A massive 3,000 page document needs more than a few days to review.

Respectfully,

Jake & Katie Avery
Main St & Hunt Ave

Subject: FW: [External] Request for a Continuance of Public Hearing Item 5.1 Beyond Tonight's Planning Commission Meeting

I would like to request that the Public Hearing for Item 5.1 be continued to a later date to be determined and that no Recommendations to the Council be made by the Planning Commission until after this continuance. This would allow the Public and the Planning Commissioners more time to evaluate the voluminous (2894 page) FEIR and respond with appropriate comments and recommendations.

The sudden release of the FEIR and rushed scheduling of the Public Hearing is not fair to the Public or the Commissioners who have a lot to absorb and respond appropriately. Also, the Commissioners will be presented with more information from the Public at the Hearing tonight that may better inform how they respond to Staff Recommendations. Community participation in the EIR process for this project is considerable as evidenced by the volume of comments to the DEIR and Public Comments submitted for this hearing.

And,..what is the hurry? This EIR has been going on for 12 years and what would be the harm in continuing this hearing until December or January allowing for a thorough and transparent review of the FEIR. I also think this would go a long way in restoring the public's confidence in participating in the EIR process and that their comments are being fairly evaluated. As it stands now, the surprise release of the monster FEIR 11 months after DEIR comments were that submitted indicated that NOT ONE further significant impact was identified. I believe over 185 people commented on the DEIR and it is hard to believe that NONE of the comments elicited a change of even one thing in the FEIR from the DEIR. It is as if the DEIR was perfect and none of the 186 comments had merit. This combined with the rushed rollout of the FEIR is a bad look for the Saint Helena Planning Department.

Personally, I know that my comments were summarily dismissed without so much as a single "you may have a point there". The public was also informed that if you want to challenge any of the City's decisions on any of these matters in court, you may be limited to raising only those issues you raised at the public hearing described in this notice in written correspondence delivered to the City prior to the hearing. I very much disagree with the responses to my comments and will be re-submitting them to preserve my right to raise these issues in court. I would also like more time to comment on the responses to my comments.

Thank you for your attention in this matter.

Subject: FW: Comments on the DEIR for the Hunter Residential Subdivision Tentative Map Application

November 30th, 2021

FR: John Milliken

1256 Hudson Ave, Saint Helena, CA 94574

Please include my comments and attachments concerning the DEIR for the Hunter Residential Subdivision Tentative Map Application (File no. PL 10-040).

1) Planning and Zoning Code Violations

There is no mention in the DEIR of the project's numerous violations of the St. Helena Zoning Ordinance. All land use decisions must be consistent with a city's general plan and zoning ordinance. *(Collier v. City and County of San Francisco (2007) 151 Cal. App. 4th 1326, 1333, citing Gov. Code 65860, subd. (a)(2); Napa Citizens for Honest Government v. Napa County Bd. of Supervisors (2001) 91 Cal.App.4th 342, 355. See also Land Management v. Contra Costa Bd. of Supervisors (1990) 222 Cal.App.3d 950,957-958 ["issuance of a permit inconsistent with zoning ordinances or the general plan may be set aside and invalidated as ultra vires"].)* The proposed Tentative Subdivision Map and related residential construction violate the St. Helena Zoning Ordinance.

Most of the violations involve non-compliance with the City's Inclusionary Housing Ordinance, Chapter 17.146, as documented by the attached Notification of Final Unresolved Issues and Questions prepared by the City's Building and Planning Director on 2/27/2020. There were no responses from the applicant to this notification mentioned in the DEIR or listed on the Project's Planning Archive. This notification was actually the fourth sent by the City Planning Department for this second attempt at a DEIR. All four document the same Chapter 17.146 violation issues. These same issues were also brought up at the initial Public Scoping Comments Meeting held in April of 2018. With the City and the Applicant well aware of the project's violations of the Inclusionary Housing Ordinance since 2018, it is a mystery as to why these violations were not addressed in the DEIR. Also, per the section in the Municipal Code cited by Contract Planner, Eric Norris, in a letter to the applicant concerning other violations of the Municipal Code: "More on point is the requirement that a map must be denied if it does not comply with the General Plan and Zoning Code. Muni Code (section 16.16.080.D) states, A tentative map shall be denied if any of the following findings are made: 1. That the proposed map is not consistent with the general plan, applicable specific plans, or other applicable provisions of this code. Simply put, the map as presented to the Planning Commission for approval must meet all of the applicable standards of the Zoning Code. No mechanism is available to avoid this requirement."

2) The DEIR Analysis is based upon an Affordable Housing Proposal that does NOT conform to the City's Municipal Code and fails to account for potential California State Density Bonus and Development Concessions.

Because the applicant has featured "Affordable Housing" as a center piece of this project from day one, it is virtually impossible to prepare an EIR to CEQA standards without having a lawful Affordable Housing Agreement (AHA) in place that details the number, types and distribution of restricted units. As it stands now, the applicant is proposing that: NONE of the 51 Market Rate 4 Bedroom Single Family Homes will be restricted; ALL of the 25 Duets of the restricted housing will be on one lot, and the 11 ADUs will be on 11 of the Market Rate lots (location to be determined). If the City were to accept this legally dubious proposal as is, the project would be eligible for a State Mandated Density Bonus that could trigger development concessions as well as allow for between 30 or 40 more units. So, a legally comprehensive EIR would have to take into account the impacts of these concessions and potentially greater number of units. And, there is also some controversy about whether or not the ADUs that are located on Single Family Lots would qualify for a designation of restricted housing and qualify as units that could be applied to the Density Bonus calculation.

Also, since the latest Project Description has an Affordable Component that is violation of the Municipal Code, there may have to be further changes made to the number, types and distribution of the restricted units to bring the project into conformance. All of this speaks to the difficulty of preparing an EIR to CEQA standards where the legality, number, types and distribution of restricted units are a moving target. The City should insist that a legally conforming AHA be formalized and a new DEIR analysis be appended based upon the details of the AHA. To not do so will send this second attempt at an EIR to the same fate as the failed first seven-year effort. The applicant has had 11 years to provide a lawful AHA and the majority of the delay in this EIR can be laid at the feet of the applicant's inability or refusal to do so.

3) Environmental Diminishment of Taxpayer Funded Conservation Easements and a City Owned "Parklet" lot.

The DEIR makes no mention of how the extension of Adams and the intersection of Adams and Starr will be built upon a state taxpayer funded conservation easement. Additionally, there is a City owned parcel that will be paved over by the extension of Starr that is currently used as a non-motorized access point to the taxpayer funded river trail and levee hiking path. The conservation easements were agreed to by the City in exchange for funds from the Department of Water Resources to be used for the construction of the Flood Project in 2009. The City agreed that the conservation

easements were to exist in perpetuity. This would not be the case if a paved road(s), that would accommodate vehicles to access the residential housing proposed by the applicant, were built on the western portion of a conservation easement. This easement is clearly shown a map of the Levee Zone Easement (map attached) by recently prepared by the City to facilitate the transfer of deed to the Napa Valley Land Trust. Not only does this proposed road development on a conservation easement violate the spirit of the DWR agreement, it also threatens the funding from this organization if they find out that an easement has been violated. There is a precedent for having to return a public agency's funding for the flood project. When it was found out the City had used FEMA funding improperly and also double billed FEMA for flood project activities, the City had to return $1.9 million in funds.

Attached are comments prepared in 2019 by a resident of St. Helena, Victoria Bradshaw, for the 2040 General Plan Update. These comments detail how the City never included plans for an extension of Adams in any of the funding agreements that provided funds to build the flood control project. None of this was reported in the DEIR. Also, in these comments is a report on the shocking lack of maintenance by the City of the levee (that continues to this day!) that was never built to accommodate a road. Once again, … none of this was mentioned or explored in the DEIR.

Environmental impacts that come with the diminishment of conservation easements were never addressed by the DEIR. These include: having to walk/ride right next to a trafficked through road lined with parking and housing instead of what is currently open space/vineyard/wild life corridor. The path from the library to the river or atop the levee is an open space jewel that is enjoyed by many residents and visitors. The open space agricultural character of path(s) that are used to walk/exercise pets away from traffic, provided sweeping views of the surrounding mountains, and provide a much-appreciated tax payer funded venue for outdoor exercise and fresh air will literally be paved over. (Please see the attached photo documenting local Starr residents out walking their dog on Thanksgiving Day along the proposed route of the Starr extension.)

4) Traffic and Public Safety Impacts Not Mentioned in the DEIR.

Although the DEIR claims to have studied the Traffic impacts of the project using the newer VMT standard (that only studies miles traveled by the project's residents), there are quite a few Traffic Impacts that were ignored by the DEIR. Also, the DEIR failed to study the impacts on Public Safety by ignoring the potential problems with evacuation routes created by the project, be it for flood or fire.

Other traffic impacts not mentioned in the DEIR include:

a) An increase in pass through traffic through surrounding residential neighborhoods by drivers looking to avoid congestion on Main Street (Highway 29) by crossing between the Silverado Trail and Main Street. Taking highway traffic off the highways and routing it through residential neighborhoods is insane. However, this is what will happen with the advent of apps like Waze or Google Maps, that will direct drivers to go through residential neighborhoods to save just a few minutes of driving time if new connector streets (Adams and Starr) are built. Once again, …none of this was studied or identified in the DEIR.

b) Residents of Hunt's Grove and surrounding neighborhood will have to navigate and intersection with cross traffic (Hunt and Starr) to walk/drive to schools, shopping, etc. Simply put, there will be a lot more traffic on Starr if a connection is made to an Adams Street extension. Once again, …none of the impacts of this new intersection on the safety of residents was identified in the DEIR.

c) Overflow parking from Hunt's Grove is already a problem on Starr and the surrounding neighborhood. These problems will be exacerbated by the new development from all the higher density development allowed on Lot 52. In addition, whoever develops Lot 52 can request a parking concession from the Density Bonus program that will allow fewer off-road parking spaces to be provided. Once again, …none of the impacts on increased demand for limited parking spaces was identified in the DEIR.

d) Evacuation routes from Vineyard Valley and the surrounding neighborhood could be impacted by the additional pressures from the proposed development. Not only will residents in Vineyard Valley be evacuated, all the residents of the project will be using the same evacuation routes. This could turn the evacuation into a Public Safety failure. Once again, …this was not studied or identified in the DEIR.

5) Public Safety Hazards Concerning the Lack of and Maintenance of the Flood Project and the Construction of the Levee

The aforementioned Comments prepared by Victoria Bradshaw in 2019 for the 2040 GP document the lack of maintenance of the Flood Project since its construction in 2010 and also how the levee was never intended to be used as a road bed. These two conditions result in a heightened degree of the chances for catastrophic levee/flood wall failure that could result in a loss of lives and property for residential development in a flood plain behind a compromised levee/flood wall. This is the opposite of risk management and it was never mentioned in the DEIR.

Here is a link to a cloud photo album that documents the construction and (lack of) maintenance from the time the levee/flood wall was started in 2009 to just last Thanksgiving Day:

https://photos.app.goo.gl/dDLvFW3nwMzxc7HP8

As you can see, the rodent damage over the years is quite extensive. The rodent damage is most extensive at the base of the VV flood wall as well as where the wall meets the levee. This is the area that would be most impacted by hydraulic forces in a major flood event. Perhaps even more disturbing are the levee inspection reports obtained from the City dating from 12/6/2019 – 7/7/2021. They state for Item 10 Animal Control, there is an Acceptable Rating ("Continuous animal burrow control program in place that includes the elimination of active burrowing and the filling in of existing burrows.") Based on the photos, the rating should be Unacceptable ("Animal burrow control is not effective or is nonexistent. Significant maintenance is required to fill existing burrows, and **the levee will not provide reliable flood protection until this maintenance is complete**.")

Additionally, since the City could be liable for levee/flood wall failure, the impact to the finances of the City and its ability to provide services to the community could also be at risk.

City of St. Helena
Planning Department

VIA Email ben@vanzutphen.us

Mr. Ben vanZutphen
237 Lorraine Ct.
Healdsburg, CA 95448

Re: **NOTIFICATION OF FINAL UNRESOLVED ISSUES AND QUESTIONS** – Hunter Residential Subdivision Tentative Map Application Re-Submittal (File no. PL 10-040)

Mr. Hunter and Mr. vanZutphen:

The purpose of this letter is to summarize our current understanding of key aspects of the Hunter Subdivision and identify issues of concern to City Staff that have yet to be resolved.

Project Description:

The property contains 16.92 acres. The development proposed includes:

51 Market Rate For Sale detached single family residences with 11 Accessory Dwelling Units ("ADUs") deed restricted for rental at Moderate Income Rents; 20 Rental Duets at Moderate Income Rents; and 5 Rental Duets (Two duets + One single) at Very Low Income rents. The total number of units proposed is 87 (including the ADUs).

The Applicants are proposing to enter into an "Affordable Housing Regulatory Agreement and Declaration of Restrictive Covenants" (hereinafter "Affordable Housing Agreement) in conjunction with the approval of a Tentative Subdivision Map.

The City's issues of concern with the proposal are discussed below.

Affordable Housing Proposal:

The Affordable Housing Agreement that you have proposed to use will require significant additional editing to conform to this proposal. The Agreement is a form that would be used for a typical multi-family rental density bonus project. Your proposal, however, requests entitlements for a predominantly for-sale single family subdivision, with a clustered multi-family component and eleven ADUs intended to satisfy the City's

inclusionary requirements. The Agreement requires edits so that it is consistent with the proposal, and to correct a number of inconsistencies within the document. The City can make edits to the Agreement, but before doing so City staff would like to highlight a number of substantive concerns raised by the Agreement and the affordable housing proposal.

1. Compliance with the City's Inclusionary Housing Ordinance.

In a letter from RSA+ dated September 4, 2019, Mr. Sill asserts that the applicant does not intend to submit the project as an Alternative Equivalent Proposal under the City's Inclusionary Housing Ordinance, because the project is consistent with the requirements of Chapter 17.146. Staff disagrees with Mr. Sill's assertion for the reasons outlined below.

First, your proposal includes only rental affordable housing units. Under Section 17.146.050(g)(2), if "the developer is required to build four or more units of affordable housing, the number of affordable units which are required to be constructed in very low, low or moderate units shall be determined by the ration of units needed in each of those categories in order to satisfy the City's fair share housing goals."

The City's Regional Housing Needs Allocation currently requires the following number of units in each of the below market rate categories :

Very low income:	_____13 units	____25%
Low income:	___ _ 9 units	____17%
Moderate income	_____11 units	___ 21%

If you intend to provide rental units as part of this development, the units must be rented to very low, low and moderate income households based on the percentages set forth above. Your current proposal does not reflect those percentages, and therefore is not consistent with Section 17.146.050(G)(2).

Second, as we have discussed previously, City staff continues to have concerns with the fact that a portion of the affordable units will be provided as rental ADUs and the remainder of the affordable units clustered on a single parcel. Section 17.146.050(I) declares:

> Affordable units shall be comparable in number of bedrooms, exterior appearance and overall quality of construction to market rate units in the same residential project. Subject to the approval of the planning commission, square footage of affordable units and interior features in affordable units need not be the same as or equivalent to those in market rate units in the same residential project, so long as they are of good quality and are consistent with contemporary standards for new housing. Affordable units shall be dispersed throughout the residential project, or, subject to the approval of the planning commission, may be clustered within the residential project when this furthers affordable housing opportunities.

ADUs are significantly smaller units that are adjunct to the primary use of the single family dwellings located on each proposed lot. There is no indication that these ADUs or the duet units would have a comparable number of bedrooms to the market rate units, as required by Section 17.46.050(I).

Further, neither the ADUs nor the 25 duet units will be comparable in exterior appearance to the market rate units. This requirement is intended to ensure that the affordable units are indistinguishable from the market rate units, so that the affordable units are more fully integrated into the overall development. ADUs and duet units clustered onto a single lot unquestionably look different than single family homes, and therefore clearly have a different exterior appearance from single family homes. The proposal will not comply with this requirement of Section 17.46.050(I) either.

Additionally, while Section 17.146.050(I) indicates that the affordable units need not have the same square footage as the market rate units, that exception is "subject to the approval of the Planning Commission." (Id.) In this proposal, where the affordable units all appear to be significantly smaller than the market rate units, Staff would not recommend that the Planning Commission make such an exception.

Finally, the affordable units are not dispersed throughout the project. Over two-thirds of the units are located on a single parcel, and an additional eleven ADUs will be located on a handful of the other 51 lots. The proposal does not meet the spirit nor the letter of the requirement that the units be dispersed throughout the project.

In summary, City staff does not believe this proposal is compliant with the City's inclusionary housing requirements. As we have discussed previously, the Municipal Code does allow a developer to propose to meet the inclusionary requirements through an equivalent alternative action. We encourage you to provide a written narrative proposing how the affordable housing proposal will further affordable housing opportunities in the City to an equal or greater extent than compliance with the express requirements of Section 17.146.050(A), or the payment of an in-lieu fee. Based on the information that you have provided to this point, Staff cannot support your current proposal as compliant with the City's inclusionary housing requirements.

2. References to Low Income Units and Households.

Throughout the Agreement, there are references indicating that the proposed development includes units that are restricted for rental to Low Income Households. (See, e.g., Recital C, Article 1, Definitions, Section 2.3, Increased Income of Tenants.) However, the proposed development includes only moderate and very low income restricted units. If there are no low income units to be included in the development, the references to low income households and low income units should be deleted. However, as noted below, the City believes that you must also set aside low income units in order to comply with the City's inclusionary housing requirements.

3. References to Density Bonus..

Recital D of the Agreement stipulates: "As consideration for providing the Restricted Units, the Applicant reserves all rights under the State Density Bonus Law, as that term is defined in Article 1 below, with respect to incentives, concessions, waivers, and reductions." Section 2.2 of the Agreement also states that you are providing the affordable units in exchange for incentives, concessions, waivers and reductions. Staff continues to question this proposal. There is no request for a Density Bonus on file. In fact, the overall project density is 5.1 units per acre, exactly at the minimum range established for the Medium Density Residential Designation in the City's General Plan. Not only are you not providing any additional units beyond the minimum allowed by the General Plan, you have not specified the nature and extent of any "… incentives, concessions, waivers, and reductions" in the Agreement. Further, this Agreement is to be entered into and recorded after entitlements are approved for the development. At that point, the City cannot provide incentives, concessions, waivers or reductions. If you are seeking a density bonus, incentives, concessions, waivers or reductions under the Density Bonus Law, please indicate what those are so the City can evaluate them as part of our review of your proposal.

4. Additional Comments Regarding the Affordable Housing Agreement:

If this affordable housing proposal is to move forward, there are a number of issues that will need to be addressed in the Affordable Housing Agreement, including the following:

a. The Agreement would have to require that the 25 duet units will be managed by a property management firm experienced in managing income restricted rental properties, as approved by the City. This is especially important in this instance, where the developer is proposing to sell the market rate units but rent the affordable units. The City would need assurance that the rental units would be competently operated, in order to ensure that the rental units remain part of the City's affordable housing stock.

b. The Agreement would have to provide a mechanism to ensure, to the satisfaction of the City, that the ADUs would in fact be rented to households in the appropriate income categories. Individual homeowners frequently use ADUs as guest houses, offices, studios, and additional living space for the occupants of the primary residence. There would have to be some mechanism in place that would assure that did not occur with the restricted ADUs. Section 17.146.050(J)(4) requires that the resale restrictions for rental units must be acceptable to the housing director and city attorney, and this issue would need to be addressed in order to satisfy the City representatives.

c. In Section 2.2(b), the graphic indicates a mix of 23 two bedroom units and 13 three bedroom units. If there are no studio or one-bedroom units, those references should be deleted from the graphic. Additionally, Exhibit B indicates all of the duet units

are two bedroom units. That would mean there are at least 25 two bedroom units. That also suggests that all the ADUs are three bedroom units, which seems unlikely.

d. One of the duet units should be described as a single unit, since there are 25 units on the clustered lot, and there cannot be an odd number of duet units.

e. If there is to be a Homeowner's Association or equivalent entity, the dues or costs associated with that entity should be addressed in the Affordable Housing Agreement and included in the rent calculation.

f. The Agreement should expressly require, per the City's ordinance, that no certificate of occupancy shall be issued, final inspection approved or release of utilities authorized for any new dwelling unit in the project until the developer has completed on-site construction of all the required affordable units. (See Section 17.146.050(M).)

