## * Read Before Using Any Census/TSN Count Data *

**Notes regarding this data:**
These counts are Raw Data Only. All material is the direct product of field studies and machine processing. Mechanical errors may not have been corrected. This raw data is not to be considered the results of a professional Traffic Engineer's evaluation of validity or reliability. It is the user's responsibility to determine the accuracy and usability of the data prior to using or release to others.

**Location Description Codes:**
Traffic Volumes Data users must understand the codes used to describe count location in order to correctly identify the location of the count they are using.

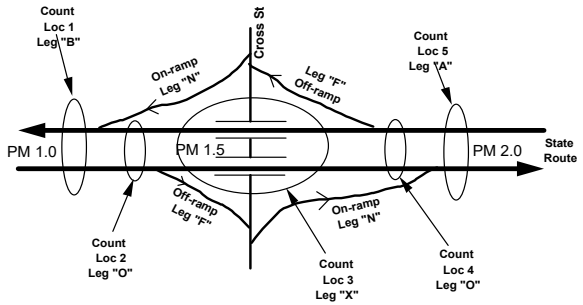
**Traffic Volumes Count Location**
**Description Definitions**

Note: Description of a location is not the exact point where counted. The count location is specified by the "Leg" code.

Leg: Indicates the approximate location on a ramp or on a state highway relative to an I/C or I/S.

N - On-ramp count location.

F – Off-ramp count location



A - Ahead of you when facing the increasing postmile direction. Count location usually
* North or East of all ramps of either direction of that interchange or intersection. See Loc 5

B - Behind you when facing the increasing postmile direction. Count location usually
* South or West of all ramps of either direction of that interchange or intersection. See Loc 1

O - Count location that is inside of the interchange ramps either direction. See Loc 2 and Loc 4

X - Count location in the middle of the interchange. See Loc 3

***Note: Normally PM increase S to N and W to E. Some Routes such as Rte 580 and 780 don't.**

## Traffic Volumes Counts

| Dist | Cnty | Rte | Pre | PM | Leg | Dir | Description | Date | Day | 24 hour Period Hourly Counts 0-1 | 1-2 | 2-3 | 3-4 |

# CHAPTER 1
# INTRODUCTION

## 1.0 INTRODUCTION

This Final Environmental Impact Report (Final EIR) contains the agency and public comments received during the public review comment period for the Hunter Subdivision Project Draft EIR (Proposed Project).

The EIR is an informational document intended to disclose to the City of St. Helena (City), public agencies and the public the environmental consequences of approving and implementing the Proposed Project or one of the alternatives to the Project described in the Draft EIR. All written comments received during the public review period (September 23, 2021 through November 30, 2021[1]) on the Draft EIR are addressed in this Final EIR, as are oral comments received at the November 2 and November 30, 2021, Planning Commission hearings on the Draft EIR.

The responses in the Final EIR clarify, correct, and/or amplify text in the Draft EIR, as appropriate. Also included are text changes made at the initiative of the Lead Agency (City of St. Helena). These changes (summarized in Chapter 2) do not alter the conclusions of the Draft EIR. This document has been prepared in accordance with the California Environmental Quality Act (CEQA; California Public Resources Code (PRC), Sections 21000–21177).

## 1.1 BACKGROUND

In accordance with CEQA Guidelines Section 15082, the City released a Notice of Preparation (NOP) on March 6, 2018 through April 9, 2018, for the required 30-day review period. The purpose of the NOP was to provide notification that an EIR for the project was being prepared and to solicit guidance on the scope and content of the document. The Draft EIR was circulated for public review and comment for a period of 67 days[1] from September 23, 2021 through November 30, 2021. Public hearings before the City's Planning Commission to receive oral comments on the Draft EIR were held on November 2, 2021 and November 30, 2021.

The comments and responses that make up the Final EIR, in combination with the Draft EIR, as amended by the text changes, constitute the EIR that will be considered for certification by the decision makers of the City of St. Helena.

[1] In response to requests from the public to extend the comment period, the City extended the comment period an additional 22 days closing on November 30, 2021. The City also held another hearing to take oral comments at the November 30, 2021 Planning Commission hearing.

## 1.2 CEQA REQUIREMENTS

Under CEQA, the Lead Agency must prepare and certify a Final EIR prior to approving a proposed project. The contents of a Final EIR are specified in Section 15132 of the CEQA Guidelines, which states that the Final EIR shall consist of:

a) The Draft EIR or a revision of the Draft.

b) Comments and recommendations received on the Draft EIR either verbatim or in summary.

c) A list of persons, organizations, and public agencies commenting on the Draft EIR.

d) The responses of the Lead Agency to significant environmental points raised in the review and consultation process.

e) Any other information added by the Lead Agency.

The Lead Agency must provide each agency that commented on the Draft EIR with a copy of the Lead Agency's response to comments a minimum of 10-days before certifying the Final EIR.

## 1.3 USE OF THE FINAL EIR

The Final EIR allows commenting agencies and the public and the City an opportunity to review revisions to the Draft EIR and the Responses to Comments received. The Final EIR serves as the environmental document to support approval of the Proposed Project, either in whole or in part, or one of the alternatives to the Project discussed in the Draft EIR.

As required by Section 15090 (a) (1)-(3) of the CEQA Guidelines, a Lead Agency, in certifying a Final EIR, must make the following three determinations:

1. The Final EIR has been completed in compliance with CEQA.
2. The Final EIR was presented to the decision-making body of the Lead Agency, and the decision-making body reviewed and considered the information in the Final EIR prior to approving the project.
3. The Final EIR reflects the Lead Agency's independent judgment and analysis.

As required by Section 15091 of the CEQA Guidelines, no public agency shall approve or carry out a project for which an EIR has been certified that identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings (Findings of Fact) for each of those significant effects, accompanied by a brief explanation of the rationale for each finding supported by substantial evidence in the record. The possible findings set forth in CEQA section 15091 are:

1. Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the Final EIR.

2. Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.
3. Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the Final EIR.

Additionally, pursuant to Section 15093(b) of the CEQA Guidelines, when a Lead Agency approves a project that would result in significant unavoidable impacts that are disclosed in the Final EIR, the agency must state in writing the reasons supporting the action. The Statement of Overriding Considerations must be supported by substantial evidence in the Lead Agency's administrative record.

The Findings of Fact and Statement of Overriding Considerations are included in a separate document that will be considered for adoption by the City's decision makers at the time of Project review.

## 1.4 PROJECT UNDER REVIEW

The Proposed Project is located on a 16.9-acre site in the northeastern portion of the city, at the eastern terminus of Adams Street, three blocks east of downtown and State Route 29, and west of the Napa River. The Proposed Project consists of the following:

- A Tentative Subdivision Map to subdivide the site into 51 lots (sized for single-family residences), a 3.4-acre parcel, and two lettered lots: a 0.06-acre parcel (Parcel "A") for an onsite irrigation well and a 0.04-acre parcel (Parcel "B"), as shown in Figure 2-4, Proposed Tentative Map of the Draft EIR. The Project applicant has stated their intent to ultimately develop the 51 lots with 51 single-family, market-rate residences. Additionally, homes on 11 of the 51 lots would be developed with an ADU as part of their initial construction. The applicant intends to ultimately develop the 3.4-acre parcel with 25 attached multifamily residential units.
- An Affordable Housing Agreement, which would require approval by the City Council subsequent to approval of the Tentative Subdivision Map.
- Design Review of the proposed single-family and multi-family units.
- A Conditional Use Permit for the development of multi-family housing. Development of the Proposed Project includes the extension of Adams Street and Starr Avenue to and through the project site and the installation of infrastructure (water, sewer, etc.) to serve the proposed homes.

A detailed project description is contained in the Draft EIR in Chapter 2, Project Description. The environmental impact analysis is included in Chapter 3 of the Draft EIR.

## 1.5 SUMMARY OF TEXT CHANGES

Chapter 3 in this Final EIR, Changes to the Draft EIR, identifies all changes made to the document by section. These text changes provide additional clarity in response to comments received on the Draft EIR, but do not change the significance of the conclusions presented in the Draft EIR.

## 1.6 RESPONSES TO COMMENTS

A list of public agencies and individuals commenting on the Draft EIR is included in Chapter 2 in this Final EIR. A total of 122 written comment letters were received along with oral comments received at the public hearings held before the Planning Commission on November 2, 2021 and November 30, 2021. Responses to comments are provided in Chapter 4 of this Final EIR. Each comment letter and each oral comment on the Draft EIR, provided at the public hearings before the Planning Commission, is numbered and presented with brackets indicating how the letter or oral comment has been divided into individual comments. Each comment is given a binomial with the number of the comment letter appearing first, followed by the comment number. For example, comments in Letter 1 are numbered 1-1, 1-2, 1-3, and so on. Immediately following the letter or Planning Commission comments are responses, each numbered to correspond to the bracketed comments. Comments received at the Planning Commission hearings are numbered as PC-1, PC-2, etc. As the subject matter of one topic may overlap between letters, the reader must occasionally refer to one or more responses to review all the information on a given subject. To assist the reader, cross-references to other comments and also Master Responses are provided. A number of comments received raised the same or similar comments; therefore, Master Responses based on specific issues of concern are provided in Chapter 4.

## 1.7 MITIGATION MONITORING AND REPORTING PROGRAM

The Mitigation Monitoring and Reporting Program (MMRP) for the Proposed Project includes all of the mitigation measures required of the Project identified in the Draft EIR, as revised in Chapter 3 of this Final EIR. The MMRP is provided as a separate document.

If the City Council chooses to approve the Proposed Project or one of the alternatives described in the Draft EIR, the City Council will be required to adopt the MMRP at the same time it adopts its CEQA Findings, as required by Section 21081.6 of the Public Resources Code.

## 1.8 OVERVIEW OF THE PUBLIC PARTICIPATION AND REVIEW PROCESS

The City notified all responsible and trustee agencies and all known interested groups, organizations, and individuals that the Draft EIR was available for review. The following list of actions took place during the preparation, distribution, and review of the Draft EIR:

- The City filed a Notice of Completion (NOC) along with copies of the NOP stating the City's intention to prepare an EIR for the Proposed Project with the State Clearinghouse for the required 30-day public review period on March 6, 2018.
- A NOC and copies of the Draft EIR were filed with the State Clearinghouse on September 23, 2021 to start the required 45-day public review period (which was extended to 67 days). The City distributed a Notice of Availability (NOA) to interested groups, organizations, and individuals regarding the availability of the Draft EIR. A public notice was placed in the Napa Valley Register newspaper. A public hearing to take comments on the Draft EIR was held on November 2, 2021 and November 30, 2021.
- Copies of the Draft EIR were available for review on the City's website (https://www.cityofsthelena.org/planning/page/hunter-draft-eir); at the St. Helena library, and at the City's offices located at 1572 Railroad Avenue, St. Helena, CA 94574.

INTENTIONALLY LEFT BLANK

# CHAPTER 2
# LIST OF AGENCIES/PERSONS COMMENTING

## FEDERAL

There were no comments received from any federal agencies by the close of the comment review period (November 30, 2021).

## STATE

There were no comments received from any state agencies by the close of the comment review period (November 30, 2021).

## LOCAL

There were no comments received from any local agencies by the close of the comment review period (November 30, 2021).

## ORGANIZATIONS

There were two comments received from local organizations; Napa Bicycle Coalition and Our Town St. Helena.

## INDIVIDUALS

More than 120 comment letters were received from individuals and organizations.

Comments received from organizations and the public are listed in Table 2-1. Comments received from individuals are listed in alphabetical order. In some instances the same commenter submitted more than one letter. To differentiate between the letters, the date the letter was received is provided; however, there are numerous instances where letters from the same commenter are issued on the same day. The number of each letter reflects the order in which responses are provided in Chapter 4.

## PLANNING COMMISSION HEARING – NOVEMBER 2, 2021 AND NOVEMBER 30, 2021

The transcript and responses to the November 2, 2021 and November 30, 2021 Planning Commission hearings are provided immediately following the comment letters and responses. There were a total of 12 speakers at the November 2, 2021 hearing and 6 speakers at the November 30, 2021 hearing. Table 2-2 lists all the commenters.

**Table 2-2. List of Commenters – Planning Commission Hearings**

# CHAPTER 3
# CHANGES TO THE DRAFT EIR

## INTRODUCTION

This chapter presents minor corrections, additions, and revisions made to the Draft EIR initiated by the Lead Agency (City of St. Helena), reviewing agencies, the public, and/or consultants based on their review. New text is indicated in underline and text to be deleted is reflected by ~~strike through~~, unless otherwise noted in the introduction preceding the text change. Text changes are presented in the section and page order in which they appear in the Draft EIR.

It should be noted that the changes represent minor clarifications/amplifications of the analysis contained in the Draft EIR and do not constitute significant new information that, in accordance with CEQA Guidelines Section 15088.5, would trigger the need to recirculate portions or all of the Draft EIR.

### Executive Summary

The last sentence on page ES-17 is revised to read:

> Of the alternatives evaluated above, Alternative ~~2~~ 3, the Park/Open Space Preserve alternative is the environmentally superior alternative.

### Chapter 1, Introduction

The text on page 1-6 is revised to read:

> **Alternative 3: Park/Open Space Preserve Alternative.** This alternative includes a 1-acre park that would preserve a majority of the on-site wetlands and would include the same number of units as the Proposed Project, including the affordable housing units and accessory dwelling units.

The text on page 1-7 under section 1.5 Organization of the Draft EIR is revised to read:

> ~~**Chapter 2,**~~ **Executive Summary—**Summarizes the elements of the Proposed Project and the environmental impacts that could result from implementation of the Proposed Project and provides a table that lists impacts, describes proposed mitigation measures, and indicates the level of significance of impacts before and after mitigation.

### Section 3.3, Air Quality

The text in the last paragraph on page 3.3-2 is revised to read:

The greatest precipitation in the City occurs from ~~October~~ November to ~~April~~ March, during which time the rainfall averages 2~~–7~~ 5 inches per month. The average annual precipitation is ~~34.61~~26.09 inches. The City has a mild climate with an annual average temperature of ~~75~~63 degrees Fahrenheit (°F). The coolest months of the year are typically ~~December~~ November through February, with an annual average low of ~~36~~ 41°F. The warmest months are typically June through September, with an annual average high of ~~89~~ 90 °F. Prevailing wind direction in the ~~City~~ Project area (as measured at the ~~St. Helena~~ Napa station, approximately ~~0.42~~ 22 miles ~~southwest~~ southeast of the Project site) is from the west (~~WRCC 2016~~ NOAA 2022)[1].

**Section 3.6, Geology and Soils**

The third sentence of the first paragraph on page 3.6-12 is revised to read:

The 1906 earthquake was of a substantial magnitude and the 1969 earthquake~~s were~~ was ~~of~~ a more moderate magnitude though with an earthquake epicenter~~s~~ located near downtown Santa Rosa."

**Section 3.9, Hydrology and Water Quality**

The fourth sentence of the last paragraph on page 4.9-7 is deleted:

~~During such a flood, the style of flooding onsite would be slow and gradual, since the high velocity flows remain limited to the regulatory floodway~~.

The first paragraph on page 3.9-12 is revised to read:

Furthermore, in highly unlikely catastrophic situations (< a 0.5% annual chance) where the levee may be overtopped or in a 200+ year flood event, Proposed Project residents would have ample warning to evacuate prior to flooding. ~~Based on a comparison of the base flood elevation to proposed lot pad elevations, flooding of Proposed Project lots would range between 0 and 5 feet in depth, with the deepest flooding occurring on the northern part of the Project site. This level of flooding would leave upper floors or residences available for refuge. Because of this, the risks from a 200+ year flood and/or levee failure are limited to property damage rather than risk of life.~~ As previously indicated, this would be an impact of the pre-existing environment on the Proposed Project rather than the Proposed Project's impact on the environment.

The first sentence in the second paragraph on page 3.9-19 is revised to read:

[1] NOAA (National Oceanic and Atmospheric Administration). 2022. "NOWData: NOAA Online Weather Data." Accessed September 2022.https://www.weather.gov/wrh/Climate?wfo=mtr.

> Given the proximity and similar setting, groundwater levels are expected to be similar or possibly shallower beneath the Project site. According to the findings of the well capacity and sustainability report (Appendix L), the existing agricultural well on the Project site (proposed to be located in Parcel B on the tentative subdivision map) was constructed in 1976 to a depth of 410 feet bgs; with a current (2022) yield of 350 gallons per minute (gpm).

The second sentence in the last paragraph on page 3.9-43 is revised to read:

> Therefore, the proposed pumping from this well is ~~not~~ likely to have ~~any~~ a less direct effect on surface flow in the Napa River than if it directly pumped from the alluvial deposits.

**Section 3.12, Public Services and Recreation**

The last paragraph on page 3.12-5 is revised to read[2]:

> Additionally, an approximately 0.6 miles pedestrian path/trail is located parallel to the gravel levee maintenance road located adjacent to the northern boundary of the Project site, as shown in Figure 3.12-1. The levee maintenance road is not a City recreation trail but is used informally as a trail by local residents.

**Section 3.13, Utilities and Service Systems**

The last sentence in the third complete paragraph on page 3.13-2 is revised to read:

> It is assumed these vineyards have previously been irrigated by the on-site well, which constitutes the only water use on site at present. However, since the well is ~~currently~~ not currently in operation it is likely that ~~if~~ the vineyard is not currently receiving artificial irrigation.

The last paragraph on page 3.13-3 is revised to read:

> In total, the City is authorized to divert and store 1~~3~~,800 acre-feet from Bell Canyon Reservoir each year, and directly divert 1 cubic foot per second between November 15 and April 15 (150 days) of each year~~. Of the City's total authorized amount, 2,000 acre-feet can only be diverted and stored between November 15 and April 15 of each year~~ (City of St. Helena 2010).

The last sentence at the top of page 3.13-8 is revised to read:

> There is an existing well on the Project site that is presently not in operation (see Section 3.9, Hydrology and Water Quality for more information on the existing well and groundwater resources).

The second sentence of the last paragraph on page 3.13-8 is revised to read:

[2] Figure 3.12-1 is included at the end of this chapter.

Water from the Bell Canyon Reservoir is treated by three licensed water treatment operators at the Louis Stralla Water Treatment Plant (WTP), located on Crystal Springs Road ~~in the~~ northeast~~ern part~~ of the City (City of St. Helena 2015a, 2019a).

The second sentence of page 3.13-26 is revised to read:

This translates to a wastewater generation rate of ~~19.88 acre-feet per year, or 0.018 MGD~~ 14,000 gallons per day (0.014 MGD) during average dry weather flows (ADWF) and 23,400 gallons per day (0.0234 MGD) during peak wet weather flows (~~Appendix J~~ Carollo 2022).

The second sentence of the second paragraph on page 3.13-29 is revised to read:

The Proposed Project is expected to generate approximately ~~0.018~~ 0.014 MGD of wastewater during ADWF and 0.0234 MGD during PWWF while in operation (Carollo 2022).

The third and fourth sentences of the fourth paragraph on page 3.13-32 are revised to read:

The Proposed Project is expected to generate approximately ~~0.018~~ 0.014 MGD of wastewater during ADWF and 0.0234 MGD during PWWF (Carollo 2022). As the WWTP currently treats an average flow of 0.384 MGD, the additional ~~0.018~~ 0.014 MGD combined with the current average flow of 0.384 MGD would not exceed the plant's permitted allowable ADWF effluent limit of 0.5 MGD, as specified under its NPDES permit (City of St. Helena 2016).

The second sentence of the second paragraph on page 3.13-36 is revised to read:

The Proposed Project would increase wastewater generation in the City by producing approximately ~~0.018~~ 0.014 MGD at buildout (Carollo 2022).

Section 3.13.6 References shall include the following additional reference:

Carollo Engineers, Incorporated (Carollo), 2022. Hunter Subdivision Hydraulic Modeling Analysis, June 24, 2022.

**Section 3.14, Transportation and Circulation**

The last sentence in the second paragraph on page 3.14-13 is revised to read:

Weekday service generally occurs every 45 minutes starting at 6:15 a.m. and ending at 10:45 p.m. Weekend service is provided every hour and is truncated during the morning and night periods. ~~Service is not provided on weekends or major holidays.~~

The first sentence in the fourth paragraph on page 3.14-13 is revised to read:

> The Napa Valley Wine Train also passes through the city; however, it is mainly used as a tourist attraction and not for commuting or passenger service ~~purposes~~. Stops are limited and occur on an irregular basis in the city.

**Chapter 5, Alternatives**

The title of Tables 5-2 and 5-3 on pages 5-10 and 5-11 are revised to read:

**Table 5-2**
**Alternative 2: No Project/~~No Action~~ General Plan Alternative Projected Solid Waste Generation**

| Land Use | Generation Rate (tons/day/unit) | Waste Disposed (tons per day) |
|---|---|---|
| 152 Single-family Residential Units | 0.0033 | 0.502 |
| | **Total** | **0.502** |

**Source:** CalRecycle 2018.

**Table 5-3**
**Alternative 2: No Project/~~No Action~~ General Plan Alternative Student Generation**

| Grades | Student Generation Rate (per total number of units) | Students Generated |
|---|---|---|
| K-2 | 0.058 | 8.816 |
| 3-5 | 0.080 | 12.16 |
| 6-8 | 0.088 | 13.38 |
| 9-12 | 0.088 | 15.84 |
| | **Total** | **57** |

**Source**: SHUSD 2010.

The second sentence in the second paragraph on page 5-11 under the ability of the No Project/General Plan Alternative to meet the Project objectives is revised to read:

> However, this alternative ~~would~~ may not achieve the Proposed Project objective of developing a variety of housing types, including multifamily housing and ADUs. ~~Housing would be less affordable to a range of incomes since development would be limited to single-family homes.~~

Table 5-7 starting on page 5-29 is revised to read:

| | | | | | |
|---|---|---|---|---|---|
| 3.14-6: Under Cumulative conditions, would the Proposed Project increase hazards due to a geometric design feature or incompatible use? This is considered a less than significant impact. | LS | NI | LS~~SU~~ | LS~~SU~~ | LS~~SU~~ |

**Appendix K**

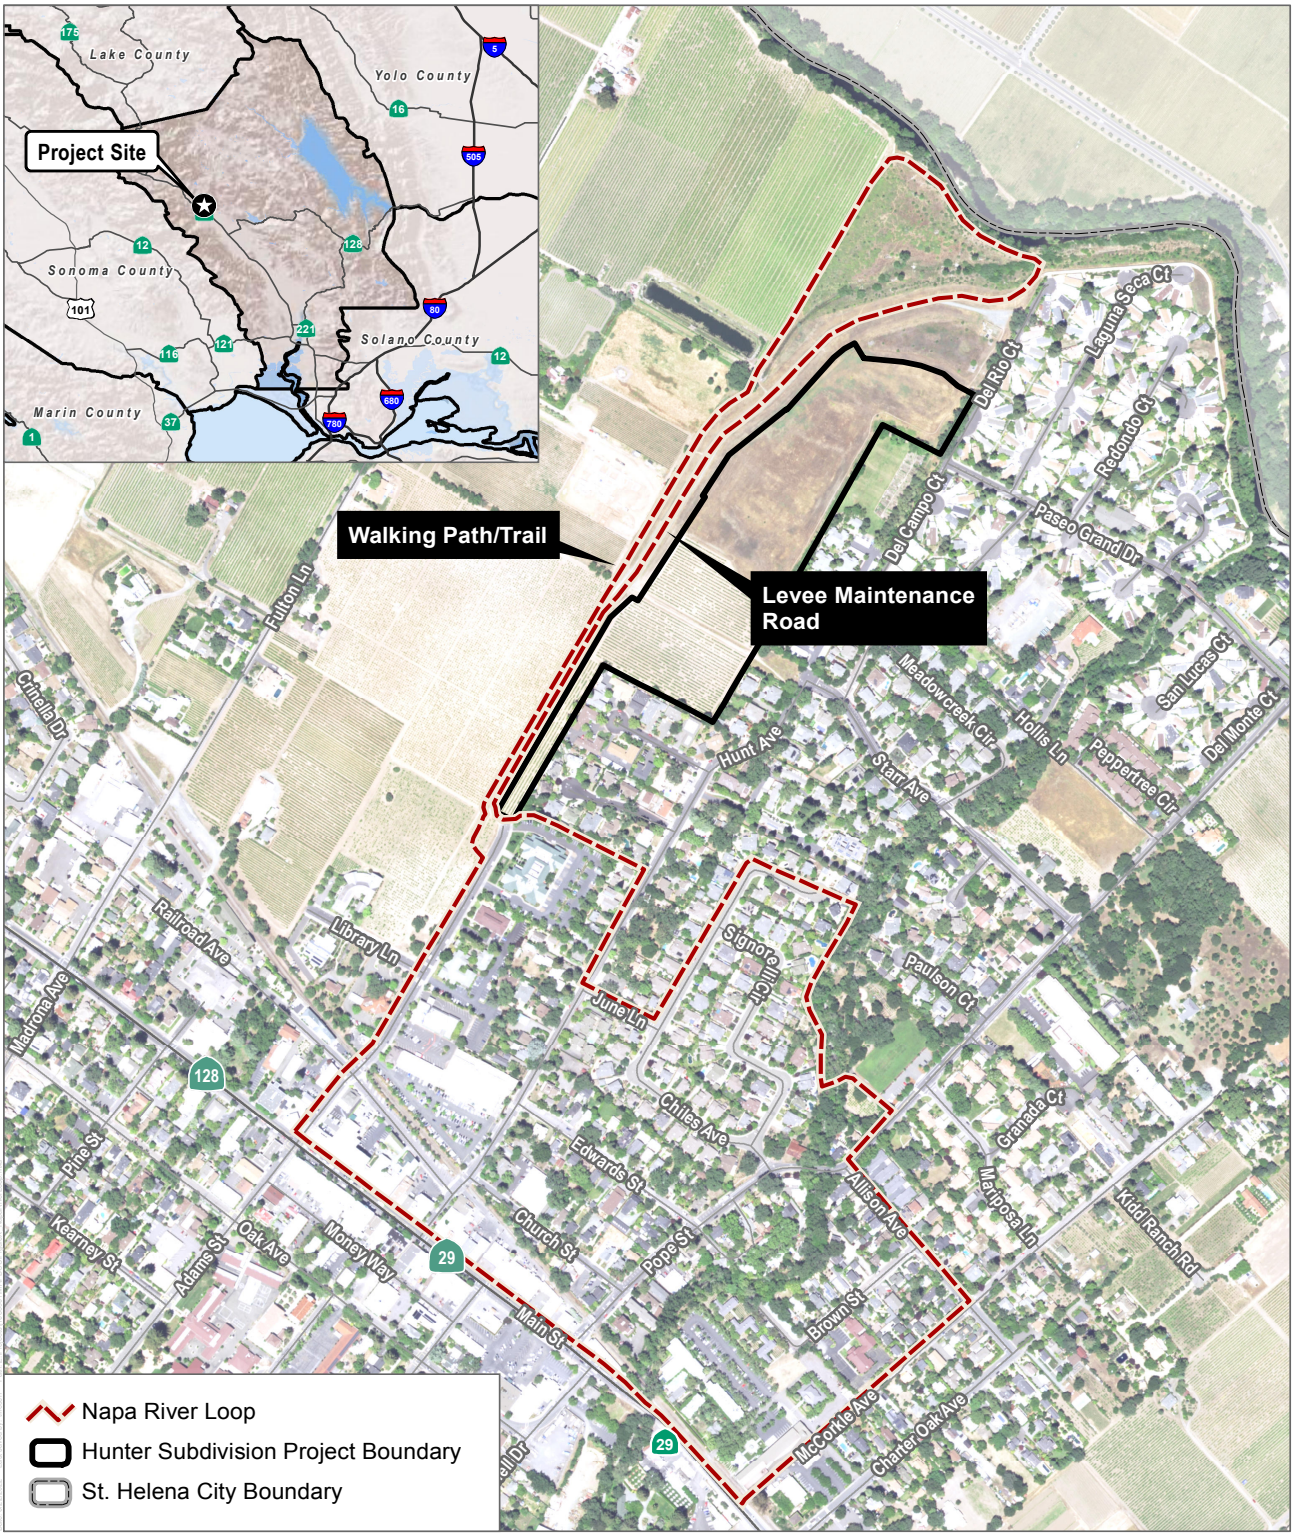

Table 7 of Appendix K, Traffic Impact Study, page 36, is revised to read:

**Table 7**
**Existing plus Project Weekday Peak Hour Intersection Level of Service**

| 13. Silverado Trail/Howell Mountain Road | unsignalized | 14.5 | B | 17.7 | C | 14.6 | B | 17.9 | C | 0.1 | 0.2 | no | no |

**Notes:**
[1] Average seconds per vehicle
[2] Level of Service (LOS)
**BOLD** value indicates unsatisfactory LOS

The change to Table 7 corrects a typographical error. The Existing Plus Project AM Peak Hour for Intersection #12 should read Level of Service (LOS) C, and not E. The analysis in the Traffic Impact Study (TIS) is based on the delay of 18.5 seconds, which corresponds to LOS C. Therefore, the project does not result in an unacceptable level of service for the AM peak hour at Intersection No. 12, and this correction does not change the results of the TIS. It should be noted that the TIS was prepared to meet City development requirements and not for purposes of the California Environmental Quality Act (CEQA). LOS is not considered an indicator of a significant environmental effect under CEQA.

# CHAPTER 4
# COMMENTS AND RESPONSES

This chapter contains the comment letters received in response to the Draft EIR during the public comment period (September 23 through November 30, 2021), as well as the transcripts from the November 2 and November 30, 2021, Planning Commission hearings on the Draft EIR. A list of all commenters is provided in Chapter 2. Each comment letter or Planning Commission comment is numbered, each comment is bracketed, and responses are provided to each comment. To assist the reader, a brief summary of the comment has been provided; however, it is only a summary and does not repeat the comment verbatim. Please refer back to the letter for the specific comment.

Master Responses have been provided to respond to the same or similar comments raised in numerous comment letters addressing the following issues:

- Emergency evacuation (Master Response 1),
- Availability of adequate water supply and compliance with the City's water neutral requirements (Master Response 2),
- Stability of the Napa River levee and flooding concerns (Master Response 3), and
- Adequacy of the City's wastewater conveyance capacity (Master Response 4) are provided on the following pages.

The responses amplify or clarify information provided in the Draft EIR and/or refer the reader to the appropriate place in the Draft EIR where the requested information can be found. Comments that are not directly related to environmental issues (e.g., opinions on the merits of the project unrelated to its environmental impacts) are noted for the record. Where text changes in the Draft EIR are warranted based on comments received, updated project information, or information provided by City of St. Helena staff, those changes are noted in the response to comment, and are listed in Chapter 3 of this Final EIR.

Any changes to the analysis contained in the Draft EIR represent only minor clarifications/ amplifications and do not constitute significant new information. In accordance with CEQA Guidelines, Section 15088.5, recirculation of the Draft EIR is not required.

INTENTIONALLY LEFT BLANK

## MASTER RESPONSE 1: EMERGENCY EVACUATION

Numerous comments were raised regarding emergency evacuation, specifically for residents of the adjacent Vineyard Valley Mobile Home Park (Vineyard Valley). Concerns included the addition of vehicles from the Proposed Project and the potential to hinder evacuation of residents in the area, including in the Vineyard Valley development during an emergency. Commentors asked whether this impact was considered and expressed concern about potential adverse impacts to public safety.

Roads that would provide emergency access near the Project site include Pope Street, Hunt Avenue, Starr Avenue, Adams Street, and Silverado Trail as well as the existing levee maintenance road that borders the northwest boundary of the Project site and the adjacent City detention basin. The Vineyard Valley development currently has only one access to enter/exit the development from Pope Street. Emergency access is provided via the maintenance road adjacent to the northern boundary.

On August 3, 2021, the St. Helena Police Department in conjunction with the St. Helena Fire Department conducted a practice emergency evacuation drill of Vineyard Valley residents. The emergency simulated a major incident, such as a fire, where the residents of Vineyard Valley would be asked to leave in a moment's notice in their vehicles. Residents evacuated in approximately 25 to 30 minutes. The attached “After Action Report,” dated Sept 20, 2021, provides additional detail on the evacuation drill.

Based on the results of the evacuation drill, the St. Helena Police Department has concluded that any additional traffic from the Proposed Project would not significantly impact the ability of Vineyard Valley residents to safely evacuate the development in the event of an emergency. The Police Department also concluded that the proposed extension of Starr Avenue to Adams Street will help facilitate future evacuations by providing additional roadway capacity and additional routing options for emergency traffic (J.Tharp September 2021)[1]. If, for some reason, the levee maintenance road is closed residents of Vineyard Valley would exit using the access onto Pope Street.

Another concern with regard to the Proposed Project’s potential impact on emergency evaluation concerned construction activities and their potential to block access to the levee maintenance road in the event of an emergency. Construction equipment would be staged on the Project site and would not be allowed to to park or be stored on or block access to the maintenance road. Access to the maintenance road would be maintained during all construction activities, even during construction of the extension of Adams Street, to ensure adequate emergency access would be available. All construction trucks and equipment would access the site from either Starr Avenue or Adams Street. No construction vehicles would be permitted on the levee maintenance road.

Emergency access and public safety is evaluated in the Draft EIR in Sections 3.8, Hazards and Hazardous Materials, 3.12, Public Services and Recreation and 3.14, Transportation and

[1] City of St. Helena Police Department, After Action Report, Lt. Justin Tharp, September 20, 2021.

Circulation. The St. Helena Fire Department has reviewed the proposed Tentative Subdivision Map and has not identified any issues with the Project's proposed emergency access.

As discussed in Section 3.8, Hazards and Hazardous Materials, Napa County, in coordination with other jurisdictions including the City, has prepared a Draft 2020 Multi-Jurisdictional Hazard Mitigation Plan Update, which has not yet been adopted (DEIR p. 3.8-11). The plan covers each of the major natural hazards that pose risks to County infrastructure and residents and includes:

- Focusing resources on the greatest risks and vulnerabilities,
- Building partnerships by involving citizens, organizations, and businesses,
- Increasing education and awareness of threats and hazards, as well as their risks,
- Communicating priorities to state and federal officials, and
- Aligning risk reduction with other community objectives.

The potential for the Project to impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan is evaluated under Impact 3.8-3 on page 3.8-20 of the Draft EIR. As noted in the discussion, the Project includes three points of access -- the extension of Starr Avenue, Adams Street, and emergency vehicle access via the levee maintenance road-- to facilitate the ingress and egress of emergency response vehicles, including the City and County Fire Department's apparatus, Project residents, and Vineyard Valley residents. The emergency vehicle access onto the maintenance road would be designed with bollards or a fence that would be kept locked. In the event of an emergency requiring evacuation, police or fire personnel/vehicles would have access to remove the bollards/unlock the gate through a locked box (e.g., knox box) to enable access to the site and as a third egress option for Project residents to evacuate. The Project has been designed to ensure all streets and roads are adequate in terms of width, turning radius, and grade to facilitate access by City firefighting apparatus, and to provide multiple points of emergency ingress and egress to ensure a safe evacuation in the event of an emergency.

The ability of the City's police and fire services to protect future Project homes and residents is addressed in Section 3.12, Public Services and Recreation. As discussed, the Project site would be served by the City's police and fire departments located at 1480 Main Street, approximately 0.2 miles from the site. Development of the Project site would increase the demand for fire protection and emergency services; however, as discussed on page 3.12-14, the Project is required to comply with Chapter 15.36 of the City's Municipal Code and the State Building Code, which requires installation of approved automatic sprinkler systems in all single-family and multi-family buildings. The Project would be developed consistent with 1993 General Plan Policy 8.5.6 and 2019 General Plan Policy PS4.D, which requires new development to meet the minimum fire flow rates specified by the City's Fire Code. In addition, as mentioned above all streets and roads are designed to be adequate in terms of width, turning radius, and grade to facilitate access by City firefighting apparatus, and to provide emergency ingress and egress. The site and construction plans for the proposed single family homes and the multi-family development on Lot 52 would be subject to plan review by the City's Fire Department to ensure proper access for fire and emergency response is provided and required fire suppression features are included.

Section 3.14, Transportation and Circulation also addresses adequate emergency access under Impact 3.14-4 on page 3.14-51. The analysis reiterates what has previously been mentioned: the Project includes two primary access points, Starr Avenue and Adams Street as well as a

separate emergency vehicle access. In the event of an emergency there would be three roadways that would enable vehicles to safely enter/exit the Project site and all streets and roads would be designed to facilitate access by City firefighting apparatus, and to provide alternative emergency ingress and egress.

INTENTIONALLY LEFT BLANK

## MASTER RESPONSE 2: ST. HELENA WATER SUPPLY AND WATER NEUTRAL POLICY FOR DEVELOPMENT

Numerous commenters have questioned the ability of the City of St. Helena (City) to meet the water demands of the Hunter Subdivision project (Proposed Project or Project), the viability of relying on the City's Water Neutral Policy, how the effects of climate change and current drought conditions are considered, and whether implications of the outcome of the City's Water Audit lawsuit should be included in the analysis. The following responds to these concerns.

### Water Demand

The Draft EIR addresses the City's water supply and availability in Section 3.13, Utilities and Service Systems. The City currently sources its water supply from Bell Canyon Reservoir, extracted groundwater from the Stonebridge Well Complex, and water purchased from the City of Napa (DEIR pp. 3.13-2 and 3). Bell Canyon Reservoir has a physical storage capacity of 2,400 acre-feet (AF) with a safe yield estimated at between 500-1,100 AF. Existing water rights permit the City to divert up to 1,800 AF between November 15 and April 15 of each year. The City owns and operates two active groundwater wells, collectively known as the Stonebridge Well Complex, that have a combined capacity of approximately 595 gallons per minute (gpm). These wells have the potential to provide 960 acre-feet of potable water per year if both are operated continuously (DEIR p. 3.13-7). However, the City limits groundwater production to a long-term average not to exceed 450 AF per year. As stated on page 3.9-19 of the Draft EIR, groundwater pumping at these two wells has averaged 350 AFY between 2006 and 2019, with a range of 182 acre-feet in 2012 to a high of 526 acre-feet in 2013. This period captures multi-year drought conditions and according to monitoring data of a groundwater monitoring well located approximately 600 feet from the Project site, the groundwater level trend has been stable through this period (DEIR p. 3.9-42).