If this affordable housing proposal moves forward, the City will provide additional edits to the proposed Affordable Housing Agreement, and the City reserves the right to recommend additional changes to the Agreement as it proceeds through the Planning Commission and City Council process.

Conformance with the St. Helena General Plan and Zoning Code:

Conditional Use Permit Required

With 16.92 acres and a total of 87 units, the overall project density is 5.14 units per acre. The site is located within the Medium Density Residential (MDR) General Plan designation with a density range of 5.1 to 16 units per acre. The site is in the MR Zoning District that permits single family residences and Accessory Dwelling Units. Residential condominium projects, attached duplex or triplex units are permitted in the MDR District subject to the Approval of a Conditional Use Permit in each case. Based on your current subdivision plan, you should concurrently submit a Conditional Use Permit application.

Grading Plan

In reviewing the grading plan dated January 31, 2019, it estimates there will be 10,202 cubic yards of cut and 24,350 cubic yards of fill. There is information in the files indicating that all earthwork on the site will be balanced and no material will be imported. Given the amount of anticipated over-excavation and re-compaction necessary to prepare the site for development, please confirm that there will be no importing or exporting of soil as a part of the grading and site preparation work.

Also, in order to address concerns raised by adjoining property owners, please provide a written description of any retaining walls proposed around the perimeter of the development site, including specific heights and locations and the site elevation differential between existing adjacent residential lots and the proposed lots in your project. It is also important for the neighbors to understand how the fencing between

their properties and yours will be addressed. Will you be providing new fencing on your property line, resulting in two fences? If so, will there be a space between the fences?

Please provide the slope of the driveway into the multi-family parcel. There is an elevation provided for the extension of Adams but no grades for the multi-family parcel are provided or for the access drive.

Please address all of the above noted issues as soon as possible. We would appreciate responses no later than within 60 days of the date of this letter. Upon submittal of the requested information, please provide a letter indicating how each of the above noted items have been addressed and cite sheet numbers and/or supporting documentation as appropriate.

Completion of the CEQA Document:

Staff will be coordinating with Dudek to complete the E.I.R. as expeditiously as possible. Staff will keep you informed of the progress as it moves forward.

Should you have any questions or need additional information, please contact me via e-mail at mderosa@cityofsthelena.org

Potential Issues Related to the Adams Street Extension to the Silverado Trail

The Adams Street extension to the Silverado Trail could potentially create problems for the City's largest-ever public project, namely the St Helena Comprehensive Flood Control Project. While that street extension appears in the 1993 General Plan and the 2040 General Plan Update, it did not appear as part of any of the county, state or federal funding agreements, which were the funding sources for nearly all of the money used to build the flood control project. Nor did the street extension appear as part of permit applications or approvals required to build the levee or flood wall. While the original design of the Flood Control Project, which was done right after Measure A passed, showed a discretionary extension of the Adams Street to the Silverado Trail, it was not part of the project by the time the EIR was finalized, the RFP was let for the flood control project and all permitting, funding and approvals were done after 2006. There is, unfortunately, a common misconception in St Helena that the extension of Adams Street to the Silverado Trail was somehow approved as part of the Flood Control Project and because it appears in the 2040 GPU. There are, however, a number of other important issues related to this particular project.

1. There were at least six different funding sources for the Flood Control Project, almost all of which had specific requirements in order to obtain funding and some of those requirements extend into perpetuity. Two of the funding sources were federal, two were from the state, one was from the county and the last was from the City's own general fund. With the exception of the funds from the City's general fund, none of the five other funding sources considered the extension of the Adams Street to the Silverado Trail and its impact on the Flood Control Project in their approval of their funds for the levee and floodwall project.

   For example, the "Maintenance and Property Improved" section of one of the state funding sources states:

   "Grantee agrees to use, manage and maintain the property developed, rehabilitated or restored with the grant funds provided in this Agreement consistent with the purposes of the program and is required to continue into perpetuity or until deemed no longer necessary by the State."

At the very least it appears the City would need to get the state's approval to build the extension of Adams Street, since the road extension was not considered when the project was approved and funded and, therefore, would not be considered "consistent with the purpose of the program," which was entirely a flood control project and not in any way a road project.

In seeking the State's approval, however, the issue of whether or not the levee and flood wall have been maintained according to the Army Corp of Engineers standards (which is required by the Flood Control Project's operational and maintenance manual) will likely be examined. From documentation about the maintenance of the levee for the first five years from its completion through 2015, it is absolutely clear it had not been maintained according to the Army Corp of Engineer standards and, in fact, has had barely any maintenance. The documentation of the maintenance of the Flood Control Project from 2016 to the present has not been available, but it is clear from the hundreds of gopher holes appearing every year in both the levee and foundation of the flood wall, no other conclusion could be reached other than the maintenance of our largest project has not been robust, let alone up to acceptable standards. Residents have been taking pictures of the gopher holes appearing each year in the levee and flood wall, just in case it ever becomes an issue. According to Dr. Nicholas Pinter, a national levee expert currently at UCD, who has spent time examining the St Helena levee and the issues related to it, has said that burrowing animals on any levee is one of the signs that a levee is not being maintained appropriately. Keeping burrowing animals away from the levee is one of the first issues raised in the Flood Control Project's own operation and maintenance manual.

2. There were also at least eight state and federal permits or approvals required in order to build the levee, flood wall, terraces, etc. Many of these permits involved specific requirements and were issued without any consideration of the extension of Adams Street. While the 1993 General Plan Circulation Element showed Adams Street as a potential street extension to the Silverado Trail, it was not a factor considered in any decision to either issue required permits or in providing funding for the Flood Control Project. To now attempt to extend Adams Street to the Trail may jeopardize some of those permits and approvals. Examples of some of the unique permits and approvals required include:

    California Endangered Species Act Incidental Take Permit;

California Fish and Game Streambed Alteration Agreement;
US Army Corp of Engineers 404 Permit;
State Water Resources Control Board Section 401Water Quality Certification;
State Historic Preservation Office;
Bay Area Regional Water Quality Control Board National Pollution Discharge Elimination System permit; and
US Fish and Wildlife Service and Atmospheric Administration Fisheries Section 7 approval.

As an example, according to the staff report to the City Council dated May 24, 2016, the California Endangered Species Act Incidental Take Permit (ITP) No. 2081-2009-004-03 through the California Department of Fish and Wildlife (DFW) required, as a mitigation measure, that a deed restriction into perpetuity be placed over a portion of the city-owned land consisting of two parcels totaling approximately 10 acres. In addition to this requirement, the funding from the Department of Water Resources (DWR) required the creation of a conservation easement deeded into perpetuity over the same area of city-owned land. This staff report goes onto explain that in 2016 the City worked with the state to develop a specific deed restriction acceptable to the state, which was discussed at that City Council meeting. The state approved the Land Trust of Napa County (Land Trust) as the third-party easement holder. To avoid a duplication of efforts, both DWR and DFW mutually agreed upon a single conservation easement and the Land Trust as the conservation easement holder.

According to the staff report, during an on-site meeting with the Land Trust staff in 2016, the subject of the extension of Adams Street extension was discussed. The conservation easement would only permit the maintenance of existing infrastructure, flood control measures and habitat. It would prohibit the construction of a street, pedestrian path or bicycle lane on that portion of the City-owned property. The staff report concluded that Adams Street could not be extended to the Silverado Trail.

To ensure that there were no other alternatives available at that time (in 2016), City staff reached out to both DWR and DFW about the conflict between the 1993 General Plan (and the proposed GPU) regarding the extension of Adams St. DWR told the City staff that it would not approve a change to the conservation easement area or possible alternative mitigation to satisfy the requirements for the grant funds. This grant was scored and

awarded partially as a reflection of the proposed mitigation measures. If the conservation easement approved by the state in 2016 was not approved, then it is possible that the basis for the grant application approval would no longer be supported and all funds would have to be returned. In order to close out that grant it would be necessary to approve the road-restricted conservation easement and record it.

The staff report goes on to explain that if the City decided to return the grant money to the DWR, it would still be necessary to work with DFW before any consideration could be given to extending Adams Street. An alignment study would be necessary to satisfy the original Endangers Species Incidental Take Permit to look at what portion would be taken out of the conservation easement to make room for the street extension. After this is done the City would have to submit a request describing the proposed area to be removed from the deed restriction for the road. DFW would then review the proposal and, either recommend alternative-mitigation measures to satisfy the original permit or to deny it. The staff report concluded that if alternative mitigation measures were approved, they would be significantly more expensive and any alternative mitigation within the existing permit area would likely cause higher mitigation requirements on other projects when future permits are issued. If DFW denies the request, then there could be some significant financial consequences ($173,000) and the complete conservation easement would be required.

At the City Council meeting in May 2016 there was much discussion of the effect of the conservation easement discussed with DWR, DFW and the Land Trust on the extension of Adams Street to the Silverado Trail. The conclusion at the City Council meeting was clear, namely the approval of the conservation easement that the state was seeking would foreclose the extension of Adams Street to the Trail. The City Council approved the proposal.

Three months after the City Council approved the conservation easement that would foreclose the extension of Adams Street to the Silverado Trail, the Land Trust Board of Trustees approved the project on July 28, 2016 at their Board meeting.

Nearly two years after the City Council approved the conservation easement that would not allow the extension of Adams Street to the Silverado Trail, the issue again was raised at the March 13, 2018 City Council meeting. At

that meeting the Council approved a contract with 'the Land Trust of Napa County for a conservation easement as required by the terms of the Department of Water Resources grant contract No. 4600009016 for an amount not to exceed $65,000." The staff report explains that staff would work with both the Land Trust and DWR on the deed restriction. Nowhere in the staff report does it mention any of the following: (1) the prior City Council's approval on May 24, 2016 of a conservation easement, which would effectively restrict a roadway through the 10-acre site; (2) the prior conversations in 2016 on the conservation easement with both the Land Trust, DWR and DFW; and (3) the conservation easement into perpetuity requirement resulting from the granting of the Endangered Species Act Incidental Take Permit.

On October 23, 2018 (or two and a half years after the City Council approved the conservation easement, which effectively restricted the extension of Adams Street to the Trail), the City Council approved a second conservation easement giving the City the ability to approve a roadway through the 10-acre site required for a conservation easement. Once again, the staff report does not mention the May 24, 2016 City Council approval of a conservation easement effectively foreclosing the extension of Adams Street to the Trail, nor does it mention the Department of Fish and Wildlife's requirement for the very same restricted conservation easement because of the ITP granted to the City when it built the Flood Control Project. Also, of some importance, is the statement in the staff report that the City had been working with the Land Trust since March 2018, when, in fact, the staff had worked with the Trust well before May 2016. By not including the information about the prior City Council approval of the road-restricted conservation easement and the information about City's prior conversations with DWR, DFW and the Land Trust, it might call into question the appropriateness of the October 23, 2018 conservation easement approved by the Council. Both the City Council and the public were not furnished accurate or complete information before the Council took action.

It is unknown if the City has recorded any easement as required by the ITP and DWR grant. Also unknown is, whether or not, the second conservation easement approved by the City Council was prefaced by any conversation with any state agency confirming the change in the previously approved deed restriction concept. It is also unknown how the City closed out the DWR grant without proof of the conservation easement being passed and recorded, which was the key item preventing the grant close out. The

conservation easement was also the final item preventing the City from getting the final $237,000 for eligible project costs. If the grant has not been closed out, both DWR and DFW would have the ability to further audit the project, including the appropriate maintenance of the project and all required mitigation measures. A logical assumption is that the DWR grant has not been paid off because there has been no appropriation by the City Council for that amount of money.

If the City attempts to extend Adams Street to the Trail, it will again be necessary to get an Endangered Species Act Incidental Take Permit from DFW for that project. Unfortunately, this will put the City in the position of asking for approval of a new permit just after the City finished ignoring the mitigation measures agreed to by the City's in its prior ITP for the Flood Project. The likelihood of getting a second ITP would not be strong after ignoring the mitigation measures required in the first ITP.

It is also unclear what position DWR would take, if the City elects to extend Adams Street. Apparently, they were adamant they would not approve it the first time the City asked DWR about it in 2016. It has been nearly a decade since the flood control project was funded and completed and it is now approaching four years since the prior City staff conversations with both DWR and DFW on the issue of the conservation easement and the ability of the City to build a road through it. It probably would be prudent to acknowledge those prior conversation to both DWR and DFW in any of the City's current round of discussions. If the City doesn't do that and the state later finds out about those conversations, then the City may well jeopardize future grants or permits from these same agencies.

There is also another significant potential conservation easement issue. The DWR grant requires a conservation easement into perpetuity basically on any city-owned property on which DWR funds were used for the Flood Control Project. The only area the City originally determined to be included in any easement is 10-acre site of the city-owned land nearest the river. The expense payment reimbursement requests by the City to the DWR under the grant during the construction of the Flood Control Project, however, also appear to include costs used on the project's access road and pedestrian path. This area is also city-owned land and is not included in the 10-acre conservation easement. This is the city-owned property furthest from the river and which connects the access road and pedestrian path adjacent to the current terminus of Adams St to the original 10-acre conservation easement

site closest to the river. If that is correct, then the part of the project closest to the current Adams Street terminus would also have to be placed into the conservation easement into perpetuity in order to satisfy the grant agreement. Even a cursory look at some obvious items appearing on and/or making up the pedestrian path and the access road were itemized by the City as having been reimbursed under the DWR grant. This issue has been previously raised with the city a couple of times, but the staff has chosen to ignore it.

3. Shortly after Measure A was passed by the voters in 1998, St Helena began working on a Comprehensive Flood Control Project. In the original design was a levee, which cut the historic flood plain in half. The reason for the location of the levee became apparent, when the City proposed to combine the placement of the levee (to be paid for with Measure A funds) with an all-weather extension of Adams Street to the Silverado Trail, which was called the Adams Street Causeway and Bridge. Glossy brochures were produced by the City and distributed to residents in order to gather public support for the project that specific alignment of the levee to help provide a roadway.

   The 2004 EIR showed the Adams Street extension as a discretionary addition to the Flood Control Project (requiring a separate environmental review) using the levee as the primary vehicle to extend Adams Street to the Trail. On June 23, 2005 the Napa County Flood Protection and Conservation District notified St Helena that the Napa County Flood Protection and Watershed Improvement Authority had made inquiries regarding the levee because <u>any portion of the levee used for a component of a future transportation facility would thereby be ineligible to be constructed using Measure A funds</u>.

   As a result, Jonathon Goldman, the Director of Public Works and City Engineer for St Helena, wrote a letter to Robert J. Peterson, Napa County Flood Control and Water Conservation District Engineer, answering the question as to whether the levee is, in fact, intended to support a road rather than simply to provide flood protection. Goldman's July 12, 2005 letter says the "levee element serves two functions in the Project, (1) provide a barrier against inundation, and (2) provide an onsite location for disposition of soils to be removed from the planned terraces. The planned levee is wider than what would be necessary if only inundation-prevention were the objective. The levee is wider in order to accommodate the disposition of soils to be removed from the terraces. If the soils to be excavated were to be trucked to

offsite disposition, traffic and other potential impacts, as well as the cost of the Project, would increase."

The rest of Goldman's letter to Peterson goes on at great length to try to convince him that the real reason for the wider levee is the volume of soils to be replaced and not the placement of a road on the levee. Assuming that Goldman's information is correct, then there is no assurance that the levee can now sufficiently serve as the foundation for an all-weather road to the Trail, since the only requirement for the wider levee was not to support a transportation facility, but simply to provide a dumpsite for extra soil. Goldman makes clear the levee is wider than necessary to provide inundation-prevention only because it was needed as a dumpsite. The implication here is that the dumpsite was not engineered to support a roadway, because that would have foreclosed Measure A funding. To now claim that additional costs were, in fact, incurred to widen the levee to provide an appropriately engineered infrastructure for a roadway, could put our Measure A funding in jeopardy.

In the 2005 and 2006 Addendums to the 2004-approved EIR, any mention of the Adam Street extension was limited to the fact that it said there was no change from the 2004 EIR because the City was not considering approval of the Adams Street Causeway/Bridge and this issue required no further consideration or analysis.

After the 2005 and 2006 Addendums to the prior-approved 2004 Flood Control Project FEIR, no Flood Control funding applications, permits, etc. likely could go forward with an Adams Street extension to the Silverado Trail as part of it because there was no EIR done on that specific project.

4. Whether the extension of Adams Street is on, adjacent to or near the levee, the levee itself would not be benefited and likely the viability of the levee and Flood Control Project would be negatively impacted. The levee itself has not been maintained appropriately and the City has already told the County that the levee was not constructed in a manor to build a future road, but rather just a "dumping" point for excess soil removed from the project terraces. The levee operational and maintenance manual already requires that a gate be placed on the access to the levee to limit the use of cars on the levee. This only supports the concept that building a public road on the levee was not anticipated in the construction of the levee.

If the roadway is built alongside the levee, then any actual construction of the extended roadway and the bridge to the Trail and any ongoing use of the roadway would not be helpful in maintaining the viability of the levee. The safety and financial risks from a levee failure far outweigh any benefit from an extension of Adams Street to the Trail. Vineyard Valley and Hunts Grove residents are the most vulnerable of our population if the levee fails or its viability is threatened. If the levee fails, particularly because the City failed to maintain it adequately or because the City threatened the viability of it because of building a roadway on top of or adjacent to the levee, then the City would likely bare the financial liability for any damages resulting from the failure. The City assumed that liability once it accepted money from the State as explained in AB 1898 and CA Water Code §12748.3, which basically indemnified the state.

5. The St Helena Comprehensive Flood Control Project was a financial disaster for the City. Not only was the project way over the projected costs, but FEMA clawed-back $1.9M for disallowed expenses (such as the cost of crushing Merlot grapes in Mendocino County). DWR also required the repayment of $2.1M for disallowed expenses and double billing the same expenses to two different state funding sources. It is unclear if that repayment has been completed. As a result of the completely inadequate handling of the financial activities involved in the project, the City hired a forensic accountant. After months of review, the forensic accountant basically gave up. If the City decides to extend Adams St to the Silverado Trail, issues related to the repayment of grants, etc. will once again raise issues concerning the mishandling of the financial accounting of the monies spent on the project. The fact the City has not been able to close out a state grant on a project that was completed in 2010 will not help the City's case.

6. If the City elects to extend Adams Street to the Silverado Trail they will likely need the approval of both DWR and DFW for the reasons explained above. In addition, the City may also need the approval of the Napa County Flood Protection and Watershed Improvement Authority (Measure A authority) since the City previously said the design of the levee was not to facilitate a future transportation facility. Other approvals would possibly need to come from the Army Corp of Engineers, who approved its permit without information pertaining to a potential future roadway on or near the levee. The Army Corp of Engineers would also likely review the maintenance of the levee if their approval is necessary. FEMA, who approved funding for two grants based on flood control needs and then

approved the revised the flood zone after the project was built without any information pertinent to a roadway on or near the levee and its potential impact on the viability of the levee would also likely seek review.

Less problematic options for any additional access to the Silverado Trail from Highway 29 would be Mills Avenue to the south or Fulton Avenue just to the north of Adams Street. Neither of these options would run into any of the financial, administrative or safety problems that as Adams Street extension poses for the City.

Subject: PC Meeting 11/2/2021 Public Comment on Hunter Project DEIR from John Milliken

First of all, I would like to provide a link to an article written by Professor Nicholas Printer of the UC Davis Center for Watershed Science that I think should be mandatory reading for each Planning Commissioner and the City Staff involved in preparing the DEIR.

https://californiawaterblog.com/2016/07/17/st-helena-california-dealing-with-a-field-of-dreams-levee-residual-risk-and-a-flood-of-controversy/

None of the issues covered in this article were mentioned in this DEIR.

Second, I would like to express my dismay at what an unprofessional, non-comprehensive, and shallow effort this latest DEIR effort represents. It is absolutely mind boggling that this DEIR could only identify two significant impacts (both traffic related) for a major development project of this size after an almost four-year effort at a cost of over $450,000. The DEIR reads like an infomercial the applicant. I intend to submit separate comments on the many deficiencies and missed impacts either completely ignored or glossed over by this so-called DEIR. I do not know who was in charge of this effort, but I think the City Council and Planning Commission should seriously consider an inquiry into how this happened and there should be consequences for those responsible. This community (whose environment is being impacted!) deserves much better than this and this DEIR effort crosses the line of professional negligence. I am not asking for a DEIR that supports the grievances of the many members of the community who are opposed to this mammoth 87-unit development, rather, I was expecting a balanced DEIR that fairly identified ALL the environmental impacts presented by this development and was prepared to lawful CEQA standards. This DEIR does neither of those things. How can a DEIR propose meaningful mitigations if it cannot properly identify environmental impacts?

I do not know if this substandard DEIR effort was by intent or the result of a lack of oversight by the Lead Agency, the City of St. Helena, but the end product is seriously flawed. As you can probably see by all the public comments submitted to date and an avalanche of comments to be submitted by the November 8th deadline, I am not the only one to have noticed this. Thankfully, many members of our community have taken on the responsibility of correcting this wrong and will be submitting comments that identify way more impacts than were identified in this DEIR. And, they are not being paid $450,00 to do this and were only given 45 days to prepare comments instead of four years.

Oh,..one more thing. When several members of the community (whose environment is being impacted!) politely asked if the comment period could be extended so that they could have more time to prepare researched, cogent comments on the lengthy 28 Mb download and 633 page DEIR document, they were quickly rebuffed and simply told no. This seems a little harsh considering that this second DEIR effort is heading into its fifth year after a failed first seven-year effort. FYI: The comment period for the first failed EIR effort in 2012 was extended to 90 days. I guess this contempt for the community (whose environment is being impacted!) is the new norm and this is what we will be dealing with for the remainder of the process. It is my hope that Planning Commissioners will ask staff some questions about this DEIR process when they are afforded the opportunity after the Public Hearing closes. The ability to ask questions was not afforded community members.

Subject: [External] Hunter Project Comment

To: City of St. Helena

This note is to express my strong objection to the proposed Hunter project development.

As a long-time resident of St. Helena, 22 years of which I have resided on the east side of town on Peppertree Circle, I have serious concerns about the construction of 87 additional homes in the Hunter location.

Regarding traffic circulation and emergency access, Pope Street is already severely impacted with traffic to and from Main Street and the Silverado Trail. As you know, the Pope Street bridge is inadequate to accommodate a large volume of traffic, and remains the single outlet through town to the Silverado Trail. The addition of more population in this isolated pocket of land without first addressing the traffic, community safety and emergency vehicle access is extremely poor, irresponsible planning.

Regarding the need for housing, I understand we need housing for families, but the isolated location of this development makes these homes the furthest in town from our public schools and transportation. This is an immediate hardship for families. We should instead build in locations that are not along the river and have walkable, safe access for children and families to our schools, businesses and public transportation.

Regarding adequate infrastructure, the city water supply and sewers are already stressed. These capacity issues should be addressed before allowing this development to proceed.

Subject: [External] Hunter Project FEIR/Public Comment/Request for Extension

Dear Planning Staff:

I am writing to request an extension to review and provide public comment to the FEIR and this proposed project. The FEIR document is over 2,000 pages in length. The mere days to review the FEIR, coupled with such a lengthy document, denies the community appropriate notice and opportunity to comment on such a major project that will absolutely impact the City of St. Helena and its residents. The community needs additional time to review and also to, for example, request public information that the FEIR refers to but does not provide. In addition, the fact that the name of the project has been changed and is no longer be referenced in public materials as the Hunter Project has deprived the community of appropriate notice. It is imperative that an extension be granted to permit adequate community review and response to this proposed project.

Thank you.

Subject: [External] The Hunter Project

To the Saint Helena Planning Commission
11.1.2022
Re:The Hunter Project

The Hunter Project is like Rasputin. It refuses to die.

The City of Saint Helena never should have originally approved consideration of this project, but seems to have been scammed or otherwise influenced to start the process long ago.

The project is extremely dense, not in character with the surrounding area.

It will use a huge amount of water, no matter what the developers try to say.

Simply look at the thing. Will it really have as little impact as the developers claim? Do we have enough water for Saint Helena now, even without the water suck
the Hunter Project will cause? Of course not.

Will the Hunter Project pave over or otherwise cover ground that now absorbs water into the aquifer? Yes, it will.

Will it displace and affect wildlife? Of course.

Is the Hunter Project in a flood zone, even though taxpayers were scammed into providing it with its own, private levee? Yes, it is.

California and the Napa Valley alternate between drought and flood. It has always been that way, and it is getting worse, as we all can see. The droughts are getting worse, and the floods, when they come, which they will, will be worse.

The Hunter Project will add more cars and traffic noise to a formerly quiet part of town. No matter how the developers claim it won't,
anyone with a brain knows it will.

Traffic; noise; air pollution; increased waste and sewage; increased use of water; increased runoff; decreased charging of the aquifer;
sitting in a flood zone; ...

How many more excuses and meetings are there going to be to try to justify a monstrosity project that never should have been considered
in the first place?

It is time to end the Hunter Project once and for all. Show that you actually care more about the quality of life in Saint Helena than you care
about making the owners of the Hunter Project rich.

Thank you.

To: Maya DeRosa <MDeRosa@cityofsthelena.org>
Subject: [External] public comment on Hunter EIR certification

As a matter of context, I want to begin with a reminder that page 13 of the October 2022 Public Review Draft, City of St. Helena Zoning Code Update states "The purpose of this Zoning Code is to: "Protect and promote the **public health, safety**, peace, comfort, and general welfare; Encourage **orderly, compatible** and beneficial uses of land; **Minimize conflicts which might result from incompatible and inappropriate land** uses…." The purpose of the CEOA EIR development process is to further those land use goals. However, based on examples such as the ones I bring below, it seems the core intent of the Hunter EIR development CEQA process is being improperly manipulated to further the financial goals of the Hunter Project developers, while completely discounting the safety of current and future residents in proximity to the Hunter Project, as proposed.

It should be also noted that Page 9 of the Planning Commision Report for November 1, 2022 on file number PL10-040 and TM 2022-001 regarding the Hunter Subdivision Map cites Government Code Section 65589.5 (j)(1) in providing that …the City may only deny the project if it finds, based on written findings supported by a preponderance of the evidence in the record that both of the following conditions exist:
1. **The housing development project would have a specific, adverse impact upon the public health or safety** unless the project is disapproved or approved upon the condition that the project be developed at a lower density. As used in this paragraph, a **"specific, adverse impact" means a significant, quantifiable, direct,**
safety standards, policies, or conditions as they existed on the date the application was deemed complete.

There are historic, significant, direct and quantifiable traffic and congestion issues in the neighborhoods proximate to the proposed Hunter Project. The Hunter EIR findings are inadequate

and unrealistically dismissive to negative impacts on public safety in St. Helena should the project be built as proposed. The dismissive response to the public safety needs of the community and the inadequacy of this EIR is substantiated by the fact that no revisions were made in EIR Section 3.1 Transportation and Circulation, in spite of numerous traffic and evacuation safety concerns posted by community members during the public comment period on the Hunter DEIR.

Section 3.14-5 of the EIR states “Under Cumulative conditions, would the proposed project conflict or be inconsistent with CEQA Guidelines section 15064.3(b)? This is considered a significant impact. No mitigation measures available.” My understanding is that CEQA section 15064.3(b) pertains to potential negative traffic impacts. **On page 3.15-5 the authors of the EIR thus acknowledge the project will exacerbate traffic problems in the immediate vicinity and there are no mitigating actions possible.**

The developers of the EIR document have completely dismissed the existing traffic issues in the developed areas adjacent to the proposed Hunter project -- Hunt Avenue/Hunt’s Grove/Meadowcreek Circle/Starr Avenue. Simply saying there is nothing that can be done to mitigate a problem doesn’t make it go away, or make it better. Observational evidence of conditions in the area around the proposed Hunter Project indicate that adding 80+ households to the area, without developing paths of emergency egress in addition to the roadways proposed by Hunter, will create immediate and negative impacts on public safety.

Section 3.14-4, page of the EIR states “Would the proposed project result in inadequate emergency access? This is a less than-significant impact.” The facts of current and past traffic problems and past traffic studies in the immediate area of the proposed Hunter Project do not support this finding. The one marginally successful August 2021 emergency evacuation drill in Vineyard Valley cited in Master Response 1 (Planning Commision Report page 1446) is not an accurate model of an emergency evacuation of the entire St. Helena area east of Main Street. This is another example of flawed and dismissive analysis in the Hunter EIR development process.

According to the EIR section 2-23, “Development of the Project site would require the extension of Adams Street and Starr Avenue onto the Project site to provide two points of ingress and egress….” In addition to aggravating the impacted neighborhood traffic situation, further increasing the density of the adjacent neighborhood housing will directly endanger current residents, well as any future residents of the proposed Hunter project, if a sudden emergency evacuation is necessary, given the few points of exit (Pope Street bridge, Main Street) from the area. Responsible addition of 80+ households to this area must require development of ***several*** additional entry and exit points; the two cited in the EIR are not sufficient to safely evacuate the planned Hunter development. In addition, due to prior land use agreements made by the City of St. Helena, it is highly questionable whether there will ever be a bridge built crossing the river at the intersection of Adams Street and Silverado Trail.

The EIR cites the historic frequency of local natural disasters in the form of floods “...1973, 1978, 1982, 1983, 1986, 1995, 1997, 1998 and 2005 (page 3.9-5)” and wildfires “August 2020 there were a number of wildfires including the LNU Lightning Complex Fire and the Glass Fire that burned large areas of Napa County including a small portion of the Project site (page ES-4).” The fragile and limited points of egress on the east side of St. Helena have had a history of creating crisis situations as a result of our frequent natural disasters, such as the recent landslide blockage of Silverado Trail in October 2021. The findings of the Hunter EIR indicate a dismissive and inadequate assessment of existing emergency evaluation problems in the area surrounding the proposed development. Another example of the inadequacy of the EIR is that the recommendations of the California State Department

of Transportation on the development of safe evacuation routes (Evacuation Route Guidance, Design Information Bulletin 93, dated 12/23/20) are not being followed in the plans for the Hunter Project.

Sherri Kelly

1192 Meadowcreek Circle

From: Lou Lavigne & Nancy Rothman
Fulton Lane, St. Helena
Subject:Hunter Project EIR

Dear Planning Commission:

Reviewing this giant proposal with little time for citizens to study should be immediately delayed to allow an appropriate longer review period.

That said in the meantime the consultant and the applicant should address the issues raised previously about this proposal..they have not gone away and on rapid review are not solved in the latest proposal.

-Flood risk-it is difficult to see how building inside the levee on the floor of the basin is a safe proposition…who is going to assume the liability..the City or FEMA? Then there is the question of flood risk to the surrounding area starting in particular with Vineyard Valley ….?
We are also concerned that if the levee is compromised the two major drainage ditches from Fulton Lane will be overwhelmed and flood water will back up toward Fulton Lane as well. This already occurs in heavy rains to some extent near the outside base of the levee due to the congested connection of the Fulton drainage ditches and poor maintenance of the ditches which apparently is a City responsibility.

-Water Supply & Sewage -how any proposal to add 20 acre feet of water use (or 6.5 million gallons…more graphic) to St. Helena's already constrained water supply could be justified based on the ludicrous idea of retrofitting 333 offsite homes or paying ~$597,000 in lieu fees just doesn't compute without an identified plan.. Where is the water going to come from? St. Helena already has constraints on obtaining more water supply? Then there is the proposed use of abandoned wells being activated for the landscaping..where are these wells and is that practical without jeopardizing the other wells of vineyards and residents in this area.
Then there is the other side of the new water usage….Sewage..how the City's sewage system and plant could be made to handle even an additional 6.5 million gallons of waste water is a major challenge considering current City finances and sewage needs.

-Traffic-St Helena recently had a good taste of incremental traffic on Pope Street and surrounding streets with the rain caused closure of Silverado Trail; not a pleasant experience.
The proposed project adds traffic issues on at least two fronts:
If as the developer proposes Starr Ave. were extended to an extended Adams Street the resultant short-cut speedway from Pope Street to Main street via Starr and Adams will further the traffic jam at Railroad and ultimately Main Street. Any proposal to add stop lights on this route would risk increasing speeds in a residential area with drivers attempting to make the light/s. Then there is the added traffic resulting from the residents and their visitors and vendors of the proposed development which will also feed into the extensions of Adams and Starr….plus the incremental intersections added by the proposed project would further add traffic hazards and congestion potential. The intersections of Pope and Starr, the extended Starr and Hunt, Starr and the new street in the proposed development and the intersection of the extended Adams and Starr plus a new proposed street in the development linking with Adams at that same proposed intersection are all going to add congestion and pollution in a residential and agricultural neighborhood.

-Parking-while the project allows for parking it is hard to see based on other areas of the City where development has occurred that the proposed project doesn't add additional cars parking on-street further adding to congestion and adding more hazards for traffic, pedestrians and bicyclists.

-Hiking Trail—everyday we see many people hiking on the City Trail alongside and the one on top of the levee literally all the way to the Napa River…a beautiful walk in surrounded by vineyards and much nature as it is also a natural habitat in places. To systematically destroy the rural charm of St. Helena including jeopardizing this hiking trail plus replacing vineyards with houses and streets is short sighted in our view.

-Affordable Housing-we recognize and support the need for additional affordable housing, however, to build it in a flood risk area and to add a major residential development with all the issues raised here and by others seems like an inefficient way to get there. The City should fully explore other more development efficient alternatives.

-Financial strength of the developer—while this isn't a topic for the EIR per se it becomes one that needs to be carefully evaluated and monitored due the disruptive nature of the proposed project to the current site and neighboring areas and the estimated long six year duration of the project. Were this ill advised project to be attempted without the City having financial assurance from the developer (perhaps in the form of a bond) that it would be completed would add an additional risk as an interruption in construction, drainage etc. could result in incremental flood and other risks…plus an eyesore of a partially completed project.

We built our home on Fulton Lane (on the former Napa Valley Oriental Nursery site) after investigating the prior history of rejection of development on the Hunter site and the resultant preservation of the levee. We also explored the flood risk in this immediate area and concluded that the levee and existing drainage ditches/swales on Fulton Lane provided a reasonable level of protection. This new Hunter project proposal (which is literally in our backyard) is a significant concern to us for a number of reasons enumerated above and we strongly recommend its permanent rejection.

In conclusion we have been unable to find the benefit to St. Helena and its residents of this proposed development. It all seems like a major step toward impairing the character of St. Helena which makes it a wonderful place to live and turning it into another congested suburb with strained municipal resources. We are totally against the proposed Hunter project.

Thank you, Lou Lavigne and Nancy Rothman 11/1/22

Public Comment Re: Item 5.1: Hunter Subdivision Project EIR

Dear Chair Ponte and Commissioners,

The Napa County Bicycle Coalition (NCBC) represents over 2,000 members and supporters throughout Napa County in advocating to make riding a bicycle in our communities safe, convenient, and accessible for riders of all ages and abilities. For over 12 years, the Napa County Bicycle Coalition has worked with local organizations, businesses, elected officials, and the public to align our transportation infrastructure with the needs of cyclists and other active transportation users.

The proposed Hunter Subdivision development, located just a few blocks away from downtown St. Helena and community destinations would provide much-needed market rate and affordable housing. Residents would be well within reasonable walking (<1 mile) or biking (<5 miles) distance of grocery stores, pharmacies, parks, schools, as well as St. Helena City Hall and the St. Helena Public Library. With implementation of adopted Bicycle and Pedestrian Plans, this development could help accelerate the City's progress toward the target active transportation mode share of 20% of trips by 2035 established in these active transportation plans.

The Hunter Subdivision Draft EIR states that the project will induce roughly 800 vehicle trips per day, a "potentially significant" increase in VMT, and claims that there are "no feasible mitigation measures," making it a "significant and unavoidable" impact. The claim that there are no feasible actions to reduce this project's VMT impact is untrue given the development's close vicinity to several destinations that create regular travel (downtown, schools, grocery stores, etc.). One of the most powerful actions to reduce VMT is to provide bicycle and pedestrian facilities that are safe and comfortable for users of all ages and abilities in order to allow people to opt for walking or biking instead of driving – an option which is easy for developers to include, given that the developer has a clean slate to work with when creating new roads.

In order to address the VMT impact and to better align this significant development with City goals around climate, public health and safety, and active transportation, we urge

the Planning Commission to recommend that the City direct the Hunter Subdivision developers to upgrade the planned active transportation facilities for Starr Avenue and Adams Street. While we appreciate that the City has included Class II bicycle lanes on Starr and Adams as a condition of approval, we believe that additional measures must be taken.

In addition to contributing towards City Goals 1, 5, and 6, NCBC's recommendations outlined below act as mitigation measures for the project's significant projected VMT increase.

Adams Street

The City's adopted 2019 Bike Plan proposes a Class I shared-use path on Adams Street east of SR 29, including along a future extension of Adams Street that connects to Starr Avenue. As Adams Street is one of the most significant east-west connections in the City of St. Helena, leading to St. Helena Public Library, Safeway, downtown St. Helena, and St. Helena Elementary School, it is crucial that all modes are provided adequate safety and access along this road. This section of Adams Street will also provide an important connection to the future Vine Trail shared-use path according to current proposed alignments.

We request that the project developers implement the planned Class I along the north side of the Adams Street extension and continue the Class I to at least Library Lane. This option is easily feasible with the 60 feet of Right of Way. We propose that the Class I be constructed by removing the parking lane from the north side of Adams Street, as the north side of Adams along this section (Library Lane to future Starr Avenue) is adjacent only to vineyards and is nonessential. Removing north side parking on Adams Street would free up 8 feet of space. We recommend that with this space, the south sidewalk be widened to at least 6 feet and the remaining space be used to contribute to a Class I on the north side.

The existing businesses on the south side of this corridor segment all have parking lots with adequate parking in addition to on-street parking on the south side. Since no proposed homes will be built on Adams Street, and all of the proposed housing has sufficient parking (3.5 spaces/unit in Lot 52 and two on-site spaces, covered guest parking, and street parking for the rest of the project), abundant parking is provided for residents in the areas around their homes. The proposed parking on the north side of Adams Street bordering the vineyard is superfluous, and the space would better serve the community and help reduce VMT by contributing towards an improved and connected active transportation network.

Starr Avenue

Although the City's adopted 2019 Bike Plan proposes a Class I shared-use path along Starr Avenue, we support the City's condition to install Class II bicycle lanes on Starr Avenue from Hunt Avenue to Adams Street. Class II bicycle lanes on the new segment will continue the existing Class II network on Starr to create a cohesive and understandable bike network along the corridor.

Additionally, we recommend that the sidewalks in the Starr extension be widened from four feet to at least five feet by narrowing the vegetation strips, in order to provide more valuable public space to pedestrians. Four-foot sidewalks are barely large enough to allow two able-bodied people to walk side-by-side. These simply do not provide sufficient space for families to walk together or for pedestrians in wheelchairs or with strollers to navigate other pedestrian traffic. This also reduces access to the social aspect of walking, a significant community health benefit the importance of which the Covid-19 pandemic has only emphasized.

-

Finally, on both Adams Street and Starr Avenue, the City should direct the project developers to implement appropriate traffic-calming measures to reduce vehicle speeding and improve road safety for all road users.

Speeding is already a significant traffic safety concern in St. Helena. As reported by resident comments listed in the DEIR Appendices, Starr Avenue is already used as a cut-through street to avoid SR 29 and Silverado Trail traffic and experiences high volumes of speeding motorists. More broadly in St. Helena, a group of citizens concerned with speeding on existing City streets has already formed and began meeting with the City Police Department to identify actions to reduce speeding. The City approved a contract with GHD to address traffic safety on Madrona and Spring after citizen reports of unsafe motorist behaviors on those streets, namely speeding. Through our Safe Routes to School safety evaluation efforts and several separate conversations with community members, parents in St. Helena have expressed their fear of allowing their children to walk and bike to school due to motorist behaviors such as speeding.