The City of Napa is contracted to provide the City with a minimum of 600 AF of water with an option for an additional 200 AF when feasible (DEIR p. 4.13-4). In the 2019 watershed report for Bell Canyon, the reservoir provided 43.6% of the City's water supply, the City of Napa supplied 42.5%, and the Stonebridge Wells the remaining 13.8% in 2018. However, the share of water from each source can change from year to year as the three sources of water supply allow for flexibility in order to adapt to changing conditions.

As shown in Table 3.13-1 on page 3.13-3 of the Draft EIR, the City's water deliveries have varied from year to year but overall have shown a decreasing trend from 1,882 AF in 2013 to 1,629 AF in 2020. The City's Safe Yield Committee determined that the potable water system can provide a total supply of up to 1,950 AF per year as a sustainable rate on a long-term basis (DEIR p. 3.13-11). This safe yield value recognizes that drought periods will be experienced and that circumstances may require the implementation of water restrictions (Phase III) during a dry year, but that these restrictions do not represent "undue hardships" (St. Helena Municipal Code Title 13 - Public Services, Chapter 13.04 Water Service System, Article 2 Water Shortage Emergencies, Drought and Water Conservation*)*. The Committee considered "undue hardship" to be Phase IV or V restrictions, or three or more consecutive months of Phase III restrictions. The domestic water demand for the Project at 19.88 AF per year is based on the Water Neutral Report prepared for the Project (Appendix J). The Water Neutral Report also estimates

outdoor/landscaping uses, which would be served by the onsite agricultural well and is therefore separate from the analysis of domestic water use.

The Water Neutral Report conservatively assumes the Proposed Project will include eight persons per single family residence which is much higher than the City's average of 2.45 persons per household (DEIR p. 3.13-24),[2] and therefore likely overstates actual water use. However, assuming this conservative estimate of 19.88 AF of domestic water use per year, the additional demand of the Project in combination with the recent total deliveries (1,629 + 19.88 = 1,648.88 AF) would still be far below the City's adopted safe yield of 1,950. Therefore, the new water demand associated with the Proposed Project could be met by the City's potable water system even without the water offset requirements of the City's Water Neutral Policy, as discussed further below.

**Water Neutral Policy**

The City's Water Neutral Policy included in Chapter 13.12, Water Use and Efficiency, of the Municipal Code requires that new development be water-neutral (from the City-delivered water system) through any combination of on-site water conservation measures and/or off-site retrofitting and/or use of well water (DEIR p. 3.13-21). For the Proposed Project, there are no opportunities for on-site water conservation since the site has no current water demand. Therefore, the Project must demonstrate water neutrality through off-site retrofitting and system improvements which must be demonstrated in a quantitative water analysis of the Project.

Per Municipal Code Section 13.12.050, the developer is responsible for identifying residential or nonresidential properties eligible for retrofitting and verify to the Department of Public Works that the required number of retrofits have been completed prior to the issuance of a certificate of occupancy. Appendix J of the Draft EIR includes the quantitative water analysis completed for the Project as required by the Water Neutral Policy. The report concluded that the offset of the Project water demands could be met through financial assistance with existing system improvements (e.g., payment of required fee) commensurate with the cost of retrofitting existing residences with low flow fixtures, but also includes a variety of suggested methods to increase domestic water supply or reduce demand to offset the Project's domestic water use.

As detailed in the Water Neutral Policy, the water demand of the Project would equate to retrofitting 333 residences with water conservation fixtures, but this is not to say that the policy can only be met through residential retrofits. For example, the Water Neutral Report referenced the potential for assisting the City in repairs to the transmission line between the City and Rutherford where a substantial amount of water is lost due to the current condition of the old pipeline. Reducing water losses is a gain for the supply system.

As part of the Project's proposed Conditions of Approval it states that no building permits may be issued until the developer has identified and implemented offsite improvements that reduce water loss from the public water distribution system and/or identify and implement offsite improvements that result in a net increase in potable water availability equivalent to 19.8 AFY,

[2] Exterior water demand (landscape irrigation, etc.) would be met by an onsite well and is not included in this estimate, which includes interior domestic uses only.

or a combination of these. Therefore, with adherence to this regulatory requirement and the required Conditions of Approval, occupancy of the Proposed Project would not occur until the City's Public Works Department has verified completion of these retrofits or system improvements that meet the City's construction standards to offset the Project's new water demand. As a result, the City would be able to meet the Project's water supply demand and result in a less-than-significant impact.

**Climate Change**

One of the effects of global climate change is an increase in variabilities of weather patterns and an increased probability to experience periods of drought. While climate change can create drier years in which precipitation is below annual averages, it can also result in very wet years.

The City recognizes that future periods of drought conditions are likely and may become more frequent. The establishment of the safe yield of 1,950 AF per year completed by the City's Safe Yield Committee provides the parameters for long term management of water supply resources. As discussed above, the new water demands for the Proposed Project would be offset through adherence to the City's Water Neutral Policy where retrofits or system improvements equivalent to the proposed new demands would be in place prior to issuance of building permits for development of the Project.

However, as mentioned above, the City may still be forced to enact water conservation and/or water rationing requirements during drought periods because of strains on the system that would be due to the effects of climate change. The City's Municipal Code (Title 13 - Public Services, Chapter 13.04 Water Service System, Article 2 Water Shortage Emergencies, Drought and Water Conservation) establishes the thresholds and requirements for water emergency phases, water conservation, and regulations that can adapt to changing conditions and enact emergency requirements for users as appropriate for long term water supply planning.

Therefore, the Draft EIR does consider the effects of climate change in Project impacts related to water supplies. The EIR determines that the Project can be adequately served based on existing water supplies. Compliance with the City's Water Neutral Policy would further ensure that the Project does not adversely effect the City's future water supplies.

**Water Audit Lawsuit**

Several comments have referenced the Water Audit lawsuit and have suggested that the outcome of that lawsuit should be considered as part of the analysis of water supply and hydrologic resources related to the Project. The lawsuit claims the City has violated its public trust in its management of water resources. The plaintiffs seek to increase monitoring and oversight of groundwater and surface water resources. The lawsuit claims poor documentation of water uses, including pumping at the City's Stonebridge Well Complex, and water deliveries to vineyards, wineries, and the Meadowood resort.

The Water Audit's complaint does not ask for changes to existing water uses. Instead, it seeks an injunction to stop the City from issuing new groundwater well drilling permits until enough

information is available to make informed water allocation decisions. The Proposed Project does not include a requirement for a new groundwater well drilling permit and so a potential injunction on new well drilling permits would not affect the Project.

As discussed on page 3.9-15 of the Draft EIR, there is an inactive groundwater well located in the northern portion of the Project site that may have been historically used to provide construction water for the City's Flood Protection Project and was used in the past for agricultural irrigation. The Project proposes to use this well for the irrigation of public and private landscaping and all other outdoor uses, which are estimated to require 17.16 AF per year (DEIR p. 3.13-32).

Regarding concerns about hydraulic conductivity with the adjacent Napa River, a site-specific well capacity and sustainability report was prepared that included conducting a 24-hour pump test as part of evaluating the hydrogeologic characteristics of the existing on-site well (Appendix L of the Draft EIR). The pump test ran at a rate of 40 gpm, which was nearly four times as high as the proposed rate for the Project (10.6 gpm). The study concluded that the onsite well draws from an aquifer with high transmissivity (i.e., ability of the water bearing unit to transmit water flow) and that the proposed pumping would not likely adversely affect either local water levels or Napa River flows. The onsite well is screened from 80 feet below ground surface (bgs) to 410 feet bgs, which is within the deeper volcanic aquifer and below the Napa Valley alluvium (the shallow water bearing unit that is considered hydraulically connected to the Napa River).

Therefore, whereas the Water Audit lawsuit is primarily concerned with the management of water resources that would affect the water levels of the Napa River, the well capacity and sustainability report determined that the pumping of the onsite well to supply the Project's public and private landscaping would not adversely affect flows in the Napa River. The analysis under Impact 3.9-2 starting on page 3.9-40 of the Draft EIR provides a detailed analysis of potential impacts associated with using the on-site well.

Considering that the Project does not require obtaining a well drilling permit and that a site-specific hydrogeologic study has demonstrated that the Project would not adversely affect water levels, the outcome of the Water Audit lawsuit would not alter the findings of the Draft EIR.

CEQA requires that the determination of significant effects be based on substantial evidence that include facts, reasonable assumptions predicated upon facts, expert opinion supported by facts, and not speculation (CEQA Guidelines § 21082.2). Therefore, the final outcome of the Water Audit lawsuit may have ramifications for the City in its long-term management of water resources but would not affect the analysis or impact significance determinations that were made in the Draft EIR.

## MASTER RESPONSE 3: NAPA RIVER FLOOD PROTECTION/LEVEE

The Hunter Subdivision Project (Project or Proposed Project) was in the past in a flood zone but is now protected from a 200-year flood event (equivalent to less than a 0.5% annual chance) by the St. Helena Comprehensive Flood Protection Project (Flood Protection Project). The Project does not have an impact on the Flood Protection Project's effectiveness or on flood hazards for surrounding communities, either directly or indirectly.

Many commenters have raised concerns that the Project would put people and property at unreasonable risk if a major flood event overtops the levee[3] (i.e., greater than 200-year flood) and/or if the levee fails. These concerns generally revolve around the Project's perceived physical impacts on the levee; the levee's current condition, inspections, and maintenance; a perception that the project would increase existing flood risks for neighboring communities (e.g., Vineyard Valley and Hunt's Grove); confusion over levee certification/accreditation; and legal, liability, and insurance questions.

Comments that raised concerns about growth inducement (due to the levee reducing SFHAs in the City) are comments on the Flood Protection Project, not the Project.

As a general matter, the bulk of the comments received do not question the accuracy of the information contained in the Draft EIR or the adequacy of the analysis presented. Rather, they express differing opinions about levels of acceptable risk and a lack of trust in the design, construction, and maintenance of the Flood Protection Project. The Draft EIR includes a detailed description of the flood hazards present; the engineering, design, and maintenance of the Flood Protection Project; and the City's emergency management procedures in Section 3.9, Hydrology and Water Quality (Draft EIR pp. 3.9-6 through 3.9-13). This information was provided for reference purposes and addresses a majority of the comments received that relate to flooding and levee protection. The reason this information was included in the Environmental Setting section of Section 3.9 (Hydrology and Water Quality), rather than being addressed as an impact, is because impacts of the environment on a project or plan (as opposed to impacts of a project or plan on the environment) are beyond the scope of required CEQA review.[4]

### Flood Risks

The Project does not have an impact on the levee's effectiveness or on flood hazards for surrounding communities, either directly or indirectly. California Supreme Court's decision in *California Building Industry Association v. Bay Area Air Quality Management District (2015) 62 Cal.4th 369* held that "agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents" but they must analyze hazards the project might risk exacerbating. For example, if a project proposes development on a site with existing subsurface hazards, then grading/development of the project may exacerbate the risk of those existing subsurface hazards.

[3] Note that references to the levee are inclusive of the floodwall component of the Flood Protection Project.

[4] "[T]he purpose of an EIR is to identify the significant effects of a project on the environment, not the significant effects of the environment on the project." (Ballona Wetlands Land Trust v. City of Los Angeles (2011) 201 Cal.App.4th 455, 473.)

Accordingly, the State Office of Planning and Research's 2018 revisions to the CEQA Guidelines—which the City uses as its CEQA thresholds of significance—removed reference to property damage, personal injury, or loss of life due to flooding or levee failure (i.e., pre-existing hazards) from Appendix G (included in the CEQA Guidelines).

Placement of the Project within an area protected from the 200-year flood does not substantially increase public exposure to flood risk, even though the risk is not zero. The Draft EIR acknowledges that there is residual risk to residents which is why the Federal Emergency Management Agency or FEMA encourages the purchase of optional flood insurance (i.e., FEMA preferred risk policy) (Draft EIR p. 3.9-8, first paragraph). The Project's Conditions of Approval require that prior to issuance of building permits, all future occupants will be provided information which describes the flood risk and notifies the buyer of the availability of low-cost Preferred Risk Policy flood insurance. Comments that address legal, liability, and/or insurance issues fall outside the scope of CEQA review, because they are not related to impacts of the project on the environment.

It is not the role of the Draft EIR to guarantee that there would be zero risk to life or property in the event of an extreme (i.e., greater than 200-year) or catastrophic flood event. The level of risk to the Project and its residents is reasonably and acceptably low due to the 200-year level of protection afforded by the Flood Protection Project. The description of flood emergency stages, preparedness, and response (Draft EIR pp. 3.9-11 and 3.9-12) remains accurate and indicates a reasonable plan for alerting and protecting residents from major flood events.

In the last paragraph on page 3.9-7, the Draft EIR speculates as to the style of flooding that would occur in the Project site based on its position outside of the regulatory floodway, if there were a levee overtopping event. The style of flooding would be dependent on the location, speed of water level rise, and levee response to an overtopping event. No portion of the Project site is located within the FEMA regulatory floodway. Therefore, the text on page 3.9-7 is revised to remove the reference to flooding being "slow and gradual." Please see Chapter 3, Changes to the Draft EIR for the revised text.

For the same reasons, the text on page 3.9-12 is also revised to remove the characterization of what could happen in the event of a flood. As previously indicated, this would be an impact of the pre-existing environment on the Proposed Project rather than the Proposed Project's impact on the environment. Please see Chapter 3, Changes to the Draft EIR for the revised text.

**Clarification on Terminology/Concepts**

Many commenters have expressed concern about the levee's design and construction, because it was not designed and built by the Army Corps of Engineers (ACOE) and is maintained by the City. As noted above, the Project does not have an impact on the levee's effectiveness or on flood hazards for surrounding communities, either directly or indirectly. California Supreme Court's decision in *California Building Industry Association v. Bay Area Air Quality Management District (2015) 62 Cal.4th 369* held that "agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents" but they must analyze hazards the project might risk exacerbating. Accordingly, comments

regarding existing structures, such as the levee, that will not be directly or indirectly impacted the Project, are outside the scope of CEQA review for this Project.

However, for strictly informational purposes the City provides the following: there are numerous non-federal levees throughout the United States that are safely built and maintained by local and/or state entities. The City of St. Helena Department of Public Works oversees inspection, maintenance and repairs of the levee, and has confirmed that the levee was designed and built by qualified contractors in accordance with ACOE engineering and safety standards (Draft EIR p. 3.9-8).

Levee certification is the process that deals specifically with the design and physical condition of the levee and is the responsibility of the levee owner or community in charge of the levee's operations and maintenance. Certification must be completed for the levee to be eligible for accreditation by FEMA. Certification consists of documentation, signed and sealed by a registered Professional Engineer, as defined in Chapter 44 of the Code of Federal Regulations (44 CFR), Section 65.2. By virtue of FEMA's approval of the City's application for a Letter of Map Revision (LOMR) and subsequent revision of the Flood Insurance Rate Map (FIRM), the levee is a FEMA-accredited levee system[5] that has undergone the certification process. While FEMA does not design, build, maintain, inspect, or certify levees, it uses the best available data about flood hazards and levee conditions to create FIRMs and Flood Risk Products (FRPs). These FIRMs and FRPs are tools that provide a more precise, up-to-date picture of the flood hazards facing levee-impacted areas, which is important given that the flood risks change over time.

The modern construction of the levee makes it more secure than other accredited levee systems that may have received accreditation decades ago, and the 200-year level of protection provides substantial additional protection against flooding that takes into consideration increased rainfall and runoff due to climate change.

**Levee Condition and Maintenance/Inspections and City Detention Basin**

Several concerns were raised that the levee has not been properly maintained and may be subject to reduced performance due to animal burrows, erosion, and/or pump malfunctions. As discussed below, these issues are outside the scope of CEQA review of the Project, because the Project does not physically infringe upon or otherwise affect the levee. (See *California Building Industry Association v. Bay Area Air Quality Management District (2015) 62 Cal.4th 369.)*

However, for strictly informational purposes, the City provides the following: the City employs qualified individuals to inspect the levee on a monthly basis to detect any potential issues and take action on them as they arise. For example, in the past issues were found with the operation/startup of the detention basin's pump and it will be repaired by a qualified contractor. Further, it is up to the professional judgement of the City's engineer as to when any animal burrows may compromise the levee's safety. Per the inspection reports, the City has an animal

[5] A FEMA-Accredited Levee System is levee system that FEMA has shown on a FIRM that is recognized as reducing the flood hazards posed by a 1-percent-annual-chance flood. This determination is based on the submittal of data and documentation as required by 44CFR§65.10 of the NFIP regulations. The area landward of an accredited levee system is shown as Zone X (shaded) on the FIRM except for areas of residual flooding, such as ponding areas, which are shown as Special Flood Hazard Area (SFHA).

burrow control program in place and conducts burrow control activities as needed. The City also makes its levee inspection reports and summary reports available online here: https://www.cityofsthelena.org/publicworks/page/flood-control-and-river-restoration-project.

Several commenters referred to erosion or runoff from the Project affecting the City's detention basin. These commenters are referred to Draft EIR pages 3.9-44 and 3.9-45, which explains that the detention basin was designed assuming the Project would consist of 70% impervious (developed) area, when in fact it would consist of about 58% impervious area. The estimate of the Project's impervious surface coverage was calculated based on design drawings of the Project. Accordingly, as discussed in the Draft EIR on page 3.9-45, the Project would not contribute increase flows or erosion to off-site properties because the detention basin has been adequately sized and designed.

Commenters also requested information on what funds were used to construct the levee (Flood Control Project), what funds the City uses for repair and maintenance of the levee, what funds would be available to repair homes in the event of a levee breach, would the City be held liable in the event of a levee breach, and is the City non-compliant with the terms of Measure A.[6] Concerns regarding the financing of the levee, ongoing repairs and maintenance, financing to address damages in the event of a catastrophic flood, and liability are outside the scope of CEQA review, because they are not related to impacts of the project on the environment. In addition, economic effects of a project are not considered significant effects on the environment unless the economic changes are connected to physical environmental effects (CEQA Guidelines Section 15131(a)).

Regarding the comment suggesting that the City could be non-compliant with the County's Measure A ordinance, it is assumed the commenter is referencing subsection G, which states "none of the projects are intended or designed to encourage population growth in the County." To clarify, the Project site has been designated and zoned for residential development since the City's 1975 General Plan. The City's Flood Protection Project was designed consistent with the intent of Measure A to provide flood protection to residents and businesses in the County. Development of this site with residential uses would not be considered encouraging new population growth in the City because this site has been planned for future development for over 45 years.

[6] Measure A is an ordinance of the Napa County Flood Protection and Watershed Improvement Authority that adopted by Napa County residents in 1998. It is used to finance the Napa River Flood Protection Project. Each City and Town in Napa County receives a portion of Measure A revenues to fund flood protection projects. Subsection G states "none of the projects are intended or designed to encourage population growth in the County."

## MASTER RESPONSE 4: WASTEWATER CONVEYANCE CAPACITY

Numerous commenters raised concerns that the additional wastewater flows from the Hunter Subdivision project (Proposed Project or Project) would significantly exacerbate an existing capacity issue in the vicinity of the Vineyard Valley Mobile Home Park. The concerns include the issue of potential increased backflow incidents that affect the Vineyard Valley mobile home community. Commenters also questioned the assumptions that were used to estimate the flows that would originate from the Project, which they assert underestimate the wastewater flows that would occur with the Project. Capacity of the City's wastewater infrastructure to accommodate the Project was another concern raised in numerous comment letters. The following responds to these concerns.

**Wastewater Flow Assessment**

The Draft EIR addresses the Project's wastewater flows in Section 3.13, Utilities and Service Systems. To support the findings of the Draft EIR, a hydraulic modeling analysis was recently conducted by Carollo Engineers who prepared the citywide Integrated Utility Master Plan (Carollo 2022). As part of their work for the Master Plan, Carollo had constructed a hydraulic model of the entire wastewater collection system for the City. The purpose of the model was to identify capacity deficiencies within the collection system under both average dry weather flows (ADWF) and peak wet weather flow (PWWF) conditions.

To identify the potential effects of the Project, the model was updated by adding the wastewater loads that would be coming from the Project to the point of connection to the sewer system, which is at the intersection of Del Rio Court and Paseo Grand Drive, upstream of the Vineyard Valley Mobile Home Park. The evaluation criteria for the Project specific analysis was the same used for the Master Plan analysis and included conservative assumptions on surcharge depth[7], maximum flow depth, and peak dry weather flow conditions (i.e., no surcharging is allowed). A copy of the memorandum prepared by Carollo is included as Appendix A to this Final EIR.

For the Proposed Project, the estimated ADWF flows would be 14,000 gallons per day (gpd) (Carollo 2022). The ADWF flows are calculated by multiplying the projected increase in residential units by the residential density of 2.45 persons per household and multiplying the result by the per capita flowrate of 66 gallons per capita per day, consistent with standards used for the citywide Master Plan. The Project's PWWF flows were also calculated based on methods used for the Master Plan and were estimated at 23,400 gpd (Carollo 2022).

The findings of the hydraulic analysis determined that under existing conditions, there is sufficient capacity within the existing sewer system for all ADWF flows. However, under PWWF conditions, there is an existing deficiency upstream of what would be the Project's point of connection that is creating a bottleneck. This bottleneck was identified in the Master Plan as a future upgrade project (Project WWGM-6) that would replace approximately 450 feet of 15-inch and 18-inch diameter pipelines along Del Campo Court, between Hunt Avenue and Paseo

[7] Sewers are surcharged when the supply of water to be carried is greater than the capacity of the pipes to carry the flow. The surface of the wastewater in manholes rises above the top of the sewer pipe, and the sewer is under pressure or a head, rather than at atmospheric pressure.

Grand drive with a 21-inch diameter pipe. In addition, 910 feet of 18-inch diameter pipeline along Paseo Drive, between Del Campo Court and Los Robles Court, would also be upgraded to a 21-inch diameter pipeline under Project WWGM-6.

With the additional wastewater flows that would be attributed to the Proposed Project (14,000 gpd), the hydraulic modeling still shows that under ADWF there would be sufficient capacity within the existing sewer system. Under PWWF conditions, there are deficiencies in the capacity of the system, however the addition of the Project flows (23,400 gpd) did not identify any additional deficiencies that are not already present downstream of the Project site (Carollo 2022). The Project's contribution represents only 0.5% of the PWWF flows, which is not considered to substantively exacerbate this existing deficiency (Carollo 2022).

Once the proposed Master Plan improvements are completed, and the upsizing of the pipes between Hunt Avenue and Los Robles Court is completed, there would be adequate capacity for both PWWF including flows from the Project (Carollo 2022). The hydraulic analysis verified that the recommended improvements provided in the Master Plan would still be valid and appropriate as stated in the plan.

Therefore, according to the hydraulic modeling which is consistent with the modeling being used for the citywide Master Plan, there is adequate capacity for the Project's ADWF under existing conditions. During PWWF, the Project would not create any new deficiencies and would represent only a very small portion (0.5%) of total flows.

The City's Master Plan already identifies existing deficiencies and have targeted projects like WWGM-6, which would upsize segments of the system, to alleviate current constraints such that the impacts would be considered less than significant, consistent with the findings of the Draft EIR.

**Wastewater Flow Estimates**

As noted above, according to the recent hydraulic analysis of projected wastewater flows from the Proposed Project prepared by Carollo Engineers (see Appendix A to this Final EIR), the Project is estimated to contribute 14,000 gpd during ADWF and 23,400 gpd during PWWF conditions. The PWWF were based on what is known as "peak rain derived inflow and infiltration (RDII)" which were estimated for the Project based on a peak RDII rate of 500 gpd per acre, consistent with the Master Plan.

The Project's ADWF flows were calculated by multiplying the projected increase in residential units by the residential density of 2.45 persons per household and multiplying the result by a per capita flowrate of 66 gallons per capita per day, consistent with standards used for the citywide Master Plan.

The Draft EIR states that wastewater flows would be 18,000 gpd which is in between the ADWF and PWWF calculated in the memorandum. The figures and data from the memorandum are more recent and were calculated by the same engineering firm that is responsible for

developing the citywide Master Plan. As a result, the Draft EIR has been modified to be more consistent with the memorandum and the changes are provided in Chapter 3 of this Final EIR.

The updated estimates for the Project's flows under both ADWF and PWWF, do not change the findings of the Draft EIR's impact assessment, and the wastewater flows attributed to the Project would still be considered less than significant as concluded in the Draft EIR.

Comment Letter 1

**From:** Patrick Band <pband@napabike.org>
**Sent:** Tuesday, November 2, 2021 6:59 PM
**To:** Maya DeRosa <MDeRosa@cityofsthelena.org>
**Cc:** Carlotta Sainato <csainato@napabike.org>
**Subject:** [External] Request for DEIR Comment Period

Ms. DeRosa -

Following up on my comments at this evening's Planning Commission hearing on the Hunter Subdivision, the Napa County Bicycle Coalition would like to request a 30-day extension of the public comment period on the Draft Environmental Impact Report. 1-1

As we discussed, there are significant shortcomings in the DEIR regarding the various City-adopted Plans that are (and are not) considered, notably the failure to include the 2019 Countywide Bicycle Plan and associated bicycle and multi-use facilities. 1-2

Given the significance of this project for the City, we feel that an additional 30-days to provide sufficient time to more deeply consider and evaluate the DEIR is more than reasonable. 1-3

Thank you for your time and consideration.

INTENTIONALLY LEFT BLANK

# Response to Letter 1
## Napa County Bicycle Coalition
## Patrick Band, Executive Director
## November 2, 2021

**1-1** The comment is requesting a 30-day extension to the Draft EIR public review period.

The Draft EIR was released for the required 45-day public review period on September 23, 2021 through November 8, 2021. In response to numerous requests, the City extended the comment period through November 30, 2021 for a total of 67 days.

**1-2** The comment asserts the Draft has numerous shortcomings but does not provide any substantial evidence as to the basis for this assertion with the exception of stating the Draft EIR failed to include the 2019 Countywide Bicycle Plan and associated bicycle and multi-use facilities.

Information on existing bicycle facilities, specifically Class II bike lanes on area roadways is provided starting on page 3.14-2 in Section 3.14, Transportation and Circulation of the Draft EIR. Existing pedestrian facilities is described on page 3.14-7 and provided on Figure 3.14-3. A discussion of existing bicycle facilities and the transit system in the area is described on page 3.14-8. Figure 3.14-4 provides a graphic of the existing bicycle network in the City of St. Helena. As noted on page 3.14-8 (when the analysis was drafted), “The Napa Valley Transportation Authority (NVTA) adopted the Countywide Bicycle Plan in October 2019, but the City has not yet adopted the plan.” Because the Countywide Bicycle Plan had not been adopted by the City it was not included under section 3.14.3, Regulatory Setting. In addition, a Condition of Approval has been included to require installation of bicycle facilities along the extension of Starr Avennue. The potential for the Project to adversely impact bicycle, pedestrian and transit facilities is addressed under Impact 3.14-1 starting on page 3.14-39.

**1-3** The comment reiterates a request to extend the Draft EIR comment period an additional 30 days.

Please see Response to Comment 1-1 that addresses this concern.

Comment Letter 2

Our Town St. Helena
*It all begins at home.*

TO: The City of St Helena Planning Commission
RE: Our Town St Helena Comments on Hunter Project

Many people in the community have inquired regarding Our Town St Helena's position on the Hunter Project. Our Town St Helena (OTSH) is a non-profit organization whose mission is to create and preserve housing that is affordable to the people vital to St Helena. The Hunter Project has been under discussion for the entire twelve years of our organization's existence. 2-1

In those 12 years, we have continually advocated for housing that benefits and serves our local community. In this time, we have seen this acute need broaden from housing for the lowest economic rung of our community - agricultural, service and winery workers - to now including the "Missing Middle "– families and professionals making up to $200,000 who cannot afford to purchase or rent a home here. This dramatic change is evident in the 400+ families who have left St Helena between 2000 and 2015 and not been replaced (City of St Helena 2018 Housing Study), and the 6% drop in population recorded in the 2020 census. It is also evident in the increased traffic congestion from commuters and service vehicles. 2-2

We understand this new Draft EIR is analyzing potential environmental impacts of the proposed project, and "housing" is not a specific part of that analysis, yet we feel compelled to comment on the project at this early stage in the process as follows:

1. **The Project is Not Consistent with the City's Basic Requirements for Owner-Occupied and Rental Affordable Units**

The City's Inclusionary Ordinance states that "affordable units shall be comparable in number of bedrooms, exterior appearance and overall quality of construction to market rate units in the same residential project." Further, "Affordable units shall be dispersed throughout the residential project, or, subject to approval of the planning commission, may be clustered within the residential project when this furthers affordable housing opportunities."

In the current Hunter plan, all of the affordable units are two-bedroom rentals while the market rate homes have 3+ bedrooms. The affordable units are isolated to one side of the property and even appear to have a separate entrance. We think that this configuration and siting are not compatible with the City's stated inclusionary basic requirements. We suggest that the City and community would be better served by a more integrated project. 2-3

OTSH Final 11/26/21 1

**2. The Project Does Not Serve the Needs of St Helena**

The Draft EIR does not address this issue, but it is very important to the community. All new housing does not necessarily serve our community's housing needs. By our rough estimation, based on the size of lots and the cost of construction, the new market rate homes will be priced at or above $2,000,000 each. 2-4

Even with the admirable inclusion of 24 rental units and OTSH's projections that at least some (15%?) of the market-rate homes may be purchased as primary residences, we see little community benefit to St. Helena to building dozens of new second homes. In fact, the migration of primary homes to renovated second homes combined with ever emerging vacation rentals (e.g., Pacaso) is taking "affordable" inventory off the market faster than it can be funded and built. We have seen neighborhoods like Sylvaner and Signorelli, which were built as middle-class subdivisions, slowly slide out of workforce housing and into the multi-million dollar second home market. It would appear the Hunter Project could start out as a primarily second home neighborhood. The 2020 US Census confirms that St. Helena does not have a large primary residence market for $2M+ homes. This is a project that makes sense from a developer's standpoint but does not benefit, and in fact could be detrimental to our community by placing even more demand on the services provided to the second homes by a commuting workforce. 2-5 2-6

**3. Is There a Better Way?**

In today's environment, the CEQA process provides somewhat standard mitigations to somewhat standard issues. There is no process to evaluate how the project fulfills the specific needs of the community. But our community IS our environment. If our City had a Housing Strategy, developers might try to design a project that could a) fill our needs and therefore, b) be supported by the community.

St Helena needs homeownership opportunities for families making up to 200K. We need townhomes, triplexes, and fourplexes, for sale and for rent, that are affordable to families making $80K and up. And, we need rental units for the people who are essential to the wine and hospitality industries which drive our economy – these are families making $30K to $80K. This is all workforce housing – housing affordable to the people making $30K to $200K who are integral to a functioning community, who participate in our City life and infrastructure, and enrich the lives and livelihoods of all who live here. Every day, St. Helena imports more and more of its workforce, leading to increased traffic and congestion. This IS an environmental impact. 2-7

Could there be ways to make the Hunter Project fulfill these needs? Maybe. But it will require the City to better define what we need and provide innovative incentives to make it happen, a developer that is willing to think outside the box and a community that is willing to increase density for new developments. 2-8

Respectfully Submitted by the OTSH Board of Directors

## Response to Letter 2
### Our Town St. Helena
### Our Town St. Helena Board of Directors
### November 26, 2021

**2-1** The comment notes Our Town St. Helena (OTSH) is a non-profit organization focused on creating and preserving affordable housing and the Hunter project has been under discussion by OTSH for the past 12 years.

The comment is noted and forwarded to the decision-makers for their consideration. The comment does not identify any specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**2-2** The comment references the need to advocate for housing that benefits the community and notes the need for affordable housing has expanded to include a much broader range of incomes.

The comment is noted and forwarded to the decision-makers for their consideration. The comment does not identify any specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**2-3** The comment refers to the City's Inclusionary/In-Lieu Fee Requirements (Municipal Code Chapter 17.146) and questions if the proposed Project is consistent with the City's requirements.

As noted in the Draft EIR Project Description on pages 2-18 and 2-32, review of an Affordable Housing Agreement by the City Council will be a subsequent discretionary process and is not part of the Tentative Map being considered by the City at this time. A determination of consistency with the City's Inclusionary/In-Lieu Fee Requirements will be made at the time that subsequent Final Map application is submitted and reviewed.

**2-4** The comment is addressing the proposed future cost of the houses.

The CEQA Guidelines do not require the fiscal or economic costs of a project to be evaluated. An EIR evaluates physical changes to the environment attributed to a project. (CEQA Guidelines, Section 15358, subd. (b) ["[e]ffects analyzed under CEQA must be related to a physical change"].) Physical changes result from land disturbance due to project construction and development of the overall project "footprint." In addition, physical changes can also include an increase in demand for services and/or increased traffic associated with generating a new population. However, economic considerations are not required to be analyzed or addressed. Therefore, the comment is noted and forwarded to the decision makers for their

consideration. The comment does not identify any specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**2-5** The comment offers an opinion that the affordable housing component would have little community benefit and that the Project homes may be purchased as second homes instead of primary residences.

The comment does not identify any specific areas where the Draft EIR is inadequate; therefore, no further response is required. The commenter's opinion is noted and forwarded to the decision makers for their consideration.

**2-6** The comment indicates the Project could be detrimental to the community by increasing demand on city services by people that commute into the city to work.

The Draft EIR evaluated the increase in demand for public services assuming the Project would be fully occupied by full-time residences. The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**2-7** The comment expresses a desire for the City to develop a housing strategy that meets the needs of the community and is supported by the community and addresses the need to provide workforce housing for a range of income brackets. The comment also notes that people commuting into the City to work create traffic and congestion.

The comment is noted and forwarded to the decision makers for their consideration. The commentor is also invited to review the Housing Element of the St. Helena General Plan, which addresses local housing needs and includes policies and actions the City will undertake to help meet these needs. The comment does not identify any specific areas where the the Draft EIR is inadequate; therefore, no further response is required.

**2-8** The comment supports the City providing incentives to developers and increasing density for new development projects.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR is inadequate; therefore, no further response is required.

Subject: [External] Hunter Project EIR Comment

Hello:
My name is Ron Amoroso. I am the owner of 1365 Grove Court, St. Helena Ca. The following are my comments on the Draft EIR # 2108032014 (The Hunter Project).

For all the obvious reasons (It's a "Agricultural Area and the reason people (revenue) comes to the Napa Valley) as well as all those much better stated and substantiated in the documentary "Kiss The Ground", I would summarily "disagree" with, and suggest the Planning Department deny allowing this development to be allowed. That movie dramatically shows how plant life causes "Carbon Recapture" that not only reduces pollution, but also "reduces the existing" Co2 buildup that is causing the radical environmental changes we are experiences. Removing the existing acres of vineyards and replacing them with houses, buildings, and other hardscapes will "increase" the production of heat, reduce the production of Carbon recapture back into the soil through "photosynthesis" and reduce air quality as well as the likelihood of adequate rainfall going forward. Please spend a hour and watch this documentary to see how this project will negatively affect this area. Buying "open space somewhere else" as has been proposed by the developer is not going to eradicate the environmental effects on this area. Is that "open space" going to be "prime agricultural" land??
For these considerations, I vote NO on this development!! 3-1 3-2

There are two big "elephants" in the room regarding the immediate impact this proposed project will have directly on this area.

1- Flood potential/The levee/Related Township liabilities

2- Availability of potable water

1- Flood Threat/City/Taxpayer Liability:
The Levee was constructed by the City of St. Helena in an attempt to protect existing "Flood Plains" currently known as Vineyard Valley MHP and the Vineyard where the Hunter Project is being proposed. As such, this levee is only accredited by FEME to 100 year flood specs since it has only been "certified" by FEMA to the 100 year Flood. Currently, it is not "unusual" for those 100 Year Flood values to be surpassed so failure has been deemed by various "experts" as inevitable!! The levee was never inspected by or approved by the Army Core of Engineers or FEMA so the City of St. Helena (Me and all the other St. Helena Tax Payers) are responsible for the results of a breach of that levee. That responsibility, which has been accepted by the City of St. Helena, is one thing when it amounts to Farmland and a MHP, and totally another when it includes 87 new housing units occupied by ?? new residents!! Both in the form of physical bodily risk and financial risk. I am not ready to assume that additional risk so Mr. Hunter can generate a handsome financial gain. Mr. Hunter needs to provide the additional security (possibly a insurance bond) to cover the additional risks that will be incurred as a result of his development converting the existing, former flood plain, "ag-land" into residential housing land. 3-3 3-4

Another reason to vote NO on this development.

2- Water availability:

Adequate potable water availability has been a ongoing issue in St. Helena for the past 15 years that I know of. Not only are there no plans to make it any better, it is routinely getting worse due, in part, to Some of the environmental issues the Hunter Project will only worsen. How can the city of St. Helena approve the addition of 87 new residential units occupied by ?? how many new residents??? Replacing existing toilets with "water saver" toilets is a "clever" idea but also one that is NOT VERIFIABLE. So, where is all the additional water going to come from to support all the new residents who will occupy the 87 new residential units??

3-5

Again, another NO vote on this development.

I don't know if any one of these issues is a "underlying" negative issue against this development. Combined, however, they represent significant and overwhelming reasons to summarily and permanently deny this project to proceed.

3-6

Thank you,

Ron Amoroso

# Response to Letter 3
## Ron Amoroso
## October 26, 2021

**3-1** The comment references a movie "Kiss the Ground" that addresses carbon recapture to reduce $CO_2$. The comment goes on to state that removal of the onsite vineyards and developing homes will increase heat and reduce the recapture of carbon back into the soil through photosynthesis. Lastly, the comment asks if the purchase of open space elsewhere would be "prime agricultural land".

The Draft EIR addresses climate change in Section 3.7, Greenhouse Gas Emissions. The Project proposes developing the 16.9-acre site, including approximately 6 acres in existing vineyards, with 87 residential units. As discussed in Chapter 2, Project Description, the proposed landscape plan includes planting approximately 185 trees, including scarlet maple (*Acer Rubrum*), Chinese pistache (*Pistacia Chinensis*) and tulip tree (*Liriodendron Tulipifera)*. Furthermore, an approximately one-acre portion of the existing vineyard within the project site would remain. The California Emissions Estimator Model (CalEEMod) includes carbon content values, which are based on Intergovernmental Panel on Climate Change (IPCC) reports, to estimate the loss of sequestered carbon (release of $CO_2$). Using the factor for "cropland," the closest land use associated with the existing vineyards, removal of the vines would result in a rate of 6.2 MT $CO_2$/acre. Regarding carbon sequestration from the planting of a variety of tree species, the Project would result in a sequestration rate of 0.0354 MT $CO_2$/tree/year assuming growth over 20 years. Therefore, based on these considerations, the Project would result in an overall gain in sequestered carbon, reducing the Project's GHG emissions presented in Table 3.7-6 of the Draft EIR.

As stated on page 3.2-2 in Section 3.2, Agriculture and Forestry Resources, the state's Farmland Mapping and Monitoring Program (FMMP) categorizes the eastern portion of the Project site as Farmland of Local Importance (9.0 acres). The western portion of the Project site is predominantly designated as Prime Farmland (5.8 acres), with portions of Farmland of Statewide Importance (0.6 acres) and Urban and Built-Up Land (0.8 acres) in the westernmost area of the Project site. To assess Project impacts the California Land Evaluation and Site Assessment (LESA) Model was used. The model returned a Land Elevaluation or LE score of 35 and a Site Assessemnt or SA score of 13.8 for a total score of 48.8 (see DEIR pp. 3.2-9 – 3.2-10 and Appendix B). As shown in Table 3.2-3 on page 3.2-10, the loss of agricultural resources would be considered significant only if the individual LE and SA subscores are each greater than or equal to 20 points. Therefore, impacts associated with the removal of prime farmland and farmland of statewide importance were found to be less than significant.

If the applicant were to purchase undeveloped land there would be no requirement 5.8 acres would need to be Prime Farmland.

**3-2** The commenter requests the City vote no on the Project.

The comment's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**3-3** The comment is addressing concerns regarding the levee and raises FEMA certification of the levee. The comment also notes levees can fail and alleges the levee has never been inspected or approved by FEMA or the Army Corps of Engineers and if the levee were to fail or be breached the City would be liable.

Please see Master Response 3 that addresses all concerns associated with the levee.

**3-4** The comment is stating the Project applicant needs to provide additional security to cover any risks that may occur due to developing a former floodplain.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 3 that addresses concerns associated with the levee and flooding.

**3-5** The comment i addresses the availability of water to supply the Project and questions the viability of retrofitting existing fixtures to offset the project's increase in water demand.

Please see Master Response 2 that addresses the issue of water supply.

**3-6** The commenter does not support this Project and is recommending the Project not be approved.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

Subject: [External] Hunter Project EIR Comment

Hello:
My name is Ron Amoroso. I own the property at 1365 Grove Court in St. Helena and would like to offer a EIR comment regarding the Hunter Project proposal.

While it is a great idea to discuss the immediate and quite local environmental effects associated with removing almost 17 acres of vineyards in favor of multiple residential housing buildings and streets, we should also be considering the "overall" effects. 4-1

While it is very important and essential to stop or severely limit the continued pollution of our environment and atmosphere, we should also be looking at, considering, and implementing practices that will begin to "cleanse the existing atmospheric pollution. We should be practicing "Regenerative Agriculture" instead of removing it in place of more carbon producing elements such as those suggested in the creation of the Hunter Project. The existing Vineyards and other green/leafy plants have the effect of drawing down the existing carbon/C02 from the atmosphere and depositing it into the ground where it benefits further plant growth and cleanses the "overall" environment in the process. 4-2

Coupled with the reasons stated in a previous comment, please vote NO to the approval of the Hunter Project!!! 4-3

Thank you,

Ron Amoroso

INTENTIONALLY LEFT BLANK

# Response to Letter 4
## Ron Amoroso
## November 2, 2021

**4-1** The comment indicates that the overall effects of the Project should be considered.

The Draft EIR prepared for the Project evaluates both the project-specific direct and indirect effects associated with construction and operation as well as the cumulative effects of conversion of the land from its existing undeveloped condition to a developed environment. The comment does not specify what overall effects the commentor believes were not addressed in the Draft EIR or why the analysis was inaccurate or inadequate. Therefore, no further response is required.

**4-2** The comment refers to the practice of "regenerative agriculture" as a way to limit carbon and $CO_2$ from entering the atmosphere and to "cleanse" the environment.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Response to Comment 3-1.

**4-3** The comment is requesting the City not approve the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**Subject:** [External] Hunter Project

I live in Vineyard Valley and am opposed to the Hunter Project.

My biggest opposition is that the Hunter Project would jeopardize the health and welfare of the residents of Vineyard Valley. 5-1

We would be subjected to a greater chance of flooding as the Hunter property would turn open space to high-density building and paving. 5-2

Also, water is already at a premium and that capacity would be extremely stretched. St. Helena does not have enough water currently for its residents. 5-3

The gate at the north end of VV is currently used by us as an emergency exit. The construction would block that exit. That would leave us with only one way out, Pope Street. The traffic jam would be enormous. In case of the next fire emergency and evacuation (and experts say there will be a "next time"), this could be a matter of life and death for VV residents. 5-4

There are also concerns about water and sewer being hooked up to VV's utility lines on Paseo Grande, our main street. We don't have the capacity to accommodate said utilities. 5-5

The construction would go on for years. Vineyard Valley would bear the brunt of all the noise, dirt, dust and commotion. 5-6

Many of us enjoy the open space as a place to walk, walk our dogs and bicycle. It makes for a healthier lifestyle as most of us at VV are senior citizens. Continuing to access our town's open space is good for our health. I personally walk every day from VV to the Library and back. Open spaces are good for a small town like St. Helena. 5-7

I strongly oppose the Hunter Project and look forward to your response. 5-8

INTENTIONALLY LEFT BLANK

# Response to Letter 5
**Bette Antor**
**November 29, 2021**

**5-1** The commenter states she lives in the adjacent Vineyard Valley mobile home park and is opposed to the Project because it would affect the health and welfare of the residents of Vineyard Valley.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the commentor believes the Draft EIR is inadequate or how the Project would affect the health and welfare of Vineyard Valley residents; therefore, no further response is required.

**5-2** The comment states that there would be a greater chance of flooding if the Project site would be converted from undeveloped land to "high-density building and paving".

Conversion of the site from undeveloped to developed would not increase flood risks to the adjacent Vineyard Valley residents. Please see Master Response 3, which addresses concerns associated with flooding.

The use of the term "high density" may reflect the commentor's opinion. However, based on the proposed residential density of 5.1 units per acres, the proposed development would be "medium density" as defined in the General Plan, not "high density" as the term is used in the General Plan.

**5-3** The comment suggests that the City does not have adequate water supplies to serve current City residents.

Please see Master Response 2 that addresses water availability to serve the Project in addition to existing City residences and businesses.

**5-4** The comment states that Project construction would block the emergency evacuation access for Vineyard Valley residents along the existing levee maintenance road resulting in an increase in traffic that could be a "life or death" situation for Vineyard Valley residents.

Project construction activities would not be allowed to block access to the levee maintenance road, as explained in Master Response 1. Access to the levee maintenance road would be maintained during all construction activities and in the event of an emergency access would be available. All construction trucks and equipment would access the site from either Starr Avenue or Adams Street. No truck access would be permitted on the levee maintenance road. Please see Master Response 1 that addresses emergency evacuation concerns for Vineyard Valley residents.

**5-5** The comment raises concerns that the Project would tie into the City's existing water and sewer lines that also serve Vineyard Valley and that adequate capacity is not available in the existing water and sewer infrastructure to serve the Project.

The ability of the City's existing water and wastewater infrastructure to serve the Project is addressed in the Draft EIR in Section 3.13, Utilities and Service Systems. An existing 10-foot wide public water line easement containing an active 12-inch water line bisects the north/northeast portion of the Project site. This easement is proposed to be abandoned as part of the Project and the water line relocated within the site. The Project would tie into this new water line with a looped 8-inch water main that would serve all the residences.

Wastewater flows from the western portion of the Project site are proposed to drain into an existing public manhole at the corner of Starr Avenue and Hunt Avenue via new 8-inch sewer pipes. The area east of Starr Avenue, lower in elevation, is proposed to drain east through the Project site via new 8-inch sewer pipes within a public easement and into an existing public manhole in the Vineyard Valley Mobile Home Park. All new sewer mains and lines are sized to accommodate Project flows, per City standards. Please see also Master Response 4 that provides more details regarding the Project's wastewater infrastructure and the ability of the City to convey and treat the Project's wastewater.

**5-6** The comment states Vineyard Valley would be affected by noise, dirt, and dust associated with Project construction.

As described in the Draft EIR in Chapter 2, Project Description, the Project applicant is only requesting approval of a Tentative Subdivision Map at this time. If the Tentative Subdivision Map is approved, the Project applicant would need approval from the City on an Affordable Housing Agreement; Design Review; Final Subdivision Map; and a Use Permit to construct the multi-family units before any grading or construction could begin.

If the Tentative Subdivision Map is approved and the applicant seeks and obtains all other required approvals, the first phase of construction would require site clearing, grading, and trenching for utilities followed by construction of the roadways and residences. For the purposes of the EIR it is assumed construction would occur over a 6+ year period, with the exception of the multi-family units, which the applicant proposes to build within a year of approval of all remaining required discretionary requirements (listed above). The secondary impacts of construction activities resulting in noise, dirt and dust are addressed in Section 3.3, Air Quality and Section 3.11, Noise and Vibration of the Draft EIR.

**5-7** The comment notes that access to open space is good for peoples' health and well-being and for the City of St. Helena.

The Project site is not publicly-owned and is therefore not a public open space for the local community to enjoy. The commenter's general comments regarding the value of open space is noted and forwarded to the decision makers for their

consideration. The comment does not identify specific areas where the commentor believes the Draft EIR is inadequate; therefore, no further response is required. Please see Chapter 3, Changes to the Draft EIR for a copy of the trails map. As shown in the map existing trails will still allow access to the Napa River.

**5-8** The commenter is stating opposition to the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the commentor believes the Draft EIR is inadequate; therefore, no further response is required.

**Subject:** [External] Proposed Hunter Project

Planning Commission,

It is hard for us to understand how anyone in Saint Helena would be in favor of the Hunter Project. In Vineyard Valley we have seniors who need assistance in an emergency and we are concerned with the congestion of traffic and how it would effect us in an emergency situation. 6-1

Beyond that and even worse is our current situation regarding the drought. We've already cut back severely, with no end in sight. The city clearly does not have enough of a water supply available to allow for the housing project. 6-2

We have not spoken to one person in Saint Helena who is in favor of the Hunter Project. 6-3

**Subject:** [External] Hunter Development EIR Resident Comments

Maya,

My husband and I live at 715 Hunt Ave and vehemently disagree that the Hunter Subdivision Project is what Saint Helena needs. We are not opposed to development of this property, but we are opposed to this particular project as it is currently planned. 7-1

The first glaring issue is that the total units will have a significant impact on our water supply. Based on 3.13-2, the finding that it would be a less-than-significant impact is incomprehensible when current residents are not allowed to water their lawns and are being fined thousands of dollars for going over their allotment of water. We do not have enough water in our city for our current residents. The EIR asks whether the proposed project would require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities. The report says there is a less-than-significant impact. How on earth can this be a realistic conclusion? We would need expanded capacity and more water storage if we were to add a total of 87 units and over 325 new residents. The building department is requiring all new projects meet water neutrality requirements, but the idea that minimal upgrades like replacing toilets and fixtures in other houses with more water saving options is somehow going to offset the water usage of 87+ full new homes/units is nowhere near a realistic projection. 7-2

Further, this water neutrality is based on 2.45 people per unit for medium/higher density residential land uses (City of St. Helena 2013, an outdated study almost a decade ago). According to the EIR, using this factor, the 87 units in the applicant's development proposal (including ADUs) would generate 213 new residents. That is a woeful underestimate that is nowhere near a real life projection. We live in this neighborhood and know that a more reasonable estimate is 2 people minimum per BEDROOM. Even if you do estimate only 1 person per bedroom, you would have 204 people in the market rate homes, 22 people in the 1 bedroom ADU's (assuming 2 people per ADU), and then an additional 25 income restricted workforce housing units (currently at 2 bedrooms and would likely have 4 people minimum in each unit (100 people). That means a total of 326 new residents, a conservative estimate, which is still 35% higher than what the EIR reports. 7-3

More realistically, with 87 new units (51 being 3/4 bedrooms (416 ppl), 25 income restricted, workforce housing units, and 11 ADU's with the rest being 2 bedroom units (140 ppl), there are likely 556 people going to be living in this neighborhood, which is nearly triple what the EIR report estimates. At the very least, we demand that the report considers what this number of new residents will mean to our community instead of the implausibly low numbers in their inaccurate estimates. We need to make sure that any EIR will report on the realistic estimations of the maximum number of people that could potentially live in this development and focus on the impact on services such as water, electric, fire, traffic etc of that many new residents, cars, and traffic, and not made up numbers to help the developer's case. 7-4

Additionally, a highly important, but rarely discussed consequence of this project is that it is projected to take more than 7 years to complete. That is 7 years of construction dust, noise, increased traffic, large trucks, and more which will significantly diminish the quality of life in our neighborhood. In the report, it is asked whether in the proposed project, in addition to cumulative development in the City, increase traffic noise that exceeds the City's noise standards. The report says that the project's contribution would not be 7-5

considerable. We completely disagree. With 7 years of construction, the increase in traffic, noise, and dust/debris will be much higher than the standards in which we live currently. 7-5 Cont.

Further, the report seems to downplay the adverse affect on scenic views around Saint Helena. We have very little green space currently and this property allows many residents to take advantage of nature and the view of the vineyards, forests, mountains, creeks, mustard grass and wildflowers. These will be torn out if the project moves forward and turned into concrete, asphalt, buildings and chemically treated lawns. 7-6

In conclusion, there are a number of inaccurate estimates throughout this EIR that make it difficult to truly understand the real life impacts of this project to the city of Saint Helena and its residents. Not only will it destroy a beautiful green space used daily by residents, we will also have 7 years of big rigs, dust, noise, traffic, water runoff, and ground disturbance that could affect our homes nearby. All of this said, the most dramatic miscalculation is the underestimation of water usage and number of people that will be living in each unit. 7-7

We strongly urge the city of Saint Helena to NOT allow this development to go forward as currently proposed. 7-8

Katie and Jacob Avery

# Response to Letter 7
## Katie and Jacob Avery
## November 30, 2021

**7-1** The comment states general opposition to this type of Project type in this location.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. As noted in the Draft EIR on page 2-12 in Chapter 2, Project Description, the Project site has been designated for residential development since the 1975 General Plan and is currently designated for Medium Density Residential in the City's recently adopted General Plan Update 2040.

**7-2** The comment states that the commenter and other City residents have undergone water saving measures and have been subject to fines for water use. The comment brings up concerns related to the City's water supply and its ability to serve the Project. Specifically, the comment argues that expanded capacity and additional water storage are needed to serve the Project and that water efficiency requirements for plumbing and bathroom fixtures per the building code are not adequate to meet the City's water neutrality requirements.

Please see Master Response 2 that addresses the City's ability to supply water to the Project and also addresses concerns regarding the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**7-3** The comment questions if the City's person per household (PPH) rate of 2.45 is outdated and is an underestimation; the comment suggests that the Project will create a population increase of 326 new occupants. The comment disputes that the PPH rate and estimates Project occupancy should be higher based on anecdotal evidence.

Population changes alone, do not, in and of themselves, constitute a physical effect on the environment. (CEQA Guidelines, Section 15126.2, subd. (d) [CEQA does not assume that "growth in any area is necessarily beneficial, detrimental, or of little significance to the environment"].) The population estimate cited in the Draft EIR is based on the City's PPH rate used for planning purposes and has little bearing, if any, on the evaluation of physical environmental effects. The projection of the number of people a project would generate is only an estimate and has limited utility because environmental impacts are primarily evaluated using a different metric based on the specific issue being evaluated.

The City's rate of 2.45 PPH for determining population is a blended rate used by the City to determine increases in population per unit for medium/higher density residential land uses. This PPH rate is also consistent with the City's 2040 General Plan EIR population assumptions (see Draft EIR p. ES-4).

Other rates are used to evaluate impacts for different purposes. For example, as stated on page 3.13-24 of the Draft EIR, a Water Neutral Report was prepared for the Project that assumes a higher PPH rate, as compared to the City's PPH, to ensure a conservative calculation of water demand. It is not uncommon for an EIR to include different assumptions depending on the issue area to be evaluated.

**7-4** The comment states that the Project would result in more new residents than what is analyzed in the EIR. The comment requests that the EIR evaluate impacts related to utilities, public services, and traffic based on higher population estimates.

Please see Response to Comment 7-3. Physical impacts associated with an increase in population are evaluated by analyzing increased demand for services. The Draft EIR properly evaluated the increase in demand for each potentially impacted resource based on industry standard demand rates provided either by the City or the service provider based on the specific land use to analyze potential environmental impacts caused by the Project.

For the purposes of public services analysis, Section 3.12 of the Draft EIR uses a household size of 2.45 PPH, which as discussed above is consistent with the City's 2040 General Plan EIR population assumptions.

For the purposes of traffic and transportation analysis, Section 3.14 of the Draft EIR does not rely on a population growth estimate, but rather daily trip rates according to the types of residential land use proposed by the Project.

**7-5** This comment notes the commentor's concern over the Project's construction timeline. Specifically, the commenter disputes that, because of the anticipated length of the construction timeline, effects related to dust, noise, and traffic would be greater to current residents over time; the commenter also argues that standards for these environmental considerations will be made more stringent as construction progresses.

As described in the Draft EIR in Chapter 2, Project Description, buildout of the Project would occur based on market conditions and timeliness of obtaining future approvals and construction permits. At this time the Project is only requesting approval of the Tentative Subdivision Map which does not include the issuance of construction permits. As noted in the Project Description, while the timeline of future construction is not finalized, the Draft EIR conservatively relies on a 6+ year construction period for analysis purposes. The associated air quality, noise and traffic impacts associated with short-term construction activities on both adjacent residences as well as phases of the Project are evaluated in the respective sections.

**7-6** The comment states concern about the Project's aesthetic impact on scenic views around St. Helena. The comment also states the Project will have a negative impact on open space in the community and generally result in undesirable aesthetic impacts.

The Project's impacts on views and change in visual character of the Project site is addressed in Section 3.1 of the Draft EIR, Aesthetics/Visual Resources. The analysis

in Section 3.1 reviews Project compliance with the City's General Plan, Zoning Ordinance, and Design Review requirements and also provides visual simulations of the Proposed Project to illustrate how development of the Project would change views of the Project site. As noted in Chapter 2, Project Description, if the Project is approved the City would require additional subsequent discretionary approvals, including Design Review.

Based on the analysis in the Draft EIR, all Aesthetic impacts would be less than significant with the exception of an increase in lighting that would result in a significant impact. Implementation of Mitigation Measure AES-1, which requires lighting design guidelines be developed for the Project to minimize glare and light spillover would reduce that impact to less than significant.

The commenter's opinion that the Project would result in undesirable impacts is noted and forwarded to the decision makers for their consideration.

**7-7** The comment summarizes other comments described above (see comments 7-2 through 7-6), involving open space, the proposed construction timeline, and estimations related to population growth.

Please see Responses to Comments 7-2 through 7-6.

**7-8** The comment expresses general opposition to the Project as currently proposed.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**Subject:** [External] Hunter Project

**This is application must NOT be approved and MUST be denied.** Three major issues (there are many more, traffic, water and tax bases. This project effectively could cause loss of life for Vineyard Valley residents and block their emergency exit in case of fire or earthquakes. This would be a murderous proposition is this project is allowed to move forward. The City then must be held responsible for any loss of life involved. Water: we are in a drought - this project must be stopped immediately if St Helena has any chance of weathering this water shortage. It's not enough to say that this drought will pass because we've been in it for 20 years. It would be irresponsible to allow this due to the water situation alone. The taxes gained would not even cover the added expenses to the city so why would you even consider putting more fiscal problems on our city? 8-1 8-2 8-3

THIS IS A TERRIBLE AND UNRESPONSIBLE PROJECT - DO NOT MOVE FORWARD. 8-4

# Response to Letter 8
## Trevor Barlow
## November 6, 2021

**8-1** The comment states general opposition to the Project and asks that the Project be denied.

The comment's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**8-2** The comment raises concerns related to emergency evacuation and access in the event of a fire or earthquake.

Please see Master Response 1 that addresses concerns associated with emergency evacuation.

**8-3** The comment raises concerns regarding the City's water supply and Project's tax revenue generation. The commenter is concerned that the Project will worsen current drought conditions and that tax revenue generated by the Project would not cover future City expenses.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, in response to the comment's concern related to the City's water supply, please see Master Response 2.

**8-4** The comment states general opposition to the Project and asks that the Project be denied.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

INTENTIONALLY LEFT BLANK

Comment Letter 9

October 28, 2021
Ms. Maya Derosa,
St. Helena Planning and Building Director

Dear Ms. Derosa,

My wife and I are deeply opposed to the Hunter Subdivision Project primarily because the City of St. Helena has an inadequate water supply during dry and critically dry rainfall years. Since 2018, St. Helena has experienced three critically dry rainfall events. If this project is approved, it will no doubt create an even greater hardship for the city's current water customers during drought periods. 9-1

St. Helena has delayed undertaking several important capital improvements projects (CIPs) for its water enterprise over the last ten years. Two years ago, St. Helena conducted a master water plan which identified 60 million dollars in needed CIPs. Until these improvements are completed, the Hunter Project's 87 additional housing units will likely over burden St. Helena's current water enterprise. 9-2

Currently, there is no plan to increase St. Helena's limited water supply other than to build a new sewage treatment plant having the ability to provide tertiary water for landscaping. Unfortunately, the construction of the treatment plant is years away from completion and the installation of a city-wide tertiary pipe system is a decade away, and at best, a "pipe dream". 9-3

Our opposition also stems from the fact that much of the data and information used in the 2021 Hunter Subdivision Project Draft EIR has been taken from past St. Helena General Plans extending back to 1993. Climate change has become a major concern during the last several years and none of the data from the City's past General Plans have given global warming the serious attention it currently requires. 9-4

In October of 2020, St. Helena imposed a 43% reduction in water use for its residential customers. This required compliance with a 65 gallon/day/occupant water allotment that resulted in fines and penalties exceeding several million dollars. The ensuing year is currently predicted to be another lower-than-normal rainfall year which may result in St. Helena imposing even stricter water restrictions in the future. 9-5

In the last two years, St. Helena is the only city among five cities in the Napa Valley that has imposed mandatory water allotments on its residential and commercial water customers. American Canyon, Napa, Yountville, and Calistoga have all relied upon "voluntarily compliance" with each city's water restrictions. This is indicative that St. Helena currently has an inadequate water supply during one or more critically dry rainfall years. The Hunter Subdivision Project Draft EIR reads the subdivision will require 20-acre feet/year of municipal water to serve the proposed 87 new residences. The simple fact is, St. Helena currently does not have enough water to sustainably support its current citizens, let alone the number of new residents the project will add to our city. 9-6

The Hunter Subdivision Project Draft EIR reads there is a pre-existing inoperable agricultural water well near the Hunter property. The Draft also reads the project is reliant on the reconstruction of that "inoperable agricultural water well". There are sections in the Draft that make it unclear where the exact location of this inoperable water well is located? In one section, the Draft reads the existing well is "near" the Hunter Subdivision property. In another section, the Draft refers to the water well's location being adjacent to proposed Lot 19. The exact location of the existing agricultural well needs better disclosure because if the existing well does not exist on the Hunter Property, it would be in noncompliance with the city's municipal code to drill a new water well for residential or commercial purposes when the existing inoperable agricultural well was originally intended for agricultural use. (S.H. Municipal Code Section 13.16.080 B.)

9-7

Section 13.16.080(A) of the city's municipal code reads: "Wells shall not be drilled, nor the water produced therefrom used for residential, commercial or industrial land use activities except that replacement well(s) for residential, commercial and/or industrial land uses may be established for well(s) which existed and were in active use prior to the effective date of this chapter; *provided that no net increase in water production results from the replacement well(s)*". It should be noted St. Helena does not maintain historical records of water production from past water wells. Consequently, this provision of the city's municipal code cannot be complied with.

9-8

The Hunter Subdivision Project Draft EIR reads that it is reliant on sharing St. Helena's municipal Stone Bridge water wells. Currently, St. Helena is being sued by Water Audit California contending the city is over-drawing water from its wells and contributing to the seasonal loss of surface flows that adversely impact Napa River's endangered fisheries and aquatic life. The Stone Bridge water wells are located very close to the Napa River and the proposed redevelopment of the Hunter Subdivision's "inoperable" agricultural water well is also very close to the Napa River. If the inoperable well is reactivated, it could potentially add to the further loss of surface flows in the Napa River.

9-9

Additionally, the outcome of the Water Audit Lawsuit may very well limit or even terminate the amount of water St. Helena can pump from its Stone Bridge wells. The presumption of sharing St. Helena municipal water in the Draft Hunter EIR may not be possible after the conclusion of the lawsuit primarily because of the well's impact on California's Public Trust Doctrine and endangered species.

9-10

The Draft EIR for the Hunter Subdivision Project significantly underestimates the amount of municipal water the subdivision will require. This is because the writers of EIRs employ California's Green Building Guidelines (CGBG) to project interior water use. As an example, California's Green Building Guidelines were used to project St. Helena's recent Hunt Street Affordable Housing Project. The guidelines projected the five dwelling units with four occupants per dwelling would require 25 gallons per day per occupant. Currently, under Phase 2 water rationing, St. Helena is being challenged to achieve compliance with residential water customers limiting their water use to 65

9-11

gallons per day per occupant. What is more important, when St. Helena approves new construction using CGMG, there is no routine follow-up by the city to ensure the occupants remain in compliance with the amount of water initially approved for the project. In the long run, this can lead to a greater demand for the city's water than what was originally approved for the development. This issue is further exacerbated because St. Helena's policy treats individual water consumption as proprietary and thereby conceals the information from the public. 9-11 Cont. 9-12

To comply with St. Helena's water neutrality agreement, the developers of the Hunter Project propose to contribute $596,808 in in-lieu fees to retrofit 333 existing households with water saving toilets, shower heads and faucets. The developer claims this will make up for the additional municipal water the Hunter Project will require. The City of St. Helena has experienced several critically dry rainfall years during the last decade at a time when most households have already installed low flow appliances. This leads one to question: *How long it will take to retrofit 333 existing homes in St. Helena? Or, if there are even 333 existing households left in St. Helena needing retrofitting?* 9-13

The bottom line is "Water Neutrality" is an example of bogus terminology. It implies a development will not use more water than was projected in the proposed permit application. Without routine municipal enforcement of the water neutral ordinance's, the term falls significantly short of accomplishing its intended purpose. 9-14

Lastly, the Hunter Subdivision Project is proposed to take place in a flood zone where water damage is possible during a higher-than-normal rainfall year. If the project is ultimately approved by St. Helena's City Council, a condition of the approval should include complete indemnification for the City of St. Helena for any future losses that may occur to the Hunter Subdivision Project due to future flooding. 9-15

Respectfully submitted,

Thomas and Margot Belt
1520 Hillview Place,
St. Helena CA 94574

# Response to Letter 9
## Thomas and Margot Belt
## October 28, 2021

**9-1** The comment expresses opposition to the Project. The commenter asserts a lack of available water to serve the Project and existing water customers.

The commenter's opposition to the Project is noted and forwarded to the decision makers for their consideration. Regarding available water supplies to serve the Project, please see Master Response 2 that addresses the ability of the City to serve the Project as well as existing water customers.

**9-2** The comment is referencing the City's Capital Improvement Projects specific to water projects to be undertaken by the City and states that absent these improvements the City will not be able to supply the Project's water needs.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, the comment is noted and forwarded to the decision makers for their consideration. No further response is required; however, please see Master Response 2 that addresses City water infrastructure projects.

**9-3** The comment notes that the City has plans to build a new sewage treatment plant to provide tertiary treated water for landscaping, but completion of this project is "years away."

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, the comment is noted and forwarded to the decision makers for their consideration. No further response is required; however, please see Master Response 2 that addresses water supply.

**9-4** The comment clarifies opposition to the Project is due to reliance on information from past general plans and expressed concern that the Draft EIR does not address climate change.

The Draft EIR explains on page 2-12 in Chapter 2, Project Description that the Project site was designated for residential development starting in the 1975 General Plan, as Medium Density Residential (MDR) in the 1993 General Plan and is designated MDR in the City's recently adopted General Plan Update 2040. Because the Project's Tentative Subdivision Map application was first submitted in September 2010 and deemed complete by the City in 2011, this EIR is required to reference the 1993 General Plan as the applicable general plan for the purposes of evaluating the Proposed Project, since this version of the plan was in effect in 2011. This EIR also evaluates consistency with the City's current General Plan (adopted 2019) for informational and consistency purposes.

It is important to note that the EIR only references applicable goals and policies from the 1993 General Plan. The analysis of Project impacts is based on current technical reports, planning documents, and applicable federal, state and local requirements and laws aimed at addressing pre-and post-development impacts. In addition, changes to the existing environmental condition are also evaluated to determine potential Project impacts.

The effects of climate change are evaluated in Section 3.7, Greenhouse Gases and the analysis references current state and local plans and not the 1993 General Plan (which does not address climate change). As noted in the section, greenhouse gas (GHG) emissions are evaluated on a cumulative level because it is not possible to evaluate GHG impacts on an individual project basis. Global climate change is inherently a cumulative impact; a project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. The Draft EIR addresses the Project's contribution to GHGs which is a leading factor contributing to global climate change.

**9-5** The comment is referring to requirements the City imposed in 2020 to conserve water for residential uses and notes the City may impose even stricter water restrictions in the future.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 2 that addresses the City's ability to provide water to serve the Project as well as existing City residences.

**9-6** The comment notes that the City of St. Helena is the only jurisdiction that has imposed mandatory water conservation within Napa County and infers this is because the City does not have adequate water supplies during critically dry years. The comment goes on to state the City does not have adequate water to serve its current residents or the Project.

Please see Master Response 2 that addresses the ability of the City to provide water to serve the Project as well as existing City residences.

**9-7** The comment asks where the agricultural water well is located on the Project site, stating that if a well does not exist, a new well could not be drilled for residential or commercial use.

The location of the existing well is described on page 2-2 in Chapter 2, Project Description and also shown as Parcel B on the proposed Tentative Map. The location of the existing well is also noted on page 3.9-19 in Section 3.9, Hydrology and Water Quality and on page 3.13-1 in Section 3.13, Utilities and Service Systems. The Project does not include drilling a new well.

**9-8** The comment is citing sections of the City's Municipal Code that address requirements for drilling a new well in the City.

The Project is not proposing to drill a new well to serve the water needs of new residential units. The Project is proposing to use the existing agricultural well to irrigate the Project's public and private landscaping. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**9-9** The comment notes water to serve the Project would come, in part, from the City's Stone Bridge Complex groundwater wells which is currently being litigated by Water Audit California. The comment goes on to state if the existing onsite well is reactivated to serve the Project it could add to further loss of water in the Napa River.

The Project's onsite well would draw from the deeper volcanic aquifer, below the Napa Valley alluvium, which is not considered hydraulically connected to the Napa River (see Appendix L of the Draft EIR). Therefore, the proposed pumping from this well is not likely to have any direct effect on surface flow in Napa River. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**9-10** The comment ssuggests that the outcome of the Water Audit litigation could limit the amount of water the City receives from the Stonebridge Complex wells because of potential impacts from the well's (assuming the commenter is referring the Stonebridge Complex wells) on protected species.

The comment is speculating what the outcome of the Water Audit litigation could be on the City and the Project. The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**9-11** The comment expresses an opinion that the Project's water demand is significantly underestimated because the analysis relied on compliance with the State's Green Building Guidelines or CalGreen.

The City requires all new development projects to comply with its Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code that establishes the process to follow to quantify the amount of water a project would require and how this increase in demand would be offset. Because all new development in the state is required to comply with CalGreen water demand is reduced due to the installation of low flow fixtures and other water-conserving requirements. The City has worked with the Project applicant's engineers to ensure the Project's water demand is reasonable, accurate and supported by substantial evidence.

**9-12** The comment indicates that there is no follow up by City staff to ensure ongoing compliance with California's Green Building Guidelines to ensure occupants comply with the requirements.

The California Green Building Guidelines or CalGreen (Title 24) includes mandatory requirements for new residential construction including allowable flow rate for faucets and showerheads. The City requires all new development to install water meters, which allows the City to track water usage. The City will ensure compliance with the CalGreen Building Code through inspections that occur throughout Project construction.

**9-13** The comment addresses the requirement of the City's Water Neutral Policy (Chapter 13.12, Water Use and Efficiency of the Municipal Code) for an applicant to either pay a fee or retrofit existing residences to offset the increase in demand for water and asks how long it would take to retrofit homes or if there are even enough homes left that need water upgrades.

Please see Master Response 2, which describes options available to retrofit existing residences or facilities to achieve water neutrality.

**9-14** The comment questions if the City's Water Neutral Policy (Chapter 13.12, Water Use and Efficiency of the Municipal Code) requirements can work without the City's enforcement of the policy and goes on to say the "term falls significantly short of accomplishing its intended purpose."

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the commentor believes the Draft EIR is inadequate; therefore, no further response is required. However, please see Master Response 2 that addresses the City's ability to supply water and the requirements of the Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**9-15** The comment notes the Project is proposed within a flood zone where water damage is possible and requests that if the Project is approved the City require, as a condition of approval, that the City be indemnified for any future losses to the Project in the event of a flood event.

Flooding and flood hazards are addressed in detail in the Draft EIR in Section 3.9, Hydrology and Water Quality. As shown on Figure 3.9-2, the Project site is not within a Special Flood Hazard Areas but is mapped as being in an area with reduced flood risk due to a levee (FEMA 2012). By being within an area of reduced risk due to levee, the Project site is considered mapped within the 500-year flood zone (FEMA 2012).

Please see Master Response 3 that addresses concerns regarding the levee.

## Response to Letter 10
### Pierre Birebent
### November 13, 2021

**10-1** The comment states a general concern regarding potential development of the property.

The comment's concern is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**10-2** The commenter states that the Project will involve major construction and states general concerns related to traffic congestion and water shortage.

The comment raises a concern related to traffic congestion. Transportation impacts are analyzed in Section 3.14 of the Draft EIR. The operational aspects of the Proposed Project that contribute to delay and congestion on local roadways is no longer considered an environmental impact under CEQA. The Transportation section analyzes transportation impacts related to consistency with plans or policies addressing the City's circulation system, including transit, roadway, bicycle and pedestrian facilities, vehicle miles traveled (VMT), any potential hazardous design elements, and emergency access. Please see Master Response 1 that addresses emergency access.

The Draft EIR concludes that the Project would have less-than-significant impacts to these areas except for an increase in VMT. As described in Section 3.14, the Project would have a significant and unavoidable impact on VMT because the Project's VMT would be 15.2% higher than the Citywide VMT per capita rate and because there are no feasible mitigation measures available to substantially reduce or lessen the impact. As discussed in Chapter 2, Project Description, the Project is currently only requesting approval of a Tentative Subdivision Map at this time. Therefore, as noted on page 2-30, the applicant has not yet prepared a construction phasing plan. It is assumed once the applicant obtains all the remaining approvals site clearing, grading and installation of the backbone infrastructure would be the first phase. Absent specific construction phasing plans the Draft EIR analysis assumed buildout of the Project would occur over a 6-year period. However, buildout could take longer dependent on market conditions and a host of other factors.

The comment also raises concern related to water supply; please see Master Response 2 that addresses the City's ability to supply water.