As the street designs are presented in the DEIR, vehicle travel lanes will be 12 feet wide, the same width as the California standard for highways. These streets will be wide, long, and straight, with minimum traffic control and no traffic-calming – similar to Madrona and Spring. We know that such design facilitates motorist speeding and we urge the City

to be proactive on traffic safety by directing the developers to include appropriate traffic-calming on Starr and Adams.

We implore the Commission to recommend that the City ensures that the above recommendations are included in the Hunter Subdivision Project as it moves forward. This project is early enough in the design stages to implement these reasonable changes that will help reduce the significant VMT impact and help St. Helena become more bikeable and walkable.

Should you have any questions about any of the above recommendations, please contact Carlotta Sainato at (707) 258-6317 or csainato@napabike.org. Thank you for your time and consideration.

Sincerely,

Carlotta Sainato

Hello Ms DeRosa,
Since the planning department is/was ready to schedule a public hearing for the Hunter/Van Phutzen project isn't it time to add it to the planning projects map? I have requested this previously and it is still not on there.
Best,
Mariam Hansen

HUNTER SUBDIVISION CONDITIONS OF APPROVAL 10-31-22

Deleted: 20

Tentative Subdivision Map TM 2022-001
APN 009-030-057

These conditions shall apply to City approval of Tentative Subdivision Map TM 2022-001. However, the only conditions herein that constitute preconditions to the approval of the Final Map are those that explicitly state that they constitute such preconditions, and such conditions may be satisfied through substantial completion, as determined by the City Engineer, by execution of a Subdivision Improvement Agreement, in a form acceptable to the City Engineer, or a combination thereof. Either substantial completion or execution of a Subdivision Improvement Agreement or a combination of both, shall enable the City Engineer to make a determination of substantial compliance with these condition and the Tentative Subdivision Map TM 2022-001.

Planning Division: General Conditions

1. This specific approval is limited to the Tentative Subdivision Map TM 2010-40, and is not intended to serve as an approval of the overall project description that was submitted with the tentative map application.

2. This approval is based upon all conditions of approval set forth herein, including mitigation measures and specified plans and agreements included by reference, as well as all applicable City rules and regulations. Any deviations from the conditions must be reviewed and approved by the City for conformity with this approval. Deviations may require approved changes to these approvals and/or further environmental review. Deviations without the above described approval will constitute a violation of permit approval.

3. Except as specifically authorized in these conditions of approval, the grading, development, use, and maintenance of the property; the size, shape, arrangement, and location of the structures, parking areas and landscape areas; and the protection and preservation of resources shall be subject to Planning Commission approval and shall conform to the conditions of approval below. Notwithstanding the foregoing, the associated grading and construction of infrastructure for the project shall be permitted without Design Review approval if the design of such infrastructure has otherwise been approved by means of the Tentative Map or Final Map. All plans and agreements (such as landscape maintenance plans) required pursuant to these conditions of approval must be submitted for review and approval and shall be implemented as approved by the City.

4. The use and/or construction of any structures or improvements authorized by this approval shall not commence until all necessary planning and building permits pertaining to the use or construction in question are obtained. Before any grading or building permit will be issued by the City, the Owner/Applicant must obtain written clearance from all departments having

conditions; such clearance shall indicate that the Owner/Applicant has satisfied all pre-construction conditions.

5. The Owner/Applicant's acceptance of this permit and/or commencement of use, construction and/or operations under this approval shall be deemed acceptance of all conditions of this approval by the Owner/Applicant.

6. The Owner/Applicant shall ensure that potential contractors are aware of City requirements. The Owner/Applicant shall notify all contractors and subcontractors in writing of the site rules, restrictions, and Conditions of Approval and submit a copy of the notice to the Planning Department.

7. Pursuant to the Municipal Code, Section 16.16.100, the Tentative Map approval is valid for a two (2) year period ending _____, 2024, unless later extended by operation of state law. The Final Map shall be filed by this date or an extension of time shall be requested prior to the expiration date.

8. Pursuant to St Helena Municipal Code, any request for an extension of the Tentative Map must be justified in writing and received by the Planning Department at least twenty (20) days prior to expiration. The time at which such map expires may be extended by the City Council for one year, and on further application twenty (20) days before the expiration of the one year extension, the subdivider may request a second one-year extension, and on further application twenty (20) days before the expiration of the second one-year extension may request a third one-year extension. No extension shall be permitted beyond the third one-year extension.

9. Prior to recordation of the Final Map and subject to City approval as to form and content, the Owner/Applicant shall include all of the mitigation measures and conditions of approval associated with or required by this Project approval on a separate informational sheet(s) to be recorded with the Final Map. All applicable conditions and mitigation measures for the Project shall be printed on grading and/or building plans.

10. Compliance with all permit conditions shall occur in accordance with specific regulations but in all cases not later than prior to occupancy or initiation of use unless another time is set by law or by this approval. Occupancy or final inspection of a project may be withheld if all conditions, including payment of fees for services rendered by the City, are not met.

11. In any action or proceeding to attack, challenge, invalidate, set aside, void or annul the City's approval of applicant's Project, in whole or in part, applicant shall defend, at its own expense and without any cost to the City, and with counsel acceptable to the City, and shall fully and completely indemnify and hold the City, its agents, officers, and employees harmless from and against any and all claims, causes of action, damages, costs, attorney's fees and liability of any kind, so long as the City reasonably promptly notifies the applicant of any such claim,

action, or proceedings and the City cooperates fully in the defense of the action or proceedings.

12. This Tentative Parcel Map shall be binding upon all parties having any right, title or interest in the real property or any part thereof, their heirs, successors and assigns, and shall inure to their benefit and benefit of the City of St. Helena.

13. If the Tentative Map is proposed to be revised, including revisions to these conditions of approval, the revisions shall be approved pursuant to and in accordance with Section 16.16.130 of the St. Helena Municipal Code.

14. The primary purpose of this review is for compliance with the General Plan and Zoning Ordinance. The owner/applicant is responsible for meeting with the Building Official/Fire Inspector to review compliance with Building and Fire Codes, including fire protection systems and the accessibility standards of Title 24.

15. All required fees, including planning fees, development impact fees, park impact fees, and building permit fees shall be paid prior to issuance of building permit unless such payment has been modified by adopted mitigation measures or conditions of approval. Fees shall be those in effect at the time of the issuance of the building permit.

16. This authorizes the creation of a tentative subdivision of a 16.92-acre parcel (APN 009-030-057) located at the north/east terminus of Adams Street into 52 lots. In addition, two lettered lots are created: Parcel A (0.06 acres) is an open space lot adjacent to an internal roadway; Parcel B (0.04 acres) will contain a private water well to be used for irrigation of landscaped areas.

17. All uses of the property shall be in compliance with the MR: Medium Density Residential zoning district regulations.

18. The applicant shall be responsible for compliance with all mitigations measures adopted as part of this project and listed in the Environmental Impact Report and Mitigation Monitoring and Reporting Program (MMRP) adopted as part of this project.

19. All conditions of approval shall be clearly identified and included on all plans submitted for future permit review and issuance.

20. Prior to applying for building permits, proposed future development on any of the newly created lots or parcels shall require the approval of a Design Review application and Use Permit application as applicable, subject to discretionary review by the Planning Commission.

21. The Applicant shall be responsible for all City plan check and inspection costs as described in the St. Helena Comprehensive Fee and Rate Schedule.

Planning Division: Final Map Conditions

22. The owners of the 51 single family residences shall be members of a homeowner's association dedicated to the maintenance of the project's common areas, the landscaping of the front yards of each of the single-family homes, the internal irrigation system (fed by the well on Parcel B), and the well on Parcel B.

23. Prior to recordation of the final map and concurrent with the Subdivision Improvement Plan, the applicant shall submit CC&R's (Codes, Covenants and Restrictions) to the City Attorney, Public Works Director and Community Development Director for review and approval. CC&R's shall be recorded at time of recordation of final map. CC&R's shall include all restrictions and maintenance regulations pertaining to, landscaping and common areas; shall include all restrictions and maintenance agreements pertaining to roads and access easements; and all restrictions and maintenance agreements pertaining to the irrigation well and internal irrigation water distribution system. The CC&Rs must be recorded prior to issuance of any building permit for any structure on the project site.

24. Pursuant to Section 16.20.090, upon approval of the final map by the City Council, the City Clerk shall execute the appropriate certificate on the certificate sheet and shall, subject to the provisions of Section 66464 of the state Subdivision Map Act, transmit the map, or have an authorized agent forward the map, to the county recorder prior to the issuance of a building permit.

25. Prior to issuance of a Certificate of Occupancy, all overhead utilities on the site shall be undergrounded.

Planning: Misc. Conditions

26. Prior to issuance of building permits, the applicant shall develop a building construction plan to be approved by the Planning Director and Building Official to insure that the homes exceed Title 24 Energy Efficiency Standards and receive a green rating under either the LEEDS, Green Points Checklist, or other acknowledged rating system for energy conservation and green building practices. The latest version of the City of St. Helena green building standards will apply at the time of building permit submittal.

27. Prior to approval of the Final Map, the applicant shall enter into an Affordable Housing Agreement with the City of St. Helena, which agreement shall be subject to review and approval by the St. Helena City Council. The Affordable Housing Agreement shall be recorded in the Official Records of Napa County, and shall ensure that the project complies with the requirements of Municipal Code section 17.146.050, Residential development project, inclusionary/in-lieu fee requirements. The Affordable Housing Agreement shall demonstrate how the project satisfies the minimum density requirement of the General Plan to construct a minimum of 87 dwelling units, including single family, multifamily, and accessory dwelling units.

Planning: Flooding Conditions

28. Prior to issuance of building permits, the occupant shall prepare a statement that has been approved by the Public Works Director for inclusion in the disclosure documents provided to purchasers of homes which describes the flood risk present at this location and notifies the buyer of the availability of low-cost Preferred Risk Policy flood insurance.

Planning: Landscape Conditions

29. City of St. Helena Community Development Department shall review the final landscape and fencing plan as part of a Design Review approval and prior to issuance of building permits for construction on the property to ensure compliance with Mitigation Measures. Landscaping shall be native, drought tolerant, compatible with oak trees and requiring minimal irrigation.

30. Landscape plans shall comply with the State of California Model Water Efficient Landscape Ordinance and Section 17.112.140 of the St Helena Municipal Code. Plans shall be designed and verified by a landscape professional and shall include drought tolerant landscaping and low water irrigation systems. Landscaping shall not block vision from exits or at street intersections.

Planning: Construction Activities Conditions

31. Mechanical equipment, including heating and air conditioning units and spa equipment, shall be located away from property lines and shall be shielded or enclosed to minimize noise levels. Noise generated shall not exceed 60 dBa, Ldn.

32. The applicant and/or construction manager shall notify all contractors and subcontractors that no trespassing is allowed on adjoining properties.

33. To reduce disturbance of residents in the project vicinity, construction activities which generate noise that can be heard at the property line of any parcel of real property within the City limits shall be limited to 8:00 a.m. to 5:00 p.m. Monday through Saturday. Delivery of materials/equipment and cleaning and servicing of machines/equipment shall be limited to 7:00 a.m. to 6:00 p.m. Exceptions to these time restrictions may be granted by the Public Works Director for one of the following reasons: (1) inclement weather affecting work, (2) emergency work, or (3)other work, if work and equipment will not create noise that may be unreasonably offensive to neighbors as to constitute a nuisance. The City Engineer must be notified and give approval in advance of such work. No construction activities shall occur on Sundays or federal or local holidays that generate noise that can be heard at the property line of any parcel of real property within the City limits.

34. This property in the vicinity of an agricultural district. All future purchasers of homes or renters living in the project shall be notified of the expectation of legal, normal agricultural activities on the adjacent land, including day or night disbursement of chemicals, and creation of dust, noise, or fumes, and of the City's Right to Farm ordinance.

Public Works: General Conditions

35. Prior to recordation, the Final Map shall be designed to the satisfaction of the Public Works Director to accommodate the following facilities in the right of way of both Starr Avenue and Adams Street:

    - Curb and Gutter in accordance with City Standard #310 for a 24" gutter.
    - Sidewalks on both sides of the street along Starr Avenue, and only on the south side of Adams Street, in accordance with City Standard #315
    - Parking lane on both sides of the street in accordance with City Standard #301 for a "Collector" street.
    - Class II on-street bike lane on both sides of the street in accordance with Caltrans' Highway Design Manual Index 1003.2 but not less than 5 feet wide.
    - Two vehicle travel lanes in accordance with City Standard #301 for a "Collector" street.
    - Striping to delineate parking, bike, and travel lanes.

36. All public improvements utility connections shall be designed in accordance with the City of St. Helena's Construction Standards (SHMC 16.32.230).

37. The City has adopted the latest edition of the Bay Area Stormwater Management Agencies Association (BASMAA) Post-Construction Manual. Applicant is responsible for conformance construction plans in accordance with the BASMAA Manual, SHMC Section 13.32 et. seq., and the State Water Resources Control Board Phase II Municipal Separate Storm Water System (MS4) General Permit (Order 2013-0001 DWQ). Approval of project by Planning Commission does not constitute compliance with storm water regulations nor a right to develop per approved plans unless this condition of approval is fully satisfied.

38. Grading plans, public improvement plans and connections to public utilities shall be prepared by a California Licensed Civil Engineer.

39. An Encroachment Permit is required prior to starting work within City right of way.

40. All public facilities damaged by construction activities shall be the responsibility of the Applicant and shall be repaired to the satisfaction of the City at the Applicant's expense.

41. During water shortage emergencies, all construction water used for the project shall be obtained from a source other than a City of St. Helena potable water sources (SHMC 13.04.221).

42. Unless exempted, any ADU or JADU constructed with a new single-family home shall have a separate utility connection directly between the ADU or JADU and the utility and payment of the normal connection fee and capacity charge for a new dwelling are required SHMC 17.116.030(G)(2).

43. Developer shall design and construct all improvements and facilities shown on any approved tentative map, site plan, or other documents submitted for permit approval, in accordance with the St. Helena Municipal Code (SHMC), and the City of St. Helena Design and Construction Standards. Approval of a tentative map depicting improvements that do not conform to the SHMC or City standards does not constitute approval of an exception to the SHMC or City standards unless explicitly stated herein or in another City resolution.

44. The developer shall be responsible for all City plan check, map check and inspection costs. The developer shall deposit funds with the City upon the initiation of plan check services. The amount of the initial deposit shall be determined by the City Engineer. Additional funds may be required based upon actual plan check and inspection costs.

45. If any of the improvements which the applicant is required to construct or install is to be constructed or installed upon land in which the applicant does not have title or interest sufficient for such purposes, the applicant shall do all of the following at least 60 days prior to the filing of the final or parcel map for approval pursuant to Government Code Section 66457:

    a) Notify the City of St. Helena (hereafter "City") in writing that the applicant wishes the City to acquire an interest in the land which is sufficient for such purposes as provided in Government Code Section 66462.5;

    b) Supply the City with (i) a legal description of the interest to be acquired, (ii) a map or diagram of the interest to be acquired sufficient to satisfy the requirements of subdivision (e) of Section 1250.310 of the Code of Civil Procedure, (iii) a current appraisal report prepared by an appraiser approved by the City which expresses an opinion as to the current fair market value of the interest to be acquired, and (iv) a current Litigation Guarantee Report;

    c) Enter into an agreement with the City, guaranteed by such cash deposits or other security as the City may require, pursuant to which the applicant will pay all of the City's cost (including, without limitation, attorney's fees and overhead expenses) of acquiring such an interest in the land.

46. Prior to the issuance of a Certificate of Occupancy, all proposed utilities, both on-site and along project frontages, shall be placed underground. This does not include surface mounted transformers, pedestal mounted terminal boxes and meter cabinets.

47. Except for the existing well on Lot 19 of the Tentative Map that will be providing irrigation water to this development, all existing wells, septic tanks and/or underground fuel storage tanks shall be abandoned under permit and inspection of Napa County Department of Environmental Health. If applicant determines that there are none, prior to the issuance of a grading permit, the project engineer shall provide a letter describing the scope of the search done to make this determination and demonstrating to the reasonable satisfaction of the City

Engineer that there are no other existing wells, septic tanks and/or underground fuel storage tanks within the boundaries of the Tentative Map.

Public Works: Fees

48. Public Works engineering and inspection fees for Improvement Plan and Final Map review shall be due and payable at the time of making the first submittal in connection with the Improvement Plans or the Final Map, as applicable.

49. All Public Works Development Impact fees shall be due and payable at the time of issuance of building permit(s) for the improvements to which they are applicable, unless otherwise authorized by the City.

Public Works: Improvement Plan and Construction Conditions

50. Improvement plans shall be prepared and submitted by a California Registered Civil Engineer for the construction of all necessary and required on-site and off-site improvements including grading, water, sanitary sewer, storm drain facilities, roadway improvements, curbs, gutters, sidewalks, parkway strips and streetlights. All design and construction shall conform to the City of St. Helena Design and Construction Standards, as applicable.

51. Per Mitigation Measure GEO-1, a detailed Soils Investigation/Geotechnical Report (the "Soils Report") shall be prepared and submitted for review with the submittal of the improvement plans. The report shall address, at a minimum, potential for liquefaction, expansive soils, seismic risk, recommendations for roadway structural sections, foundation, and other items as mentioned in the Mitigation Measure. The improvement plans shall incorporate all design and construction criteria recommended in the Geotechnical Report and acknowledgement of inclusion of any recommendations in the soils report applicable to improvements within this development shall be included on a signature line for the Geotechnical Engineer on the cover sheet of the improvement plans. The signature line should include a statement that the Geotechnical Engineer has reviewed the plans and that the plans have incorporated recommendations as outlined in the Soils Report.

52. All private water mains, sewer mains and storm drains shall be clearly labeled "Private" on the improvement plans.

53. Improvements plans shall include a storm water pollution prevention plan. Erosion control measures shall be included within the improvement plans and the projects WDID number shall be included on the cover sheet of the improvement plans.

54. The improvement plans shall include the following note per the *Engineering Controls* portion of Mitigation Measure NOI-1: "All mobile and stationary construction equipment employing an internal combustion engine shall be equipped with suitable exhaust and intake silencers which are in good working order."

55. Roadway Improvements:

    a. The structural section of all road improvements shall be designed based upon a geotechnical investigation that provides the basement soils R-value and expansion pressure test results. A copy of the geotechnical report shall also be submitted with the first set of improvement plan check-prints.

    b. Where new roadway improvements abut existing paving and sidewalk, curb and gutter, the existing pavement and concrete curb and gutter section shall be saw-cut and reconstructed to provide a smooth conforms conform. The limits of such reconstruction shall be as determined by the City Engineer.

    c. Pavement markings and signage shall be provided on all streets as necessary and as required by the City Engineer. Signage restricting parking and red painted curbing shall be installed where appropriate. Speed limit signs and other regulatory and informational signs shall be installed at locations determined by the City Engineer.

    d. Street lighting shall be designed to provide to meet safety requirements and minimize glare. Street light standard and luminaries of the design, spacing, and locations shall be approved by the City Engineer. All lighting must have shields.

    e. Ramps for disabled persons meeting the most recent standards shall be provided at all intersections and at the limits of the improvements where they do not adjoin existing sidewalk improvements. Sidewalk warps shall be provided as necessary to allow a clear four-foot-wide walkway at all locations, including areas where mailboxes, streetlights, and fire hydrants obstruct sidewalks.

56. In accordance with mitigation measure BIO-1 of the approved environmental document, a qualified biologist shall conduct a habitat assessment for bats in trees adjacent to the Project site within 2 weeks prior to any Project construction (site clearing, grading). The habitat assessment shall include a visual inspection of potential roosting features (bats need not be present) and presence of guano within the Project site and 50 feet around these areas. Potential roosting features found during the survey shall be mapped and described in a survey letter report. If roosting bats (individuals or colonies) are detected within the Project site, California Department of Fish and Wildlife shall be notified as soon as possible prior to any construction activity to confirm the bats can be avoided during construction. If a bat roosting or maternity colony cannot be completely avoided, a qualified biologist shall prepare a bat mitigation and monitoring plan for California Department of Fish and Wildlife review and approval, and that plan shall be implemented prior to commencement of construction that could impact the roosting bats or maternity colony. A written report of the findings shall be provided to the City prior to grading.

57. In accordance with mitigation measure BIO-2 of the approved environmental document, if construction activities are scheduled to occur during the breeding season for birds (February

1 through August 31), prior to commencement of construction the Project applicant or their contractor shall implement the following measures to avoid potential adverse effects to nesting raptors and other nesting birds:

- Preconstruction surveys by a biologist of all potential nesting habitats within 500 feet of construction activities, where accessible, shall be conducted by a qualified biologist. Surveys shall occur no more than 14 days prior to the initiation of site disturbance. If construction is stopped for 14 days or more during the breeding season, a new preconstruction nesting bird survey must be conducted before work can be restarted to ensure no new nesting has occurred in the interim.

- If preconstruction surveys indicate that nests are inactive or potential habitat is unoccupied during the construction period, no further mitigation is required, following submittal of a survey report letter to the City of St. Helena Planning Department.

- If active nests are found during preconstruction surveys, a no-disturbance buffer shall be created around active nests during the breeding season or until it is determined by the biologist that all the young have fledged. The buffers shall be established by the biologist in conjunction with the California Department of Fish and Wildlife. Typical buffers may include 500 feet for raptors and 50 to 250 feet for other bird species based on the location of the nest, the nesting species present, and types of construction activities that may cause potential nest abandonment. The perimeter of the buffer zone shall be fenced or marked with staked flagging.

58. In accordance with mitigation measure BIO-3 of the approved environmental document, wetland permits (e.g., 404 Nationwide Permit, 401 Water Quality Certification, and 1602 Streambed Alteration Agreement, respectively) shall be obtained prior to any grading work. Prior to issuance of a grading permit, the Project applicant shall demonstrate authorization from the Army Corp of Engineers and any other regulatory agency to alter the wetland.

59. Prior to the commencement of grading, the developer shall provide evidence that an archaeological monitor has been retained to be present on the site during all ground-disturbing activities per mitigation measure CUL-1.

60. Per mitigation measure CUL-2 of the approved environmental document, if human remains are unearthed during grading operations, work must stop within 100 feet of the find and the county Coroner shall be contacted immediately.

61. Per mitigation measure GEO-2 of the approved environmental document, if known or suspected paleontological resources are unearthed during grading or trenching operations, the area of discovery shall be roped off by the contractor to include a 50-foot radius buffer and remain off-limits until cleared by a qualified paleontologist.

62. Per mitigation measure HAZ-1 of the approved environmental document, the Project applicant shall ensure the following subsurface soils testing and follow-up analysis be performed prior to obtaining a grading permit:

    - A soils testing work plan shall be developed in accordance with DTSC's Interim Guidance for Sampling Agricultural Properties (DTSC 2008) by an appropriately licensed individual (i.e., professional geologist, environmental engineer, or similar qualification) for the portions of the Project site historically used for agriculture. Special consideration shall be given to targeting site soils that are representative of historic agricultural use, and to avoid sampling recent fill material placed during levee construction. Prior to carrying out soils testing, the work plan shall be submitted to the Napa County Division of Environmental Health (as the Certified Unified Program Agency for all cities and areas of Napa County) and the City of St. Helena for review and approval.

    - The number of soil samples, sampling methods, compounds tested, background samples (if applicable), and laboratory analyses shall be completed in accordance with DTSC's Interim Guidance. Should analytical results exceed naturally occurring concentrations or applicable CHHSLs, the health risks of such a condition shall be evaluated in human health risk assessment as described in DTSC standards and guidance (e.g., preliminary endangerment assessment guidance manual). • The risk assessment shall describe measures that must be implemented to ensure potential health risks to construction workers, site residents, and the general public as a result of hazardous materials are reduced to a cumulative risk of less than one in one million for carcinogens and a cumulative hazard index of 1 for non-carcinogens, or as required by the Napa County Division of Environmental Health acting as the Certified Unified Program Agency and/or DTSC oversight. In the event human health risk assessment shows elevated chemical concentrations pose a risk to human health or the environment, the risks shall be eliminated or substantially reduced by removal (e.g., excavation of soils and off-site disposal) or remediation of contaminated soils, and/or implementation of institutional controls and engineering controls (IC/EC). IC/EC may include use of a construction risk management plan, use of hardscape to cap problem areas, importation of clean soil in landscaped area to eliminate exposure pathways, and/or deed restrictions. If IC/EC are implemented, an Operations and Maintenance Program shall be prepared and implemented to ensure that the measures adopted are maintained throughout the life of the Project.

63. Per mitigation measure NOI-1 of the approved environmental document, the contractor shall implement the following for onsite noise control and sound abatement means that, in aggregate, would yield sufficient construction noise reduction during the site preparation, grading/excavation, and building construction phases of the Project to ensure compliance with the FTA-based guidance standard of 90 dBA hourly Leq at or beyond the property lines of the nearest residences, as noted.

    Administrative Controls – At all times during site preparation and construction:

- Comply with Chapter 8.24 of the Municipal Code with respect to allowable construction periods,
- Minimize idling time of onsite equipment, and
- Either locate onsite stationary construction equipment (such as generators or air compressors) as far from adjacent residential property boundaries as is feasible or place this equipment inside an approved noise-attenuating casing (e.g., sound-attenuated air intakes and heat vents, exhaust mufflers, etc.), or place this equipment indoors.

Engineering Controls – All mobile and stationary construction equipment employing an internal combustion engine shall be equipped with suitable exhaust and intake silencers which are in good working order; and

Install Sound Abatement – During site preparation and construction which involves the operation of more than two pieces of heavy equipment (dozer, backhoe, front-end loader, crane, tractor, etc.) for at least one hour and when operating within 25 feet of the exterior of a residence (either offsite or onsite), do the following:

- Erect a temporary barrier (i.e., plywood sheet) or install sound blankets (or comparable temporary solid barriers) on the Project's construction fencing, or
- Locate sound path intervening containers or trailers onsite to block direct line-of-sight between residences and the operating heavy equipment.

Public Works: Improvement Plan and Construction Conditions

64. Starr Avenue: Prior to the issuance of a Certificate of Occupancy, Starr Avenue shall join the existing Starr Avenue at Hunt Avenue and shall be improved to include the facilities listed in condition of approval #58. The structural section of the street shall be per recommendations contained in the Soils Report.

65. Adams Street: Prior to the issuance of a Certificate of Occupancy, Adams Street shall join the existing section of Adams Street (currently a dead end) and be extended into the subdivision. The street shall be improved per condition of approval #58. At the northerly terminus of Adams Street, a conform shall be constructed with Class 2 aggregate base to connect to the existing walking path/access road/levee. A gate shall be included at the terminus of the road and connection to the walking path/access road that has appropriate signage indicating it is not a through road for vehicles. The gate shall be constructed per direction from the Fire Chief and shall include a Knox box. The structural section of the street shall be per recommendations contained in the Soils Report.

66. Street A: Prior to the issuance of a Certificate of Occupancy, Street A shall be improved to include two 10 ft. travel lanes, two 8 ft. parking lanes, curbs, gutters, a 6 ft. planter strips and

Deleted: 12

4 ft. sidewalk on the south side of the road and a 10-foot distance from the face of curb to the right-of-way line on the west side of the road. The total right-of-way width shall be 56 feet. The area between the curb and the right-of-way line on the west side of the street shall be graded such that it can be passable by pedestrians (cross slopes should not exceed 5%). The structural section of the street shall be per recommendations contained in the Soils Report.

67. Streets B and C: Prior to the issuance of a Certificate of Occupancy, Streets B and C shall be improved to include two 10 ft. travel lanes, two 8 ft. parking lanes, curbs, gutters, 6 ft. planter strips and 4 ft. sidewalks within an overall 56 ft. right-of-way. The cul-de-sac associated with Street C shall be constructed per City Standard 304. The knuckle at the intersection of Streets B and C shall be constructed per City Standard 305. The structural section of the street shall be per recommendations contained in the Soils Report.

68. EVA: From Street A to levee: Prior to the issuance of a Certificate of Occupancy, the emergency vehicle access road (EVA) shall be improved to provide an all-weather access road (paved) from Street A up to the existing levee road to the north. The width of the EVA shall be a minimum of 21 feet from face of curb to face of curb within an overall 25 ft. wide dedicated EVA. The EVA shall accommodate emergency vehicles (must provide for turning radii to accommodate fire vehicles as per the Fire Department requirements.) Turning templates shall be provided with the improvement plans during the plan check process to ensure the EVA can accommodate Fire Department apparatus.

69. Access from Lot 52 to Starr Avenue shall be for EVA and pedestrian purposes. Ownership of this parcel shall be the same as Lot 52, or the access point shall be made part of Lot 52.

Deleted: at a minimum, the same width and configuration as the EVA. If pedestrians are to use this access point, pedestrian facilities (min. 4-foot sidewalk) shall be provided adjacent to one side of the roadway. If a sidewalk is included, overall width of this parcel shall be at least 31 feet

70. Adjacent to Lot 51 there is a portion of existing right-of-way that needs to be vacated by the City prior to the recordation of the final map. The applicant shall provide all descriptions and plats to the City for vacation of this right-of-way. The vacation of the right-of-way by the City of St. Helena shall either be done prior to or concurrently with the recordation of the final map.

71. Per Mitigation Measure AES-1, all streetlights shall include shields and downward focused to reduce glare and spillover light and to minimize effects on wildlife and to retain the rural ambience of the development.

Public Works Water and Sanitary Sewer Improvements Conditions

72. As detailed in the Final EIR for the project, the Developer is required to off-set the Project's water demand of 37.04 AFY. The Project's landscape water demand is estimated at 17.16 acre-feet per year, which is within the capacity of the existing on-site well. Due to the new potable water demand on the City system in the amount of 19.8 AFY, the Developer shall implement an alternative innovative method of mitigating water use as allowed under Section 13.12.030(B) of the SHMC and/or Appendix J of the EIR. The required improvements to offset water demand are as follows: Identify and implement offsite improvements that

reduce water loss from the public water distribution system and/or identify and implement offsite improvements that result in a net increase in potable water availability equivalent to 19.8 AFY, or a combination of these. No building permit may be issued until the City has confirmed that the Developer has completed the approved measures and such measures have been accepted by the City, or Developer has entered into a public improvement agreement with the City to ensure the completion of such improvements and provided security in one of the forms described in Government Code section 66499 in an amount equal to the estimated cost of construction of the proposed offsite improvements as determined, or reviewed and approved, by the City Engineer. Any public improvements shall be constructed to St. Helena Public Works Construction Standards whenever applicable.

73. Any modifications to the existing well other than the installation or maintenance of pumping and storage equipment and connection to the onsite irrigation water distribution system, shall require a permit per section 13.16.060 of the St Helena Municipal Code.

74. The Final Map shall include easements to provide for the installation of the private onsite water system connected to onsite well.

75. All homes and the proposed multi-family parcel shall be served by the onsite well for landscaping and other outdoor water use. Only interior fixtures may be served by City of St. Helena domestic water.

76. All parcels must be connected to the internal irrigation well for outside uses, including landscape irrigation and exterior hose bibs.

77. The Applicant shall make written application to the City of St. Helena in conformance with Chapter 13.04 of the St. Helena Municipal Code for Water Service to the new parcels.

78. The applicant/owner shall be required to install water mains and service lines to serve the project parcels with City water. All water mains and lines within the public right of way shall be constructed in conformance with City standards.

79. The applicant/ owner shall make written application to the City of St. Helena for annexation to the Sewer District and for Sewer Service to the new parcels in conformance with Chapter 13.20.070 of the St. Helena Municipal Code.

80. All public water and sewer mains must be located in public right-of-way wherever possible. Where public water and sewer mains must be located on private property, all necessary easement dedications must be made part of the final map or by separate document (if outside of the boundaries of the final map) prior to final acceptance of the improvements by the City.

81. Sewer grades must be designed such that ultimate finished floors are a minimum of 12” above upstream manhole or clean-out rim elevations. Inadequate elevation differentials or grade on private laterals, as determined by the City, must be mitigated by either raising finished

floor elevation(s) or installing privately owned and operated sewer lift station(s) with grinder/ejector pump(s) on site.

82. All water improvements shall conform to the City standards.

83. The existing 10 ft. public waterline easement shall be abandoned by separate document once the relocated water line has been built and is operational.

84. Prior to the first Certificate of Occupancy, the existing 12-inch waterline running through the development shall be relocated to Starr Avenue by the applicant/developer. At the westerly end of Starr Avenue, the line shall be reconnected to the existing 12-inch waterline outside north of Lot 46.

85. The proposed well and appurtenances (pump, etc.) for this development shall be owned and operated by the Homeowner's Association for this development. The well shall supply irrigation water for all landscaping of common areas and on all lots within the subdivision to limit use of domestic water produced by the City. Signage shall be provided on each lot warning of the use of well water and that the well water shall not be used for domestic purposes. Piping for all irrigation water from the well shall be purple pipe (same as used for recycled water). Also, disclosure statements (either through disclosures as required by the Department of Real Estate or on the final map) shall be provided to all property owners notifying them about use of well water and statements warning that well water should not be used for domestic purposes.

86. The sewer easement on lot 21 shall be a minimum of 15 feet wide and shall be located entirely within Lot 21. Statements shall be included on the final map precluding any permanent structures from being constructed within this easement. The sewer line shall be connected to the existing sewer main in Paseo Grand Drive.

Public Works Drainage Improvements Conditions

87. Prior to the issuance of the first building permit, all City-required improvements related to storm water for the project shall be installed by the project developer at its expense. Drainage improvements shall be designed and funded by the developer in accordance with the Design Criteria utilizing the rationale method and any applicable adopted City drainage plans.

88. Prior to the issuance of the first building permit, the applicant shall submit for review and approval, drainage plans and hydraulic calculations prepared by a Registered Civil Engineer. The drainage plans and calculations shall indicate the following conditions before and after development:

    - Quantities of water, water flow rates, major water courses, drainage areas and patterns, diversions, collection systems, flood hazard areas, sumps and drainage courses.

Deleted: All project related flooding impacts shall be mitigated …

Deleted: issuance

89. Post-development flows leaving the site shall not exceed pre-development flows.

90. Prior to building permit issuance, the applicant shall provide to the City an analysis of the capacity and condition of existing drainage facilities downstream of the development (including any detention/retention ponds), including recommendations for off-site drainage improvements, which shall be constructed prior to the issuance of the first certificate of occupancy. Site grading and drainage improvements shall be shown on the improvement plans.

91. The 100-year overflow and pipeline easement on Lot 25 shall be dedicated on the final map and language shall be included on the final map prohibiting any permanent structures (including garages, sheds, swimming pools, etc.) from being constructed within the easement, as well as provisions (including requirement regarding grading) that ensure that Lot 25 remain in a condition such that it allows relief for the 100-year storm overflows.

92. Prior to Final Map recordation, the developer shall obtain a construction easement from the City over Parcel 009-030-019 to construct the drainage improvements, wall, and fence on lots 5-20. The drainage ditch on Lots 5-20 shall be privately owned and maintained.

Public Works Final Map Conditions

93. A final map, as defined in the State Subdivision Map Act, shall be prepared by a licensed surveyor or civil engineer, showing all parcels, rights-of-way, and easement(s) shall be filed with the City Engineers Office. The final map shall be substantial conformance with the approved Tentative Map and all applicable conditions of approval. The final map is not valid until it has been approved and recorded.

94. Prior to building permit issuance, the developer shall secure all necessary rights-of-way and easements for both onsite and offsite improvements. Rights-of-way and easements shall be dedicated on the map or provided by separate instrument. The developer shall prepare all necessary legal descriptions and deeds. Offers of dedication shall be either via easement or fee title).

95. The applicant shall transmit by certified mail a copy of the conditionally approved Tentative Map together with a copy of Section 66436 of the State Subdivision Map Act to each public entity or public utility that is an easement holder of record. Written compliance shall be submitted to the City of St. Helena

96. The final map shall not be approved prior to approval of the Subdivision Improvement Plans.

97. Prior to approval of the final map, the developer shall either complete required improvements in accordance with the approved improvement plans or enter into a Subdivision Improvement Agreement with the City. A certificate of occupancy shall not be issued for any structure until required improvements are completed to the satisfaction of the City Engineer.

Deleted: off-site

Deleted: issuance of a grading permit, easements from all of the existing adjacent property owners backing up to Lots 5-20 shall be obtained to allow for the construction and long-term maintenance of the proposed ditch at the base of the retaining wall as depicted in Section 2 on page TM4 of the Tentative Map.

Deleted: This

98. Abandonment of existing 10-foot public water easement crossing the property shall be included on the final map or by separate document.

99. The unnumbered lot between Lots 3 and 4 as shown on the Tentative Map shall be included as part of Lot 52 and shall not be a separate lot.

Public Works Construction Conditions

100. No grading or other construction shall be performed until the improvement plans have been approved and signed by the City Engineer. Encroachment Permits and Building Permits will not be issued prior to the approval of the improvement plans. An Encroachment Permit is required for any work within the City's rights of way.

101. The developer shall keep adjoining public streets free and clean of project dirt, mud, materials, and debris during the construction period, as is found necessary by the City Engineer.

102. Prior to the issuance of a grading permit, the developer shall provide evidence that a Notice of Intent has been submitted and received by the Regional Water Quality Control Board for a General Construction Activity Storm Water Permit. A copy of the project Storm Water Pollution Protection Plan shall be submitted to the City.

103. If any hazardous waste is encountered during the construction of this project, all work shall be immediately stopped and the Napa County Environmental Health Department, the Fire Department, the Police Department, and the City Inspector shall be notified immediately. Work shall not proceed until clearance has been issued by all of these agencies.

104. Prior to final preparation of the subgrade and placement of base materials, all underground utilities shall be installed and service connections stubbed out behind the sidewalk. Public utilities, Cable TV, sanitary sewers, and water lines shall be installed in a manner which will not disturb the street pavement, curb, gutter and sidewalk, when future service connections or extensions are made.

105. Where soil or geologic conditions encountered in grading operations are different from that anticipated in the soil and/or geologic investigation report, or where such conditions warrant changes to the recommendations contained in the original soil investigation, a revised soil or geologic report shall be submitted for approval by the City Engineer. It shall be accompanied by an engineering and geological opinion as to the safety of the site from hazards of land slippage, erosion, settlement, and seismic activity. Additionally, if field conditions warrant installation of any subdrains, the location, size and construction details must be provided to the City for review and approval prior to construction.

106. Prior to placing the final lift of asphalt, all public sanitary sewer lines shall be video inspected at the expense of the contractor/developer. All video tapes shall be submitted to the City.

If any inadequacies are found, they shall be repaired prior to the placement of the final lift of asphalt.

107. All streets, curbs, gutters, sidewalks or other public facilities damaged in the course of construction associated with this development shall be the responsibility of the Developer and shall be repaired to the satisfaction of the City at the Developer's expense.

108. The applicant shall submit a proposed haul route for all trucking associated with this project to the City Engineer for review and approval prior to issuance of a grading permit.

109. Dust control must be maintained to the City's satisfaction.

110. A certificate of occupancy shall not be issued for any structure until required improvements are completed to the satisfaction of the City Engineer.

Public Works Subdivision Final and/or Release of Securities Conditions:

111. All public improvements shown on the Improvement Plans shall be completed and accepted by the City prior to release of any security posted.

112. All punch-list work shall be completed, and any outstanding inspection fees or other charges shall be paid prior to issuance of any certificate of occupancy or prior to acceptance of the improvements, at the discretion of the City.

113. Video inspections shall be made of all storm drain and sewer lines installed by developer as set forth in the approved improvement plans to ensure that they are clean of dirt, rocks, debris or other material. Contractor/developer shall be responsible for cleaning and flushing all storm drain lines prior to acceptance by the City. If flushing of the storm drain system is required, the contractor/developer shall put sufficient plugs/filters in place to ensure that any debris, mud or other material is not washed beyond the piping system in the subdivision nor into any natural water course. A copy of the DVD of all storm drain lines shall be delivered and reviewed by the City prior to acceptance. This condition shall be satisfied prior to issuance of any certificate of occupancy or prior to acceptance of the improvements, at the discretion of the City.

114. Developer shall provide sufficient security guaranteeing the public improvements for a period of one year.

115. A complete set of As-Built or Record improvement plans showing all substantial changes from the original plans shall be certified by the Civil Engineer of record and submitted to the City Engineer prior to acceptance of the public improvements.