**10-3** The comment expresses general opposition to the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**Subject:** [External] Hunter Project - Public Comment

To St Helena Planning Dept
Attn M De Rosa
Reference: The Hunter Project, St Helena CA

Please add our concerns to the file for the proposed Hunter Project which has come back to life after being soundly rejected 6 years ago. This project still has no grounds for approval. It is in an area of possible serious flooding, there is a dire lack of water in the town of St Helena, traffic issues will be exacerbated by dumping vehicles on Pope St to cross a totally inadequate bridge with a dangerous intersection at the Silverado Trail. The list of problems is lengthy and it doesn't take an expensive EIR consultancy fee to be realistic about the negative impacts to the community. Please reject the proposal when it comes before the Planning Commission. 11-1 11-2

Sincerely
Earl and Trudy Bouligny
497 Silverado Trail
St Helena CA 94574

Comment Letter 14

November 29, 2021

Maya DeRosa, Building and Planning Director
City of St. Helena
mderosa@cityofsthelena.org

Re: Hunter DEIR Public Comment

Ms. DeRosa:

Thank you for the opportunity to review and comment on the Draft EIR for the Hunter project. For the past 17 years, I have lived less than ¼-mile from the project site and have frequented the nature trail adjacent to the site at least weekly. Below please find my comments on four sections of the draft. 14-1

3.4-1 Wildlife Habitat

The EIR only provides commentary on "Special Status Wildlife," and only the white-tailed kite and pallid bat are considered potentially affected. I can't say that I've seen the kite or the pallid bat in that area, but over the past years I have seen bats and I have watched at least three different species of hawks hunt at the project site. Great blue heron and black-crowned night heron are commonly seen in the adjacent open space and trees. Perhaps none of these species have special status, but at what point is their occupation of the land worthy of consideration? At what point do we consider the cumulative effects of this and other projects that continue to take away large chunks of open space from birds and ground animals which depend on these foraging and hunting grounds? 14-2

3.4-3 Migratory Corridors

For the past 17 years, I have watched Canada Geese fly up and down the Valley, directly over my house, and routinely stopping to forage at the Project Site. This usage decreased when a large portion of the site was planted to grapes, but the geese continue to use the undeveloped area. Anyone who has lived on the floor of the Valley knows that it is a significant migratory corridor for Canada Geese. 14-3

The EIR states, "Lighting and increased usage of the site by humans may result in indirect effects to local wildlife using the riparian corridor for nursery sites or as a migratory corridor. Any site disturbance to these resources could result in a potentially significant impact." It goes on to state that the Project's Mitigation Measures such as reducing glare will mitigate impacts. This section of the EIR provides a myopic viewpoint by first stating that wildlife is not present and unaffected, then going on to state that mitigation measures will take care of everything. Reducing glare is meaningless when you have completely removed their habitat. What about the geese??? 14-4

The Project, with its measly one-half acre of remaining open space, will completely remove this historically valuable migratory stopping ground for Canada Geese. This significant impact is omitted in the Draft EIR. 14-5

The EIR authors will dismiss these wildlife and migratory corridor comments. They will tell you that all the impacts have been mitigated, that the Canada Geese and the hawks and the bats and the fox and skunks and coyotes and countless other species who have historically used the Project site have other places to forage and nest and hunt. They will say these species aren't "special." They will say there is no significant impact. But at the end of the day, what was once open space used by all these animals will be gone forever and replaced with homes and roads and cars and noise. The cumulative effect of project after project in this Valley will add up, the habitat will be gone, and with it the wildlife. 14-6

3.13 Infrastructure – Water

The analysis of water impacts is quite long and difficult to follow. The City should consider how a revised EIR and future EIR's could be required to provide impacts and conclusions which are easier to understand. Regardless, I have several issues with the EIR water analysis and its conclusions: 14-7

1. Table 3.13-8 shows projected supply and demand data from the 2010 Water Supply Plan, which concluded that "water supplies under both the Likely Buildout Scenario and Full Buildout Scenario would not be sufficient to meet demands during all scenarios." The 2010 Plan went on to conclude that "the long-term safe yield of the City's water supply is 1,950 acre-feet per year." The deficit between this safe yield and the projected demands on Table 3.13-8 was presumed to be made up by approximately 500 acre-feet of future conservation efforts. It claims that these efforts have been successful since usage has averaged 1,637 acre-feet from 2013-2020. Having provided these data points, the EIR then concludes, "Considering the current downward water usage trend due to water conservation measures and that future demands are required to offset their projected use, future water demand is not expected to exceed the existing policy limit of 1,950 acre-feet annual use set by the Safe Yield Committee..." 14-8

   I have two issues with this analysis. First, on the supply side, the EIR gives credence to the 1,950 acre-feet supply as though it is a sustainable value for the foreseeable future. This value was established in a 2010 study. Since then, 11 years later, our Valley has and continues to change significantly. It is hotter and it is drier. This change has been accelerating in the past five years, and yet the EIR is basing the City's sustainable water supply on 2010 data. The EIR should show a combination of historical rainfall through 2021 along with some projections of the accelerating effects of climate change to at least offer a scientifically based forecast of a truly sustainable water supply value for the next 30 years. It is likely that climate change will drive us towards a supply value more like those shown in Table 3.13-8 for "dry year" or "critical dry year." ***The supply values for these categories are 12% - 34% below the 1,950 acre-feet value which the EIR assumes is sustainable.*** In citing the 2010 Safe Yield value of 1,950 acre-feet, the EIR has made a wishful and risky assumption of the stability of the City's water supply which benefits the Applicant. 14-9

   Secondly, on the demand side, I have issue with the overly simplistic and optimistic conclusion that future water demand will not exceed the City's supply. As previously quoted, the EIR claims that the City is on a "current downward usage trend" based on data from 2013-2020 in Table 3.13-1. This is not true! The EIR takes as its starting point usage from 2013 (1,882 acre-feet), compares it to 2020 usage (1,629 acre-feet) and concludes a downward trend. In fact, if one 14-10

uses 2015 as the starting point, there is clearly a trend of *increasing* usage over the past six years, and *during a time in which the City has made a focused conservation effort*.

14-10 Cont.

Further issue on the demand side is the lack of credible evidence or any attempt to validate the notion that water offsets or in-lieu of payments will keep the growing demand (see previous paragraph) below the likely decreasing supply limit of 1,950 acre-feet. There is not an endless supply of old toilets in town to replace with new ones and there are limitations on what the City can do with in-lieu fees to curb demand. I find the conclusion that "future water demand is not expected to exceed the existing policy limit" to be another leap of faith to the benefit of the Applicant, as it poses an unrealistic baseline assumption that we need not concern ourselves with the actual water usage of the project (or other future projects for that matter).

14-11

2. On page 3.13-31, the EIR attempts to answer question 3.13-2 "Would sufficient water supplies be available to serve the Proposed Project and reasonably foreseeable future development during normal, dry, and multiple dry years?"

The EIR again takes shelter in the outdated 2010 Safe Yield value of 1,950 acre-feet, but fails to answer the question. As I noted earlier, we have good reason to question the integrity of the 1,950 value, but regardless, the question posed here asks about dry and multiple dry years. Again referring to Table 3.13-8, the City's supply for dry and critically dry years are 12% - 34% below the 1,950 acre-feet value. Given the trend of the past five years, how can this EIR ignore climate change and the increasing likelihood that 1,950 is not a sustainable value and that City supply could be significantly less for any given year or multiple years? Do not ignore the drought! Do not ignore the last five years!

14-12

Furthermore, the EIR again takes shelter in the notion that the City's water-neutrality policy will offset future use. So, what does water-neutrality mean for this project? Let's look at the Water Neutral Report in Appendix J. The proposed mitigation measures identified in the report include:

> "1. Assist the City in fixing the leaking transmission line between the City and Rutherford. It's our understanding there is a substantial amount of water lost as part of the old pipeline.
> 2. Place/replace water meters that are not in place or functioning improperly.
> 3. Paying the in-lieu fee to be used by the City for any of the options identified in the attached Report or otherwise selected by the City."

14-13

Fixing a transmission line leak is not offsetting future water demand. Fixing a leak simply maintains the supply—*it does not reduce usage* by this Project or anywhere else in town. Replacing water meters could influence use but it does not in and of itself reduce demand. Paying fees could reduce demand, but only if the City uses those fees to reduce demand. In the end, Appendix J proposes that the Applicant pay an in-lieu of fee of $596k—a nice sum, but when the increased demand of this Project's 76+ units hits the water system, what will have been done by the Applicant or the City to truly offset this demand? It looks like a lot of math without a true impact.

*Developers are buying entitlement then burdening the system with increased demand. This lack of true offset is perhaps evidenced by the increase in usage from 2016 (1,465 acre-feet) to 2020*

14-14

***(1,629 acre-feet), an increase of over 11%.*** Usage should have been decreasing, but it has not because the offset program does not work, it just provides developers with another way to buy entitlement. 14-14 Cont.

Lastly, the EIR makes no attempt to address the question about "reasonably foreseeable future development." Given the conflicts between general plans, growth ordinances, and SB330, it is understandably difficult to forecast the actual number of housing units in the foreseeable future, but that is not a good reason to make overly simplistic assumptions which favor the Applicant. Development pressure is ever-increasing in St. Helena and one-by-one, the project EIRs make claims of "less than significant impact" while cumulatively making a very significant impact. The City must provide guidance to the EIR process which makes science-based forecasts of "reasonably foreseeable future development" so that assessments such as this EIR can properly consider cumulative impacts. Question 3.13-2 was not fully answered. 14-15

In summary, the entire water supply, demand, and impact analysis is thick with math but thin with science. It relies on dated values such as the 2010 Safe Yield without due consideration of climate change, and it assumes water offsets that are not defined and likely will not be realized.

For the past 10 years, the City's residents have dealt with the harsh reality of drought. Whereas in generations past there was always hope for droughts to end, climate change has made drought a likely standard rather than exception. It is incumbent upon the City to take a conservative approach to the supply data being used by developers and by EIR authors; otherwise, the cumulative effect of projects approved on old data will result in a water deficit we can't overcome. 14-16

The City must re-evaluate the Safe Yield based on current data and climate change forecasts. The City must have more certainty regarding its water supply. The City must get past its current water emergency restrictions. Then and only then should the City even consider a project of this size. To approve this project under the current conditions is risky and cavalier. The City's residents have worked hard to endure the effects of the drought. We shouldn't have to shoulder the risk this Project poses to our collective future. 14-17

3.14-2 CEQA 15064.3(b) VMT Criteria

Although the EIR seeks multiple ways to mitigate VMT for the Project, it ultimately concludes that "Because there are no feasible mitigation measures available to substantially reduce or lessen the impact of the Proposed Project to less than significant, the impact is a **significant and unavoidable impact**." Next to water, our City's primary struggle is with increasing traffic and congestion. The cumulative effect of unchecked regional development has created horrendous traffic challenges in St. Helena which increasingly detract from quality of life for residents and quality of experience for tourists. The inability of the Project to mitigate significant impact of traffic is important and another reason to delay consideration of a project this large until the City can conservatively absorb the impact. 14-18

Concluding Comments

Several years ago, the City decided to protect Vineyard Valley from future floods. The City had multiple engineering options to accomplish that objective. Ultimately, the City—on behalf of its taxpayers— 14-19

gifted Dennis Hunter with a levee that turned his floodplain into a valuable piece of developable land. The City—on behalf of its taxpayers—then wrote Dennis Hunter a big check to pay for a thin and otherwise useless strip of land to build a portion of the levee which in turn made his land so valuable. The City—on behalf of its taxpayers—then gave him all the dirt from the flood project to build up his site. If this project is approved, it will tax our water supply and traffic, and guess who will pay for that? The City's residents will pay for it in further water restrictions and increased traffic. Dennis Hunter will have paid some modest impact fees which will not come close to addressing the actual impacts and, once again, the City's taxpayers will be left to pick up the tab for this and all the other cumulative impacts of projects whose EIRs espoused similar "less than significant" impacts or showed lots of math to rationalize how our over-burdened infrastructure could—remarkably—handle yet another project!

14-19 Cont.

*The City is not ready for this project.* At the very least, it needs to scientifically assess climate change impact on future water supply. It needs to accurately assess future development impact, both residential and commercial, on water and traffic. It needs to assess water demand without making unrealistic assumptions about conservation. It needs to reconfigure its water neutrality requirements such that future projects must truly offset demand, not simply buy their way out.

14-20

The City cannot afford to continue a pattern of approval based on EIR's which make rosy assumptions based on old or incomplete data. It must start making hard decisions which favor its citizens and not out-of-town developers.

14-21

Thank you for considering my comments.

## Response to Letter 14
### Ethan Brown
### November 29, 2021

**14-1** The commenter notes that they live near the Project site and frequently uses the trail adjacent to the site.

This comment is an introduction to comments that follow. The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**14-2** The comment notes that the Draft EIR focuses on impacts to special-status wildlife and describes their observations of common wildlife species using the Project site, notably bats, hawks, great blue heron, and black-crowned night heron. The comment requests analysis of cumulative effects of development on birds and other animals that use the Project site and vicinity.

The Draft EIR analyzes impacts to biological resources using the thresholds of significance listed on page 3.4-42. These thresholds, which are taken from the State CEQA Guidelines Appendix G, do focus the analysis on special-status species due to their sensitivity to impacts. However, the thresholds do include interference with movement of native resident wildlife species and migratory corridors, regardless of the species status. The Draft EIR identifies a significant impact to migratory corridors and potential nursery sites within the adjacent riparian corridor and provides mitigation (BIO-5 and AES-1) to reduce the impact to less than significant. The thresholds also consider any conflicts with any local policies; however, there are no local policies that provide protections for non-special-status wildlife.

The Draft EIR analyzes impacts to bat and bird species (DEIR pp. 3.4-46 through 3.4-47) and includes mitigation measures to reduce potential impacts to bat species (BIO-1) and bird species (BIO-2). These analyses and mitigation measures apply to both special-status and non-special-status species. The Draft EIR also analyzes cumulative impacts of the project (DEIR p. 3.4-51), finding that the Project's contribution to cumulative impacts would be less than significant due to the relatively low habitat value of the Project site and the availability of similar or better habitat in the vicinity.

**14-3** The comment describes observations of Canada geese foraging on the Project site within the remnant grassland. The comment asserts that the Napa Valley is a significant migratory corridor for Canada geese.

Although Canada geese may periodically forage on the Project site, it is unlikely that the approximately 9.7 acres of mowed annual grassland without a nearby open water area represents critical foraging habitat for this highly adaptable species. This species is not a federal or state protected species but they are protected under the Migratory Bird Treaty Act, as are all migratory birds. Canadian geese are regionally abundant and have become resident in many areas (Mowbray et al. 2020)[8].

**14-4** The comment asserts that the Project would remove habitat and that reducing glare would only be valid mitigation measure for areas that retain habitat value.

The comment is correct and mitigation measure BIO-3 requires wetland permits (e.g., 404 Nationwide Permit, 401 Water Quality Certification, and 1602 Streambed Alteration Agreement, respectively) be obtained prior to any grading work to ensure no net loss of wetlands or other protected waters. This mitigation focuses on reducing operational indirect impacts to the riparian corridor such that it will continue to provide habitat after Project development. Refer to Response to Comment 14-3 regarding impacts to Canada geese.

**14-5** The comment notes again that the Project would adversely affect Canada geese that may stopover to forage on the Project site.

Please refer to Response to Comment 14-3.

**14-6** The comment summarizes the points raised in Comments 14-2 through 14-4.

Please refer to Responses to Comments 14-2 through 14-4.

**14-7** The comment states the analysis of water impacts is long and difficult to follow and requests the City consider how to make future EIRs easier to understand.

The commenter's request is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**14-8** The comment refers to data presented in Table 3.13-8 of Section 3.13, Utilities and Service Systems, of the Draft EIR that references the City's water supply and demand usage.

The comment provides an introduction to the following comments. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required. Please refer to Response to Comment 14-9 that addresses water supply and demand.

[8] Mowbray, T. B., C. R. Ely, J. S. Sedinger, and R. E. Trost (2020). *Canada Goose* (Branta canadensis), version 1.0. In Birds of the World (P. G. Rodewald, Editor). Cornell Lab of Ornithology, Ithaca, NY, USA. *https://doi.org/10.2173/bow.cangoo.01*

**14-9** The comment suggests that the City's 2010 Water Supply Plan is inadequate and that the referenced long-term safe yield of 1,950 acre-feet does not consider climate changes since that plan was completed.

The City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code requires that "new development" shall be contingent upon the ability of the City to provide water without exceeding safe yield. In December 2010, the City Council appointed the Safe Yield Committee to determine the annual safe yield of the City's potable water system. The ultimate goal of the Committee was to determine whether, at the present time, potable water usage was below, above, or equal to the safe yield of the potable water supply system. The Safe Yield Committee analyzed the reliability of the City's water supplies in a 2010 study and determined that providing a total supply of up to 1,950 acre-feet was sustainable and has been adopted by the City as a policy limit. While climate change can create drier years in which precipitation is below annual averages, it can also result in very wet years.

The purpose of establishing a safe yield considers that precipitation can and likely will vary considerable from year to year and periods of extended droughts will occur. Note that St. Helena Municipal Code (SHMC) Title 13 - Public Services, Chapter 13.04 Water Service System, Article 2 *Water Shortage Emergencies, Drought and Water Conservation* regulate the establishment of water emergency phases, water conservation, and regulations that can adapt to changing conditions and enact emergency requirements for users as appropriate. However, the main purpose for providing this information (i.e., the safe yield) is provided as part of establishing existing conditions and background for the City water supplies and policy limits adopted by the City. The Draft EIR analyzes the potential effects of the Proposed Project including its specific water demand and whether there would be a significant impact due to the effects of the Project. This analysis is included beginning on page 3.13-31 as well as on page 3.9-40 and compares the proposed demand by the Project against the past actual demand numbers for the City compared to the adopted policy limits. Please see also Master Response 2 that addresses water issues.

**14-10** The comment challenges the conclusion made in the Draft EIR that water demands for the City are on a downward trend.

The commenter suggests that viewing data from between 2015 and 2020 instead of between 2013 and 2020, as presented in Table 3.13-1 in Section 3.13, Utilities and Service Systems, of the Draft EIR would change the conclusion of the recent trend. As shown in Table 3.13-1 of the Draft EIR, the City's water deliveries have varied from year to year but overall have decreased from 1,882 acre-feet in 2013 to 1,629 acre-feet in 2020. Looking at the longer trend from 2013 to 2020, instead of just from 2016 to 2020, reflects a downward trend in water deliveries. Please see also Master Response 2 that addresses water issues.

**14-11** The comment suggests that there is insufficient evidence to support the conclusion that water offsets or in-lieu payments would help limit water demands below 1,950 acre-feet.

The analysis on page 3.13-24 of the Draft EIR shows how the Proposed Project's indoor water demands of 19.88 acre-feet would not combine with the highest City demand over the last 8 years (1,882 acre-feet) to be above the policy limit of 1,950 acre-feet. The 1,950 acre-feet figure represents what the City considers to be the safe yield for the water supply system and is not a "supply limit". Note that St. Helena Municipal Code Title 13 - Public Services, Chapter 13.04 Water Service System, Article 2 Water Shortage Emergencies, Drought and Water Conservation regulate the establishment of water emergency phases, water conservation, and regulations that can adapt to changing conditions and enact emergency requirements for users as appropriate.

**14-12** The comment concerns the validity of the City's use of a safe yield of 1,950 acre-feet in the face of climate change.

As discussed in Response to Comment 14-9, the City is currently using the safe yield of 1,950 acre-feet developed by the Safe Yield Committee as a guideline policy but can also impose emergency measures (St. Helena Municipal Code Title 13, Chapter 13.04, Article 2) that can be used to emplace water conservation and regulations as necessary. The Project is also required to adhere to the Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code. As discussed in more detail on page 3.13-31 of the Draft EIR, a Water Neutral Report (Appendix J) was prepared for the Proposed Project (required by the City) to demonstrate compliance with the City's Water Neutral Policy by providing in-lieu fees to fund conservations measures that offset the water demands of the Project. Therefore, the City's safe yield value of 1,950 acre-feet is not the sole basis of the analysis as to whether the Proposed Project would have a significant effect on water supply during dry and critically dry years.

Please see also Master Response 2 that addresses water issues.

**14-13** The comment takes issue with the effectiveness of the City's Water Neutral Policy and how it is used in the analysis of the Project's water demand.

Adherence to the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code to fund such measures as fixing an existing leaking water conveyance pipe does offset demand by increasing water supplies compared to the existing conditions of water losses due to the leak. As a result, compliance with the Water Neutral Policy offsets new water demand with measures that reduce demand elsewhere or otherwise increase water supplies. Therefore, the City's Water Neutral Policy and Municipal Code requirements is an appropriate and effective measure to include in the analysis of the Draft EIR. Please see also Master Response 2 that addresses water issues.

**14-14** The comment suggests that the offset program [Water Neutral Policy] does not work as evidenced by an increase in the water demands in 2016 (1,465 acre-feet) as compared to 2020 (1,629 acre-feet).

As shown in Table 3.13-1 of the Draft EIR, the City's water deliveries have varied from year to year but overall have decreased from 1,882 acre-feet in 2013 to 1,629 acre-feet in 2020. Looking at the longer trend from 2013 to 2020, instead of just from 2016 to 2020, indicates a downward trend in water deliveries. See also Master Response 2 that addresses concerns associated with available water supplies.

**14-15** The comment suggests that "reasonably foreseeable future development" was not adequately considered in the analysis of Impact 3.13-2.

The analysis of Impact 3.13-2 beginning on page 3.13-31 of the Draft EIR, includes discussion of the long-term safe yield that was adopted by the City in 2011 that would apply to all future development. The analysis also discusses how future development is required to adhere to the state's CalGreen requirements, as well as the City's MWELO irrigation requirements for landscaping. In addition, all reasonably foreseeable future development would be required to adhere to the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code and any emergency water conservation phases that may be enacted. In particular, the Water Neutral Policy requires that the Project, as well as reasonably foreseeable future development, must demonstrate a quantitative analysis of the Project's water demand. For offsite improvements, the required number of retrofits have to be completed prior to the issuance of a certificate of occupancy for the new development. Inclusion of these regulatory requirements demonstrates how the Project, along with reasonably foreseeable future development would not significantly impact water supplies during normal, dry, and multiple dry years.

**14-16** The comment claims that the water supply and demand analysis is insufficient, does not consider climate change, and that the water offsets required for the Project to be water neutral will not be realized.

As referenced in Response to Comment 14-9, the City adopted the safe yield as policy but also included conservation measures that can be employed during drought periods. The safe yield considers that multiple dry years are likely due to climate change and the additional measures as well as the Water Neutral Policy and Municipal Code requirements can be effective tools to adapt to variances in precipitation that is expected under normal conditions as well as what can be anticipated with climate change. Data documenting the City's water deliveries since 2013, not long after adopting the Safe Yield Committee's report as policy, indicates that a downward trend has occurred despite covering some very dry years during that timeframe. See also Master Response 2 that addresses water supply.

**14-17** The comment recommends that the City re-evaluate the safe yield policy and get past the current emergency restrictions prior to approval of the Project.

The comment does not directly address the adequacy of the Draft EIR, but rather makes suggestions for the City related to its policies regarding water supply management. As detailed in the Draft EIR on page 3.13-3 in Table 3.13-1, the City's water deliveries have been on a downward trend from 2013-2020. Through this period, the water deliveries have been below the safe yield and as noted on page 3.19-40 of the Draft EIR, the groundwater Subbasin, one of the sources of water supply, was recently found to be exhibit stable groundwater levels. The emergency restrictions have been enacted in order to continue effectively manage the water supply system during periods of low rainfall and combined with the Water Neutral Policy and Municipal Code requirements ensures that water supplies will meet demand.

**14-18** The comment addresses cumulative traffic conditions in the City and notes that because the Project would result in a significant and unavoidable impact related to Vehicle Miles Traveled, the City should delay consideration of the Project until the underlying traffic and infrastructure issues are addressed.

The commenter's opinion that approval of the Project should be delayed is noted and forwarded to the decision makers for their review.

**14-19** The comment provides the commenter's perspective on the City's decision to construct a levee and floodwall along a portion of the Napa River.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration.

Please see Master Response 3 that addresses the history of the levee and floodwall.

**14-20** The comment states that a scientific analysis of the effects of climate change on water supply need to be addressed along with an assessment of future development on water supply and traffic and the City's Water Neutral Policy needs to ensure projects offset their water demand and not just pay a fee.

The comment does not identify any specific issues with the accuracy or adequacy of information provided in the Draft EIR. Regarding climate change, the Draft EIR evaluates the Project's increase in greenhouse gas emissions (GHG) which contribute to global climate change in Section 3.7, Greenhouse Gases. The analysis reflects what the California Environmental Quality Act or CEQA requires be evaluated which includes quantifying the Project's GHG emissions to determine if the Project exceeds adopted thresholds. The Project's increase in demand for water is evaluated in Section 3.13, Utilities and Service Systems and traffic is evaluated in Section 3.14, Transportation and Circulation. The commenter's opinion that the City's Water Neutral Policy including Chapter 13.12, Water Use and Efficiency of the

Municipal Code needs to be reconfigured is noted and forwarded to the decision makers for their consideration.

**14-21** The comment expresses an opinion that EIRs should not rely on old or incomplete data and residents of the City versus out of town developers need to be considered when making land use decisions.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**To:** Maya DeRosa <MDeRosa@cityofsthelena.org>
**Subject:** [External] I AM OPPOSED TO THE HUNTER PROJECT

Hi Maya DeRosa,

I am writing to let you know that I am very opposed to the Hunter Subdivision Project.

My concerns are:

1. Availability of water
2. The plan calls for sharing water with Vineyard Valley --- I AM VERY OPPOSED TO THIS! — 15-1
3. Impact on traffic. Our city has become unbearable when it comes to traffic and now you want to build 51 homes in a small, small area. — 15-2
4. You will destroy the beauty of the walking trail that so many of us enjoy. Saint Helena does next to nothing for it's residents in terms of walking paths and accessibility to nature. This is probably our only walking path --- and you want to take that away. — 15-3
5. I have yet to see an environmental impact study. — 15-4

Thank you,

Andree Bryan
Resident of SH and Vineyard Valley

Andree Bryan
Board of Director
St. Helena Public Library – Friends and Family

# Response to Letter 15
**Andree Bryan**
**October 30, 2021**

**15-1** The comment states a concern related to water availability. The comment also states opposition against the Project's proposed water sharing component with Vineyard Valley.

Please see Master Response 2 that addresses the City's ability to supply water and the requirements of the Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**15-2** The comment expresses concern over the Project's impact on traffic.

Please see Response to Comment 10-2 that addresses traffic concerns.

**15-3** The comment expresses concern regarding the Project's impact on the adjacent walking trail.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. Please see Response to Comment 106-3. In addition, please see Chapter 3, Changes to the Draft EIR, for a new figure that shows the adjacent trails.

**15-4** The comment states that the commenter has not obtained access to the Project's "environmental impact study."

The City sent notices to all residences within 300 feet of the Project site that an EIR was available for review, per City requirements and will also send notices for future public hearings.

The City also sent a Notice of Availability on September 23, 2021, to public agencies and interested parties that the City had released the Draft EIR for review and comment. Based on requests from the public, the City extended the public comment period from the required 45-days to 67-days to provide more time for review and comment. During this review period, the Draft EIR for the Project was available for review at (1) the St. Helena Public Library, 1492 Library Lane, St. Helena, CA 94574; (2) St. Helena Planning Department, 1572 Railroad Avenue, St. Helena, CA 94574; and (3) on the City's website at https://www.cityofsthelena.org/planning/page/ceqa-document-center.

Subject: [External] Hunter project

The proposed Hunter project will have 87 water consuming households. The project's consultants claim the project will be water neutral if 333 existing homes are retrofitted with new toilets, shower heads and faucets. The only way to know for sure is to install in all 333 homes and monitor the usage for at least a year's climate cycle. Under the extreme drought we going through, it's in the best interest of the people who currently live in Saint Helena that their water needs are met. We need to know for sure if the Hunter project is water neutral!!

The levee that's supposed to protect the proposed development it is said to be sufficient to withstand the 200 year flood. In the DEIR it says that if the levee fails, the houses behind would only flood the first floor's by 5 feet. People could escape to the second floor. (Unless they have a disability and couldn't make it)? If the levee fails is the city of Saint Helena responsible? The cost of a failure could cost millions!! If the city is responsible for cost of damage shouldn't all current home owners be notified of potential liabilities? I have been told the City of Saint Helena is responsible for the maintenance of the levee does anyone working for the city have experience or training on levee maintenance? 17-1

## Bernerd Buckley
## October 26, 2021

**17-1** The comment raises concerns related to potential levee failure. Specifically, the commenter is concerned with emergency evacuation in the event of levee failure for those with a disability and the cost of levee failure. The comment also states that future homeowners should be notified of potential liabilities related to the levee. is addressing concerns regarding the levee and raises FEMA certification of the levee.

Please see Master Response 3 that addresses concerns associated with the levee and Master Response 1 that addresses emergency evacuation.

Subject: [External] Hunter project

Almost all affordable housing is located east of Main st. About 40% of that housing is located on Hunt st. to Starr ave. The Monte vista apartments and Hunts Grove being the largest. There also senior affordable housing at the Woodbridge property.
The families who live in these homes are forced to park blocks from their homes because the properties were built with inadequate parking. There will be 50 cars parked on the street, from the path Hunt st to Adams st, on Grove ct, Monte Vista, Hunt st, Starr ave and Meadowcreek Cir. The additional proposed 25 affordable homes will between the Monte Vista apartments and Hunts Grove. This will increase the number of affordable homes in that area to over 40%. and additional parking problems. This Hunter project has a real negative effect on these people of limited resources in the area. The Hunter development only benefit the developers not the current residents of Saint Helena.

Subject: [External] Hunter Subdivision

Maya DeRosa
St. Helena City Planning Department

We are writing you to express our opposition to the Hunter Subdivision Project. We are not opposed to more housing to relieve the general housing shortage in St. Helena, but if this project goes forward we ask why such an imbalance of "affordable" living is being bunched around the east side of our town? I'm sure the west side offers available space. In fact, I'm sure future residents who will live in these homes would appreciate living amongst general neighborhoods as opposed to being clustered and corralled into one confined "project" area in a flood zone. 22-1

I'd like to express our thoughts on a few key issues:

We are on the tipping point on water resources. If one adds up the water needed to be allocated to this project, I ask from where is this resource is going to come from? 22-2

We all know traffic is at a breaking point, just look at what the temporary closure of Silverado Trail did to the already crowded streets of St. Helena. Now, add in the additional cars which will compete for road space and the already inadequate parking situation. 22-3

What's more, there is a popular walking path that looks like it will be terminated without an alternate path. 22-4

Another consideration is the likelihood of another 100 year flood. Who is going to be held liable for damage and injury? 22-5

We fear that if the Hunter Subdivision is approved the Adam Street property will have developers lining up once again to make their proposals. We are concerned about the future of St. Helena if this project is approved. 22-6

We urge you to consider all these issues and vote down the proposal for this new housing project. 22-7

Respectfully,

Jeffrey Burton and Maureen Moulton

# Response to Letter 22
**Jeff Burton**
**November 8, 2021**

**22-1** The comment expresses opposition to the Project due to their opinion that affordable housing should not be confined to the east side of the City and in a flood zone.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

As noted elsewhere in these Responses, the Project site is not located in a flood zone which would preclude residential development.

**22-2** The comment states that the City is limited on water resources and inquires about the source of water to serve the Project.

Please see Master Response 2 that addresses the issue of water supply.

**22-3** The comment states that the Project would result in additional traffic congestion and that the parking situation in the City is inadequate.

The adequacy of parking supply and traffic congestion is not an environmental impact under CEQA; therefore, the commenter's concern is noted for the decision makers and no further response is required. However, at the time building permits are requested, as required by the Municipal Code, the City will confirm the Project complies with Section 17.124.030.A.1 of the City's Zoning Code that addresses residential parking requirements.

**22-4** The comment states that a popular walking path would be terminated by the Project without establishment of an alternate path.

The Project does not propose removing the existing trail or levee maintenance road, as explained in Section 3.12, Public Services and Recreation on page 3.12-17. The comment does not identify specific areas where the commentor believes the Draft EIR is inadequate; therefore, no further response is required. Please see Chapter 3, Changes to the Draft EIR for a copy of a trails map that shows the existing trails near the Project site.

**22-5** The comment asks who would be held liable for damage and injury in the event of a 100- year flood.

Determining legal liability for a potential future event is not within the scope of CEQA review; therefore, no further response is necessary

**22-6** The comment states that approval of the Project would attract other proposals to develop the Adams Street property and expresses concern about the future of the City.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**22-7** The comment urges the City to consider the issues raised in the comment letter and to reject the Project.

The comment's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

Dear Sir/Madam,

I write to register my grave concerns with and opposition to the proposed Hunter Project. 23-1

While there are many reasons to oppose the project, my primary concern is the project's impact on our extremely limited water supply. Their proposed mitigation measures seem laughably inadequate, especially given the project's long term impact on the city's water consumption. 23-2

Our need for affordable housing can be better met by smaller, specifically targeted projects for seniors and lower income families. 23-3

Sincerely,

Lynda M. Burton

**Subject:** [External] Hunter Project

Good day!

We, too, are concerned about the proposed project. While we, more than many, appreciate the need for additional and affordable housing, we do not believe this project is the way. 27-1

Water is paramount, we are already short of the precious material, the addition of the number of proposed homes will severely be negative. The sewage addition, will also be a great negative to the Vineyard Valley neighborhood, where we live, which is already at the limit. The additional homes, will be a strain (at least) to the current levy (if altered) on the flood zone which this property has been protected by it and the "seawall" installed in the last few years. As well, the levy is an additional "escape route" for our neighbors, all of whom are over 55, in the event of fires, floods, etc. 27-2 27-3 27-4

Please add our names to the list of folks objecting to this project. 27-5

Thank you, in advance.

INTENTIONALLY LEFT BLANK

# Response to Letter 27
## Bob Childs and Nancy Carlson
## November 6, 2021

**27-1** This comment expresses general opposition over the Project, while acknowledging the need for additional affordable housing.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**27-2** The comment states a concern over Project's water usage and impact on water availability.

The commenter's concern is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, please see Master Response 2 that addresses the City's ability to supply water and the requirements of the Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**27-3** The comment expresses concern over the Project's impact on the City's sewer capacity.

The commenter's concern is noted and forwarded to the decision makers for their consideration. As described in Section 3.13 of the Draft EIR, the Proposed Project would not exceed the City's current permitted wastewater treatment plant capacity; also, pursuant to Municipal Code Section 3.32.020, the City collects development impact fees on new development to pay for public improvements related to sewer projects. The Project applicant would be required to pay these fees, which would help fund upgrades and improvement to the City's sewer system.

See also Master Response 4 that addresses concerns regarding the City's sewer system.

**27-4** The comment expresses a concern regarding the current condition of the levee and the impact the Project would have on it related to the floodplain and emergency evacuation.

Please see Master Response 3 that addresses City liability in the event of a flood and concerns related to the levee and Master Response 1 for further information on emergency evacuation.

**27-5** The comment requests that the commenter be added to the list of public members opposed to the Project.

The commenter has been added to a list of interested public members to receive notices regarding the Project; however, this list does not distinguish those who support or oppose the Project.

**Subject:** Re: [External] Proposed Hunter Street Subdivision

To Whom it may concern:
I am a resident of Vineyard Valley and hereby join with over 200 park residents in registering my opposition to the above-referenced subdivision. 28-1
As a former attorney and builder/developer with over 35 years experience with large-scale residential developments, I believe the proposed project is ill-advised and fraught with a host of potential developmental and legal problems. I am particularly concerned that the city of St Helena would even consider such a large-scale development in light of the persistent drought and the resultant water restrictions that have already been imposed on the residents of St Helena in response to the water shortage. This project, should it be approved, will only exacerbate the existing water restrictions/ shortages and concomitant penalty provisions that have already been imposed on drought-weary city residents. Furthermore, should the subdivision be approved, the risk of building on a flood plain will subject the city to numerous and costly lawsuits, which will inevitably ensue. Given the well- publicized financial difficulties the city has experienced in recent years, the idea that the city would even consider approving this project strikes me as being extremely ill-advised. Additionally, I would expect that should the project be approved, it will expose city officials to legal challenges for claims of misfeasance and malfeasance, which will undoubtedly be costly to defend. 28-2 28-3 28-4
I have purposely omitted any references to the many other allegations and concerns that have already been articulated by the hundreds of St Helenians who have already written in opposition to this project.
I pray that the city council will reject the proposed Hunter subdivision.
Sincerely,
**Robb A. Cohen**

Members of Planning Commission and City Council

Re: Hunter Project

I am enclosing one of the best articles written on the St Helena dilemma of the Hunter Project. I could wax eloquently on all the issues with this project, but a review of the article written in 2016 by Nicholas Pinter, Professor of Watershed Sciences at UC Davis really encapsulates the flood and water issues with this project. Nothing has changed since 2016. Yesterday's rains should highlight these issues. The river rose from a dry creek bed to 14 ft in a matter of hours. 30-1

We talk of about 100 year flood plains without really understanding the mathematics and probability of this number. You can at least understand that this does not mean we cannot have a catastrophic flood tomorrow. Houston is in a 500 year flood plain and they have had 3 catastrophic floods 3 years in a row.

We also have the issues of not putting another bridge across the Napa River, the high traffic problem and the proposal for water mitigation by providing better flush toilets which is seemingly idiotic. 30-2

The Hunter project is a no go for the citizens of the St Helena. They made that perfectly clear 6 years ago. The council and commission must: 30-3

1. Review this article and articulate why these issues are still not real
2. Get a written letter from FEMA that they would cover another flood on this land
3. Guarantee that the City would not be liable for further flood issues if housing is built here
4. Have a legitimate proposal for traffic control without building another bridge 30-4
5. Come up with a better water mitigation plan. We have been on Stage 2 water conservation. We cannot ask the citizens to save more to build this ill conceived project. 30-5

The Hunter project is too big a risk to leave it to a brief meeting and the votes of a few commissioners and the city council. This is a huge risk to the city which needs greater in person debate. Zoom doesn't do it. 30-6

## St. Helena, California: Dealing with a Field-of-Dreams Levee, Residual Risk, and a Flood of Controversy

Posted on July 17, 2016 by UC Davis Center for Watershed Sciences

*by Nicholas Pinter*

A new $37.2[1] million levee in the town of St. Helena, on the floodplain of the Napa River, has a colorful history and has been stirring local acrimony since its inception. This project illustrates both the attraction of levee protection, in this case protecting a low-income neighborhood ("low income" by Napa standards) hit by disastrous flooding in 1986 and again in 1995, as well as pitfalls of this strategy for long-term risk management. There are clearly positive elements of the St. Helena levee project, but also numerous missteps that have mired the project in dissent and even, opponents argue, threaten to bankrupt the town. With important planning and zoning decisions now pending, the St. Helena levee is a case study for other communities to examine before they consider all of the options for flood-risk management.