116. Prior to acceptance of the public improvements, the developer shall provide a written statement signed by his or her engineer certifying that they observed the work during construction and that site grading and all private site improvements have been completed in accordance with the improvement plans approved by the City Engineer.

117. Prior to acceptance of the public improvements, the developer shall provide a written statement signed by his or her geotechnical engineer certifying that they observed the work and reviewed testing results, and that all of work was performed in accordance with the recommendations included in the Soils Report or other recommendations necessitated by field conditions.

Fire Department Conditions

118. Prior to the issuance of a Certificate of Occupancy, the developer is responsible for fire hydrants to be included and installed within the development (number, location and spacing) to the satisfaction of the Fire Department. Locations of the fire hydrants shall be approved by the Fire Department prior to approval of the final map.

119. Plans submitted for building permit shall exhibit compliance with the current St. Helena Fire Code, as adopted and codified in St. Helena Municipal Code Chapter 15.36.

120. Prior to issuance of future building permits, all construction plans for homes and other structures shall include fire sprinklers as required by the City of St. Helena Fire Department.

121. One hour minimum fire-resistant construction on all exterior walls within 10' of property boundary is required. Fire resistant construction of interior walls shall be determined by type of occupancy.

122. Any gates installed to control vehicular access to a property are required to be setback 30-feet from the property line and/or edge of pavement, whichever is greater. No vehicle gates may be installed without Fire Department and Public Works Department review and explicit approval.

123. Access to the levee road is restricted for public use and only granted to emergency vehicles and emergency egress for Vineyard Valley Mobile Home Park residents. Signage prohibiting its use by the public is recommended. Public access will be granted at the discretion of the Authority Having Jurisdiction during emergencies/evacuations.

HUNTER SUBDIVISION

Request by Ben and Kelly Vanzutphen to subdivide a 16.9-acre parcel to establish 51 single-family residential lots and one parcel for future multi-family development

(Tentative Map #2022-001)

Community Development Department

Nov. 1, 2022

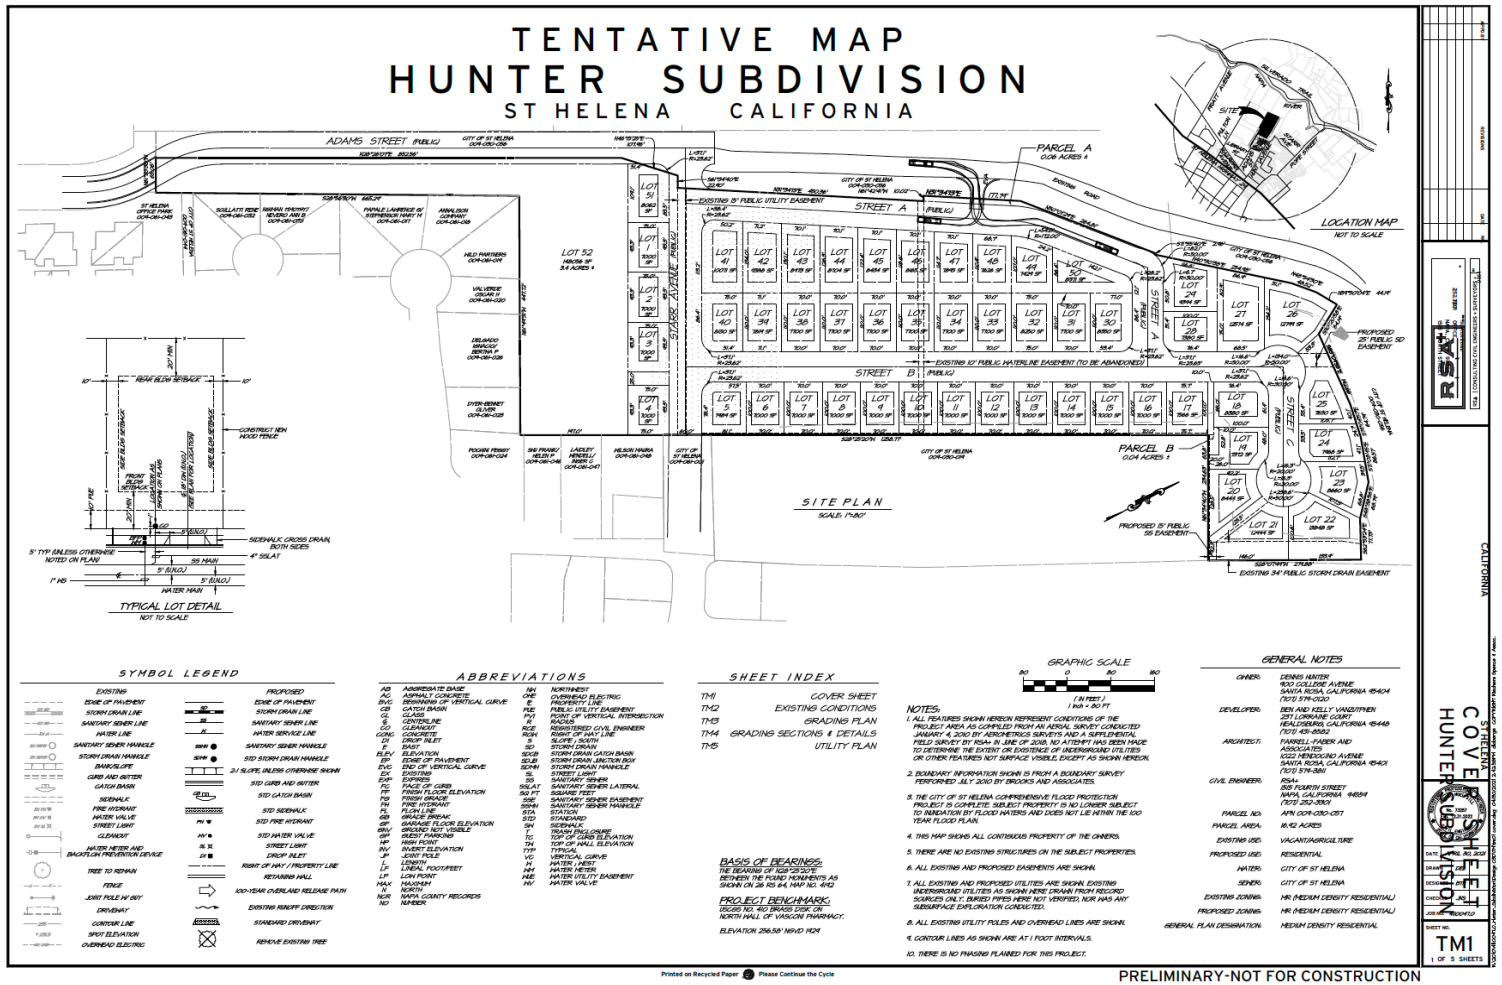
Presentation Summary

- Project Description
- Site Location and Setting
- Analysis
- Environmental Impact Report
- Issues of Concern to the Community
- Staff’s Recommendation
- Next Steps
- Question and Answer

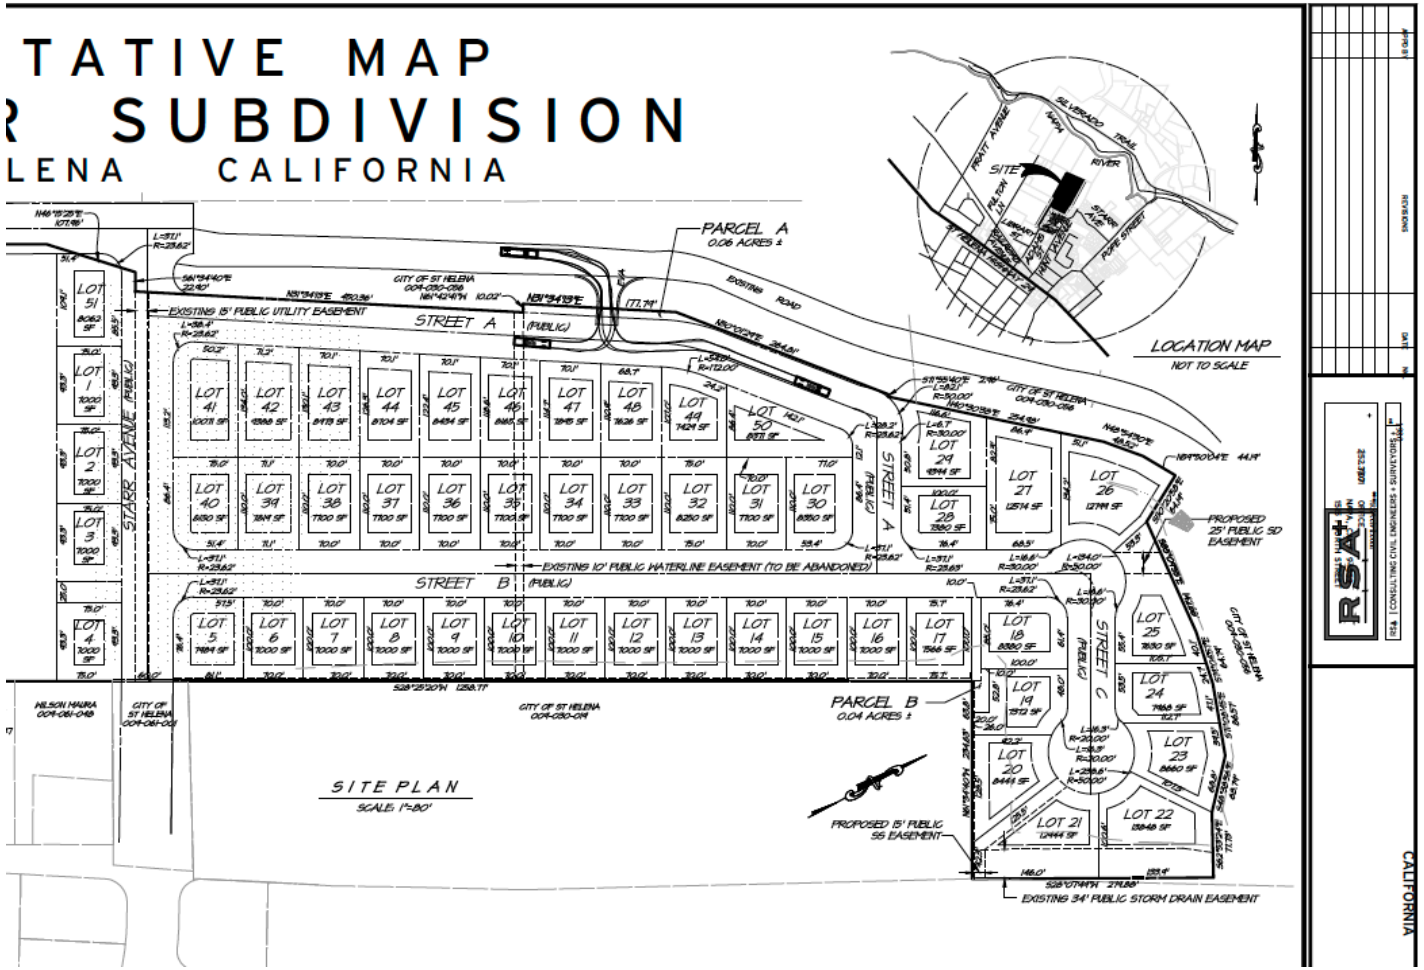
Project Description

The proposed project being considered by the Planning Commission at this time is a Tentative Subdivision Map to subdivide a 16.9-acre parcel of land in the eastern area of the city, east of the existing terminus of Adams Street. The proposed subdivision would create 51 lots for single family homes, and a separate parcel (lot 52) on which multi-family attached housing units would be built.

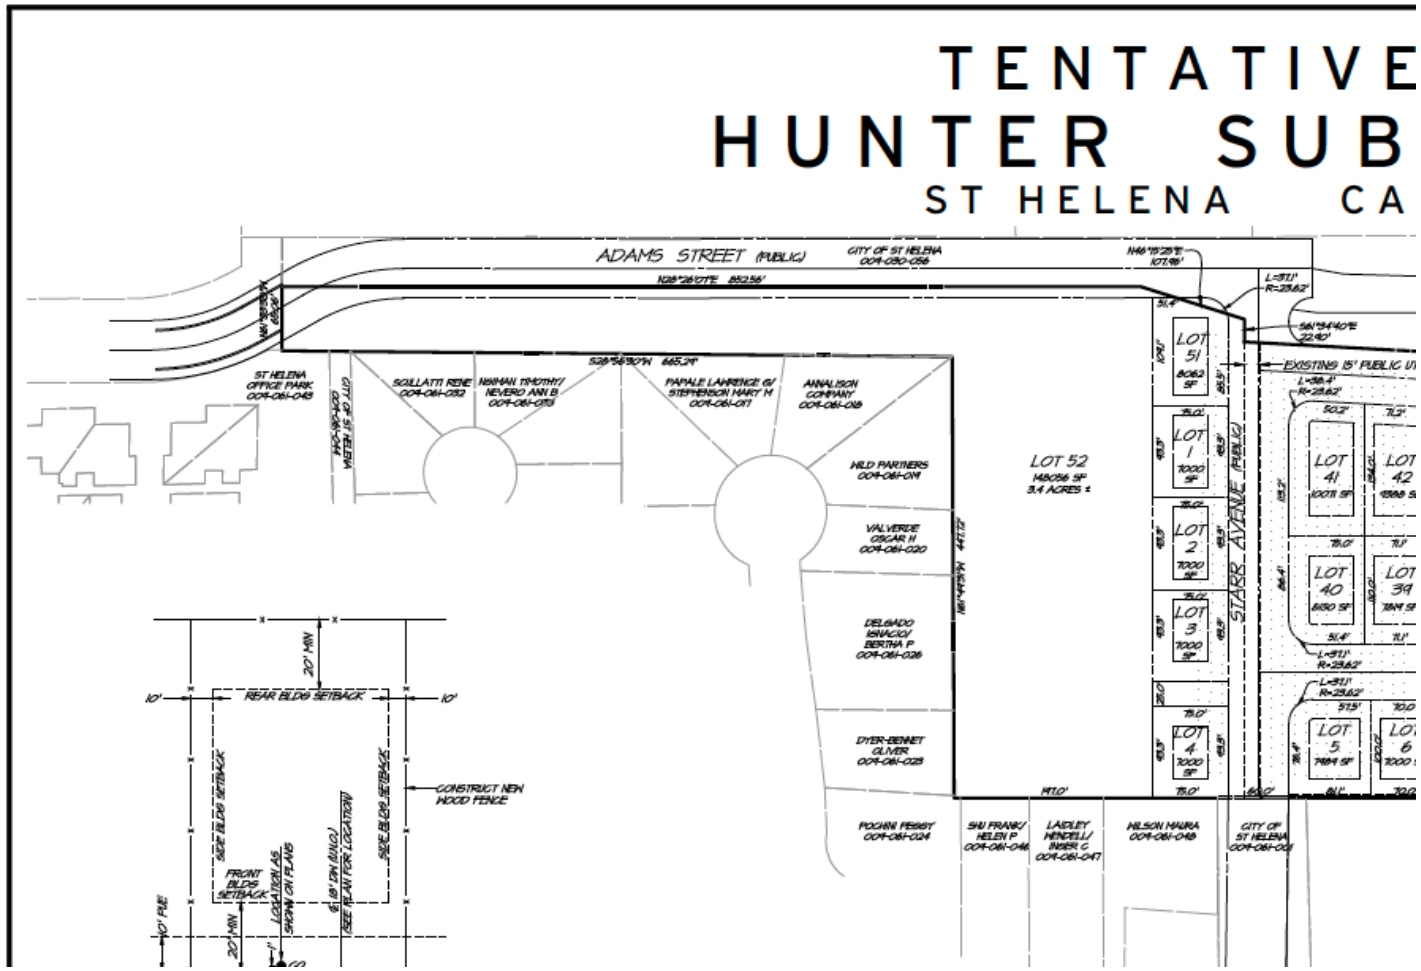
Project Description



Project Description



Project Description



Project Description

The Applicant proposes to construct a total of 87 single- and multi-family homes and accessory dwelling units:

- Single Family Homes: 51 units
- Attached Multi-Family: 25 units
- Accessory Dwelling Units: 11 units
- TOTAL: 87 units

The overall residential density of the project, including all residential types, is 5.15 units per acre (87/16.9 = 5.15).

Project Description

Several future applications will be needed before the project can be developed (in addition to complying with conditions of approval):

- Affordable Housing Agreement
- Design Review
- Conditional Use Permit for Multi-Family Housing

The only application before the Commission at this time is the Tentative Subdivision Map.

Analysis: Tentative Subdivision Map Findings

Planning Commission's role in tentative maps is to make a recommendation to the City Council. The City Council approves or denies tentative maps.

Section 16.16.080(A) of the SHMC defines the findings which must be made to recommend approval of a tentative map. A map can be denied *only* if facts in the record support a conclusion that these findings cannot be made.

Analysis: Tentative Subdivision Map Findings

A. In recommending approval or conditional approval or in approving or conditionally approving a tentative map, the planning commission and city council shall find:

1. That the proposed subdivision, together with the provisions for its design and improvement, is consistent with the general plan, any applicable specific plan, and other applicable provisions of this code; and

2. Except for condominium conversion projects where no new structures are added, that the design of the proposed subdivision provides, to the extent feasible, for future passive or natural heating or cooling opportunities in the subdivision, as described in the state Subdivision Map Act and any guidelines promulgated by the city council.

Analysis: Govt Code Limits on Denials

Also, Government Code Section 65589.5(j)(1) provides that if a housing development project complies with applicable *objective* general plan, zoning, and subdivision standards and criteria in effect at the time the application was deemed complete, the City may only deny the project if it finds, based on written findings supported by a preponderance of the evidence in the record that both of the following conditions exist:

1. The housing development project would have a specific, adverse impact upon the public health or safety unless the project is disapproved or approved upon the condition that the project be developed at a lower density. A "specific, adverse impact" means a significant, quantifiable, direct, safety standards, policies, or conditions as they existed on the date the application was deemed complete.
2. There is no feasible method to satisfactorily mitigate or avoid the adverse impact identified pursuant to paragraph (1), other than the disapproval of the housing development project or the approval of the project upon the condition that it be developed at a lower density.

Analysis: General Plan

1993 vs 2019 General Plan

Because the project application was deemed complete in 2011, the General Plan and Zoning Code at the time (including the 1993 General Plan) are used for purposes of determining General Plan consistency.

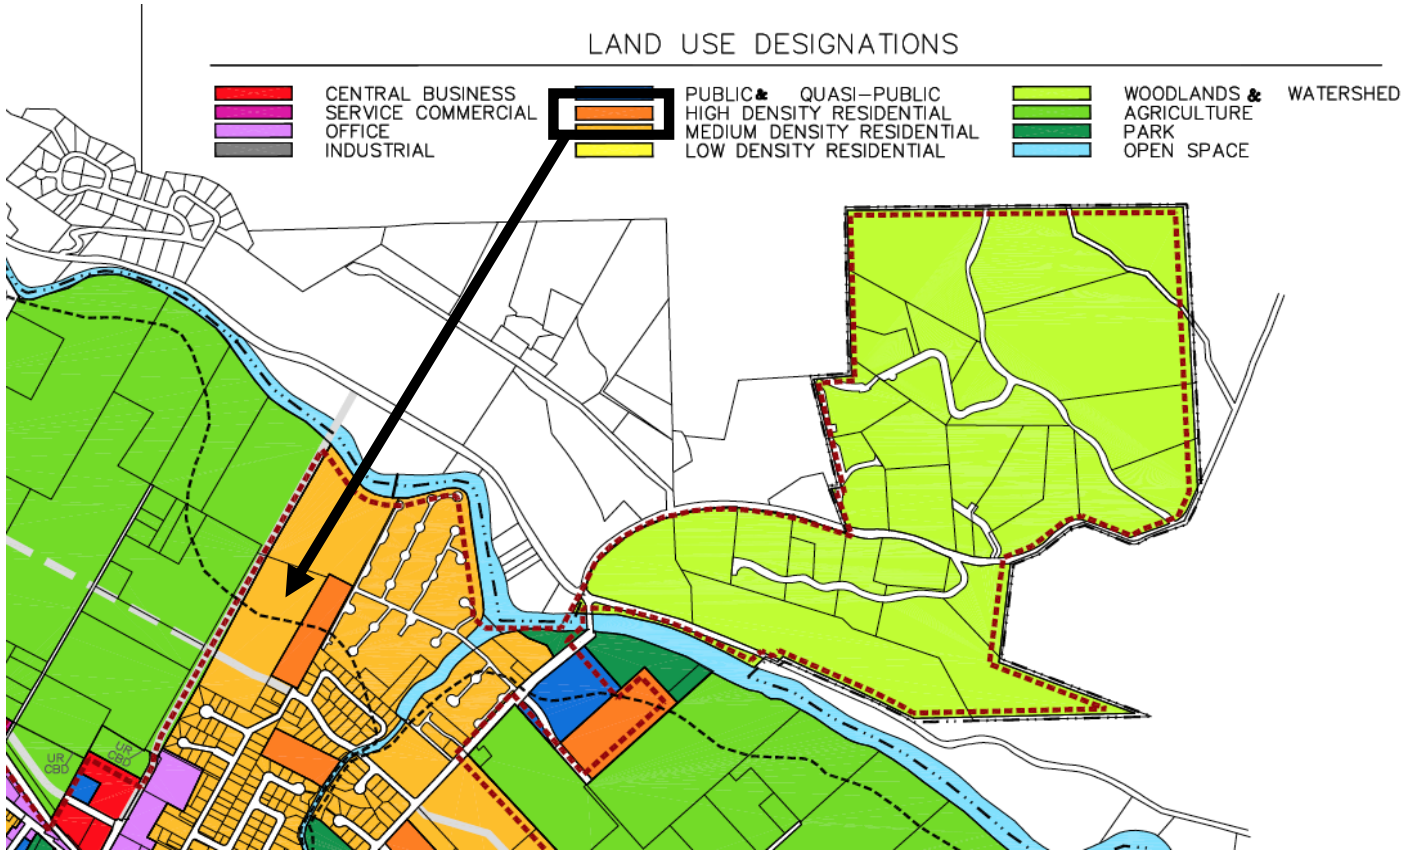
Policies in the 2019 General Plan do not apply for the purpose of determining General Plan consistency.

Analysis: General Plan

1993 General Plan

The 1993 General Plan designates the site for Medium Density Residential. *Project is Consistent with the Land Use Map.*

Separate review of 2019 General Plan policies concluded the project is also consistent.

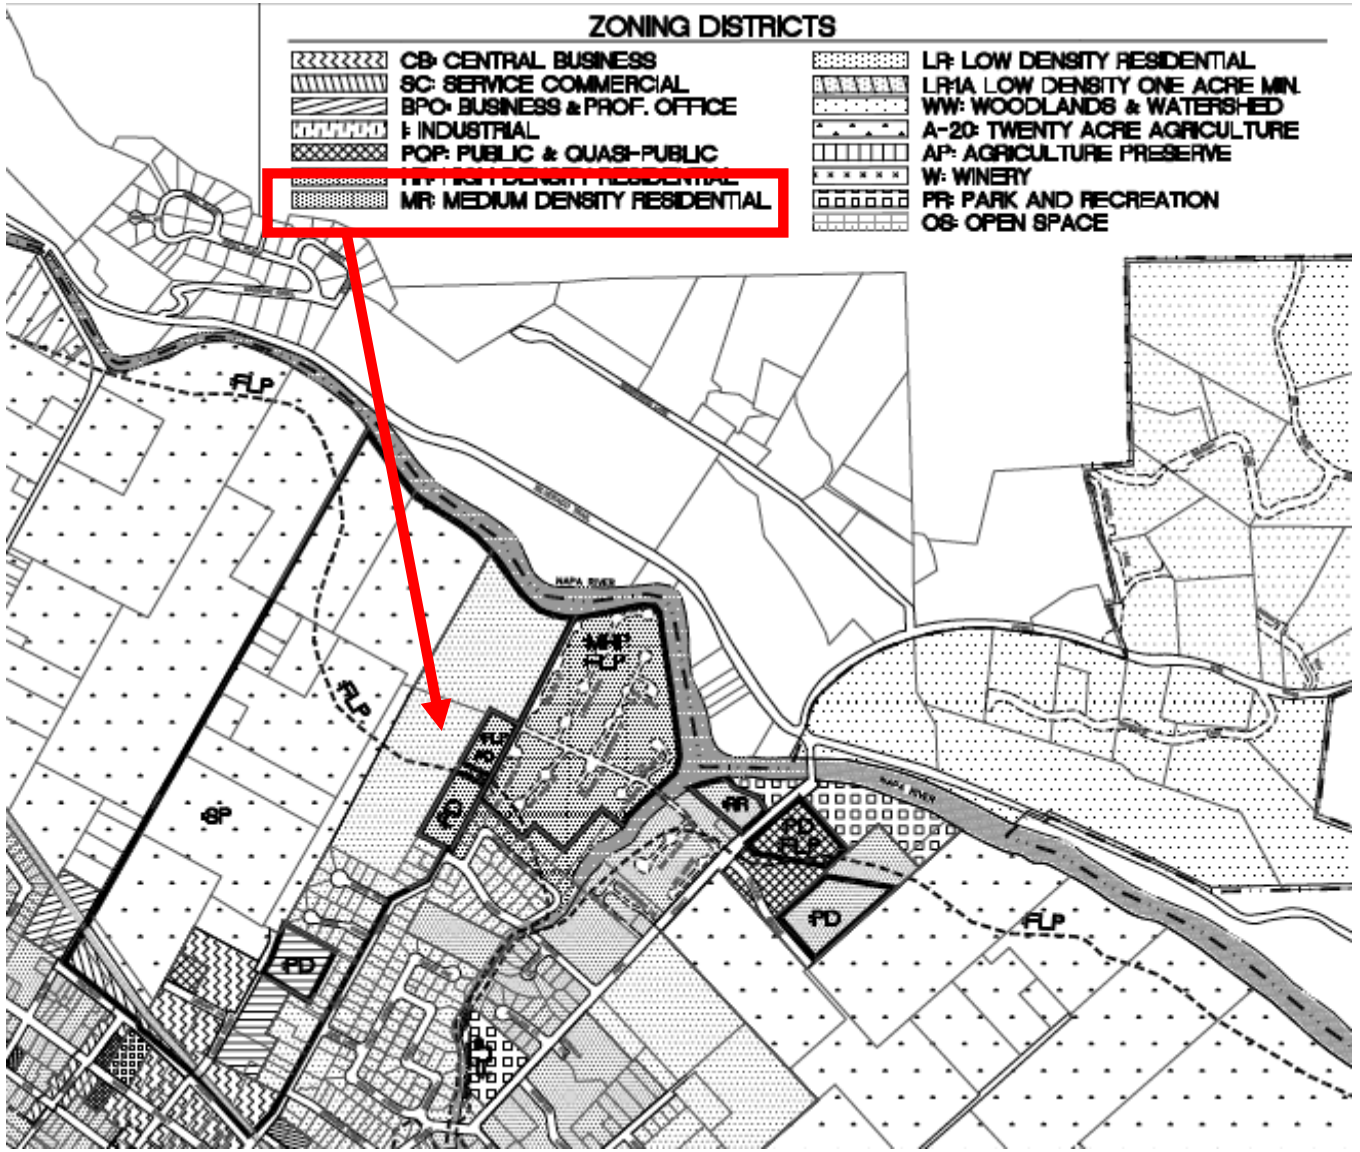


Analysis

Zoning Map

The project site was zone “MR” (Medium Density Residential) on the 2010 Zoning Map.

Project is Consistent



Analysis: Zoning

Zoning Code

Development standards for lots in the MR zoning district:

- Minimum lot area: 7,000 square feet
- Minimum lot width and frontage: 70 feet
- Minimum density: 5.1 units per acre

Based on these standards:

- All proposed residential lots1 are at least 7,000 square feet in size
- All proposed residential lots are at least 70 feet in width
- The overall density of the project, including the proposed 25 multi-family homes on Parcel 52 and the proposed 11 accessory dwelling units, is 5.15 units per acre, which meets the minimum required density.

Project is Consistent

Analysis: Heating and Cooling

Passive Heating and Cooling

- Approximately 40 of the proposed lots would allow a house oriented in an east-west configuration, allowing these homes, if properly designed, to take advantage of solar exposure.
- Approximately 40 of the proposed lots would allow for homes oriented so that, if front and rear doors and windows were opened, the prevailing upvalley breeze would provide for natural cooling.
- There is no existing shade on the property, but future homes would be required to install landscaping, including trees that would provide shade.

Project is Consistent.

2019 General Plan

2019 General Plan

The 2019 General Plan designates the site for Medium Density Residential. *Project is Consistent with the Land Use Map.*

Separate review of 2019 General Plan policies concluded the project is also consistent.

Environmental Impact Report

A Draft EIR was prepared with a 45-public review period beginning on September 23, 2021 and ending on November 8, 2021.

Due to the volume of comments, the public review period was extended to November 30, 2021 for a total of 67 days.

Environmental Impact Report

- Aesthetics (Potentially Significant, but mitigation available)
- Agriculture and Forest Resources (Less than Significant)
- Air Quality (Less than Significant)
- Biological Resources (Potentially Significant, but mitigation available)
- Cultural and Tribal Resources (Potentially Significant, but mitigation available)
- Energy (Less than Significant)
- Geology and Soils (Potentially Significant, but mitigation available)
- Greenhouse Gas Emissions (Less than Significant)
- Hazards and Hazardous Materials (Potentially Significant, but mitigation available)
- Hydrology and Water Quality (Less than Significant)

Environmental Impact Report

- Land Use and Planning (Less than Significant)
- Mineral Resources (Less than Significant)
- Noise and Vibration (Potentially Significant, but mitigation available)
- Population and Housing (Less than Significant)
- Public Services (Less than Significant)
- Recreation (Less than Significant)
- **Traffic and Transportation** (Significant and Unavoidable)
- Tribal Cultural Resources (Less than Significant)
- Utilities and Service Systems (Less than Significant)
- Wildfire (Less than Significant)

Environmental Impact Report

Four alternatives examined:

- Alternative 1) No Project/No Development Alternative,
- Alternative 2) No Project/General Plan
- Alternative 3) Park/Open Space Preserve Alternative
- Alternative 4) Increased Density/Affordable Housing Alternative

Environmental Impact Report

Based on the analysis in the Draft EIR, Alternative 1, the No Project Alternative, would result in the fewest environmental impacts, and is the "environmentally superior alternative." Section 15126.6(e)(2) of the CEQA Guidelines states that if the environmentally superior alternative is the No Project Alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.

Of the other alternatives evaluated, Alternative 3, the Park/Open Space Preserve alternative is the environmentally superior alternative. However, according to the Draft EIR, "... this alternative would not avoid all of the significant impacts associated with the Project and all of the identified mitigation would still be required."

Environmental Impact Report

A **Statement of Overriding Considerations** has been prepared which provides the following reasons why approving the project is appropriate:

1. The Project provides needed housing to the City, particularly affordable housing.
2. The City, per the adopted 2015 Housing Element, has a jobs to housing ratio above the County average, indicating a need for additional housing. As of the most recent Housing Element Progress Report (April 2022), the City had not met its regional housing needs allocation for very-low or moderate income housing.
3. The Project would implement the City's General Plan. The Project site is identified as a housing site in the City's current General Plan, the current Housing Element, and the previous two iterations of the City's General Plan.
4. The significant and unavoidable impact is related to VMT. Ultimately VMT per capita will be reduced by providing necessary housing in jurisdictions with a high number of jobs. As stated previously, the City of St. Helena currently has a jobs housing imbalance which the Project will help address.
5. The Project will pay development fees which will assist in needed infrastructure improvements in the City, including wastewater treatment and collection systems.
6. The Project would construct the extension of Starr Avenue and the partial extension of Adams Street consistent with the General Plan Circulation Element.

Environmental Impact Report

A total of 121 Draft EIR comment letters were received. Responses to Comments were prepared and included in the Final EIR. Topics included:

- Concern about the capacity of downstream sewer lines to accommodate additional flows generated by the project.
- Concern about the “high density” of the proposed project.
- Concern about the loss of open space and the ability to walk on informal trails located on the project site.
- Concern about projected water use and the ability of the project to feasibly comply with the City’s water neutrality requirement.
- Concern about future traffic congestion and traffic safety impacts (including for children walking to school).

Environmental Impact Report

(EIR Comments Continued)

- Concern about the project's impact on the ability of residents in the Vineyard Valley mobilehome community to evacuate in the event of an emergency.
- Concern about the ability of the City-constructed levee on the Napa River (built to protect the Vineyard Valley mobilehome community from flooding) to protect new homes in the proposed project.
- Concerns about changes to the appearance of the project site when existing open space and vines are replaced with a suburban neighborhood.
- Concerns about the project's effect on the City's plans to construct a new roadway connection to the Silverado Trail.

Responses to all of the comments received during the public review period are included in the Final EIR and Responses to Comments, Attachment 7 to this staff report.

Environmental Impact Report

All comments are responded to in the Final EIR. “Master responses” were written to address frequently expressed comments:

- Emergency evacuation
- Water Neutrality
- Flood protection and Napa River levee
- Wastewater conveyance

Individual responses to other comments.

Issues of Concern

Based on public input and prior review of the project, the following are issues of concern to the public. These are not necessarily related to the findings of approval for the tentative map.

- Water Neutrality
- Trail/Open Space
- Levee/Flooding
- Parking
- Aesthetics
- Sewer Capacity
- “High Density” Nature of the Project
- Traffic/Congestion
- Intersection Design Adams Street/Starr Avenue and Starr Avenue/Street A
- Vacation of City Property

Water Neutrality

The project is required to comply with the City's water neutrality ordinance, which requires that new development offsets its use of City water. The project will offset its use by:

- Using an existing on-site water well for outdoor irrigation and other uses (approx. 17 acre-feet/year savings)
- Constructing other improvements as specified in the proposed conditions of approval.
- All improvements must be in place before final map can be recorded.
- *Retrofitting of toilets or other fixtures in existing homes is not proposed.*

Staff Recommendation

Staff recommends that the Planning Commission:

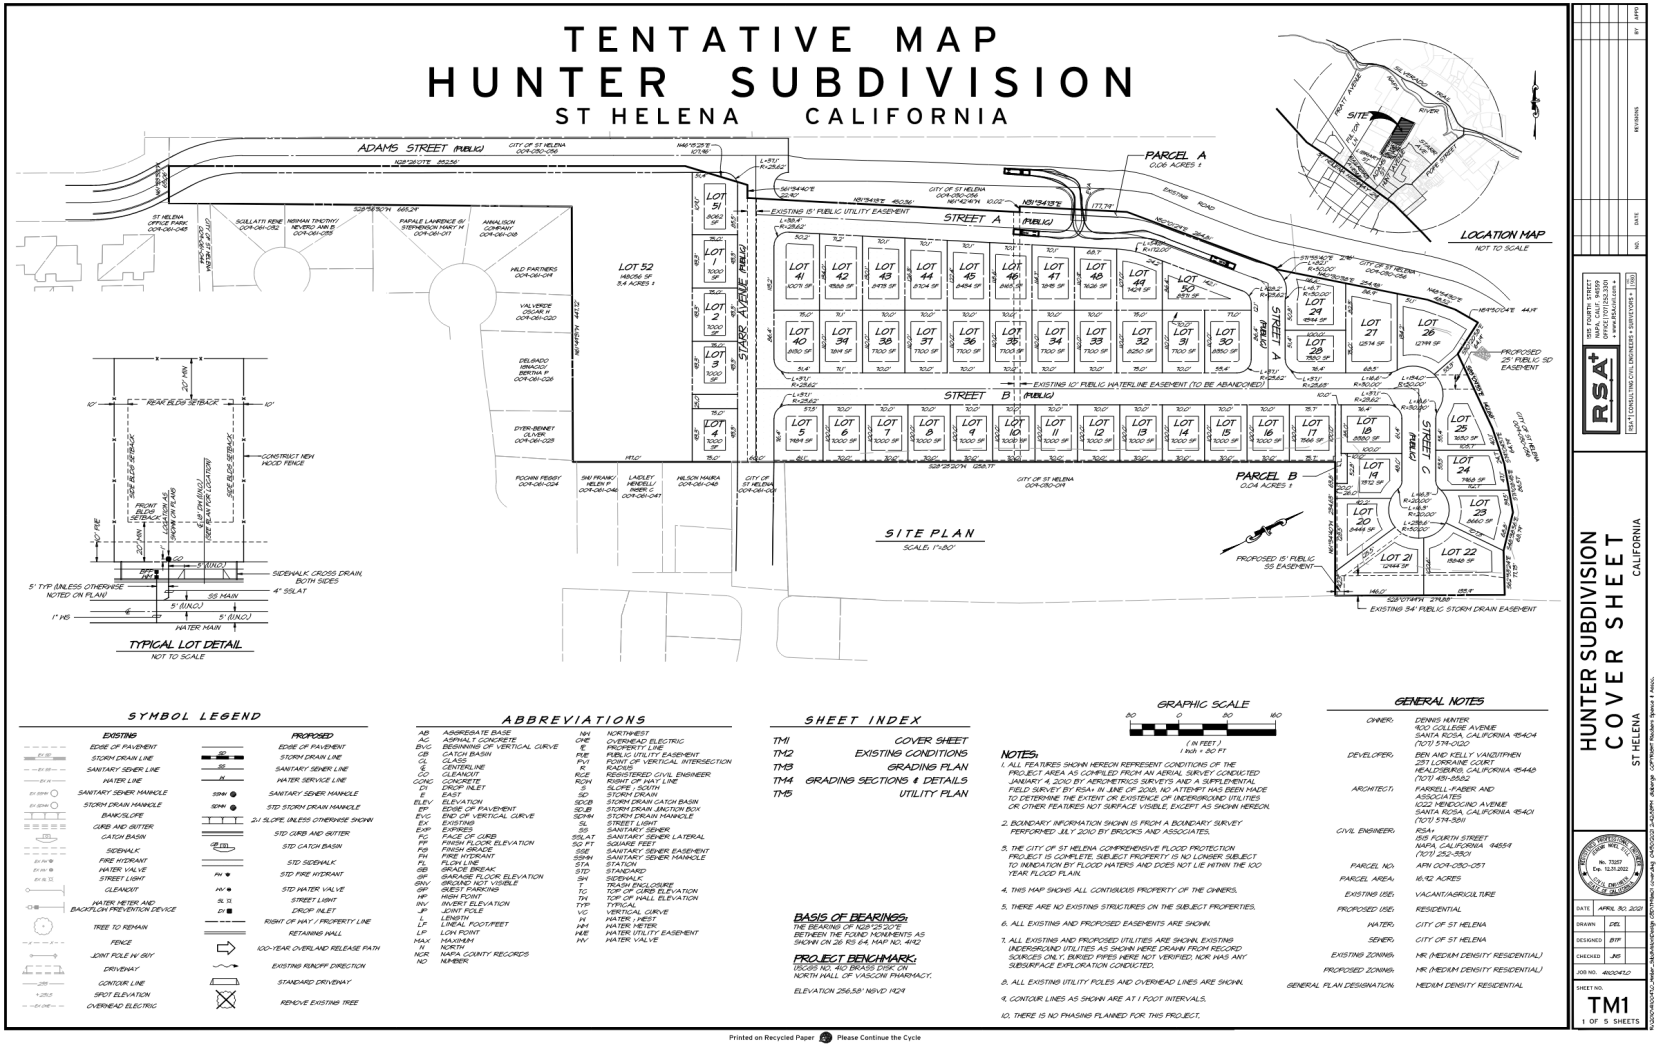
1. Recommend that the City Council adopt a Resolution recommending certification of the Final EIR, approval of the Mitigation Monitoring Program, Findings of Fact and Statement of Overriding Considerations; and
2. Recommend that the City Council adopt a Resolution recommending approval the requested Tentative Map No. 2022-001, File #PL10-040 for the Hunter Subdivision project.

Separate Resolutions have been prepared for these recommendations.