After the release of a recent journal article on levee protection, one reporter tried to wake me up with the following opening question – "Prof. Pinter, why do you hate levees?" I laughed in appreciation of a good icebreaker, and then explained how levees, floodwalls, and other structural protections are valuable tools in a diverse toolkit used to manage flood risk. But levees also come with adverse consequences that need to be rigorously evaluated and balanced against their potential benefits. Those negative impacts and the need for careful evaluation are often lost in the rush to build new levees or enlarge existing structures, typically in the aftermath of a damaging flood.

St. Helena is a town of about 6,000 people along the Napa River about 20 miles upstream of the City of Napa. The river there is small, averaging just 46.7 cubic feet per second (cfs) of flow over the duration of record, but subject to flash flooding after intense local rainstorms. Since 1862, 28 major floods have struck the Napa Valley[2], including 1955, 1963, 1967, 1973, 1978, 1981, 1983, 1986, 1993, 1995, 2002, and 2006. Most of St. Helena is located a safe distance from the river, but starting in the 1970s, the Vineyard Valley area was developed, including 468 homes, apartments, and mobile homes at risk of flooding[3]. Most of these are in what is now mapped by FEMA as the so-called 100-year floodplain. During the five-year review process for development of the mobile home park, local residents report that the issue of flood risk was never raised.

Figure 1 – The Vineyard Valley neighborhood of St. Helena under water during the 1986 flood.

Intense rain events hit the upper Napa Valley in February of 1986 and again in March of 1995, sending the Napa River over its banks and into the new Vineyard Valley development. Damages in each event were estimated at over $50 million in St. Helena alone. During the 1995 flood, over 400 residents of St. Helena were evacuated, and 200 mobile homes in Vineyard Valley were declared a total loss. In both 1986 and 1995, other communities such as Calistoga and Yountville also were hard-hit, including inundation of much of downtown Napa. As described by the Napa Valley Register, *"Overnight, the Napa River*

*swelled from a modest tributary of San Francisco Bay to a wrathful Amazon."* The 1986 flood killed three people, forced the evacuation of over 2,500, and caused total damages estimated at $100 million[2].

A typical pattern in flood response is that it takes a one-two punch to motivate any large-scale action to address flood risk. The 1995 flood in Napa was that second punch. Surveying the damage, Napa County officials dusted off a flood-control plan initially drafted by the Corps of Engineers but defeated by a voter referendum in the 1970s. The original Corps flood control plan was considerably reworked and, particularly in the City of Napa, many forward-thinking elements were added, including channel habitat preservation and reconnection of the historic floodplain. Flood control was now put to the voters again, in the form of Measure A, a half-percent county sales tax, which was passed in March of 1998 with a two-thirds voter majority. With local cost-share funding secured through the referendum, Napa County began moving forward with the large-scale flood plan in Napa, with smaller portions of the funding apportioned to other communities along the river.

In St. Helena, plans were drawn up that focused on a large levee and floodwall to protect the Vineyard Valley area, as well as several other elements. These other elements of the project included bank stabilization, removal of a channel constriction, internal stormwater management, and excavation of a storage area outside the levee (a "terrace," the project calls it) planted in native vegetation. The channel restriction, for example, involved the removal of 17 mobile homes and the associated land closest to the river, which opened that area to better pass flood flows. This bend in the river channel represented a chokepoint during floods, significantly obstructing flow and raising water levels in that area and upstream. Removal of these homesites and augmenting the conveyance capacity of the channel at this chokepoint certainly lowered flood danger by both reducing at-risk infrastructure and by lowering water levels during future floods.

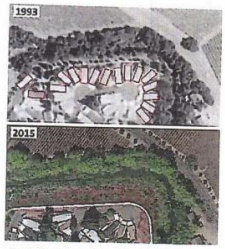

Figure 2 – The positive side of flood control. As part of the St. Helena project, a total of 17 mobile homes were permanently and the flood wall set back from the river.

Although the St. Helena project included several forward-thinking elements, it remained much more of an "old school" structural flood-control plan than what was implemented in Napa. The St. Helena plan centered on approximately 2,000 ft of floodwall surrounding the Vineyard Valley mobile home park and another ~2,000 ft of levee that extends from the floodwall to the north and west. As now required of urban levees in California, the system protects to the "200-year" level – that is, designers of the levee and floodwall have affirmed that they will keep out floods up to those with a 0.5% chance of occurring in any year.

On a map the St. Helena levee is relatively small, a tiny fraction of the length of the systems that protect the Central Valley or great alluvial floodplains of the Midwest. But its height is impressive. Standing on the new levee crest above the Napa River, one can almost imagine looking out on the Sacramento or Mississippi River. The levee is also proportionally wide, with a crest 15-20+ feet across, wide enough to meet requirements for much larger rivers and floodplains. Wide enough, in fact, to carry two full lanes of traffic. Indeed, the initial St. Helena planning documents[4] called for a multi-function levee that would also serve as a new roadway. This new road would have crossed the floodplain and the river across a new bridge, connecting St. Helena to the Silverado "wine trail" on the northeast bank. Currently that connection is across the Pope Street bridge, a historic stone structure built in 1894 and so narrow that it is terrifying to cross even when the driver coming the other way hasn't spent

the afternoon sampling the latest vintages. Using flood-control funding to simultaneously serve another goal might not be illegal, but it raises questions about priorities in design details. In this case, the proposed bridge link was rejected after litigation focused on its environmental impacts, but before levee construction. Nevertheless, the width of the St. Helena levee retained the width of a road to nowhere, as well as – importantly – a path that took the levee far wide of the housing it was funded to protect, enclosing a broad swath of floodplain undeveloped and empty except for rows of grapevines. More on this in a moment.

Another interesting aspect of the St. Helena levee is the funding to plan and design the project. The city obtained an $8 million grant from FEMA's Hazard Mitigation Grant Program (HMGP). HMGP uses a slice of FEMA's total disaster-related funds to promote "mitigation," meaning actions taken by communities to lower their overall exposure to future disasters. Flood-mitigation strategies favored by FEMA nationwide include buyouts and relocation of repeatedly flooded homes or elevation of floodplain structures up beyond the reach of future floods.

FEMA carefully monitors HMGP projects to make sure that taxpayer funds are used for their intended purpose. In 2013, when FEMA audited St. Helena, the city was unable to account for a large block of HMGP money. Among project expenditures, the city had spent $1.64 million on lobbying expenses, reportedly including lavish entertainment expenses in Washington aimed at securing Army Corps of Engineers and other federal funding for levee construction. When FEMA reviewed the city's books, it disallowed $1.9 million in expenses, requiring St. Helena to withdraw this amount from its operational accounts. Further local acrimony ensued because the city repaid the FEMA money without adequately, some argue, disclosing the financial missteps and the resulting impacts on city finances. This repayment resulted in a $1.5 million budget deficit and significant cuts to city services.

The details above are a selection of the complaints voiced by local levee opponents in St. Helena. This dissent contrasts with the broad consensus surrounding the much larger flood-control measures implemented in the City of Napa. Large public projects never reach perfect consensus, but the Napa Project solicited input from a broad range of stakeholders and integrated these opinions in final project designs. In contrast, the St. Helena project continues to roil that community even now that the levee is complete and a done-deal.

The final shoe – probably the most problematic element of the St. Helena flood-control debate – is now dropping, five years after the levee's completion. The current issue results from the unusual pathway of the levee, which sweeps well north and west of the neighborhoods previously flooded and includes 16.9 acres of undeveloped vineyard land. Undeveloped until now, that is. Just 17 days before the passage of Measure A, the mechanism that funded large-scale flood engineering throughout Napa County, much of the empty floodplain land behind the St. Helena levee was purchased by a private developer. On Sept. 8, 2010 the developer submitted plans to convert the empty agricultural land behind the levee into high-density residential development, including 87 new residential units[5]. This despite an explicit provision in Measure A that "none of these projects are intended or designed to encourage population growth."

My research group has worked hand-in-hand with floodplain residents to provide them planning guidance and technical expertise. We've also studied levee projects that would increase flood heights for neighbors, increase long-term flood risk, or degrade habitats, sometimes in exchange for very limited local flood-protection benefits. After struggling with this balancing act time and again, we've proposed a **three-step "levee sniff test" to preliminarily judge any proposal**. New or enlarged levees and floodwalls may be an appropriate solution if the system is designed to protect floodplain infrastructure that is:

1. *concentrated,*
2. *high in value, and*
3. *pre-existing.*

Figure 3 – The Levee Sniff Test

The most crucial – and often the most politically fraught – of these criteria is the third. The worst case is construction of "field of dreams" levees – new, expensive, often muscular levees surrounding undeveloped or sparsely occupied floodplain land. "Build it and they will come" – field-of-dreams levees are meant to attract new construction and development on the floodplain. Political leaders see expansion of their local tax base, and developers salivate over the prospect of transforming low-cost floodplain land into urban real estate as soon as the new levee "solves the problem of flooding forever."

By intent or by accident, the St. Helena project created a "field of dreams" levee. The original position of the levee was set by the desire of the city to piggyback a long-sought transportation project onto available flood-control funding. A private developer saw an opportunity for windfall profits and snapped up this floodplain acreage. What remains unclear is why, when plans for the roadway were scrapped, did St. Helena not downsize its levee? Local levee opponents see nefarious motives here, and the optics are not good. In 2008-2009, local residents had proposed several possible levee alignments that hugged the edges of existing neighborhoods that needed protection. These alternatives would have eliminated the "field of dreams" issues, cut construction costs, and would have significantly reduced future flood levels for neighboring properties outside the levee. But these alternatives were rejected at the April 14, 2009 meeting of the City Council. Why? Perhaps simply a result of frustration at the grassroots opposition and the desire to move forward with the existing blueprint, however much conditions had changed since those plans were drawn up.

> *"Residual Risk – the small but real possibility that a levee may fail or be overtopped during future floods."*

So past mistakes aside, why not fill in every square inch of land behind a levee once you've got one? The problem with levees, and with field-of-dreams levees above all, is that no type of structural flood protection can ever reduce the flood risk to zero. Even the strongest levee or floodwall carries a "residual risk" of failure or overtopping during large floods. Furthermore, having flood waters pour over or burst through a tall barrier turns the gradual process of floodplain inundation into a much more violent, dangerous, and damaging event. The history of occupation of U.S. floodplains is a history of levee failures, with headlines almost every year bringing footage of disastrous levee failures somewhere in the country. One levee system on the Mississippi River, not an atypical one, was breached 14 times through its history, only to be patched and raised each time, in the process driving up flood levels for the next event and contributing to the next failure. Expert after expert, blue ribbon panel after panel, has implored engineers, local leaders, and floodplain residents to not forget about residual risk. Brig. Gen. (Ret.) Gerald Galloway, former commander of the US Army Corps of Engineers puts it this way, "Let no one believe that because you are behind a levee, you are safe" (Galloway, 2005). The point has also been made more bluntly, "There are two kinds of levees ... [t]hose that have failed and those that will fail" (Martindale and Osman, 2010).

*"Developers and home builders may be gone, but residents of Natomas will be there and are the ones who are rolling the residual-risk dice year after year."*

Neglecting residual risk of flooding behind levees creates a false sense of security for residents and a lunatic calculus in which the local community can find itself with far greater long-term flood risk than before the levee was built.

California has made these mistakes before. In fact, the leading example of a "field of dreams" levee, discussed in floodplain management circles around the world, is Natomas on the northwest side of Sacramento. The Natomas Basin is ringed by 42 miles of levees, encompassing approximately 53,000 acres of the floodplains of the Sacramento and American Rivers. This land was sparsely populated until roughly 1990. Despite a tangled history, the Natomas system was built and they did come. On-going levee construction, particularly improvements initiated in 1992, ushered in a wave of development. As of 2010, Natomas was home to over 22,800 structures, the large majority of them residential units and home to more than 90,000 people[6]. The City of Sacramento currently plans to permit up to 1,000 additional single-family homes per year, 500 multifamily residential units per year, and unlimited industrial, commercial, and retail construction behind this levee[7]. Today, total property in Natomas at risk of flood damage, should the levee fail or be overtopped, exceeds $8.5 billion, with flood depths that could reach 25 feet[8]. Heroic efforts are now underway by the Sacramento Area Flood Control Agency, the California Central Valley Flood Protection Board, and the Corps of Engineers to patch deficiencies in the Natomas levee and raise the overall protection provided by the system. When that huge – and hugely expensive – effort is complete, the State of California, the Corps, and FEMA will sign off that they have reduced the statistical chance of catastrophic flooding in Natomas to 0.5% per year (less than once every 200 years, on average). That is a high level of protection by US standards, and engineers and leaders who are implementing the project will be justifiably proud of their accomplishment.

But ... our country's 400+ year history with levees also tells us that such claims of almost complete flood protection have often been repeated, and almost always were over-stated. Lots of reasons why this has happened in the past, and many of those reasons hold true for the future. But even at face value, a 0.5% exceedance probability for a system now protecting $8.5 billion in property translates – crudely – into up to $42.5 million in risk each year. If those 22,000+ homes and other structures had already been there before the levee (concentrated, high-value, and preexisting), then this annual $42.5 million in residual risk would have been a necessary tradeoff. But because Natomas was a field-of-dreams levee built intentionally to create new floodplain infrastructure, the large majority of this $42.5 million/year is all-new and added risk.

Who bears this residual risk if (some would say "when") California's drought turns to flood and hands us a ">200-year flood?" Or a lesser flood that finds a chink somewhere in the 42-mile long, gopher-prone armor that surrounds Natomas? Developers and home builders may be gone, but residents of Natomas will be there and are the ones who are rolling the residual-risk dice year after year. So too are all US taxpayers, since we bankroll disaster relief. Federal expenditures for disaster relief have averaged ~$35 billion per year in recent years[9], equivalent to about $400 per year per US household.

Residual risk also can be borne by the governmental agencies that facilitate "field of dreams" levees. Legal liability came to roost in California in 2003, when the Court of Appeals found the state liable for $500 million in damages resulting from a levee break on the Yuba River in February of 1986, the same storms that flooded St. Helena. The case was Paterno v. State of California, and although the state neither built nor maintained the levee that gave

way, the court found that it was responsible for inadequate maintenance and management of the system. And liability extends to counties and towns as well; for example, California Assembly Bill 80 made local jurisdictions liable for "property damage caused by a flood [if they] ... unreasonably approv[e] new development in a previously undeveloped area[10]." In the Paterno case, the financial hit of that $500 million decision shook the financial structure of the entire state, such that California was forced to borrow funds from Merrill Lynch in order to pay the claims against it[11].

So where does St. Helena and its levee fit into this broader picture? This levee and the new construction proposed behind it are tiny compared to what has gone onto Sacramento area floodplains, St. Louis floodplains, Houston floodplains, and others. But the principles are the same, and the potential consequences for a small community like St. Helena are proportionally even more threatening than for a large city. The St. Helena Vineyard Valley levee was built to protect residents who had the misfortune of living in a neighborhood built on the edge of the Napa River and far into the floodplain, a neighborhood that should not have built in the first place. That was certainly mistake number one. But after repeated and devastating floods, those residents were justified in seeking a mitigation solution. The second crucial misstep occurred in 2009, when the city approved a levee map that enclosed a large area of floodplain empty except for rows of grapevines. Whether by nefarious purpose or just fatigue, St. Helena opened the door to the crucial and difficult decision now in front of them – whether to bow to the pressure and temptation of approving development of that empty land behind their levee.

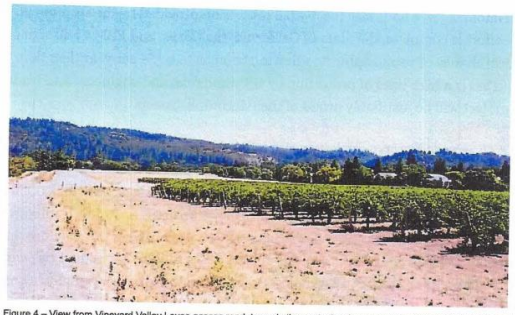

Figure 4 – View from Vineyard Valley Levee access road, towards the east, showing current conditions of the proposed development area. Figure IV.A-3a in Hunter Valley Subdivision Project, Draft EIR, Dates 5/29/2012.

One concern certainly on the minds of St. Helena city leaders is the threat of litigation if they deny the development plans in front of them. When such cases go to court, plaintiff lawyers typically cite the Fifth Amendment of the US Constitution, which states that "private property [shall not] be taken for public use, without just compensation." The legal claim is that refusal to allow development of the owner's land constitutes a "takings" of the value of that land. The St. Helena situation is typical of many examples where the legal threat of a takings claim is used to thwart zoning or planning to manage flood risk and other natural hazards. Developers and their lawyers argue that zoning to prevent development is unjustified, arbitrary, and an infringement of the rights of landowners. On the contrary. The St. Helena developer purchased agricultural land in a floodplain at a price consistent with those conditions. Despite the construction of a levee at taxpayer expense surrounding that

land, it remains a floodplain. The limitation on building expensive homes and apartments on that floodplain is imposed by nature, not the City of St. Helena.

Fear of lawsuits and potential liability is a tangible pressure on a town like St. Helena. But in considering development of floodplain land behind a field-of-dreams levee, these communities are perhaps looking at the lesser threat. Bowing to the will of the developer dodges a likely "takings" lawsuit, but loads St. Helena with new residual risk – risk that is small as an annual percentage, but large in total magnitude. The mean value of a detached home is St. Helena is $640,000 and an attached unit is $401,000[12]. Given current plans for 51 new single-family homes, 11 granny units, 24 multi-family units[5], and a typical value of 50% content damages for flood-loss estimates, these 87 new units could suffer $49 million in damages if that area were inundated. After the 1995 flood, residents of Vineyard Valley sued the City, and residents of the proposed new development could take the same action. The 2003 Paterno decision against California amounted to just 0.5% of the state's total budget that year. For comparison, the City of St. Helena, with revenue to its general fund of $10.5 million in FY 2015/16, could face a financial hit totaling 469% of its annual resources. In other words, the legal liability from the proposed new development could bankrupt the city nearly five times over.

> *"The legal liability from the proposed new development could bankrupt the city nearly five times over"*

St. Helena was founded in the mid-1800s, near enough the Napa River to gain the benefits of that proximity, but up and off the floodplain. However beginning in the 1970s, the town suffered the same magnetic pull as countless other communities across the US – succumbing to pressures for growth and the attraction of empty land ever closer to the river. Located deep in the Napa River floodplain, the Vineyard Valley neighborhood was reviewed and approved, reportedly without even discussing the possibility of flooding. This was an oversight for which residents paid dearly in 1986 and again in 1995. Mistake followed mistake: land that never should have been developed, an expensive levee that has already sent the town into financial distress and political discord, and a levee map that somehow enclosed much more floodplain land than the neighborhood it was designed to protect. St. Helena now has a last chance to bring this cascade to an end and avoid construction of 87 new homes behind their field-of-dreams levee. Floodplain managers, river scientists, and prudent leaders worldwide counsel that levee protection is never absolute, and that even the tallest and strongest wall comes with an inherent residual risk, a small but real possibility that it may fail or be overwhelmed during future floods. For concentrated and existing floodplain infrastructure, levees can be the right solution, and residual risk preferable to no action at all. But towns like St. Helena should understand that levee protection brings a range of consequences, including the possibility of multiplying, not diminishing, the long-term risk of damage and potentially even loss of life in their community.

[2] City of Napa. 2009. Hazard Mitigation Plan, 2009 update.

# Response to Letter 30
## Arlene and Richard Corsetti
## October 25, 2021

**30-1** The comment references a 2016 article written about flooding and water issues in the City and flood-loss damages in the event of a catastrophic flood event.

The comment does not identify any specific issues with the accuracy or adequacy of information provided in the Draft EIR; therefore, no further response is required.

Please see Master Response 3 that addresses the levee and flood concerns.

**30-2** The commenter states their opinion on current issues including the lack of a second bridge across the Napa River, traffic problems, and the Project's compliance with the City's Water Neutral Policy.

The commenter's opinion does not identify any specific issues with the accuracy or adequacy of information provided in the Draft EIR. The Project's increase in demand for water is evaluated in Section 3.13, Utilities and Service Systems and traffic is evaluated in Section 3.14, Transportation and Circulation. The commenter's opinion on the need for another bridge across the Napa River is noted and forwarded to the decision makers for their consideration. Please see Master Response 2 that addresses the City's Water Neutral requirements.

**30-3** The commenter states that the City Council and Planning Commission must review and refute the article referenced in Comment 30-1 (above), receive a letter from FEMA guaranteeing that another flood in the area would be covered, and guarantee that the City would not be liable for further flood issues if housing is built in the area.

The comment does not identify any specific issues with the accuracy or adequacy of information provided in the Draft EIR. Regarding the referenced article, please see Response to Comment 30-1 above. This comment is noted and forwarded to the decision makers for their consideration.

Determining legal liability for a potential future event is beyond the scope of CEQA and is not required to be evaluated in an EIR.

**30-4** The comment raises general concerns for the City to consider specific to traffic congestion absent another bridge across the Napa River.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration.

**30-5** The comment opines that the Project should have a better water mitigation plan because current City residents should not be asked to save more water than they currently are.

Please see Master Response 2 regarding City water supply and requirements of the Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**30-6** The comment states an opinion that the Project is too risky to be left to the vote of Planning Commission and City Council. The commenter opines that the Project needs in-person debate rather than using the Zoom platform.

The City has recently returned to in-person Planning Commission and City Council meetings. During the COVID-19 pandemic, holding meetings virtually was consistent with Government Code Section 54953, as amended by AB 361, which authorizes teleconference meetings under the Brown Act during proclaimed states of emergency. The commenter's opinion is noted and forwarded to the decision makers for their consideration.

Comment Letter 31

**Response to Hunter Project Draft EIR Report**

**Hazards and Hydrology:**

The Draft EIR does not adequately address the potential danger of a flood in this area due to climate change dynamics.
Replacing the currently available absorbing soil with homes and concrete augments flood danger.
When it floods, personal safety of Hunts Grove, Vineyard Valley, and Hunter Project residents would be hazardous. 31-1

Regarding the water neutrality issue in the DEIR, we are currently restricted in our use of water with no anticipated increase in our water supply. Paying into a fund to retrofit toilets does not provide more water and does not adequately mitigate estimated water usage by the Hunter Project. 31-2

**Public Utilities:**

Increased sewer flow from the Hunter Project would inevitably impact the currently inadequate sewer structure in Vineyard Valley. The DEIR does not adequately address this impact. 31-3

**Transportation:**

We believe the Hunter Project would negatively impact our Vineyard Valley evacuation plan. This has not been adequately addressed in the DEIR. 31-4

We are concerned the sizeable increase of vehicles on our Saint Helena roads will exacerbate traffic congestion, especially on Pope Street and the Pope Street Bridge. We believe this impact is sufficient to deny the Hunter Project. 31-5

Saint Helena

INTENTIONALLY LEFT BLANK

# Response to Letter 31
## Carroll and Ellen Cotten

**31-1** Without providing specific examples, the comment challenges the Draft EIR analysis of potential flood impacts due to climate change dynamics.

Because this comment does not provides specific criticism of the analysis, no response is possible. Please see Master Response 3 which provides a general response to concerns related to flooding and the levee near the Project site.

**31-2** The comment takes issue with the effectiveness of the City's Water Neutral Policy and how it is used in the analysis of the proposed Project's water demand.

Adherence to the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code to fund such measures as fixing an existing leaking water conveyance pipe does offset demand by increasing water supplies compared to the existing conditions of water losses due to the leak. As a result, the Water Neutral Policy does offset new demands with measures that reduce demand elsewhere or otherwise increase water supplies. Therefore, compliance with the City requirements is an appropriate and effective measure to include in the analysis of the Draft EIR. See also Master Response 2.

**31-3** The comment generally asserts that the Project would negatively impact the City's sewer system.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Therefore, no response is required. Please see also Master Response 4 that addresses concerns regarding the City's wastewater system.

**31-4** The comment expresses concern that the Project would negatively impact the emergency evacuation plans within the area.

Please see Master Response 1 that addresses concerns associated with emergency evacuation.

**31-5** The comment expresses general concerns regarding traffic congestion in the City and along the Pope Street Bridge.

The comment does not identify any specific issues with the accuracy or adequacy of information provided in the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration. The operational aspects of the Proposed Project that contribute to

delay and congestion on local roadways is no longer considered an environmental impact under CEQA. Please also see Response to Comment 10-2.

Comment Letter 32

**Richard Crebs**
**10 San Juan Court**
**Saint Helena, CA. 94574**
**(707) 580-0418**

November 2, 2021

Ms. Maya DeRosa, Planning & Building Director
City of Saint Helena
1572 Railroad Avenue
Saint Helena, CA 94574

**Delivered via email to:**mderosa@cityofsthelena.org

Dear Ms. DeRosa:

Generally, this is a fatefully flawed project projected upon a majority of fill generated from the construction of the flood control levee, subject to probable seismic events and/or flooding, exasperating demands on water we do not have and adding to almost daily traffic gridlock at commute time on the Eastside roads. This town would be better served leaving the land as open space for all to enjoy. 32-1

The following are my specific objections to the Hunter EIR.

**3.9 HYDROLOGY AND WATER QUALITY** Commencing on page 367)
The document sets forth in the Section **Flooding Due to Levee Failure or 200-Year Flood Event** (Page 374) propose mitigating the potential risk by suggesting that resident "will have the option of purchasing flood insurance (i.e., FEMA policy").

> (Since the levee project was not certified by the Army Corp of Engineers it is my understanding that if it should fail the city would ultimately be responsible for all ensuing damages.)

Instead require the developer to Hold the City harmless in the case of any future flooding if the project is completed and require the developer to post an evergreen Fifty Million ($50,000,000) Surety Bond to support the "Hold Harmless" Agreement. 32-2

Anything less puts the city, and there for its citizens, at the risk of massive litigation of the Hunter Project should flood in the future. It is not the Cities or its citizens responsibility to be put at significant financial risk just so a developer can profit by develop an extremely questionable parcel with other multiple challenges such as water, sewer, and traffic concerns.

**3.13 -Utilities and Service Systems**
**3.13.4 Impacts**
**Table3.13-9 Proposed Project Water Demands** 32-3

The Hunter EIR reports calculates that this project will consume 19.88- acre feet of municipal water and 17.16- acre feet of groundwater.

This EIR ignores the very factual issues surrounding both municipal and groundwater available. This project should not be allowed to draw any groundwater as indicted for landscaping purposes. Instead, there are commercially available systems to capture all bath water, treated and used for flushing toilets and landscaping. Similar projects have demonstrated a net savings of up to 33% in potable water. A greywater system for *each* housing unit should be mandated.

32-3 Cont.

**Wastewater Treatment**

The Hunter EIR ignores whether the existing sewer lines situated North to South dissecting VVMHP. If this project is approved then Hunter should be required, under bond, to pay for not just the physical wastewater upgrades necessary but also due payment and consideration afforded to the VVMHP residents during any construction necessary to an increase in wastewater capacity to accommodate the wastewater demands determined necessary.

32-4

**Appendix J**
**Water Neutral Report**

This water neutral report vacuously concludes that rather than undertaking and paying for a portion of the cities Capital Improvement Program (CIP) need that they opt to offer a fop in the form of $596,809.19 in retrofit fees. Currently, the CIP five-year projected cost approximate $60,000,000. If the City should choose to approve the Hunter Project, then an a more equitable requirement would be to require Hunter to pay ten (10%) of that amount or the sum of $6,000,000 to assuage the required in lieu fees.

32-5

**3.14-1.Traffic**

All of this report's conclusions are either erroneous, misleading, or incorrect. It does not matter what theoretical studies the reference all of the surface roads on the Eastside of town are already at maximum capacity. There is a solution which the Hunter study studiously avoids. If they wish to have the city approve this project, then let them significantly help ameliorate the Eastside traffic problem by paying for a new bridge connecting Adams Street to the Silverado Trail.

32-6

Respectfully submitted:

Richard Crebs
(This letter off comments regarding the Hunter Project are submitted by me as an individual and not on behalf of any organization)

# Response to Letter 32
## Richard Crebs
## November 2, 2021

**32-1** The commenter states the Project is flawed because it is proposed on fill placed on the site as part of the City's Flood Protection Project; would be subject to seismic events and flooding; would increase demand for water; and would increase traffic congestion. The comment recommends the site be left as open space.

Consistent with the recommendations in the Geotechnical Report, the existing fill/soils on the site would be removed, re-compacted and returned to the site along with additional fill. The site would be graded and leveled to ensure a stable base for new development (DEIR p. 2-31).

Potential hazards associated with seismic events is addressed in Section 3.6, Geology and Soils. As noted on page 3.6-12, the Project site is not crossed by an active earthquake fault zone, nor is it crossed by any potentially active faults. The closest earthquake fault zones are the Rodgers Creek Fault, located about 15 miles to the southwest of the Project site and the southern part of the West Napa Fault, located approximately 17 miles southeast of the Project site. Development would be required to comply with the California Building Code which sets forth structural design requirements associated with seismic loads. As part of this process, a design-level geotechnical investigation would be completed (in addition to the existing geotechnical investigation already completed) to assess site conditions at a greater level of detail and make geotechnical recommendations to be incorporated into the site development plan, grading plan and building plan. The City requires that such geotechnical recommendations be verified at time of grading and building construction prior to issuance of a certificate of occupancy. In addition, mitigation measure GEO-1 is imposed to ensure preparation of a design-level geotechnical report that includes specific design criteria to ensure the Project is designed to meet all current seismic safety standards (DEIR pp. 3.6-22 and 3.6-23).

Please see Master Response 3 that addresses flooding concerns and Master Response 2 that addresses water supply concerns and Response to Comment 10-2 regarding traffic.

The Project site is not owned by the City and is not public open space but designated by the General Plan and zoned for Medium Density Residential development. The commenter's desire to see the site left undeveloped is noted and forwarded to the decision makers for their consideration.

**32-2** The comment references the analysis of potential flooding due to a levee failure and suggests residents should purchase flood insurance in the event of a flood event and

the City should require the Project applicant post a bond to "hold the City harmless" in the event of a flood.

The Draft EIR evaluates flood risks due to a 200-year flood event as well as due to failure of the levee starting on page 3.9-8 in Section 3.9, Hydrology and Water Quality. As noted on page 3.9-8, The City's Flood Protection Project, specifically the levee and floodwall along the Napa River and Sulphur Creek, was constructed to provide protection from a 200-year flood event. The levee was designed and constructed in accordance with all applicable U.S. Army Corps of Engineers Engineering Manuals and has been reviewed by the Federal Emergency Management Agency or FEMA. The flood control system was also evaluated for stability during a seismic event and was found to be stable by two engineering firms. The Project site is outside of a FEMA special flood hazard area; therefore, purchase of flood insurance would be required. However, because there remains residual risk of flooding from catastrophically large floods (such as a 500-year flood) or levee failures, residents in flood-prone areas, even if outside of a regulatory flood zone, have the option to purchase optional flood insurance. Regarding the applicant's liability in the event of a flood and purchase of a bond to absolve the City of any responsibility to residents in the event of a catastrophic flood event, please see Master Response 3.

**32-3** The comment opines that the EIR ignores issues associated with availability of water and believes the Project should not use groundwater for landscape irrigation in lieu of capturing and treating all domestic wastewater or "grey water" for irrigation and goes on to state a grey water system should be mandated for every residence.

The Project is required to off-set its water demand, per the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code. In compliance with these requirements the Project applicant prepared a Water Neutral Report (see Appendix J). The City requires all new projects to be water neutral and not consume water without offsetting the demand. Please see Master Response 2 that addresses the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code requirements.

**32-4** The comment is referring to the City's wastewater system and whether the Project would increase wastewater conveyance in the same infrastructure that also serve the Vineyard Valley Mobile Home Park and states if the Project is approved the applicant should be required to fund any improvements to the City's wastewater system.

The Project's connection to the City's wastewater (or sewer) system is described on page 2-29 in Chapter 2, Project Description. Wastewater flows from the western end of the Project site are proposed to drain into an existing public manhole at the corner of Starr and Hunt Avenue via new 8-inch sewer pipes. The area east of Starr Avenue is proposed to drain east through the Project site via new 8-inch sewer pipes into an existing public manhole on the adjacent parcel in the Vineyard Valley Mobile Home Park. The City's system is sized to accommodate wastewater flows from the Project and there is adequate conveyance capacity within the existing lines. The Project

would not require any modifications to the City's system and impacts were determined to be less than significant (DEIR p. 3.13-29). Please see Master Response 4 that provides additional details regarding the City's sewer system and ability to serve the Project.

**32-5** The comment questions if the Project's estimated in-lieu fee is adequate based on the City's current Capital Improvement Projects (CIP) budget.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, please see Response to Comment 2 that addresses the Project's compliance with the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**32-6** The comment expresses general concerns regarding traffic congestion in the City and would like the Project to pay for a new bridge to connect Adams Street to the Silverado Trail.

The Proposed Project does not include the construction of a new bridge and does not involve any further extension of Adams Street, east of Starr Avenue. Any extension of Adams Street connecting to Silverado Trail would require further study and approval by the City and the City's Public Works Department has determined is not required for this Project.

**Subject:** [External] Public Comment - Hunter Subdivision

Dear Maya,

We share a property line with the proposed Hunter Project and are in opposition of the development. In addition to our concerns over traffic, water, flooding, etc. another top concern is the loss of open trail space that we see so many St. Helena residents use daily. There are no other open walking or hiking paths in St. Helena and it would be a huge loss to both locals and tourists who all enjoy the space. 33-1

A separate concern- we understand that one of the biggest benefits to this project is affordable housing. The fact that the developer is proposing ADU's on the single-family home lots to fulfill the affordable housing requirement is offensive to the law. 33-2

Best Regards,
Nicole and Scott Dale
1326 Monte Vista Ave

INTENTIONALLY LEFT BLANK

# Response to Letter 33
## Nicole Dale
## October 28, 2021

**33-1** The comment states general opposition to the Project and explains that the commenter shares a property line with the Project. The commenter expresses general concerns over traffic, water, flooding, and the adjacent walking trail.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, to address the commenters' general concerns regarding water and flooding, please see Master Responses 2 and 3.

**33-2** The commenter opposes the Project's proposed ADUs and claims the ADUs should not be used to fulfill the affordable housing requirement.

The City's Inclusionary Housing Ordinance requires a minimum level of affordability in the housing which is ultimately developed on the Project site. The Project applicant will submit a detailed proposal regarding how the Project will meet this requirement which will be part of a subsequent discretionary approval (Affordable Housing Agreement) at or prior to the recordation of the Final Map. This must be approved by the City Council before development of homes can take place. Staff will review the applicant's proposal before making a recommendation to the City Council on the Affordable Housing Agreement. A determination of consistency will be made at the time that subsequent application is submitted and reviewed (DEIR pp. 2-18 and 2-32).

The commenter's opinion is noted and forwarded to the decision makers for their consideration.

**Subject:** [External] Hunter Project

Dear Maya,

I respectfully submit these comments in response to what I see as a deficiency in the DEIR process for the Hunter Project, specifically, violations of AB 52.

It is known that this area was a burial and artifact site of Native Americans who resided here before us. AB 52 has requirements applicable for this project, including consultation with Native American tribal representative(s) affiliated with this geographic region.

California law defines consultation as the "meaningful and timely process of seeking, discussing, and considering carefully the views of others, in a manner that is cognizant of all parties' cultural values and, where feasible, seeking agreement." Gov. Code § 65352.4 (emphasis added).

Respectful, effective consultation consists of in-person meetings between appropriate representatives of the parties, which the tribe may wish to host at its reservation or rancheria. During consultation meetings, the parties should make a point to identify any significant impacts the proposed project would have on tribal cultural resources and discuss potential avoidance or mitigation measures; the tribe may identify additional consultation topics in its response to the lead agency's notice letter. Agencies should also be aware that tribes may take a broad view of cultural resources and extend this characterization to entire landscapes, as contemplated under AB 52's tribal cultural resources definition. *See* Pub. Res. Code § 21074(a)(1)(A). AB 52 also requires agencies to recognize that tribes may attach cultural or spiritual value to these resources, apart from their scientific or archaeological merit. *Id.*

34-1

This DEIR does not indicate such consultation occurred and in fact seems to state the opposite, that the Tribal Chairman, Scott Gabaldan, was not only not in consultation, but not contacted.

This is law.

Beyond law, is nothing sacred?

Please consider.

Gayle Davies

St Helena resident

INTENTIONALLY LEFT BLANK

# Response to Letter 34
## Gayle Davies
## November 29, 2021

**34-1** The comment suggests that the Project did not comply with AB 52 requirements for consultation with Native American tribal representatives affiliated with the area including Scott Gabaldan, tribal chairman of the Mishewal Wappo Tribe of Alexander Valley.

Section 3.5, Cultural and Tribal Cultural Resources of the Draft EIR describes the Project's compliance with AB 52 requirements. Pursuant to AB 52, the City sent letters to all tribes (who have requested notification) who are traditionally or culturally affiliated with the geographic area of the Project site. A letter was sent to Vincent Salsedo with the Mishewal-Wappo Tribe of Alexander Valley on April 23, 2018. No response was received from the Mishewal Wappo Indian Tribe in response to the AB 52 letter. All records of correspondence related to AB 52 notification and any subsequent consultation are on file with the City.

INTENTIONALLY LEFT BLANK

Comment Letter 35

November15, 2021

To: MAYA DEROSA, AICP

City of St. St. Helena Planning and Community Development Department

My comments focus on the section of the EIR defined as HYDRLOGY AND WATER QUALITY, Section 3.9. and my focus is on the potential effects of the proposed Hunter
Subdivision on the Vineyard Mobile Home Park, a community of over 55 age group. We strongly believe that mitigation is necessary in several areas. The EIR for the proposed Hunter subdivision states that no mitigation is necessary. The following areas need mitigation or further research.