Next Steps

- City Attorney briefing on Housing Crisis Act (2018)
- Tonight is **not** the final hearing for this application
- City Council is the final decision-making body for the EIR certification and the Tentative Map approval or denial

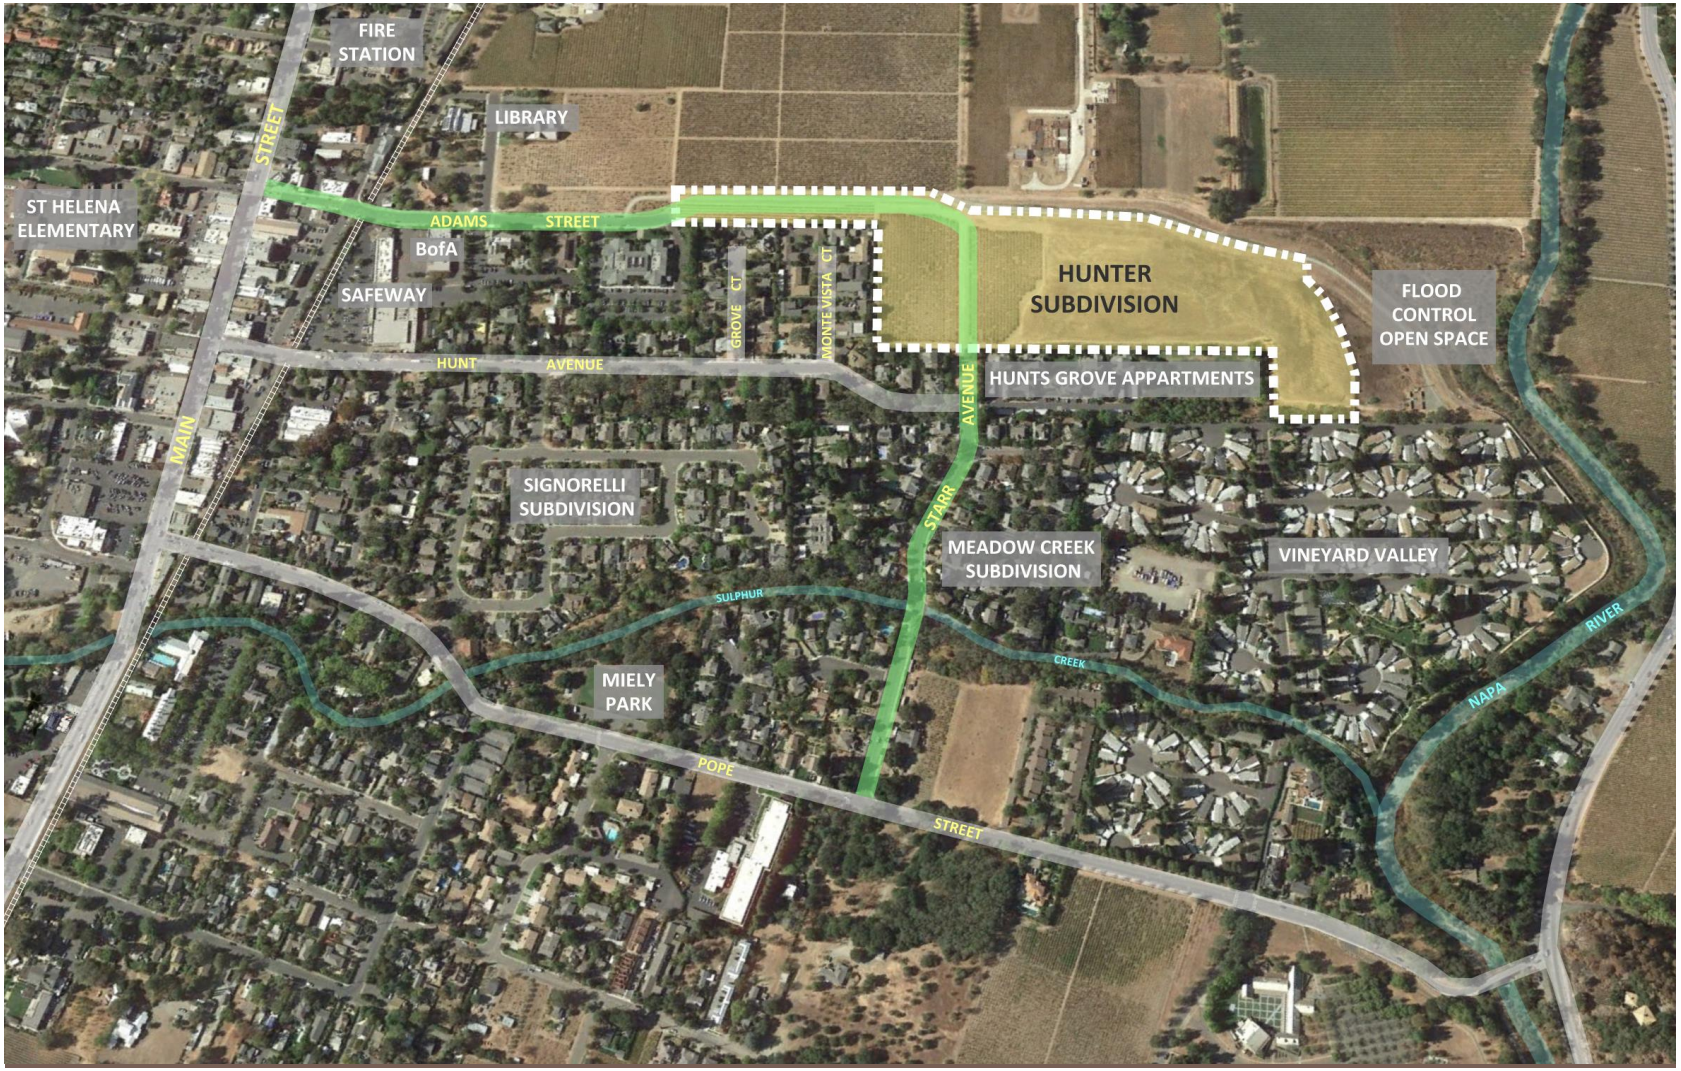
Questions?



Printed on Recycled Paper Please Continue the Cycle

Site Plan

Hunter Subdivision Project



Aerial Map

Hunter Subdivision Project

Project Objectives

- Subdivide the site to accommodate residential development at a density of 5.1 units per acre – the lowest density allowable via the Medium Density Residential District.
- Provide a variety of housing types, including multi-family, single- family and accessory dwelling units.
- Provide housing at a range of incomes including very low, low and moderate income households.
- Provide opportunities for the city to implement key Housing Element goals.
- Provide opportunities for the city to accommodate its RHNA requirements.
- Minimize traffic related impacts by providing more local housing opportunities.
- Improve alternative transportation amenities including pedestrian and bicycle links including a connection to the Napa Valley Vine Trail.

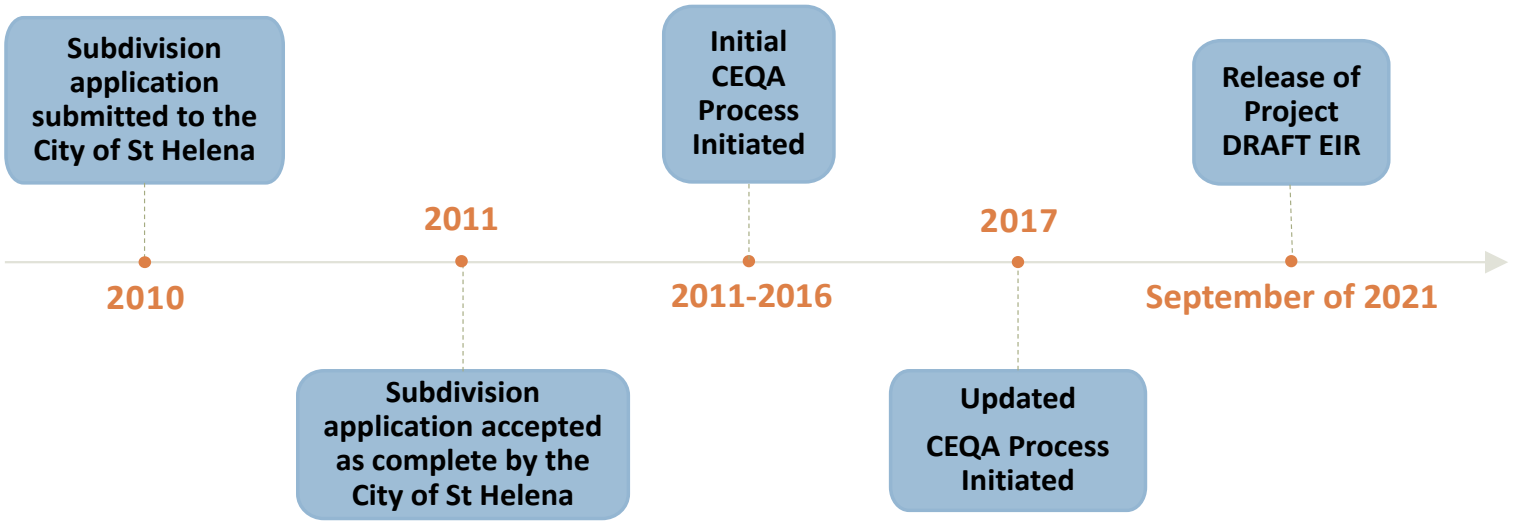
Project Description

The project includes a request to approve a Tentative Map to subdivide the 16.9-acre parcel into 51 single-family lots and one 3.4-acre parcel (Lot 52). The 51 single-family lots would range in size from 7,000 to 8,000 square feet, with some larger corner and cul-de-sac lots. In order to meet the minimum density requirements for the site, at least 87 dwelling units must be built as a part of the project.

The project will include 87 dwellings consisting of the following:

- 51 Market-rate single-family dwellings.
- 11 ADUs on 11 of the single-family lots (not income restricted).
- 25 Multi-family, affordable units proposed on Lot 52.
- All units will be built concurrently – no phasing.

Project Timeline



Project Character Concepts

Character

Hunter Subdivision Project

Project Exhibits – Master Plan

Community Goals

The Project will Provide:

Housing for a Variety of Incomes

- Variety of Housing Types
- 11 ADUs
- Compact Efficient Design

A Walkable & Bikeable Community

- Walkable Community Centered Around Physical Activity
- Access to Regional Trail Systems
- Adjacent to Transit

A Water Neutral Community

- Providing a High Volume Well
- Low Water Use Design
- Storm Water Infiltration and Groundwater Recharge

PLANNING COMMISSION REPORT

Planning Commission Meeting of November 1, 2022

FILE NUMBER: PL22-036

SUBJECT: Request by Vanguard Properties, Inc. for a Planning Commission Sign Permit approval in order to approve two identification banners on the property located at 1345 Railroad Avenue in the Central Business (CB) zoning district.

PREPARED BY: Xinia Gamero, Permit Technician III

REVIEWED BY: Maya DeRosa, Community Development Director

APPROVED BY: Maya DeRosa, Community Development Director

LOCATION OF PROPERTY: 1345 Railroad Ave.

APN: 009-212-005

GENERAL PLAN/ZONING: CB: Central Business

APPLICANT: Vanguard Properties, Inc. / Patricia Rollins

PHONE: 415-321-7027

PROJECT DESCRIPTION

The applicant is requesting Planning Commission sign permit approval to install two (2) double-sided identification banners on the primary frontage of the building located at 1345 Railroad Ave. The proposed double-sided banners each measure approximately 19-sf (8'-4" X 2'-3") and will be constructed of a dark navy canvas fabric with white lettering and the Vanguard Properties logo. There will be four banner support poles (two per banner) that will be bolted and attached to the exterior of the building. No illumination is proposed for this signage.

ANALYSIS

CEQA

This project is exempt from the requirements of CEQA pursuant to Section 15311, Class 11(a) of the CEQA Guidelines which exempts on-premise business signs. The proposed project is not subject to any of the exceptions to the use of a categorical exemption as outlined in CEQA Section 15300.2. The project site is not located on or near an environmentally sensitive area, is not visible from a scenic highway, is not included on a hazardous waste site, and will not impact historic resources or otherwise generate or contribute to any potentially significant impacts.

GENERAL PLAN

The subject property has a General Plan land use designation of Central Business (CB).The CB land use designation includes retail and commercial uses that serve local residents and the surrounding areas. The CB district extends from Sulphur Creek along Main Street to midway between Adams Street and Pine Street, west of Oak Avenue and along the north side of Adams Street east of Main Street. General Plan Update 2040 policy applicable to the proposed project include:

- **CD2.D-**Require businesses and structures to be of a scale commensurate with existing older buildings in the CB and SC land use areas.

Staff Response: Staff finds that the proposed identification banners are consistent with the General Plan in that it promotes additional commercial activity and opportunity in the City's Central Business district.

ZONING

PLANNING COMMISSION SIGN PERMIT:

The project site is zoned Central Business (CB). Typical CB uses include offices, restaurants, specialty retail and lodging, with particular emphasis on pedestrian-oriented retail and service uses on the ground floor level and offices located on upper floors. Signs are regulated by St. Helena Municipal Code (SHMC) Section 17.148. Planning Commission approval must be obtained for all signs not permitted with an administrative sign permit as described in SHMC Section 17.148.040. The purpose of the Planning Commission sign permit is to allow the consideration of illuminated signs, signs that are larger, or signs in addition to those permitted with an administrative sign permit. The planning commission shall consider the compatibility of the sign to the site, the appropriateness of the materials and colors in relation to the project, the compatibility of the sign to the small town character of St. Helena, and the impact the sign may have on surrounding properties. The commission shall not approve signs which obscure or detract from the architecture of a historic building or structure.

Staff Response: Although the stone building at 1345 Railroad Avenue is on the City's Historic Resource Master List, staff determined that the proposed signage is compatible with the site, size appropriate to the building and its surroundings and does not detract from the architecture of the historic structure. The proposed signage associated with this application is in compliance with the restrictions and prohibitions detailed in SHMC Section 17.148. Additionally, the signs will not impede, obstruct or create hazards with respect to pedestrian traffic as the lowest portion of the banners will hang 10' feet above

the ground surface, meeting the minimum height requirement of 7'6" feet per St. Helena Municipal Code Section 17.148.110(C).

ISSUES

Staff has not identified additional issues related to this application that require additional discussion.

CORRESPONDENCE

As of the completion of this report, staff has not received correspondence related to this application.

STAFF RECOMMENDATION

For the reasons described above, staff recommends that the Planning Commission:

1. Determine that the project is exempt from the requirements of CEQA pursuant to Section 15311 of the CEQA Guidelines; and
2. Approve the application for a Planning Commission sign permit at 1345 Railroad Avenue permitting the signage described in this report in the compliance with the attached resolution.

CITY OF ST. HELENA PLANNING COMMISSION

RESOLUTION NO. PC2022-0XX

GRANTING PLANNING COMMISSION SIGN PERMIT APPROVAL TO 1345 RAILROAD AVE. (PL22-026)

PROPERTY OWNER: 1345 Railroad Ave, LLC. **APN:** 009-212-001

RECITALS

1. The applicant submitted an application for a sign permit on July 7, 2022 in order to place new signage on the existing commercial building located at 1345 Railroad Avenue in the Central Business (CB) zoning district;
2. The applicant proposes to install two (2) double-sided identification banners on the primary frontage of the building. The proposed banners will each measure approximately 19 square-feet and will be constructed of a dark navy canvas fabric with white lettering and the Vanguard Properties logo; and
3. The Planning Commission of the City of St. Helena, State of California, considered the sign, staff report, and all testimony, written and spoken, at a hearing on November 1, 2022; and
4. Now, therefore let it be found that, the Planning Commission approves the sign permit and thereby authorizes the modifications contained in said plans attached as Exhibit A to this resolution based on the findings below and subject to the conditions of approval enumerated herein.

RESOLUTION

A. In making the findings in this Resolution, the Planning Commission relied upon and hereby incorporates by reference all of the documents referenced in this Resolution and the associated staff reports, City files for this matter, correspondence, presentations and other materials.

B. The Planning Commission hereby finds that this project is exempt from the requirements of CEQA pursuant to CEQA Guidelines Section 15311, Class 11 (a), which exempts installation of on-premise signs.

C. The Sign Permit for the above described is granted subject to compliance with the following conditions. The conditions noted below are particularly pertinent to this permit and shall not be construed to permit violation of other laws and policies not so listed:

1. The permit shall be in conformance with all City ordinances, rules, regulations and policies in effect at the time of issuance of a building permit.

2. This permit shall be vested within one (1) year from the date of approval. However, the permit may be extended for up to two (2) one-year periods pursuant to the St. Helena Municipal Code, Section 17.08.130, Extension of Permits and Approvals. Any request for an extension of the Sign Permit must be justified in writing and received by the Planning Department at least thirty (30) days prior to expiration.
3. This permit will expire if the use is discontinued pursuant to existing ordinances and regulations.
4. In any action or proceeding to attack, challenge, invalidate, set aside, void or annul the City's approval of applicant's Project, in whole or in part, applicant shall defend, at its own expense and without any cost to the City, and with counsel acceptable to the City, and shall fully and completely indemnify and hold the City, its agents, officers, and employees harmless from and against any and all claims, causes of action, damages, costs, attorney's fees and liability of any kind, so long as the City reasonably promptly notifies the applicant of any such claim, action, or proceedings and the City cooperates fully in the defense of the action or proceedings.
5. This sign permit shall run with the land and shall be binding upon all parties having any right, title or interest in the real property or any part thereof, their heirs, successors and assigns, and shall inure to their benefit and benefit of the City of St. Helena.
6. All signs must be maintained by the property owner, tenant, or permittee. In event a sign becomes derelict for reasons of lack maintenance the approval may be revoked and the sign subject abatement. The sign shall be removed by the property owner within thirty (30) days abandonment or termination of use pursuant to the St. Helena Municipal Code, Section 17.148.110.
7. The signs authorized by this sign permit shall conform to the details and dimensions shown on the Exhibits which were reviewed and approved by the Planning Commission at their November 1, 2022 meeting. The approved identification banners measure approximately 19 square feet each.
8. A building permit shall be obtained by the applicant prior to installation of the approved signage.
9. No internal illumination of signs is permitted. Internally illuminated means a sign which is illuminated from a lighting source within the internal structure of the sign which illuminates the entire face of the sign (does not include neon signs or halo illuminated signs).
10. An Encroachment Permit shall be obtained by the applicant prior to installation of the signs if work involves locating of any person or structure on public property, such as a sidewalk, driveway, or street, if necessary.
11. Provided they are in general compliance with the Sign Ordinance, minor modifications may be approved by the Community Development Director.

I HEREBY CERTIFY that the foregoing sign permit was duly and regularly approved by the Planning Commission of the City of St. Helena at a regular meeting of said Planning Commission held on November 1, 2022 by the following roll call vote:

RE: 1345 Railroad Avenue, St Helena, CA 94574 (File #PL22-036) Exterior Banner Sign Approval

Dear Planning Department:

We are following up on your correspondence requesting additional written information to our signage application, dated September 16, 2022. In answer to your questions, highlighted below;

As previously stated, we are requesting approval to install 2 exterior banner signs for our newly renovated real estate office at the above address (APN#009-212-005). We are requesting approval of (1) the two two-sided banner signs, measuring 27" x 100"with the Vanguard logo on each side, as shown on the attached photo.
(2) The site plan reflect measurements over the sidewalk and is well above code.
(3) The site plan has the correct sign area, see item #1
(4) The banner is double-sided.
(5) The banners support poles will be attached to the exterior of the building with 4 each 3/8" x 3" expansion bolts as shown in the drawing.
(6) Banner sign dimensions are noted on the drawing, i.e., Two banners , two sides, 27" wide, 100" long. Logo appears at the bottom of each.

Please refer to the attached rendering with additional details provided by our architectural firm, R. Bruce Ballentine.

The banner is made of Sunbrella canvas fabric and the color is a dark navy blue with white lettering depicting our Vanguard Properties Logo.
(Sunbrella at http://sunbrella.com-upholstery -canvas-navy-5439-0000).

We sincerely appreciate your consideration and look forward to responding with any further details you may require. I can be reached at patti@vanguardnapa.com or by phone at (760)835-7706.

Thank you.