1. Section 3.9.1 looks at Regional Climate. This section studies only up to 2016. We have had 2-4 years of drought since 2016 and this needs to be factored into the decision-making process. Climate change could cause a continuation of drought. 35-1
2. There are several references to Engineering studies done to design, finance and construct the St. Helena Comprehensive Flood Control and River Restoration Project. The owners of the Hunter property need to do their own Engineering studies and the City needs to more clearly direct the public how to find these studies if in fact there are some current studies available. 35-2
3. Page 3.9.8 of the EIR states "The Proposed Project does not include any element that exacerbates existing flood hazards for off-site properties or the general public (i.e.). through flood plain encroachment that blocks or redirects flood decision-making flows or by placing habitable structures within areas with reasonable risk of flooding). 35-3
4. Where is the proof of this assertion? The engineering studies if available should be reasonably easy to obtain and read.
5. The Hunter property is at a higher elevation that Vineyard Valley. When there are rainstorms, excessive drainage would flow toward Vineyard Valley Mobile Home Park. We are all aware that the sewer systems in the City of St. Helena as well as VV Mobile Home Park are inadequate. The Proposed Hunter Development must design additional sewer systems and not use already inadequate drainage. The new sewer system must include blue or purple pipe to direct water to the Water Treatment Plant where it will be treated to use as non-potable water for landscape and other non-potable uses. 35-4
6. One of their intentions is to direct overflow to the Flood Project Detention Basin. The Detention Basin was designed to retain overflow and direct overflow through a water cleaning process and back into the Nap River. This was designed when the property consisted of 16.9 acres of permeable soil. The Proposed Project once again is using studies done while designing the Flood Project. They determined that the Proposed Hunter Project would consist of up to 70% of the impervious surface area. The Proposed Hunter Project is *estimated* to be developed at *approximately* 58% of impervious surface. Words like estimated and assumed are not scientific. That language is repeated throughout this EIR. 35-5
7. Page 3.9.45 states that the entire project was paid for by Measure A sales tax and other government bonds and loans. I think the Proposed Project should design and build their own Detention Basin. Why should they be able to take advantage of money coming from a sales tax and intended to protect housing already constructed. This as well as River Restoration was the purpose of the Measure A Ordinance. On page 1 of the Measure A Ordinance under Section 2 Findings, Letter G states "None of the projects in the Plan are intended or designed to 35-6

encourage population growth in Napa County." This is repeated on pages 7 and 8. This reference to "The Plan," refers to the plan put forth in the Measure A Ordinance. 35-6

8. In summary this Proposed Project would endanger Vineyard Valley because of their inadequate plan for directing runoff. Cont.

9. They intend to use the Detention Basin designed for very different circumstances, tagging on to the 33 million dollar Flood Project. This could endanger residents of Vineyard Valley Mobile Home Park. 35-7

35-8

10. The dust and dirt will affect the quality of life for as many years as it takes to build. I am guessing two to three years. 35-9

11. It is in direct conflict with the Measure A Ordinance. This alone should stop the Proposed Project. 35-10

12. The added traffic will make Vineyard Valley residents as well as our neighbors suffer the difficulties created by this added traffic. This is not only an inconvenience but also creates a safety hazard. Emergency evacuations would be impossible. 35-11

13. As I read the EIR a few times it became evident that a wealthy Developer has proposed building a project using Engineering and Geomorphic data from the St. Helena Comprehensive Flood Control and River Restoration Project. They want to use the Detention Basin designed when the 16.9 acres was permeable surfaces. Words like estimate and assumed do not show adequate studies to go forward with the project. 35-12

Priscilla (Pa) Dell St. Helena

# Response to Letter 35
## Priscilla Dell
## November 15, 2021

**35-1** The comment discusses how climate change is addressed in Section 3.9, Hydrology and Water Quality and questions why current rainfall conditions post 2016 were not included in the Environmental Setting section, as the City has been experiencing drought conditions since 2016. The comment goes on to note that climate change is contributing factor to drought.

Information from the Western Regional Climate Center, which provides rainfall data dating from 2016 was the most current rainfall information available at the time the Draft EIR was being compiled in 2019. The information in Section 3.3, Air Quality has been updated based on more recent data from the National Oceanic and Atmospheric Administration and the revised text is provided in Chapter 3, Changes to the Draft EIR. Climate change is recognized to be a contributing factor to drought conditions and the commenter's request that this be factored into the City's decision making process is noted and forwarded to the decision makers for their consideration.

**35-2** The comment suggests that the Project proponent should do their own engineering studies related to the City's Comprehensive Flood Control Project. In addition, the comment suggests that the City should more clearly direct the public to current studies.

The Project applicant is not required to conduct independent engineering studies to evaluate the City's Flood Control Project. The City of St. Helena along with a team of consultants designed, permitted, and constructed the multi-objective flood control and habitat restoration project which was constructed in 2009 and 2010, and provides 200-year flood protection for residential properties along the Napa River as well as restores important floodplain and aquatic habitat. See also Master Response 3 for further information regarding the levee and flood protection.

Regarding recent documents related to the City's Comprehensive Flood Control Project, recent inspection reports and summary reports can be found on the City's website here: Flood Control and River Restoration Project | City of St Helena.

**35-3** The comment questions the conclusion of the Draft EIR that the Proposed Project will not exacerbate flood hazards.

As stated in Section 3.9 of the Draft EIR on pages 3.9-7 and 3.9-8, the Project site is not located within a FEMA special flood hazard area based on mapping that is provided by FEMA. The Project site is protected by the recently constructed levee that is designed to provide 200-year flood protection with additional freeboard protection. As a result, by definition, using the most recent mapping provided by

FEMA in 2012, the Project would not encroach upon a flood zone, redirect flood flows, or place habitable structures in an area with reasonable risk of flooding.

See Master Response 3 for further discussion of the levee system.

**35-4** The comment claims that excessive storm drainage from the site would flow toward Vineyard Valley Mobile Home Park. In addition, the comment suggests that the Project applicant include blue or purple (recycled water) pipes to direct water to the Water Treatment Plant for use as non-potable water after treatment.

As stated in the Draft EIR on pages 3.9-44 and 3.9-45, the additional stormwater runoff created by the Proposed Project would be directed to the City-owned off-site detention basin, adjacent to the Project site, which has been designed to store the increase in storm water runoff from the Project site during a 100-year storm event. In fact, the detention basin was designed assuming that the Project site would be developed with 70% impervious surfaces; however, the Project would develop less of the site (58%) with impervious surfaces. In addition, the Project would require compliance with the City's Municipal Code and improvement standards associated with approval of tentative subdivision maps, which currently do not require recycled water infrastructure be provided. Therefore, since the off-site detention basin was designed with adequate capacity to accommodate stormwater flows from the Proposed Project there would be a low likelihood of excess flows draining from the Project site into the adjacent Vineyard Valley Mobile Home Park.

Please see Master Response 4 for further information on the City's wastewater system.

**35-5** The comment suggests that the City's detention basin was not designed appropriately and did not correctly factor in the Project's contribution of stormwater runoff. The comment goes on to note using words like "estimated" and "assumed" are not scientific.

As stated in the Draft EIR on page 3.9-45, the City's detention basin was designed to accommodate future development of the Project site assuming the City would be developed with up to 70% impervious surfaces. However, the Proposed Project would develop less of the site with impervious surfaces (58%) which would produce lower runoff volumes, and therefore the detention basin would have more than sufficient capacity to accommodate stormwater flows from the Project site.

Regarding the terminology used to describe development of the site it is virtually impossible to determine with 100% certainty the exact outcome of various engineering studies. For example, development of the Project site with impervious surfaces could fall between 57.38% to 58.23%; therefore, it is proper to estimate or assume approximately 58% of the site would be developed with impervious surfaces. This is an accepted approach in scientific and engineering studies.

**35-6** The comment suggests that the Project build its own detention basin and contends that the Project is not consistent with the language in Napa County's Measure A Ordinance, which states that flood control projects in the County should not be designed to encourage population growth.

The City's detention basin, as noted on page 3.9-45 of the Draft EIR, was designed with the knowledge that the Project site could be developed and introduce as much as 70% impervious surface coverage due to development of the site. The Project, as designed, would introduce 58% impervious surface coverage. Therefore, as proposed, there is adequate capacity in the City's existing detention to accommodate the Project and there is no need to construct an additional basin. Measure A, as described on page 3.9-6 of the Draft EIR, was passed in 1998 by Napa County and provided the basis for a number of flood improvement projects, whereas the Project site has been designated and zoned for future residential development dating as far back as the City's 1975 General Plan, as stated on page 2-12 of the Draft EIR. The Project is not funded in any part with Measure A funds and the City's Flood Control Project, which did receive Measure A funds, was designed to provide flood protection for both developed areas within the City as well as areas already planned for future development, including the Project site.

**35-7** The comment claims that the Project would not adequately direct stormwater runoff and would 'endanger' Valley Vineyard Mobile Home Park.

Please see Response to Comment 35-4.

**35-8** The comment suggests that the City's detention basin was designed under different circumstances and the Project could endanger Vineyard Valley Mobile Home Park residents.

As stated in Responses to Comments 35-4 and 35-6, the detention basin was designed assuming that the Project site would be developed with 70% impervious surfaces. The Proposed Project would develop only 58% impervious surfaces, and therefore the City's detention basin, which was planned to accommodate development of the Project site, would have more than enough capacity to handle runoff volumes from the Project site.

**35-9** The comment refers to dust and dirt affecting the quality of life over a two to three-year period of development.

There is no evidence that dust attributed to construction activities would measurably affect the quality of life. The comment does not identify any specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**35-10** The comment alleges the Project is in direct conflict with Measure A and this should prohibit the Project from moving forward.

Please see Response to Comment 35-6 and Master Response 3.

**35-11** The comment is referring to an increase in traffic associated with the Project that would create a safety hazard and would make emergency evacuation impossible.

The comment does not elaborate on what safety hazards the Project would create nor does the comment indicate where the analysis in the Draft EIR may be deficient or inadequate regarding safety. Therefore, a response is not required.

Master Response 1 provides further information on concerns regarding emergency evacuation.

**35-12** The comment refers to prior concerns raised specific to the use of information from the City's Flood Control Project; adequacy of the detention basin to accommodate the Project's stormwater; and terminology describing information from technical studies.

Please see Responses to Comments 35-3 through 35-6.

Comment Letter 36

October 23, 2021

Dear City of St. Helena Planning Department and City Council,

I submit the following Comments on the Draft Environmental Impact Report for the Hunter Subdivision Project:

1. There is currently an unmanaged traffic problem at the east side of the intersection of Adams Street and Railroad Avenue. Specifically, egress and ingress on Adams Street at the north side of the parking lot for Smiths Pharmacy, Safeway, and a few other businesses is already unsafe. How will the Hunter Subdivision be built without severely exacerbating this already dangerous traffic problem? 36-1

2. There is currently an unmanaged traffic problem on Adams Street between Main Street and Railroad Avenue. Specifically, traffic already backs up on Adams Street on the east side of Main Street impeding access to the service station on the north east corner of the intersection as well as Chase Bank on the south side of Adams Street. During tourist seasons the traffic on this block of Adams Street backs up to the four way stop sign/ Intersection at Adams Street and Railroad Avenue causing dangerous and time consuming traffic jams. It is gridlock until the traffic signal changes. How will the Hunter Subdivision be built without severely exacerbating this already dangerous traffic problem? 36-2

3. There is a conservation easement intended to preserve the land, protect wildlife habitat, And provide for public access consistent with the purposes of the Flood Protection Corridor Program in direct proximity to the proposed Hunter Subdivision project. How would the Hunter Subdivision project be able to proceed without having a negative impact on the flora, fauna, and Napa River adjacent to the proposed project? 36-3

4. We recently underwent emergency evacuations due to wild fires surrounding St. Helena. Evacuation for the residents of Vineyard Valley Mobile Home Park (VV), occupied mostly by senior citizens, was difficult and scary. Had the fire come .25 miles closer there would surely have been significant loss of life. Currently there is Pope Street or the levee road as exit routes for VV. How is it possible for the developer to build and populate the Hunter Subdivision without significantly endangering the lives of VV residents the next time an emergency evacuation is ordered? 36-4

5. There is already a severe parking problem on Star and Hunt Avenues and other nearby streets due to insufficient parking at Hunts Grove, Woodbridge Village, the recently acquired fourplex on Adams Street, and the numerous multifamily apartment buildings on Grove Court. With a proposed 87 homes, and possibly more, how will the Hunter Subdivision provide the minimum 174 parking spaces that would be required in order to not exacerbate our current parking problems? 36-5

6. How have the developers actually *proven* the Hunter Project would be water neutral and have no negative impact on the Napa River at the very outset of the project and remain water neutral in perpetuity? 36-6

I look forward to reading the results of the studies that will be conducted to address my, and and all the other peoples' numerous concerns about the foreseeable negative impacts the Hunter Subdivision Project would have on St. Helena.

Sincerely,
Nancy Dervin

INTENTIONALLY LEFT BLANK

# Response to Letter 36
## Nancy Dervin
## October 23, 2021

**36-1** The comment expresses concern regarding traffic congestion at the intersection of Adams Street and Railroad Avenue, and potential traffic safety issues due to egress and ingress for the parking lot currently used by businesses near the intersection.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. The intersection of Adams Street and Railroad Avenue was thoroughly analyzed in Section 3.14, Transportation and Circulation of the Draft EIR and Project impacts at this intersection were found to be less than significant. Additionally, vehicular collisions within the City were also analyzed on page 3.14-47 of the Draft EIR and again Project impacts were determined to be less than significant.

**36-2** The comment expresses general concern regarding traffic congestion along the Adams Street corridor, specifically near the east side of Main Street near the intersection of Adams Street and Main Street.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. However, as explained on page 3.14-1 in Section 3.14, Transportation and Circulation, "the California Environmental Quality Act (CEQA) Guidelines were updated to remove evaluation of the delay that vehicles experience at intersections and on roadway segments, which is often measured using a level of service (LOS) metric. Therefore, the operational aspects of the Proposed Project that contribute to delay and congestion on local roadways is no longer considered an environmental impact under CEQA. These concerns are discussed in the Proposed Project's Traffic Impact Study (TIS) in relation to consistency with General Plan policies (see Appendix K)." The analysis of vehicular queuing and congestion were addressed in Appendix K and also in Section 3.14. Project impacts were concluded to be less than significant for this section of Adams Street and Main Street.

**36-3** The comment refers to a conservation easement designed to preserve land and protect habitat and provide public access consistent with the City's Flood Protection Project and questions how the Project would not affect the land, habitat and access provided for under the conservation easement.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no response is required. The City has confirmed that the easement noted by the commenter does not include any part of the Project site. Please see Chapter 3, Changes to the Draft EIR for a trails map showing adjacent trails near the Project site.

**36-4** The comment states a concern related to emergency evacuation due to wildfires, specifically for Vineyard Valley residents.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. However, emergency evacuation was analyzed in Section 3.14 of the Draft EIR and Project impacts were determined to be less than significant. Please also see Master Response 1, that provides more details specific to emergency evacuation for both Vineyard Valley residents and Project residents.

**36-5** The comment expresses concern over the Project's parking supply and the parking supply of the surrounding neighborhood.

The CEQA Guidelines do not require that parking be evaluated in an EIR; therefore, the commenter's concern is noted for the decision makers and no further response is required. However, at the time building permits are requested City staff shall confirm the Project complies with the residential parking requirements in the St. Helena Zoning Code.

**36-6** The comment expresses concern related to the effectiveness of the City's Water Neutral Policy.

Please see Master Response 2 that addresses the City's ability to supply water to the Project and also address concerns regarding the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**Subject:** HUNTER PROJECT

*To: St. Helena Planning Department*
*Our community faces serious challenges which would be compounded by the proposed Hunter Project. Its proximity to Vineyard Valley recalls to us the heroic measures necessitated there during flood and fire emergencies over recent years. Traffic issues are also profound, particularly as regards the Pope Street Bridge. Local practical and safety considerations must weigh more heavily than the profit motive for development. Please reject this Hunter Project.* 37-1 37-2 37-3

*Julie Dickson, 1817 Spring Street, St. Helena*

INTENTIONALLY LEFT BLANK

# Response to Letter 37
## Julie Dickson
## October 15, 2021

**37-1** The comment generally states that the Proposed Project would compound existing community challenges and recalls a previous flooding event.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration.

**37-2** The comment refers to 'profound' existing traffic issues, especially related to the Pope Street Bridge.

The comment does not address the accuracy or adequacy of the Draft EIR, and the assertion of "profound" issues is the commentor's unsupported opinion; therefore, no further response is required. Potential Project impacts, as well as impacts related to the Pope Street Bridge are analyzed in detail in Section 3.14 Transportation of the Draft EIR and within Appendix K, Traffic Impact Study. The comment is noted and forwarded to the decision makers for their consideration.

**37-3** The commenter opines that practical and safety considerations of developing the Project should be weighted more than profits and that the Project should not be approved.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**From:** C. Echols <cechols47@gmail.com>
**Sent:** Sunday, October 17, 2021 8:50 AM
**To:** Maya DeRosa <MDeRosa@cityofsthelena.org>
**Subject:** [External] Hunter Subdivision Project

I live at the back of VV MHP. One advantage of living back here is the quiet and views. I am greatly concerned about potential noise, traffic, water and sewage availability, and possible property devaluation.

38-1

What steps are being taken to lessen the negative impact on the VV MHP residents?

Thank you,
Chris Echols
11 Del Rio Court

INTENTIONALLY LEFT BLANK

# Response to Letter 38
## Chris Echols
## October 17, 2021

**38-1** The comment states his general concerns related to noise, traffic, water, sewer capacity, and property devaluation.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. However, the Project's impact on noise, transportation, water, and sewer capacity are analyzed in Sections 3.11, Noise and Vibration; 3.14, Transportation and Circulation; and 3.13, Utilities and Service Systems in the Draft EIR. The commenter's concern related to property devaluation is an economic concern that is not required to be evaluated in an EIR. As described in Section 3.13, the Proposed Project would not exceed the City's current permitted wastewater treatment plant capacity; also, pursuant to Municipal Code Section 3.32.020, the City collects development impact fees on new development to pay for public improvements related to sewer projects. The Project applicant would be required to pay these fees, which would help fund upgrades and improvements to the City's sewer system. Please see Master Response 2, related to water concerns and Master Response 4 that addresses sewer issues.

The analysis of noise associated with Project construction and operation is included in Section 3.11, Noise. Noise associated with construction activities is often the most annoying to nearby residents. As discussed on page 3.11-16, the City exempts construction activity noise if conducted during specific limited daytime hours. The City's Health and Safety Code (Chapter 8.24 of Title 8, the Health and Safety Code) requires noise generating construction activities (including demolition, excavation, and building construction), be restricted to the hours between 8:00 a.m. and 5:00 p.m., Monday through Saturday, and prohibited on Sunday and holidays (City of St. Helena Chapter 8.24). This ensures that sensitive receptors are not disturbed by early morning or late night activities. However, the City's 1993 General Plan includes Implementing Policy 8.3.11, which states "Require construction operations to use noise suppression devices and techniques and limit noisy construction activities to the least noise sensitive times (8 a.m. to 5 p.m., Monday through Friday)." Note, the City's 2019 General Plan does not include this requirement. Due to the proximity of residences to the Project site and the potential for construction noise to be an annoyance, the impact is considered potentially significant and mitigation measure NOI-1 is required. This mitigation requires administrative controls, engineering controls, and/or installation of sound abatement. Installation of an effectively placed storage container or a temporary plywood or blanket barrier on a portion of the site boundary that blocks line-of-sight between the source(s) of noise emission and the receptor of concern (e.g., residence) would be expected to provide a minimum of 3-5 dBA of noise reduction. Compliance with the City's Health and Safety Code and mitigation measure NOI-1 would address construction noise (p. 3.11-16). Noise

associated with Project operation which primarily is related to an increase in traffic was modeled to determine if the City's noise standards would be exceeded. Project-related traffic noise increases along roadways where the Project would contribute trips would in all cases be less than 1 dBA, as shown in Table 3.11-8. Such increases would be well below the 3 dB perceptible increase threshold and below the City's noise standards (p. 3.11-20). Thus, impacts are less than significant.

Comment Letter 39

**Subject:** [External] COMMENT TO PLANNING COMMISSION and the AGENDA ITEM

We are writing to register our strong objections to the proposed Hunter Subdivision on the east side of St. Helena. While we recognize the need for more housing in the Napa Valley, and low cost housing in particular, we find the Draft EIR for this project inadequate in several ways. 39-1

The DEIR seems particularly short sighted in its assessment of water supply to the proposed 80+ households. Because St. Helena's current water shortage has put all residents and businesses in the city under strict water rationing, the idea of adding a significant number of homes to our already inadequately supplied town simply does not make good sense. Yes, droughts come and go, and we might hope for relief at some point in the future, but climate change is real, it is here now, and using past water supply and usage figures to predict future needs is foolhardy. More to the point, the idea that retrofitting 333 households with more efficient fixtures will result in an adequate supply of water to this development is dubious to say the least. We would assert that, given our history of droughts, most St. Helena residents have already upgraded to water efficient toilets and showerheads in recent years; how will the city or the developer identify households to be retrofitted? What data shows that sufficient water would be the result of this retrofit? How can the developer claim the existing well proposed as the source of landscaping irrigation can supply sufficient water in future years? How can the DEIR claim that this proposed subdivision does not significantly impact St. Helena's water supply? 39-2

Another area of concern is the health and safety of households built behind the levee in the event of flooding. The plan and DEIR are based on a two hundred year flood plain projection which strikes us as overly optimistic in the extreme. Again, climate change makes such assumptions risky; better to plan for the worst and hope for the best. To make matters worse in this regard, we understand neither the Army Corps of Engineers nor FEMA have inspected and certified that the levee meets required standards. What if the levee fails because of shoddy construction or inadequate maintenance? The idea that households in the proposed project could shelter upstairs in the event of a flood is both cold hearted and cynicall Who pays for the property damage in that case? The developer? The city? What would that do to the city's finances and the city taxpayers? 39-3

Traffic impacts are another major concern. Hunt and Starr Avenues are already full of cars going too fast and trying to circumvent Hwy 29 traffic. Adding more houses along an extended Adams Street and Starr Avenue will only make matters worse since the only points of entry and exit are Adams or Hunt connecting to Hwy 29, or Starr connecting to Pope Street. We fail to see how the proposed development meets its goal of "minimizing traffic related impacts" as stated in the Project Objectives. What happens if we have a major earthquake or fire or flood? Residents in our neighborhood already have few options given the traffic on Hwy 29 and the very limited capacity of the Historic Pope Street bridge. The DEIR states that, "given the project is so flat, the proximity to hilly terrain or landslides due to post-fire conditions would not be a concern." That is laughable since the Silverado trail is closed just north of Pope Street right now because of a landslide caused by rain! How can the DEIR claim to have found "no significant impact with regard to wildfire" given the present conditions? Adding more households to this residential neighborhood as proposed will result in more dangerous conditions in an emergency and should not be approved by the Planning Commission. 39-4 39-5

As residents of St. Helena we are grateful for the opportunity to express our concerns about this proposed subdivision. We hope the Planning Commission and the City Council will think carefully about all proposed developments, who benefits from them along with who does not, how the city can accommodate them fairly and support them with adequate city services, and what is the right thing to do for the whole community.

39-6

Sincerely,
Cindy and John Ford

# Response to Letter 39
## Cindy and John Ford
## November 1, 2021

**39-1** The commenters express their general opposition to the Project and Draft EIR.

The commenters' opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**39-2** The comment raises concerns about the City's water supply and Draft EIR's assessment of water supply impacts. The commenter takes issue with the effectiveness of the City's Water Neutral Policy and how it is used in the analysis of the proposed Project's water demand. The comment also questions whether existing groundwater resources could sufficiently serve the Project.

The City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code requires new development to "completely offset its water requirement" by identifying residential or non-residential properties eligible for retrofitting with water efficient hardware and verifying that the required number of retrofits have been completed prior to the issuance of a certificate of occupancy (DEIR p. 3.13-21). To accomplish this the City requires all applicants to prepare a Water Neutral Report identifying compliance. Adherence to the City's Water Neutral Policy and Municipal Code to fund such measures as fixing an existing leaking water conveyance pipe would offset demand by increasing water supplies compared to the existing conditions of water losses due to the leak. As a result, compliance with these requirements offsets new water demands with measures that reduce demand elsewhere or otherwise increase water supplies. Therefore, compliance with the City requirements is an appropriate and effective measure to include in the analysis of the Draft EIR. See also Master Response 2.

As discussed on page 3.9-43 of the Draft EIR, the aquifer where the Project is located on is known to be a productive alluvial aquifer, and therefore, there would be sufficient yield available from the on-site well to supply the Project's landscape irrigation demand as also demonstrated by the findings of the site-specific well pump test conducted on the existing agricultural well on the Project site. The proposed rate of pumping is relatively low and the resulting radius of influence would be highly localized, and greatly overshadowed by the radius of influence associated with the much higher producing agricultural and municipal supply wells in the surrounding vicinity.

**39-3** The comment expresses concerns related to the Project's proximity to the levee and the event of potential flooding. The comment specifically expresses concerns related to the current condition of the levee in terms of its inspections and certifications by

FEMA or the Army Corps of Engineers. The comment also questions who would be responsible for costs in the event of a major flood and subsequent potential property damage.

Please see Master Response 3 that addresses concerns associated with the levee and flooding.

**39-4** The comment expresses general concerns regarding traffic congestion along Hunt Avenue and Starr Avenue, as well as traffic connecting to Highway 29.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, the comment is noted and forwarded to the decision makers for their consideration and no further response is required.

**39-5** The comment expresses concern regarding landslides as well as the potential for emergency evacuation routes to be congested. The comment states that the sentence within the Executive Summary of the Draft EIR that states the "Project site is flat so fire hazards due to proximity to hilly terrain or landslides due to post-fire conditions would not be a concern" is false since there are presumably closures to Silverado Trail currently due to landslides caused by rain.

In 2018 the CEQA Guidelines, Appendix G, were updated to include a separate evaluation of wildfires. Appendix G focuses on those areas located "in or near state responsibility areas or lands classified as very high fire hazard severity zones." On page E-3 of the Executive Summary, it explains the Project site is not located within a state responsibility area and not designated as being within a very high fire hazard severity zone. Because the Project site is flat potential fire hazards associated with spread of wildfire due to sloped or hilly terrain would not be a factor. The closure of Silverado Trail due to mudslides associated with loss of vegetation is not applicable to this Project. Because the Project site is flat there would not be any hazards associated with mudslides. Please see Master Response 1 which addresses concerns regarding emergency access and evacuation routes.

**39-6** The comment thanks the City for the opportunity to comment on the Proposed Project and asks the City to review the Project's impact on the whole of the community.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**Subject:** [External] Public Comment November 2 PC Meeting

Dear Planning Commission,

I am commenting on Agenda Item 5.1. I will try and keep this rather brief. Other commenters have discussed some very large elephants that are in the DEIR room, and I would like to point out the Option 4 elephant that is standing in the corner. Option 4 seems conveniently buried at the bottom DEIR, but maybe they were saving the best for last. 40-1

St. Helena is running out of available space and time to even make a dent in the next RHNA cycle. Water and potential site flooding issues aside, maybe now is a good time for some discussion and consideration of low and affordable housing alternatives. Adams Street dead-ends at this parcel, is this where the can-kicking can finally stop? 40-2

Thank you,
Chris Fowler

# Response to Letter 40
## Chris Fowler
## October 30, 2021

**40-1** The comment expresses interest in exploring "Option 4."

It is assumed that "Option 4" is a reference to Alternative 4, which is described beginning on page 5-14 of the Draft EIR. The comment does not identify any specific areas where the Draft EIR analysis is inadequate. The comment does not identify any components of Alternative 4. Therefore, no further response is required. However, the commenter's interest in Alternative 4 is noted and forwarded to the decision makers for their consideration.

**40-2** The comment expresses interest in providing low and affordable housing in the City.

The Project proposes affordable housing as described in Chapter 2, Project Description. The Project applicant is also required to prepare an Affordable Housing Agreement for City review and approval. The comment does not identify any specific areas where the commenter believes the Draft EIR analysis is inadequate. Therefore, no further response is required. However, the commenter's interest in providing affordable housing is noted and forwarded to the decision makers for their consideration.

Comment Letter 43

**Tuesday, January 4, 22**

**Public Comment on Draft EIR for the Hunter Subdivision Project (Water Supply Discussion Only)**

Undersigned's comments are confined to the water supply discussion in the Draft Environmental Impact Report ("EIR"). They address factual matters and also comment on the applicant's "water neutrality" presentation. 43-1

1. Draft EIR page 3.13-3: the statement is made that "Average historical yield from the [Bell Canyon] reservoir is approximately 1,800 acre-feet per year." Yet, Table 3.13-1 shows potable water deliveries ranging in water years' 2013-20 from a high of 927 AFY (2013) to a low of 643 AFY (2016). In short, the "average historical yield," assuming "historical yield" means historical deliveries, is less than one-half of the 1,800 AFY asserted textually on page 3.13-3. 43-2

As a matter of historical interest, deliveries from Bell Canyon reservoir were much higher in the twenty-year period ending in 2007. But the City was not meeting its State permit-imposed bypass obligations in those years. As documented in the Baseline Report of the Water & Sewer Infrastructure Subcommittee ("Subcommittee Report") of the General Plan Update Steering Committee (June 24, 2010), page 5, the City overdrew the reservoir by on average 525 AF yearly in the period 1988-2007. (The Subcommittee's Report was thoroughly vetted by City Staff and was presented to the Council with no disagreement as to its factual statements.) 43-3

The subsequent steep drop in annual deliveries from the reservoir is largely attributable to the City's coming into compliance with its State permit-imposed bypass obligations. The EIR statement at page 3.13-4 is euphemistic: "In recent years, the annual yield from Bell Canyon Reservoir has declined significantly due to required water releases into the Napa River to support fish habitat and also from drought conditions." Rather, as stated in the 2010 Subcommittee Report, the releases came about in and since 2008 (not "recent") and came about due to a City policy change to abide by State bypass obligations. As the Draft EIR on page 3.13-6 indicates, Napa purchased water that was 43-4 43-5

1

expected to augment overall potable water supply basically did no more than replace water previously misappropriated from Bell Canyon.

43-5 Cont.

In fact, the historical yield of Bell Canyon varies greatly with rainfall in any given water year. This is documented on page 4 of the Subcommittee's Report. "Averages" conceal wide fluctuations in Bell Canyon productivity. The issue, long recognized, is the City's difficult water supply situation in successive (especially more than two) dry or very dry years. *See* discussion of Safe Yield Report, point 5 below.

43-6

2. Draft EIR page 3.13-3: the statement is made that "the City is authorized to divert and store 3,800 acre-feet from Bell Canyon Reservoir each year." This is incorrect. Correctly stated, the City's storage right is 1,800 AF – and NOT 3,800 AF.

43-7

The City's storage "right" was the subject of significant discussion among the undersigned, City Staff, and the Napa Local Agency Formation Commission ("Napa LAFCO") in fall 2020. Napa LAFCO, with the City's concurrence, in its Napa County Water and Wastewater Municipal Service Review Final ("Napa MSR Final" (November 2, 2021)), correctly states (in revision of the prior draft), on page 215: "Bell Canyon Reservoir is owned and operated by the City and has a storage capacity of 2,350 af, of which the City has a storage right of 1,800 af."

43-8

The 2010 Subcommittee Report, page 4, also correctly states the City's storage right. "The maximum amount that the City is allowed to **divert to storage** in any one year is 1,800 acre-feet." (Bolding in original) Again, the City approved this statement, after thorough discussion including with the undersigned, in spring 2010 prior to publication of the Subcommittee Report on June 24, 2010.

43-9

The 3,800 AF comes about by combining the storage right in State Permit 9157 (1,800 AF) and the forecasted additional storage right in State Permit 14810 (2,000 AF). Permit 14810 authorized the raising of the dam at Bell Canyon from 75 feet to 105 feet, which would have added 2,000 AF of new storage, but the dam was not raised, and the additional storage right was not earned. In consequence the City's storage right has remained at 1,800 AF, as set forth in Permit 9157.

43-10

2

3. Draft EIR pages 3.13-5 to 3.13-7 discuses Napa City's sources of water. This discussion is not relevant. As noted on EIR page 3.13-4, the City of St. Helena has a "take-or-pay" contract with the City of Napa. This means that our City in indifferent to Napa City's sources of water. Napa must supply the City's contracted-for water no matter what supply difficulties it may be experiencing with its own sources of water (including curtailed deliveries from the State Water Project). 43-11

4. Draft EIR page 3.13-7: the statement is made: "The City currently restricts the use of groundwater from [the Stonebridge Well Complex] with goal of limiting extraction to 450 AF per year for long term sustainability." The source of this statement is page two of the March 2011 Safe Yield Report. In general, the City's sourcing strategy has been to take the 600 AF from Napa, produce what it can from Bell Canyon consistently with satisfying its bypass obligations, and meet the remainder of potable water demand from its two production wells at the Stonebridge Well Complex. Table 3-13-1 shows annual well production in water years 2013-2020. It has on average been significantly less than 450 AFY, ranging from a high of 400 AFY (2013) to a low of 240 AFY (2019). To undersigned's understanding, the reasoning behind this strategy is to limit groundwater production as much as possible due to environmental concerns for the Napa River, which is a gaining river in our area (which means that groundwater helps to sustain flows in the river). In short, the City since 2011 has achieved a long-term average significantly below 450 AFY. 43-12 43-13

Having said that, the City delivered 576 AF from the Stonebridge Well Complex in the water year ending June 30, 2021, per monthly Water Report for June 30, 2021, posted in the Public Works section of the City's website under "Water." This represents 34.6% of total water year deliveries. This is significantly more on an absolute basis and also on a percentage basis than the City has produced at the Stonebridge Well Complex in any past water year going back to 1992, when the first of the Stonebridge production wells was completed. Undersigned's personal view is that production in this substantial amount will prove to be not sustainable. 43-14

5. Draft EIR page 3.13-8: the EIR presents Table 3.13-7, entitled "City of St. Helena Safe Yields." The Table in column 2 presents a total 43-15

3

normal water year safe yield of 1950 AF. The Safe Yield Committee presented this number in the Report of the Safe Yield Committee (March 17, 2011). As stated in its Report, page 3, the Committee calculated the *net* safe yield, after taking into account "unavailable water," at 1658 AF. ("Unavailable water" is the volumetric difference between metered water deliveries at delivery sources – Bell Canyon, City Wells, Napa Water Delivery Point in Rutherford -- and metered water deliveries to customers. There are a number of factors that account for lesser metered sales' volumes than metered input volumes from the City's three sources of water, with system distribution leaks likely playing a significant part in accounting for the difference.)

43-15 Cont.

The "net safe yield" represents the Safe Yield Committee's assessment (in 2011) as to the water quantity available for sale while meeting the definition of "safe yield" as defined by the Safe Yield Committee (and subsequently adopted by the Council.) As defined by the Committee, the "safe yield" is the quantity of water needed to supply the City through most rainfall years, including a dry year, without water shortage restrictions. The Committee's definition continued: "It is recognized that the safe yield, as so defined, could place significant hardship on water customers in a Critically Dry Year (rainfall at 21.9 or less) or in periods of two or more Dry Years."

43-16

As important, there have been supply changes since the Safe Yield Committee did its work more than ten years ago that could affect the "safe yield" calculation. In particular, Bell Canyon may have been less productive than the Committee modeled. The Safe Yield Committee assumed that the Water Enterprise would purchase 200 AF (over the 600 AF) of option water when available; in the last decade there has been no purchase of Napa contract option water. At the same time, the City has benefitted from changes in the Napa contract, especially the yearend 2011 contract amendment. The City also appears to be under environmental and legal pressure to reduce pumping from the Stonebridge Well Complex. The basic point here is that the City should undertake a re-assessment of the "safe yield' and "net safe yield" of its potable water delivery system.

43-17

43-18

Indeed, the Safe Yield Report concludes: "the City should re-determine the usage/supply balance at the end of each fiscal year in the

43-19

ordinary course of business at the Water Enterprise. This will require recalculation each year of the forward-rolling, five-year average total potable water usage. It should also take into account any changes in supply conditions." The EIR does not cite to work subsequent to 2011 along these lines by the City.

43-19 Cont.

6. Draft EIR page 3.13-8: the statement is made that "the Louis Stralla Treatment Plant (WTP) is "located on Crystal Springs Road in the northeastern part of the City [citations omitted]." The WTP is located on Crystal Springs Road, but it is not within contiguous City limits in what would generally be understood as "the northeastern part of the City," namely City limits near Deer Park Road and Silverado Trail. Rather, the WTP, while in City limits, is northeast of contiguous City limits and is surrounded on all sides by Napa County lands. See Figure 1.3, NAPA MSR Final. (Following a convincing documentary showing by LAFCO in the final phases of the draft MSR in the fall of 2020, the City advised undersigned that it would revise City maps to show that the City-owned land at Bell Canyon reservoir is within City limits.) Succinctly, Bell Canyon sits on City land, within City limits, which is an island surrounded by County lands.

43-20

7. On page 3.13.10 the EIR, in the last bullet point on that page, notes that the 2010 Water Supply Plan recommended, among other recommendations, "a water rate structure that will ensure adequate program funding while encouraging water conservation by accounting for reduced water consumption in the base water rate and increasing high-tier rates." Unfortunately, this recommendation was not consistent with the subsequently decided decision in *Capistrano Taxpayers Assn. v. City of San Juan Capistrano*, 235 Cal.App.4th 1493, modified (with no change in judgment), 236 Cal.App.4 th1123a (2015). The California Supreme Court denied review, and the *Capistrano* case became the accepted law in California. In accordance with the *Capistrano* case, the City (like many California cities) abandoned tiered rates in its last (2016) rate increase, bringing its rate structures into compliance with State Proposition 218 as interpreted and implemented by the *Capistrano* case. In consequence, it is not possible to incentivize conservation through tiered rates whereby higher volume customers pay more per unit of consumption.

43-21

5

8. A comment on the Municipal Code Section 13.12.030, discussed at Draft EIR pages 3.13-21/22 & 3.13-24/25 ("water neutrality" issue). As the applicant states, City policy requires that new development offset completely its potable water use. The applicant estimates annual indoor water demand at 20 AFY (rounded). This is not a small amount to offset through off-site water efficiency improvements.

The Municipal Code (section 13.12.030D) places the burden on the applicant-developer to identify properties eligible for retrofitting. Ideally, the developer should not be able to shift the burden of offsetting new water use through an in-lieu fee from itself to the City. Rather, certificates of occupancy should not issue unless and until the developer shows that it has effectively offset the potable water usage of new housing units at the time it seeks occupancy permits. 43-22

In EIR Appendix J, applicant's "Water Neutral Report," prepared by RSA+, a civil engineering firm, RSA+ calculates that 333 off-site residences would need to be retrofitted with water-saving fixtures to achieve an annual off-set savings of 20 AF, calculating the total cost (labor and materials) at $600,000 (rounded). In its conclusion RSA+ seems to recognize the impracticality of locating and retrofitting such a large number of residences on the City's potable water system. 43-23

The RSA+'s conclusion states: "The offset of the water project demands may *best* be met through assisting the City of Sr. Helena with existing water system improvements via in-lieu fees. The project will pay $596,808 as an in lieu fee equal to the cost of retrofitting enough residences with low flow fixtures to achieve savings equal to the proposed use." Italics added.

In short, the applicant appears to be proceeding on the premise that the Council, as it has discretion to do under the Municipal Code (section 13.12.030B), will accept an in-lieu fee, equal to the cost of residential water efficiency upgrades, in place of the upgrades themselves. 43-24

In my opinion it is reasonable to conclude that retrofitting 333 off-site residences is "impractical," which is a basis for Council acceptance of an in-lieu fee under the Municipal Code (section 13.12.030B). At this

juncture, with the water efficiency program in place for many years, it would appear to be both difficult not just to locate a sufficient number (333) of residences in need of water efficiency upgrades and also to persuade eligible residents to undertake paid-for water efficiency improvements. There are no doubt administrative issues for both the developer and the City that would make such a large retrofit program difficult to accomplish successfully. Based on my own experience with our (thinly) staffed City Government, I am skeptical, to put the matter mildly.

43-24 Cont.

But there also appears to be a disconnect between the $600,000 in-lieu fee proffered by the applicant, calculated by the applicant in Appendix J as the total cost (labor and materials) of retrofitting 333 residences, and the in-lieu fee necessary to accomplish a reduction of 20 AFY through improvements in the City's water distribution system. It does not equate to say that if the City spends $600,000 on water distribution improvements, it will in fact achieve 20 AF in annual potable water savings. The goal of the water neutrality policy is to ensure neutrality is achieved, and indeed achieved commensurate with the time that the water system must respond to the new demand. Hence the City needs to identify a specific system improvement or improvements that will in fact offset the 20 AFY in new development usage. This statutory requirement is not achieved by allowing an in-lieu fee with no shovel-ready, offsetting improvements ready to go.

43-25

Then there is the further question of the amount of the in-lieu fee, if the Council decides to accept an in-lieu fee. The Municipal Code (section 13.12.030B) reads: "If the city council determines that retrofitting existing residential or nonresidential buildings is impractical or constitutes an unusual hardship on an applicant, it may authorize the payment of to the city of an in-lieu retrofit fee in lieu of complying with the requirements of subsection A of this section." Subsection A deals with the calculation of the number of retrofits. It is silent on the calculation of the in-lieu fee. The Council appears to have unfettered authority in fixing the amount of the fee. Assuming this is correct, the fee should be in an amount sufficient to pay for system improvements that in fact accomplish an offsetting 20 AFY reduction.

43-26

7

For example, if a system improvement to achieve a 20 AFY offset costs $1,250,000, then that should be the amount of the fee. Conversely, if a system improvement to achieve a 20 AFY offset costs $250,000, then that should be the amount of the fee. If a system improvement results in more than a 20 AFY reduction, then it may be appropriate for the Water Enterprise (ratepayers) to share in the cost, such that the applicant is paying a ratable amount equal to the cost of achieving a 20 AFY reduction. Now, it may be difficult, perhaps impossible, to quantify water savings associated with a specific system improvement, especially improvements designed to reduce unmetered losses in the distribution system ("unavailable water"). Still, the objective in accepting an in-lieu fee is ensuring that the new usage (20 AF) is completely offset, and the applicant should bear the burden of that cost, whatever it is.

43-27

9. The applicant assumes that it can lawfully satisfy landscaping water demand through a well on the applicant's property. This may well be correct, but it may not be a complete given. The County's Groundwater Sustainability Agency ("GSA") is addressing the issue of groundwater withdrawals (diversions), with GSA approval of the Groundwater Sustainability Plan ("GSP") due by January 31. 2022. (That is not the end; the State Department of Water Resources ("DWR")) will then be review and approved/disapproved the GSP within the following two years.) The City, Planning Commission, and/or City Council should review the applicant's proposed groundwater usage for conformity with the GSP following GSA approval of the GSP in early 2022.

43-28

Respectfully submitted,

Alan Galbraith

Member, GSPUC Water & Sewer Infrastructure Subcommittee, 2009-10
Member, Safe Yield Committee, 2010-11
Member, Groundwater Resources Advisory Committee, 2011-14
St. Helena Mayor, 2014-18

Member, Groundwater Sustainability Plan Advisory Committee, 2020- to date

## Response to Letter 43
### Alan Galbraith
### December 9, 2021

**43-1** The comment notes that the points raised in the letter are specific to the water supply discussion and address factual issues as well as the Project applicant's water neutrality proposal.

Please see Master Response 2. The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Therefore, no further response is required.

**43-2** The comment refers to information specific to the average historical yield from the Bell Canyon reservoir and potable water deliveries available to the City and questions the accuracy of the information provided.

The reported average historical yield of 1,800 acre-feet per year is the accurate figure that was used in the Draft EIR for the 2040 St. Helena General Plan Update and was based on reporting by Luhdorff and Scalmanini in their Groundwater Sustainability Report in 2016 (found here: https://www.napawatersheds.org/managed_files/Document/8266/Napa%20Valley%20Subbasin%20Basin%20Analysis%20Report_2016_sm.pdf). This reported historical average is not be confused with the more recent numbers that are listed in Table 3.13-1 of the Draft EIR. The more recent average is indeed much less than the historical average as reported by Luhdorff and Scalmanini in 2016.

**43-3** The comment cites to a technical document prepared by the city's Water and Sewer Infrastructure Committee that address deliveries to Bell Canyon reservoir prior to 2007.

Please see Master Response 2. The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Therefore, no further response is required.

**43-4** The comment is referring to why there was a decline in water deliveries to Bell Canyon (after 2007) due to compliance with state permit requirements.

Please see Master Response 2. The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Therefore, no further response is required.

**43-5** The comment refers to information in the Draft EIR noting that Napa County purchased water that was expected to add to the overall water supply but ended up only replacing water that had been misappropriated.

Please see Master Response 2. The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Therefore, no further response is required.

**43-6** The comment is noting that the historical yield of Bell Canyon reservoir fluctuates annually depending on rainfall amounts and cites to a report prepared by the city's Water and Sewer Infrastructure Committee. This challenges the City to supply water during successive dray water years.

Please see Master Response 2. The comment does not identify any specific areas where the EIR or analysis is inadequate. Therefore, no further response is required

**43-7** The comment states information in the Draft EIR addressing the amount of water the City is authorized to divert and store is incorrect.

The commenter correctly notes that the amount of water the City is authorized to divert and store from Bell Canyon Reservoir is 1,800 acre-feet or AF. The Draft EIR text on page 3.13-3 will be corrected to read 1,800 AF and is included in Chapter 3, Changes to the Draft EIR. Note that the water supply analysis (see Impact 3.13-2 on p. 3.13-31), does not rely on either the 3,800 AF number or 1,800 AF. The analysis uses the more conservative "safe yield" of 1,000 AF for a normal dry year (see Table 3.13-7). Therefore, this comment does not result in any change to the impact analysis and significance finding.

**43-8** The comment is providing background on the storage capacity of Bell Canyon reservoir and the amount the City's storage rights.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. See Response to Comment 43-7. No further response is required.

**43-9** The comment is referring to a 2010 Subcommittee Report which notes the City's storage right of 1,800 AF.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. See Response to Comment 43-7. No further response is required.

**43-10** The comment describes where the 3,800 AF amount was derived from and references Permit 14810 that authorized raising the dam at Bell Canyon reservoir to 105 feet to permit more water storage.

Please see Response to Comment 43-7. The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Therefore, no further response is required.

**43-11** The comment dismisses the need to discuss the City of Napa's water sources and states it is not relevant because the City has a "take or pay" contract with the City of

Napa so the source of the City of Napa's water is of no consequence to the City of St. Helena.

The commenter's opinion regarding the information contained in the environmental setting for water supply source in Section 3.13, Utilities and Service Systems is noted. The information provided in the Draft EIR regarding the City of Napa's water sources is provided because the City of St. Helena has a contract with the City of Napa for water and this is part of the environmental baseline.

**43-12** The comment refers to the amount of groundwater the City obtains from the Stonebridge Well Complex.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Therefore, no further response is required. Please see Master Response 2 for additional information.

**43-13** The comment explains why the City limits extracting groundwater from the Stonebridge Well Complex to minimize impacting the Napa River

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Therefore, no further response is required. Please see Master Response 2 for additional information.

**43-14** The comment indicates that based on information provided on the City's website, the City has increased its allotment of groundwater from the Stonebridge Well Complex by approximately 35% in 2021, which the commenter opines is not sustainable.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Therefore, no further response is required. Please see Master Response 2 for additional information.

**43-15** The comment references Table 3.13-7 in the Draft EIR and compares the information in this table to information provided by the Safe Yield Committee.

The comment does not draw any conclusions or question the data provided in Table 3.13-7 (DEIR p. 3.13-8). Therefore, because the comment does not identify any specific areas where the Draft EIR is inadequate, no further response is required. Please see Master Response 2 that addresses water supply.

**43-16** The comment discusses the 'net safe yield' as defined by the Safe Yield Committee and notes that this net safe yield could affect the availability of water during critical dry years.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. Please see Master Response 2 for additional information.

**43-17** The comment addresses changes that could affect the 'safe yield' calculation due to changes in water availability.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. Please see Master Response 2 for more information on water availability.

**43-18** The comment suggests that the City is under "environmental and legal pressure" to reduce groundwater pumping from the Stonebridge Well Complex and suggests that the City should reassess the 'safe yield' and 'net safe yield' water assumptions.

The comment does not identify any specific areas where the EIR or analysis is inadequate; therefore, no further response is required. Please see Master Response 2 for additional information.

**43-19** The comment references conclusions of the Safe Yield Report which requires annually recalculating the average total water usage and account for changes in water supply. The comment notes the Draft EIR does not cite work prior to 2011 that speaks to these conclusions.

Water supply deliveries for the years 2013 through 2020 are included in Table 3.13-1 on page 3.13-3 of the Draft EIR.

**43-20** The comment states the Draft EIR incorrectly characterizes the location of the Louis Stralla Treatment Plant as being within the City limits.

See Chapter 3, Changes to the Draft EIR for a text change to page 3.13-8 of the Draft EIR to more accurately describe the location of the water treatment plant. This text change does not affect the analysis of this issue in the Draft EIR.

**43-21** The comment opines that a recommendation from the City's 2010 Water Supply Plan is not consistent with a 2015 court case that eliminated the ability to use tiered rates to incentivize water conservation.

The referenced bullet point in the Draft EIR on page 3.13-10 is merely providing background information related to the 2010 Water Supply Plan and recommendations that were contained within that document. The analysis within the Draft EIR does not rely on whether the referenced recommendations have legal viability. However, the comment is noted and forwarded to the decision makers for their consideration.

**43-22** The comment opines that the Project's water demand of 20 AFY (rounded up) is not a small amount to be offset through water efficiency improvements.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. However, Master Response 2

addresses the Project's compliance with the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**43-23** The comment is referencing the Project applicant's Water Neutral Report, included as Appendix J and notes that retrofitting 333 off-site residences or paying an in-lieu fee would meet the requirements of the City's policy.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. However, Master Response 2 addresses the Project's compliance with the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**43-24** The comment opines that payment of the in-lieu fee would be more practical than trying to find 333 residences to retrofit.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. However, Master Response 2 addresses the Project's compliance with the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**43-25** The comment states a concern that payment of an in-lieu fee without identifying where that money would be spent to off-set the Project's increase in water demand is needed for the City to meet the intent of the policy.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. However, Master Response 2 addresses the Project's compliance with the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**43-26** The comment addresses how the City calculates the in-lieu fee and notes the fee should be in an amount that is sufficient to off-set a 20 AFY increase in water demand.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. However, Master Response 2 addresses the Project's compliance with the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**43-27** The comment states an opinion that the in-lieu fee be sufficient to off-set the Project's increase in water demand to meet the intent of the City's Water Neutral Policy.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. However, Master Response 2 addresses the Project's compliance with the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**43-28** The commenter notes the Project intends to use the existing well for landscaping but states that the County's Groundwater Sustainability Plan (GSP) has not yet been adopted by the County, Department of Water Resources, or the City.

The Project is proposing to use the on-site agricultural well for all public and private landscape irrigation. As discussed in the Draft EIR on page 3.9-42, the total water demand of the Proposed project that would likely be sourced from groundwater including both the onsite well and water that would be supplied from the Stonebridge Complex would only represent 0.9% increase in demand. Of that, the water from the onsite well would be less than half that amount. Otherwise, the GSP for the Subbasin which has not yet been completed, as the comment notes, and suggesting that there could be a potential conflict with that document would be considered conjecture which is outside the scope of CEQA. However, as stated on page 3.9-40 of the Draft EIR, in a recent assessment of the groundwater conditions, Napa County and its technical consultant have determined that the Subbasin is not exhibiting significant and unreasonable impacts with regard to the applicable sustainability indicators defined by the Sustainable Groundwater Management Act (SGMA). As a result, there is sufficient evidence to support a conclusion of a less-than-significant impact related to use of the onsite groundwater well.

Comment Letter 44

To: Xinia Gamero <XGamero@cityofsthelena.org>
Subject: [External] Hunter Project

Hello Ms. Gamero,

Along with all the arguments against the Hunter Project such as severe water scarcity, increased global warming with more gas vehicle emissions, destroying an established in-place bike/walkability access to grocery stores, the pharmacy and downtown shopping, essential to cities for their citizens and businesses. 44-1

I'd like to submit the issue of safety for seniors at Vineyard Valley and all local First Responders.
Presently, half the senior residents of VV Park evacuate to the main drive to the South exit of the park onto Pope St., while all First Responders enter into VV on the right side of the entrance driveway, off of Pope St. safely passing each other.
The other half of VV residents exit to the trail at the north end of the park, where the Hunter Project is under consideration.
Without that North access, all senior residents of VV Park will be forced to get onto the main drive at the same time, going the same way. Time is of the essence! 44-2
If an evacuation order were in effect again, the senior residents could possibly be stranded in a fire evacuation and First Responders would be hindered in their ability to evacuate the park and start protective measures. A life and death situation is very possible for both the senior residents and the First Responders. Delays could prove deadly!

I also have a question. If a loss of life should occur because of the passing of this project, would the city be prepared for probable lawsuits for their actions limiting access to safety for senior residents and First Responders? 44-3

Thank you,
Dottie Gingerelli

# Response to Letter 44
## Dottie Gingerelli
## October 30, 2021

**44-1** The comment generally mentions the Project's potential impact to water supply, vehicle emissions, and bicycle and pedestrian facilities.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**44-2** The comment expresses concern related to emergency evacuation for Vineyard Valley residents.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. However, emergency evacuation was analyzed Section 3.14 of the Draft EIR and Project impacts were concluded to be less than significant. Please also see Master Response 1, for more details related to emergency evacuation for both Vineyard Valley residents and Project residents.

**44-3** The comment poses a question related to the potential loss of life due to the Project.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

INTENTIONALLY LEFT BLANK

Comment Letter 45

Honorable Planning Commission Chair and Commissioners,

As you review the Hunter Project, it is important to note the long and complicated history of this project and the behaviors of this Santa Rosa Casino Development Applicant. During the decade long history, the applicant has sued the city multiple times, forced the city to construct the levee around his property (by refusing to allow access for the flood protection of the senior community of Vineyard Valley), refused to supply documentation on numerous items requested by city staff such as movement of tons of soil, updated soil testing and maps, affordable housing plans that comply with the St Helena Housing Ordinance, Density bonus plans and any specific information regarding the size, bedrooms, bathrooms, etc. for each housing unit which is necessary to calculate traffic, water use, etc. 45-1

The project violates the HCD approved St Helena Housing Element in numerous ways including the continued segregation of low income housing, the requirement that the affordable housing must be spread throughout the project., and must be "for sale" as well as apartments. St Helena has illustrated distinct and repeated actions that segregate low income housing from market rate neighborhoods – as evidenced by 98% of ALL affordable and multi-family housing being placed on the East side of St Helena. It has created an undeniable "other side of the tracks" situation, and despite the claim that the land is more affordable on the East Side, the State of California does not accept that as a waiver of the law. In fact, that exact argument serves to aggravate the segregation of neighborhoods by conveniently ruling out the possibility for any diverse housing or socioeconomic and racial diversity in those neighborhoods. 45-2 45-3

Not only does this project propose 25 new units of affordable restricted housing on the East Side, it is designed specifically to place the affordable apartments immediately adjacent to the existing multi-family housing along Adams rather than distributing it through the rest of the market rate housing as is required by other St Helena Housing Element and laws. 45-4

Attached is a professional perspective from a housing segregation expert describing the situation in St Helena. 45-5

The city and you personally, stand to face discrimination claims, and lawsuits if you continue to make decisions in violation of the St Helena ordinances as well as the State's laws by perpetuating the long pattern of housing and racial segregation in St Helena. To date, realtors in St Helena list housing on the West Side of town as "preferred side of town" or "the desirable West Side". Even realtors know exactly what has been done and use it to realty sales advantage. 45-6

You are now informed, and with a full read of the St Helena ordinances, zoning codes 17.144 and 17.146, the Housing Element and General Plan as well as new California laws to prevent housing discrimination and segregation, citizens should be assured that you will do what is required by law, and not put the city or yourselves at risk for litigation and embarrassment of being an ongoing segregated city. Do not give this Santa Rosa developer who has no interest in following our laws put us in an embarrassing and legal situation for his own personal financial gain. 45-7

You will certainly hear from the applicant that he is "helping St Helena housing", when in fact this project will provide a mere 5 units of very low income housing and the previously proposed affordable housing second units (ADU's) will be above moderate - which is simply market rate. So in what sense does this enormous subdivision, that is wholly reliant on our levee where we have full liability, causes unmitigable traffic at one of the ONLY exits out of the city, eliminated the proposed Adams St extension 45-8

to the Trail, further segregates our city, and exacerbates our ongoing severe water shortages helpful to us? Please do not play his game. Please stand up to protect this city, its resources, its liability and its integrity. If not you, then who? 45-8 Cont.

Thank you.

Sincerely,
Diane Green
Daniel Wheaton
Mark Arnett
Carl Barnes
Gary Oncina
James Pelligri

## Response to Letter 45
### Diane Green, Daniel Wheaton, Mark Arnett, Carl Barnes, Gary Oncina, James Pelligri

**45-1** The comment states that it is important to note the history of the Project and actions by the Project applicant, including litigation and refusal to supply documentation requested by City staff.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

Please see Responses to Comments 45-2 and 45-4 regarding compliance with the City's Inclusionary Housing Ordinance and Response to Comment 84-3 regarding the density bonus.

**45-2** The comment states that the Project violates the "HCD-approved" St. Helena Housing Element through the segregation of low-income housing from market rate housing and not spreading the units throughout the Project site and including units for sale.

The comment does not address the adequacy of the Draft EIR, but instead expresses the commentor's opinion about the project. However, as part of the applicant's future Affordable Housing Agreement proposal, as required under the City's Inclusionary Housing Ordinance, there must be demonstration that the Project be consistent with the City's Affordable Housing Ordinance and be "spread throughout the Project" (Municipal Code 17.146.050 (I)). Housing Element Implementing Action HE4.A would require that affordability levels of inclusionary units in a project be "further distribut[ed] … within the various income categories." Any determination of compliance with the City's requirements for affordable or inclusionary housing will be made at the time that the applicant submits a formal application for an Affordable Housing Agreement. Such an Agreement will need to be approved by the City Council following the Tentative Subdivision Map approval but prior to the Final Map being recorded and before any development of homes can take place.

**45-3** The comment suggests that the segregation of low-income housing from market rate neighborhoods only within the eastern area of the City limits the possibility for diverse housing and socioeconomic and racial diversity in those neighborhoods (in the western area of the city).

Please see Response to Comment 45-2. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**45-4** The comment opines that the Project strategically places the affordable units adjacent to the existing multi-family housing along Adams Street rather than distributing units throughout the rest of the market rate housing, as required by the St. Helena Housing Element.

Please see Response to Comment 45-2.

**45-5** The comment references an article about housing segregation in St. Helena.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**45-6** The comment alleges that the City and Planning Commissioners may face discrimination claims and lawsuits due to housing and racial segregation by not requiring affordable housing in the western area of the City in violation of City ordinances and state law.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**45-7** The comment refers to Zoning Code sections 17.144 and 17.146, the Housing Element and General Plan as well as new California laws to prevent housing discrimination and segregation.

Please see Response to Comment 45-2. The comment does not identify any specific areas where the EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**45-8** The comment suggests that the Project does not propose enough affordable housing relative to the impacts on traffic, water supply, housing segregation, and liability due to flooding. The comment also references that the Project eliminates the proposed Adams Street extension connecting to Silverado Trail.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 2 regarding water to serve the Project and Master Response 3 that addresses concerns regarding the levee. The Proposed Project does not eliminate the future extension of Adam's Street connecting to Silverado Trail. The Project does not require Adam's Street be extended any farther east of Starr Avenue. Any extension of Adams Street connecting to Silverado Trail would require further study and approval by the City and is not required for this Project.

An attachment to this letter can be found in Appendix B

Comment Letter 46

From: Diane Green <dgreenhagg@gmail.com>
Date: Tue, Nov 2, 2021 at 2:04 PM
To: <planningcommission@cityofsthelena.org>, <cityclerk@cityofsthelena.org>

Honorable Planning Commission Chair and Commissioners,

As you review the Hunter Project, it is important to note the long and complicated history of this project and the undesirable behaviors of this Santa Rosa Casino Development Applicant. During the decade long history, the applicant has sued the city multiple times, forced the city to construct the levee around his property (by refusing to allow access for the flood protection of the senior community of Vineyard Valley), refused to supply documentation on numerous items requested by city staff such as movement of tens of tons of soil, updated soil testing and maps, affordable housing plans that comply with the St Helena Housing Ordinance, Density bonus plans and any specific information regarding the size, bedrooms, bathrooms, etc. for each housing unit which is necessary to calculate traffic, water use, etc. The EIR is insufficient because as stated by a Dudek Rep at the last Public meeting on this topic - "We cannot do an EIR without size of homes, bathrooms, etc. or any density bonus information." This is on tape. 46-1

The inadequacy of the EIR is also that the project violates the HCD approved St Helena Housing Element and our own housing laws 17.144 and 17.146. For example, the continued segregation of low income housing, the requirement that the affordable housing must be spread throughout the project, and must have some "for sale" units that are below market rate. 46-2

St Helena has illustrated distinct and repeated actions that segregate low income housing from market rate neighborhoods, as evidenced by 98% of ALL affordable and multi-family housing being placed on the East side of St Helena., and often in separate apartment projects.

It has created an undeniable "other side of the tracks" situation, and despite the claim that the land is more affordable on the East Side, the State of California does not accept that as a waiver of the law. In fact, that exact argument serves to aggravate the segregation of neighborhoods by conveniently ruling out the possibility for any diverse housing or socioeconomic and racial diversity ever in those neighborhoods because "it's too expensive for that. over here" Without City intervention and enforcement of our own anti-segregation requirements of projects like this to ensure a mix of housing types for variable income families, you contribute to maintaining a "put them in groups over there" kind of St Helena. 46-3

You can see that hte 25 new units of affordable restricted housing on the East Side is designed specifically to place the affordable apartments in a "project" immediately adjacent to the existing lower income multi-family housing along Adams rather than distributing it through the rest of the market rate housing AS IS REQUIRED by St Helena Housing Element, St Helena laws, ordinances as well as CA Statelaws against discrimination. And NONE are for sale which is also required. 46-4

Attached is a professional perspective from a housing segregation expert describing the situation in St Helena. 46-5

The city and you personally, stand to face discrimination claims and lawsuits if you continue the trend of decisions that violate of the St Helena stated goals and ordinances as well as the State's laws by 46-6

perpetuating the long pattern of housing and racial segregation in St Helena. We all know and see that realtors in St Helena list housing on the West Side of town as "preferred side of town" or "the desirable West Side". Even realtors know exactly what has been done, and use it to realty sales advantage. 46-6 Cont.

With a full read of the St Helena ordinances, zoning codes 17.144 and 17.146, the Housing Element and General Plan as well as new California laws to prevent housing discrimination and segregation, citizens should be assured that you will do what is required by law, and not put the city or yourselves at risk for litigation and embarrassment of being an ongoing segregated city. Do not give this Santa Rosa developer who has no interest in following our laws and actually does not want to work within our city's own clearly stated goals of changing from "the other side of the tracks" city where we put our diverse and lower income population into segregated projects. It's not who we are, so don't let this uber wealthy and questionable casino developer put us and you in an embarrassing and legal situation for his own personal financial gain. 46-7

You will no doubt hear from the applicant that he is "helping St Helena housing", when in fact this project will provide a mere 5 units of very low income housing. On top of that, the previously proposed 11 affordable housing ADU's (ADU's) will now be "above moderate" - which is simply a clever way to say market rate. 46-8

So in what sense does this enormous subdivision, that further segregates our city, is wholly reliant on our levee where we have full liability, causes unmitigable traffic at one of the ONLY exits out of the city, eliminated the proposed Adams St extension to the Trail in his plans, and exacerbates our ongoing severe water shortages helpful to us? Please do not play his game. Please stand up to protect this city, its resources, its liability and its integrity as a welcoming and diverse place to live. If not you, then who? 46-9

Thank you.

Sincerely,
Diane Green

## Response to Letter 46
### Diane Green, Daniel Wheaton, Mark Arnett, Carl Barnes, Gary Oncina, James Pelligri
### November 2, 2021

**46-1** The comment states that it is important to note the history of the Project and actions by the Project applicant, including litigation and refusal to supply documentation requested by City staff. The comment further states the EIR is insufficient because it is not possible to do an EIR without knowing the size of homes and without any density bonus information.

The comment regarding the history of the Project and Project applicant is noted and forwarded to the decision makers for their consideration. Regarding the Draft EIR, the analysis used the assumption that single-family lots would range in size between 7,000 and 12,000 square feet with most lots in the 7,000 to 8,000 square foot range, and the attached multifamily housing units would comprise 30,000 to 45,000 total square feet of building area. The construction of these units would require approval by the planning commission and attached residential units would also require a conditional use permit. The Medium Residential (MR) zoning district also contains a density bonus that may be given for affordable housing projects; however, the applicant has not requested consideration of a density bonus as part of the Proposed Project application. This information is included within the Draft EIR. Therefore, no further response is required; and the comment is noted and forwarded to the decision makers for their consideration.

**46-2** The comment opines that the Project violates the St. Helena Housing Element and housing laws 17.144 and 17.146 through the segregation of low-income housing from market rate housing and the lack of availability of “for sale” units listed below market rate.

Please refer to Response to Comment 45-2. Any determination of compliance with the City’s requirements for affordable or inclusionary housing will be made at the time that the applicant submits a formal application for an Affordable Housing Agreement. Such an Agreement will need to be approved by the City Council following the Tentative Subdivision Map approval but prior to the Final Map being recorded and before any development of homes can take place. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**46-3** The comment suggests that the segregation of low-income housing from market rate neighborhoods outside of the eastern area of St. Helena limits the possibility for diverse housing, socioeconomic and racial diversity in those neighborhoods. The comment also suggests that City intervention and enforcement of anti-segregation

requirements is necessary in order to ensure a mix of housing types for varying family incomes.

Please see Response to Comment 45-2. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**46-4** The comment opines that the 25 new affordable housing are specifically placed adjacent to the existing lower income, multi-family housing on Adams Street rather than placed among market rate housing, as required by City and state laws. The comment also states that none of these units are for sale which is also required by law.

Please refer to Response to Comment 45-2. Any determination of compliance with the City's requirements for affordable or inclusionary housing will be made at the time that the applicant submits a formal application for an Affordable Housing Agreement. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**46-5** The comment references an article about housing segregation in St. Helena.

The comment does not identify any specific areas where the EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**46-6** The comment suggests that the City and Planning Commissioners may face discrimination claims and lawsuits if violations to City ordinances and state law continue. The comment also suggests that realtors benefit from advertising the west side of St. Helena as preferred or more desirable.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**46-7** The comment states that the City should comply with its ordinances, the Zoning Code, the Housing Element and General Plan as well as new state laws to prevent housing discrimination and segregation. The comment further states that the Project Applicant has no intention to follow laws or contribute to the City's goal of minimizing housing segregation.

Please refer to Response to Comment 45-2. Any determination of compliance with the City's requirements for affordable or inclusionary housing will be made at the time that the applicant submits a formal application for an Affordable Housing Agreement. The comment does not identify any specific areas where the Draft EIR

analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**46-8** The comment states that the Project Applicant will claim he is helping the housing situation in the City when he is only providing five units of very low income housing and the ADUs will be at market rate.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**46-9** The comment opines that the Project would not help the City because it would further segregate the City and result in impacts related to traffic, water supply, and liability to flooding. The commenter asks the Planning Commissioners to protect the City.

The comment does not identify any specific areas where the EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**Subject:** [External] Hunter Project Public Comments and DEIR input

Honorable Planning Commission Chair and Commissioners,

As you review the Hunter Project, it is important to note the long and complicated history of this project and the behaviors of this Santa Rosa Casino Development Applicant. During the decade long history, the applicant has sued the city multiple times, forced the city to construct the levee around his property (by refusing to allow access for the flood protection of the senior community of Vineyard Valley), refused to supply documentation on numerous items requested by city staff such as movement of tons of soil, updated soil testing and maps, affordable housing plans that comply with the St Helena Housing Ordinance, Density bonus plans and any specific information regarding the size, bedrooms, bathrooms, etc. for each housing unit which is necessary to calculate traffic, water use, etc. 47-1

The project violates the HCD approved St Helena Housing Element in numerous ways including the continued segregation of low income housing, the requirement that the affordable housing must be spread throughout the project., and must be "for sale" as well as apartments. St Helena has illustrated distinct and repeated actions that segregate low income housing from market rate neighborhoods – as evidenced by 98% of ALL affordable and multi-family housing being placed on the East side of St Helena. It has created an undeniable "other side of the tracks" situation, and despite the claim that the land is more affordable on the East Side, the State of California does not accept that as a waiver of the law. In fact, that exact argument serves to aggravate the segregation of neighborhoods by conveniently ruling out the possibility for any diverse housing or socioeconomic and racial diversity in those neighborhoods. 47-2

Not only does this project propose 25 new units of affordable restricted housing on the East Side, it is designed specifically to place the affordable apartments immediately adjacent to the existing multi-family housing along Adams rather than distributing it through the rest of the market rate housing as is required by other St Helena Housing Element and laws. 47-3

Attached is a professional perspective from a housing segregation expert describing the situation in St Helena. 47-4

The city and you personally, stand to face discrimination claims, and lawsuits if you continue to make decisions in violation of the St Helena ordinances as well as the State's laws by perpetuating the long pattern of housing and racial segregation in St Helena. To date, realtors in St Helena list housing on the West Side of town as "preferred side of town" or "the desirable 47-5

West Side". Even realtors know exactly what has been done and use it to realty sales advantage.

47-5 Cont.

You are now informed, and with a full read of the St Helena ordinances, zoning codes 17.144 and 17.146, the Housing Element and General Plan as well as new California laws to prevent housing discrimination and segregation, citizens should be assured that you will do what is required by law, and not put the city or yourselves at risk for litigation and embarrassment of being an ongoing segregated city. Do not give this Santa Rosa developer who has no interest in following our laws put us in an embarrassing and legal situation for his own personal financial gain.

47-6

You will certainly hear from the applicant that he is "helping St Helena housing", when in fact this project will provide a mere 5 units of very low income housing and the previously proposed affordable housing second units (ADU's) will be above moderate - which is simply market rate. So in what sense does this enormous subdivision, that is wholly reliant on our levee where we have full liability, causes unmitigable traffic at one of the ONLY exits out of the city, eliminated the proposed Adams St extension to the Trail, further segregates our city, and exacerbates our ongoing severe water shortages helpful to us? Please do not play his game. Please stand up to protect this city, its resources, its liability and its integrity. If not you, then who?

47-7

Thank you.

Sincerely,
Diane Green
Daniel Wheaton
Mark Arnett
Carl Barnes
Gary Oncina
James Pelligri

## Response to Letter 47
### Diane Green, Daniel Wheaton, Mark Arnett, Carl Barnes, Gary Oncina, James Pelligri
### November 2, 2021

**47-1** The comment states that it is important to note the history of the Project and actions by the Project applicant, including litigation and refusal to supply documentation requested by City staff.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**47-2** The comment opines that the Project violates the City's Housing Element through the segregation of low-income housing from market rate housing and the lack of availability of "for sale" units listed below market rate. The comment suggests that the segregation of low-income housing from market rate neighborhoods outside of the eastern area of the City limits the possibility for diverse housing, socioeconomic and racial diversity in those neighborhoods.

The comment does not address the adequacy of the Draft EIR, but instead expresses the commentor's opinion about the Project. Please refer to Response to Comment 45-2. Any determination of compliance with the City's requirements for affordable or inclusionary housing will be made at the time that the applicant submits a formal application for an Affordable Housing Agreement. Such an Agreement will need to be approved by the City Council following the Tentative Subdivision Map approval but prior to the Final Map being recorded and before any development of homes can take place. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**47-3** The comment opines that the 25 new affordable housing are placed adjacent to the existing lower income, multi-family housing on Adams Street rather than placed among market rate housing, as required by City and state laws.

Please refer to Response to Comment 45-2. Any determination of compliance with the City's requirements for affordable or inclusionary housing will be made at the time that the applicant submits a formal application for an Affordable Housing Agreement. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**47-4** The comment references an article about housing segregation in St. Helena.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**47-5** The comment opines that the City and Planning Commissioners may face discrimination claims and lawsuits if violations to City ordinances and state law continue. The comment also suggests that realtors benefit from advertising the west side of St. Helena as preferred or more desirable.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**47-6** The comment states that the City should comply with its ordinances, the Zoning Code, the Housing Element and General Plan as well as new California laws to prevent housing discrimination and segregation.

Please refer to Response to Comment 45-2. Any determination of compliance with the City's requirements for affordable or inclusionary housing will be made at the time that the applicant submits a formal application for an Affordable Housing Agreement. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**47-7** The comment opines only five units of very low income housing are provided and the ADUs will be at market rate. The comment suggests that the Project would not help the City because it would further segregate the City and result in impacts related to traffic, water supply, and liability to flooding. The commenter asks Planning Commissioners to protect the City.

As noted elsewhere in these Responses, any future Affordable Housing Agreement specifying the type and number of affordable housing units will be reviewed and approved at a future date. It is not correct that a specific number of very low income units has been proposed or approved. The comment does not identify any specific areas where the EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**Subject:** Fw: [External] Picture of electric panel and diesel pump sitting in water at the back gate in Vineyard Valley

Ms. DeRosa,

This is at the back of Vineyard Valley, where the emergency exit exists that we used for our fire drill this summer. There is a gate at the end of Del Rio and we exited thru that gate and up onto the access road during the drill (fire and police were present). The electric panel and diesel pump are right there by the gate. This is a picture taken after the heavy rains we just had. Imagine an entire season with heavy rains. Very concerning. 48-1

**Subject:** [External] Levee

Dear Ms. DeRosa,

It has been brought to my attention that the levee has not been maintained for several years. There are gopher holes and visible proof of other animals digging in the dirt which certainly must undermine the integrity of the foundation of the levee over the years and would not be a safe place for a housing project. Please provide documents or where I might access them which show the levee has been properly maintained since being built. 49-1

Thank you.

Elizabeth Green
Resident, Vineyard Valley

# Response to Letter 49
## Elizabeth Green
## November 5, 2021

**49-1** The comment expresses concern over the condition of the levee and suggests that the project site is not a safe place for residences. The commenter requests maintenance records for the levee.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 3 which addresses concerns associated with the levee and flooding.

INTENTIONALLY LEFT BLANK

Comment Letter 50

November 1, 2021

Dear Ms. DeRosa,

My husband and I are writing to oppose the Hunter Project. We live in Vineyard Valley. We are very concerned about this project being built literally in our back yard. The obvious concerns are WATER: where is it going to come from to accommodate 81 new dwellings and the amount of people living in them. We don't have enough right now with 3 years of draught. 50-1 50-2

Our next concern is emergency evacuations. With only two ways out of Saint Helena, the additional residents occupying these dwellings will create a mass exodus (along with all the residents of Calistoga) during an emergency evacuation. More than likely, the Trail will be closed in various areas in the event of another fire or flooding, which has been the case with the recent fires and the recent heavy rains, so really, that leaves *one way out* for everyone. Two lanes, possibly at night with no power? A very dangerous scenario. 50-3

Then there is the endless stream of construction trucks, i.e., dump trucks carrying dirt, lumber trucks, tractors, etc., going up and down 29 and our Main Street, 5 days a week, 8 hrs. a day, for a projected time of at least **6 years!!!** Imagine the traffic that it would create to the already stressed Hwy 29 and our small town of Saint Helena. We are experiencing this right now with part of the Trail closed. The traffic on Pope St. from Starr would create horrendous congestion especially going over the Pope Bridge. 50-4

Parking would be another nightmare with all the additional cars this project would create. It is already a problem, especially during tourist season. 50-5

Vineyard Valley would be directly impacted if they were to try to use our sewer system which runs down the middle of our park on Paseo. This was discussed at the meetings at the fire house three years ago. Our sewer system would not be able to handle the additional waste and water, and it was discussed that it would have to be replaced, meaning we would have major construction going on in the middle of our park as a result of that. 50-6

The residents on Del Campo and Del Rio who bought their homes for the tranquility and view on the other side of the wall from their homes at the back of our park, would be obliterated. This small section of nature and beauty back there which so many of the residents in SH enjoy on a daily basis would be gone. 50-7

Of another major concern: I worked with Chief Hartley all this year on fire preparedness for VV, and one of the things we initiated was the use of the back gate on Del Rio which goes up on the access road for a second emergency evacuation exit. We had our first fire drill using that road this summer. What would happen to our second emergency exit? Would residents of the 81 new dwellings be using that road too? We would never make it out of here if that were the case. 50-8

We hope you and whomever else is responsible for these decisions will very seriously consider these extremely important issues that will affect all of us who live in Saint Helena for years to come if this project is allowed to go forward. 50-9

Sincerely,

Elizabeth & Rodney Green
Vineyard Valley

# Response to Letter 50
## Elizabeth and Rodney Green
## November 1, 2021

**50-1** The comment states general opposition to the Proposed Project and notes that the commenters reside in close proximity to the Project, in Vineyard Valley.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required.

**50-2** The comment expresses a general concern related to the Project's water supply; that the current supply is not adequate to serve the proposed residential development.

Please see Master Response 2 that addresses water availability to serve the Project in addition to existing City residences and businesses.

**50-3** The comment expresses concern over the Project's impact on emergency evacuations, specifically in the event of fire or flooding.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. However, emergency evacuation was analyzed Section 3.14 of the Draft EIR and Project impacts were concluded to be less than significant. Please see Master Response 1, that provides more details specific for emergency evacuation for both Vineyard Valley residents and Project residents.

**50-4** The comment raises concerns related to construction traffic; specifically, the commenter is concerned with potential impacts to Highway 29, Pope Street, and the Pope Street Bridge and also notes the temporary closure of Silverado Trail.

Potential Project impacts, as well as impacts related to the construction of the Project, along Highway 29, Pope Street, and the Pope Street Bridge are analyzed in detail within Section 3.14 Transportation of the Draft EIR and within Appendix K, Traffic Impact Study. The comment describes portions of the Silverado Trail that were temporarily closed creating additional congestion along the Pope Bridge; however, the exact location and reason for the closure is not stated. Since the closure is not expected to be permanent, no further response is required.

**50-5** The comment expresses a general concern with the Project's potential impact to parking.

The adequacy of parking supply is not an environmental impact under CEQA; therefore, the commenter's concern is noted for the decision makers and no further response is required. However, at the time building permits are requested, as required by the Municipal Code, the City will confirm the Project complies with

Section 17.124.030.A.1 of the City's Zoning Code that addresses residential parking requirements.

**50-6** The comment expresses a concern related to the sewer system that would serve the Project. The commenter believes that the current sewer system does not have capacity to serve the Project and that additional construction would be required to meet the needs of the Project.

The comment does not identify any specific areas where the Draft EIR analysis is Inadequate; therefore, no response is required. Please see Master Response 4 that addresses capacity concerns with the existing wastewater system and Chapter 3, Changes to the Draft EIR for revised language regarding the results of a sewer capacity study.

**50-7** The comment expresses a concern that certain City residents would have views that would be negatively impacted by the proposed development.

The Draft EIR analyzes potential changes in views associated with development of the Project under Impact 3.1-2. The Proposed Project is within the City's Urban Limit Line and would be consistent with the type and character of residential development adjacent to the site. The design of the subdivision maintains the existing street pattern and maintains existing street views of the surrounding area, consistent with the 1993 and 2019 General Plan Policies. The Project would modify long-range views of existing vineyards located to the west and on the Project site as well as views of rolling hillsides which would be partially blocked by development of new residences. However, although long-range views of hillsides and views of the on-site vineyard and open space are available in the vicinity of the Project site, and these views are not unique in that views of these features are available throughout the City.

To illustrate how development of the site could look and how it could affect public views and the existing visual character, visual simulations were prepared (see DEIR pp. 3.1-29, 3.1-30, 3.1-35, 3.1-37, 3.1-39). It was determined that because the Proposed Project would not conflict with applicable regulations governing scenic quality or substantially degrade the existing visual character or quality of public views of the site and its surroundings and impacts would be less than significant.

**50-8** The comment raises a concern about the Project's effect on a secondary emergency access gate for Vineyard Valley residents.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Please also see Master Response 1, that provides more details specific for emergency evacuation for both Vineyard Valley residents and Project residents.

**50-9** The comment requests the City “very seriously consider” the issues raised in this comment letter.

The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required. The comment is noted and forwarded to the decision makers for their consideration.

INTENTIONALLY LEFT BLANK

Comment Letter 51

City of St Helena, City Hall
Received
NOV 08

November 3, 2021

1480 Main St.
St Helena, CA 94574

Dear Ms. DeRosa,

My husband and I live in Vineyard Valley. A major concern is that the access road along the levee that Vineyard Valley used for the first time ever fire drill this summer, would be used for all the construction trucks, i.e., lumber trucks, dump trucks, bull dozers, etc., and to bring in materials; coming up 29, going thru Main St., and turning right on Adams and then to that access road. Has anyone given any thought as to where all these construction related trucks and vehicles are going to park for **6 years**??? It would seem logical that at the very least, the access road would become part of the construction zone and would not be available for an emergency exit if we had another dire circumstance such as the Glass fire over the next ***six*** years that the project is proposed to take. With that thought in mind, if the project goes forward, what happens if VV needs to use that road in the event of an emergency? 51-1

If Adams St. is extended to create a way to the Silverado Trail, then picturing that, it only seems logical that the access road would become part of that route. Then the question becomes, can VV still exit the gate at the end of our park like we did for the fire drill up onto the access road, and would we become part of the mass exodus of all the new residents from 81 new dwellings trying to get out in an emergency? It would be a disaster, as we have over 200 homes here. 51-2

Also, if that access road becomes part of the construction zone, it could be greatly compromised from all the wear and tear, and the city would need to repair it before it might be used in another emergency. We discovered a large pothole during the fire drill which Chief Hartley had repaired after the drill. 51-3

Along with this concern are emergency resources in the event of another major fire or possible flood. I know for a fact that there are only two patrol cars on duty at any given time. It seems like an additional 80+ dwellings and all the people that would be living there would greatly tax our emergency services, and I'm sure you're aware that our fire department is severely taxed right now. 51-4

Another concern: Has the levee been maintained since the flood project? We have heard that it has not and we are working to find out the answer to that. 51-5

Another concern: Who's responsibility is it financially if there is loss of property or life if there is another flood on the proposed project, Saint Helena or Hunter? This is not at all clear. 51-6

This project is a very bad idea to the detriment of all of Saint Helena, and we have only named a few of the issues it will impact. We sincerely hope the issues that all of the residents have brought up are very carefully weighed as so much is at stake. 51-7

Thank you.

Rodney & Elizabeth Green
Vineyard Valley

# Response to Letter 51
## Rodney and Elizabeth Green
## November 3, 2021

**51-1** The comment raises concerns related to the access road along the levee and the Project's impact on emergency access for Vineyard Valley residents. Specifically, the comment is concerned with access and construction zone for construction trucks and vehicles and how construction might impact emergency evacuation.

Construction activities are not permitted to block access to the levee maintenance road and in the event of an emergency access to the levee would be available. All construction vehicles and equipment would access the site from either Starr Avenue or Adams Street. No truck access would be permitted on the levee maintenance road. Please see Master Response 1 that addresses emergency evacuation concerns for Vineyard Valley residents.

**51-2** The comment expresses a concern related to the possible extension of Adams Street to access the Silverado Trail. The comment questions whether Vineyard Valley residents, along with new residents from the Project, could use the access road for emergency evacuation under this scenario.

The Project does not include the future expansion of Adams Street connecting to Silverado Trail. This is a separate City project and is not required for the Project.

**51-3** The comment states a concern related to the maintenance and condition of emergency access roads. The commenter is concerned that construction would negatively impact the condition of emergency access roads.

The City is responsible for maintaining roads within the City's jurisdiction. Please see Response to Comment 51-1 regarding the levee maintenance road and also Master Response 1 that addresses emergency evacuation concerns.

**51-4** The comment expresses a concern related to the Project's impact on emergency response services and the ability of the Fire Department to serve the Project.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. However, the Draft EIR evaluates the ability of the City's police and fire departments to accommodate the increase in demand for service in Section 3.12, Public Services and Recreation. As noted on page 3.12-1, the closest police and fire station to the Project site is located 0.2 miles to the southwest. Development of the site was assumed in the City's 1993 General Plan as well as the recently adopted 2019 General Plan. The addition of new residences would not adversely affect the ability of the City's police and fire personnel to serve the site. The City's police and fire departments have adequate staff to accommodate the increase in demand for

services and do not anticipate a decline in response times to the site. Please see Master Response 1.

**51-5** The comment questions whether the Napa River levee has been maintained since it was constructed.

Please see Master Response 3 that addresses concerns associated with the levee maintenance and flooding.

**51-6** The comment asks who would be held liable for damage and injury in the event of a flood.

Please see Master Response 3 that addresses issues related to the levee and flooding. Determination of legal liability for a potential future event is outside the scope of CEQA. The comment does not identify any specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**51-7** The comment expresses general opposition to the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required.

Comment Letter 52

**To:** Public Comment <publiccomment@cityofsthelena.org>
**Subject:** [External] Hunter Project Questions

Questions for Planning Commission Meeting 11-2-2021 re: Hunter Project

#1 Will the sewer plant upgrade of 16.2 million as per our agreement be completed before construction would begin and will it effect the $57,000 fine. 52-1

#2 The existing sewers were constructed many years ago with the size predicated on the houses they served at that time. Will the existing system be reengineered to handle the increased load 52-2

#3 The Water Audit suit calls for the decommissioning of existing wells that are not in use will this have any effect on the project. Will a new permit be required for the now out of use well. 52-3

#4 The Water Audit suit also cites meeting sustainability goals from our existing wells providing domestic water will the addition of all of the residential units drawing from these what will the impact be and what effect will this have on the suit by Water Audit. 52-4

#5 Do we know if both the new well and the current one in use by the City of St Helena are serviced by the same aquifer? 52-5

#6 Given that the proposal will be to retrofit 300 plus homes with water saving devices to augment the additional users, would it be more prudent to have this done and accomplished prior to the additional use of water for the development. My concern is that very few residents, certainly not 300, will embrace the idea and agree to have water saving devices installed in their homes. Many of us had this done in prior years and are not in need of such an endeavor. So the fear is that the money will sit in a slush fund and the actual use for water saving devices never take place and the development will still start using the water which we have so little. Will the 300 plus homes be just on the east side as the well is our main supplier of water. 52-6

Gale Greisen
1181 Starr Ave
St Helena

INTENTIONALLY LEFT BLANK

# Response to Letter 52
## Gale Greisen
## November 2, 2021

**52-1** The comment asks whether the sewer plant upgrade of 16.2 million would be completed before Project construction, and whether it would affect the $57,000 fine.

The comment references a separate sewer plant upgrade project and does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The new wastewater treatment plant will have the same dry-weather treatment capacity at the existing plant. The comment is noted and forwarded to the decision makers for their consideration.

**52-2** The comment states that the City's sewer infrastructure was constructed based on housing to be served at that time. The comment asks whether the existing sewer system would be re-engineered to handle the increased load from the Project.

Please see Master Response 4 that provides more details regarding the Project's wastewater infrastructure and the ability of the City to convey and treat the Project's wastewater. See also revisions to the text of the Draft EIR in Chapter 3, Changes to the Draft EIR.

**52-3** The comment asks whether the Water Audit lawsuit, which calls for the decommissioning of existing water wells not in use would have any effect on the Project. The comment asks whether a new permit would be required for the out-of-use well.

The comment is speculating what the outcome of the Water Audit litigation could be on the City and the Project. Please see Master Response 2 that addresses concerns regarding water including the ongoing Water Audit lawsuit. The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**52-4** The comment asks what effect the increase of residential units by the Project would have on the Water Audit lawsuit, which cites sustainability goals for existing wells providing domestic water.

Please see Master Response 2 that addresses concerns regarding water including the ongoing Water Audit lawsuit. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**52-5** The comment asks whether the "new well and the current one in use by the City of St. Helena" are serviced by the same aquifer.

It is not clear what the “new well” is that is referred to in this comment. As discussed in the Draft EIR, the Project is not proposing to drill a new well to serve the water needs of new residential units. The Project is proposing to use an existing onsite agricultural well to irrigate the Project’s public and private landscaping. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**52-6** The comment asks whether it would be more appropriate to retrofit homes with water-saving devices prior to adding the Project’s increase in demand. The commenter is concerned that few residents would agree to have water-saving devices installed in their homes and that the Project would be constructed and occupied prior to offsetting the Project’s increase in demand. The comment asks whether the homes to be retrofitted with water-saving devices would only be on the east side of the City.

The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required. Please see Master Response 2 that addresses water supply concerns.

**Subject:** [External] Hunter Project DEIR Water Comment

Re: Hunter Project DEIR

October 12, 2021

Water

The Hunter Project DEIR's claim that the Hunter Project is "water neutral" is downright laughable. The report doesn't even calculate the acre feet of water that will be taken from the city's aquifer directly upstream from its own municipal wells. Unless the developer is proposing zero landscaping, how could there be no impact on Saint Helena's groundwater, one of the city's three critical water sources?! As for indoor water usage, the proposed $596,808 for water efficiency improvements in 333 existing homes to offset the daily 17,752 gallons from city water (also coming in part from the aquifer) is nice in theory, but the city should insist that this investment, and its proven results, be implemented before development. Saint Helena's current residents will be harmed if the promised benefits fail to materialize, and they should be understandably suspicious of developers' proposed offsets. Remember the roughly $800,000 "offset" provided by the developer of the Las Alcobas hotel to mitigate the loss of 20 on site low income housing units? Really? Where are the twenty replacement low income housing units purchased by that $800,000? 53-1 53-2 53-3 53-4

The DEIR is wholly inadequate in defining the Hunter Project's potential impact on Saint Helena's water supply, both for residents, as well as wildlife. The city should insist on the DEIR fully disclosing groundwater impacts, and as well, insist on bona fide, rigorously verifiable conservation benefits as a prerequisite to development. 53-5

Saint Helena resident's are already under Phase II water restrictions due to drought and water supply shortage, and will face the likely prospect of draconian Phase III water restrictions with one more below normal rainy season. It would be irresponsible, reckless and potentially harmful for existing citizens for the city to approve a large, new development, with its huge additional water demand, without securing a truly neutral water supply . 53-6

# Response to Letter 53
## Henry Gundling
## October 12, 2021

**53-1** The comment finds fault with the claim that the Project would be "water neutral" and that the Draft EIR does not calculate the amount of water supplied from the City's aquifer upstream of the municipal wells.

The Proposed Project is required to be in compliance with the City's Water Neutral Policy. Appendix J of the Draft EIR provides the required Water Neutral Report for the Project as the first step in compliance. The Draft EIR provides an analysis of the sources of water to supply the Project's water demand beginning on page 3.9-40 and also on pages 3.13-35 and 3.13-36. See also Master Response 2 for further details on the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**53-2** The commenter claims any water used for landscaping would have an impact on the City's groundwater supplies.

The Draft EIR analyzes the potential impact of the Project's water demand sourced from groundwater on pages 3.9-40 through 3.9-43 and also on pages 3.13-35 and 3.13-36. The Draft EIR concludes that the Project's demand on groundwater supplies is relatively small and, in part, would be addressed via adherence to the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code. See also Master Response 2.

**53-3** The comment questions the ability of the Project to be able to meet the Water Neutral Policy requirements to offset the proposed water supply demand for the indoor water usage.

The Proposed Project is required to adhere to the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the City's Municipal Code. See further discussion of the City's Water Neutral Policy and Municipal Code requirements in Master Response 2.

**53-4** The commenter cites an example project (Las Alcobas Hotel) as one where funds from the developer may not have resulted in the intended outcome.

The comment is referring to a different project and does not identify any specific areas where the Draft EIR analysis is inadequate. See also Master Response 2.

**53-5** The comment states that the Draft EIR is inadequate because it does not disclose groundwater impacts for residents and wildlife and that the City should insist on verifiable conservation benefits.

The Draft EIR analyzes the potential impact of the Project's water demand sourced from groundwater on pages 3.9-40 through 3.9-43 and also on pages 3.13-35 and 3.13-36. The potential impacts to wildlife are analyzed in Section 3.4 Biological Resources. The reference to conservation benefits likely refers to the efficacy of the Water Neutral Policy and Municipal Code which is beyond the scope of CEQA in relation to the Proposed Project. See Master Response 2 for additional information specific to water supply.

**53-6** The comment expresses a concern related to the City's current and future water restrictions and states the Project should not be approved due to its impact on water supply.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Please see Master Response 2 that addresses water availability to serve the Project in addition to existing City residences and businesses.

**Subject:** [External] Opposition to Hunter Subdivision

Hello:
I am a homeowner at 1370 Grove Court in St Helena, CA. I live several hundred feet from the planned Hunter Division. While I support affordable housing, I do not see this plan as an affordable housing plan. It appears to be a wolf in sheep's clothing--designed to make developers wealthy and deleteriously alter the landscape of St Helena. I am not satisfied with the environmental impact report (EIR) that has been filed and I am deeply concerned about the negative environmental impacts this huge development will have on our neighborhood. Given how precariously we sit perched on flood plains, and how limited water resources and other land resources are, I do not believe we can accommodate the additional population density contemplated by the report. We cannot support the additional traffic. I oppose this development. 55-1

55-2

I also am concerned that sufficient concern has not been given to preservation of protected wildlife and whether this would affect any sacred burial sites of the Wappo Indian tribe. Flood project dig unearths Wappo artifacts, bones | The Weekly Calistogan | napavalleyregister.com 55-3

55-4

Please feel free to contact me with any questions.
Kathleen Guneratne

# Response to Letter 55
## Kathleen Guneratne
## November 29, 2021

**55-1** The commenter indicates her support of affordable housing but does not consider this to be an affordable housing project.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. Please refer to Chapter 2, Project Description of the Draft EIR, which describes the Project. See page 2-18 that addresses affordable housing. At this time the only request by the Project applicant is to subdivide the lots consistent with the General Plan and Zoning. The Project will need to fulfill the code required inclusionary housing requirements which will be specified in a future affordable housing agreement.

**55-2** The comment opines that the Project will result in negative impacts to the neighborhood due to being within a flood plain, limited water resources, increase in population and traffic, and opposes the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

Please see Master Response 3 that addresses concerns associated with the levee and flooding; and Master Response 2 that addresses the adequacy of water supplies.

**55-3** The comment notes concern for adequate preservation of protected wildlife.

Direct and indirect impacts to federal and state protected wildlife are addressed in Section 3.4, Biological Resources of the Draft EIR. Mitigation is included to conduct pre-construction surveys to ensure these species are not disturbed if present. The Draft EIR provides for adequate protection of protected wildlife species.

**55-4** The comment asks if the Project would affect any sacred burial sites of the Wappo Indian Tribe and references an article in a local newspaper.

Pursuant to AB 52, the City sent letters to all tribes requesting notification and received responses from the Federated Indians of Graton Rancheria and the Yocha Dehe Wintun Nation. No response was received from the Wappo Indian Tribe. Neither the Federated Indians of Graton Rancheria nor the Yocha Dehe Wintun Nation tribe requested formal consultation with the City. The analysis of potential impacts to cultural resources is included in Section 3.5, Cultural and Tribal Cultural Resources.

**To:** Maya DeRosa <MDeRosa@cityofsthelena.org>
**Subject:** [External] Hunter EIR

Hello Maya,
Here are my comments on the Hunter Project EIR:

The project has to be water neutral, though using 18,000 gallons per day. One of the mitigations is installing water meters at each home in Vineyard Valley—247 of them. There used to be water meters—there is a remnant of one in my driveway. The city deemed it too expensive to read them all, so now we have only two—one for north of the creek and one for south. The water neutrality also plans to remove 5 acres of lawn in town and retrofit toilets. 56-1

Many other projects had to retrofit toilets in town. We had to retrofit some in the 1990s when we built a commercial building on Vintage Avenue. How many toilets are left to be retrofitted? 56-2

The fire department wants an emergency exit from the dead end cul de sac at the far eastern end of the project. The main exit route in VV is private property. The owners of Vineyard Valley will certainly object to this.

This would have to connect with the main exit route for over 200 homes in Vineyard Valley. Experience has shown that in a dire emergency VV has so much trouble getting everyone out they decided to have them drive out the levee road! In future they would have to drive past the new Hunter homes! 56-3

If there is a choice between building a freeway off ramp style bridge next to the existing Pope Street Bridge over Napa River and a new bridge for Adams St, I support extending Adams Street to the Silverado Trail. If Hunter is built that would handle the increased traffic in a much better way. Besides, as a historian, I don't want to see the setting of the 1894 Pope Street Bridge denigrated by a monstrous new structure. The bridge is on the National Register of Historic Places. 56-4

Is Nov 2 the last time comments on the EIR will be accepted? If so this has been awfully hush hush. Where is the public outreach??? 56-5
Best,
Mariam Hansen

INTENTIONALLY LEFT BLANK

## Response to Letter 56
**Mariam Hansen**
**October 18, 2021**

**56-1** The comment suggests methods to achieve water neutrality, including installing water meters, but also states that this approach did not work in Vineyard Valley.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. Please see Master Response 2 that addresses compliance with the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**56-2** The comment notes that other projects were required to retrofit toilets in the City and questions how many are still needed to be retrofitted.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. Please see Master Response 2 that addresses compliance with the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**56-3** The comment suggests that Vineyard Valley residents will object to building an emergency exit from the Project's proposed cul-de-sac. The commenter has concerns related to emergency evacuation.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. However, emergency evacuation was analyzed Section 3.14 of the Draft EIR and Project impacts were concluded to be less than significant. Please also see Master Response 1, that provides more details specific for emergency evacuation for both Vineyard Valley residents and the Proposed Project.

**56-4** The comment states opposition to a "freeway off-ramp style bridge" at the existing Pope Street bridge over the Napa River and a preference to extend Adams Street to Silverado Trail.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**56-5** The comment raises a general concern about the public comment period and outreach efforts.

The Draft EIR was released for the required 45-day public review period on September 23, 2021 through November 8, 2021. In response to numerous requests, the City extended the comment period through November 30, 2021 for a total of 67 days.

Comment Letter 57

**From:** Donna Hardy <mhardysh@att.net>
**Sent:** Monday, November 1, 2021 10:16 AM
**To:** Maya DeRosa <MDeRosa@cityofsthelena.org>
**Subject:** [External] Hunter Draft EIR

Good Morning Maya,
Attached are my questions and concerns about the proposed Hunter Project that will be discussed at Tuesday's Planning Commission Meeting. Please distribute it to the members and make it a part of public record.

Thank you,
Donna Hardy
620 Harvest Lane
Saint Helena, CA 94574

After reviewing the Hunter Project Draft EIR, I find the items listed below of concern:

1) Does the City of St. Helena have enough water in drought years to permit 87 new homes to be built? Can Water Neutrality be achieved by water conservation and retrofitting old fixtures in town? Should an agricultural well be used for landscape watering to help a proposed housing development achieve Water Neutrality? 57-1
2) The 1993 General Plan, which is the document being used for this Subdivision request, stipulates that Adams St. be extended to the Silverado Trail; why is this not being required as a condition for the project? 57-2
3) The Hunter property was in the flood plain before the Measure A Levee was built. After its completion. FEMA then changed the zoning to Firm X, which no longer requires homeowners to purchase Flood Insurance. If the project is approved and homes are built behind a levee the City of Saint Helena created and is required to maintain, the city could be held responsible for the losses if the levee ever failed. Could the city be held in non-compliance of the terms of the Measure A agreement if homes were built as proposed? Did the Measure A Project change the buildability of the Hunter Land? 57-3
4) It is a requirement that the project be Water Neutral by retrofitting old toilets in town and other water savings measures to offset the interior water use of the 87 new homes. The city is presently in a Phase II water emergency, and homes have been allocated water usage based on the number of people living in them. If usage is over the limit, fines are given, and no new water hookups are allowed during this time. With these restrictions why are we currently considering a subdivision of 87 new homes and how much more can be done to save water if the dry years continue? 57-4

All exterior watering for the Project is proposed to be an on-site, inactive, groundwater well that was inoperable at the time of the site visit for the Draft EIR. The Subbasin monitoring well may be within the pumping influence zone of the Stonebridge Complex wells which supplies the entire city with up to 20% of its water demand in normal years, and up to 30% in dry years. Currently the City of Saint Helena is being sued by Water Audit, CA which is critical of its use of the Stonebridge wells for municipal use and a pattern of no discretion in issuing permits for new wells. The City Council is having a Closed Special Meeting on Nov. 1 to discuss the matter. Is the Planning Commission not concerned that approving the use of a groundwater well for outside irrigation of new homes in the city will potentially further open them to another suit from Water Audit, CA or another agency? 57-5 57-6

On page 490 of the EIR there is a chart that shows water supplies would not be sufficient to meet demands under all scenarios. It is then suggested if supply were low, amount could be increased by

1) conservation
2) modifying rates to encourage conservation
3) increasing ground water production.

With the current drought the city has tried conservation with some level of success, but did not get the results they expected. Stiff fines were implemented modifying the rates to further encourage conservation and the first month over a million dollars in fines were dolled out. Presently the City is, out of necessity, using more groundwater from the Stonebridge Wells to supply the city's needs. Given our small number of water resources it will only get worse with more housing, and using a presently inoperable well for all outdoor irrigation on the project could open us up to further suit.

57-7

In the Transportation and Circulation portion of the EIR,, 3.14, pg 522, the streets impacted by the project are defined.

Saint Helena residents know that Starr Ave. is a short route for cars traveling from the Silverado Trail to Safeway, Railroad Ave., or other parts of the city. Pope Street serves most people that come from the Silverado Trail to destinations in Saint Helena, it is the first access street off of the trail if coming from Napa, and an easier street to navigate at Main St. because there is a traffic signal. Pratt Ave. or Deer Park Road, both further North on the trail both have stop signs at Main St. or Hwy 29 and are not always as easy to cross. Early in the morning or after work the stop sign at Pope and Starr can be busy with cars waiting for a break in the Pope St. traffic to complete a left-hand turn. Starr is not a street for mainly the residential neighborhood as defined in the Draft EIR, but a cut through street to get to the center of town or out to the Silverado Trail. If the Hunter Project is put through this will only get worse.

57-8

Railroad Ave. is another cut through street that locals use to avoid driving on Main St., and does not mainly serve the industrial and commercial uses in the downtown area as defined in the EIR. There is more vehicle traffic on Railroad Ave. than industrial or commercial traffic.

57-9

Adams Street is a main downtown street with three areas where traffic can bunch up, at the Railroad Ave. intersection, a four way stop, the railroad tracks when the Wine Train is coming into the station or leaving, and at the Main St. signal. I question the defined use of some streets in the EIR, either the person writing the descriptions does not know how locals use the streets, or the descriptions were used to make the streets look less busy.

57-10

The Hunter project with the extension of Adams and Starr Ave. will increase traffic tremendously for present residents in the area, but one way to help alleviate some of this increase is to extend Adams Street to the Silverado Trail. The 1993 General Plan states "The city desires that the Adams Street extension to the Silverado Trail be completed in an expeditious manner:" and "The city will work with potential developers to acquire the needed combination of public and private financing required to implement this project."

57-11

The Hunter Project has used items in the 1993 General Plan which are agreeable to their project i.e., zoning of the land from agriculture to Medium Density Residential, and the extension of Starr Ave. to Adams St. and Adams St. to Starr. They have chosen to overlook the one thing in the General Plan that would help mitigate some of the traffic and circulation problems the development would create for existing, nearby residents. If the Hunter Project is approved the city should require that Adams St. be extended to the Silverado Trail before the first house is built for the safety of new residents and to preserve quality of life for existing neighbors. This would provide a direct route to the center of Saint

57-12

Helena, relieve traffic on the historic Pope St. Bridge and reduce traffic using Pope St. and Starr Ave. as a by-pass route.

57-12 Cont.

The Hunter Land was originally a part of the Flood Plain until the City of Saint Helena built a Levee as a part of the Measure A Flood Protection Project. After this project was completed, FEMA re-evaluated the land's danger of flooding and revised the FIRM rating to Zone X, alleviating the need to buy Flood Insurance for homes built on the land. Could the Hunter Project put the city in violation of the terms of the Measure A project by allowing homes to be built on land that was previously a part of the Flood Plain? The Measure A agreement states that money from the fund cannot be used to create projects that promote growth, increase population and allow land to be developed that was not previously so. Did the Measure A change the buildability of the Hunter Land taking it out of the flood plain? With the change of FIRM rating, it appears it did. If so the city, by allowing homes to be built without raised foundations, could be in violation of the Measure A requirements.

57-13

The Hunter Draft EIR states that chance of flooding is low and if it were to occur it would be with warning and slow. There would be little chance of loss of life as people would have time to evacuate the area or go the second stories of their homes to avoid the water. Why should homes be built in an area where there would even be such a possibility? With the danger of property loss if there were a breach in the levee, threat of the city being held responsibly, putting additional strain on the city's already minimal water supply, and all the other concerns I have raised, this sub-division should not be approved.

57-14

Respectfully submitted by,

Donna Hardy

620 Harvest Lane

Saint Helena, CA 94574

INTENTIONALLY LEFT BLANK

## Response to Letter 57
### Donna Hardy
### November 1, 2021

**57-1** The comment asks whether the City has enough water in drought years to serve the Project and whether water neutrality could be achieved by water conservation and retrofitting old fixtures. The comment goes on to ask whether an agricultural well should be used for landscape watering to help the Project achieve water neutrality.

The Project is proposing to use the existing on-site well to supply water for landscaping, as explained on page 2-26 in Chapter 2, Project Description. Please see Master Response 2 that addresses water supply.

**57-2** The commenter interprets the City's 1993 General Plan as requiring that Adams Street be extended to the Silverado Trail and questions why this extension is not required by the Project as a condition of approval.

The Project does not include the future expansion of Adams Street connecting to Silverado Trail. The City's Public Works Department reviewed the tentative subdivision map and determined the extension of Adams beyond the new intersection with Starr Avenue is not required. This is a separate City project and is not required for the Project. The comment is noted and forwarded to the decision makers for their consideration.

**57-3** The comment states that the project site was within a flood plain before the Napa River levee was built and that after levee construction, the flood zone designation was changed. The comment states the City could be held responsible in the event of a levee failure. The comment goes on to ask whether the City would be held in non-compliance of the Measure A agreement if the Project is developed and if the levee changed the buildability of the site.

Measure A, as described on page 3.9-6 of the Draft EIR, was passed in 1998 by Napa County and provided the basis for a number of flood improvement projects. The Project site has been designated and zoned for residential development dating as far back as the City's 1975 General Plan, as stated on page 2-12 of the Draft EIR. The Project is not funded in any part with Measure A funds. The City's Flood Control Project, which did receive Measure A funds, was designed to provide flood protection for both developed areas within the City, as well as areas already planned for future development, including the Project site. For further detail, please see Master Response 3 for more information concerning the levee.

**57-4** The comment asks whether the Project would be required to retrofit fixtures in the City and implement other water saving features, in compliance with the Water Neutral Policy. The comment also expresses concern given the City's current water supply and water saving requirements.

As stated in the Draft EIR on page 3.9-41, the Proposed Project is required to comply with the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code. See also Master Response 2 for more information on water supply.

**57-5** The comment opines that the Project would use groundwater from an on-site well for exterior (landscaping) uses and that the well is within a subbasin that may include the pumping influence zone of the Stonebridge Complex, which supplies some City water.

The on-site well was evaluated in the referenced well capacity and sustainability assessment (Appendix L of the Draft EIR) and was determined to have sufficient capacity to meet the proposed demand. The assessment conducted a 24-hour pumping test at a rate (40 gallons per minute [gpm]) of approximately four times the proposed rate (10.6 gpm) which only produced one foot of drawdown in the pumping well. The proposed average pumping rate of 10.6 gpm is relatively small compared with existing agricultural wells (DEIR p. 3.9-43). Therefore, the Draft EIR correctly identifies that the proposed use of the well would have a less-than-significant impact on the subbasin and as a result also on the City's Stone Bridge wells.

**57-6** The comment states that the City is currently under litigation by a corporation, Water Audit California, for its use of wells in the Stonebridge Complex and pattern of issuing new permits for wells. The commenter raises a concern that the Project would further raise issues given the ongoing litigation.

See Master Response 2 for details related to the litigation involving the Water Audit.

**57-7** The comment opines that there is insufficient groundwater supply to meet the Project's demand and that use of the on-site well could result in further litigation.

See Master Response 2 for further details regarding the City's water supplies and ability to meet future demands. As noted in the Draft EIR on page 3.9-41, the Proposed Project would be required to adhere to the City's Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code which requires conservation measures or fees to fund the City's conservation measures commensurate with the Project's demand. Otherwise, whether use of the existing onsite well could be the subject of litigation is outside the scope of CEQA and does raise any issue as to the adequacy of the analysis in the Draft EIR.

**57-8** The comment raises concerns regarding peak hour traffic at the intersection of Pope Street and Starr Avenue and states that Starr Avenue serves more than residential users because many motorists use it as a shortcut and further claims the EIR does not represent this street correctly in terms of the types of its users.

Starr Avenue is classified as a "residential street" per the Circulation Element of the City's 2019 General Plan, which is defined predominantly as a roadway that provides

residential access and support for local trips. The Proposed Project would not alter the existing or General Plan classification of Starr Avenue or alter the way the road is used. Section 3.14 of the Draft EIR, as well as Appendix K, Traffic Impact Study, analyzes the intersection of Pope Street and Starr Avenue, both in terms of potential level of service (LOS) impacts and vehicular queuing. The analysis concludes that the impact to this intersection, with or without Project traffic, in every analysis scenario, would be less than significant and would not require improvements to the intersection. An analysis of LOS or traffic congestion and queuing is no longer required to be evaluated in an EIR as by law, an increase in LOS can no longer be considered an environmental impact under CEQA.

**57-9** The comment states her personal observation that Railroad Avenue is used by motorists as a shortcut street to avoid Main Street and claims the EIR does not represent this street correctly because it does not mainly serve industrial and commercial uses.

Railroad Avenue is classified as a “downtown/mixed-use street” per the Circulation Element of the City’s 2019 General Plan, which is defined predominantly as a roadway that supports all travel modes and promotes multimodal access. The Proposed Project would not alter the existing or General Plan classification of Railroad Avenue or alter the way the road is used. Further, Section 3.14 of the Draft EIR, as well as Appendix K, Traffic Impact Study, thoroughly analyzes several intersections along Railroad Avenue (intersections with Fulton Lane, Adams Street, and Hunt Avenue), both in terms of potential LOS impacts and vehicular queuing. The analysis concludes that the impact to these intersections, with or without Project traffic, in every analysis scenario, would be less than significant and would not require improvements to the intersection. An analysis of LOS and queuing is no longer required to be evaluated in an EIR as. by law, an increase in LOS can no longer be considered an environmental impact under CEQA.

**57-10** The commenter offers an observation that Adams Street is a busy downtown street and raises a concern related to the Draft EIR’s description of the users of this street and others in the area.

Adams Street is classified as a “downtown/mixed-use street” per the Circulation Element of the City’s 2019 General Plan, which is defined predominantly as a roadway that supports all travel modes and promotes multimodal access. The Proposed Project would not alter the existing or General Plan classification of Adams Street or alter the way the road is used. Further, Section 3.14 of the Draft EIR, as well as Appendix K, Traffic Impact Study, thoroughly analyzes several intersections along Adams Street (intersections with Main Street, Railroad Avenue, and Library Lane), both in terms of potential LOS impacts and vehicular queuing. The analysis concludes that the impact to these intersections, with or without Project traffic, in every analysis scenario, would be less than significant and would not require improvements to the intersection. An analysis of LOS and queuing is no longer required to be evaluated in an EIR, as. by law, an increase in LOS can no longer be considered an environmental impact under CEQA .

All roadways analyzed within Section 3.14 of the Draft EIR, as well as Appendix K, Traffic Impact Study, utilized descriptions and characterizations as described in the Circulation Element of the City's 2019 General Plan.

**57-11** The comment opines an extension of Adams Street to the Silverado Trail would alleviate traffic created by the Project and provides excerpts from the 1993 General Plan that stipulates this extension.

The City acknowledges that the extension of Adams Street to Silverado Trail is included in the adopted Circulation Element of the General Plan. See Response to Comment 57-2. The comment is noted and forwarded to the decision makers for their consideration.

**57-12** The comment offers an opinion that the Project should be conditioned to extend Adams Street to the Silverado Trail to reduce traffic on the Pope Street Bridge, Pope Street, and Starr Avenue. The commenter believes the Project uses objectives from the General Plan that support the Project but overlooks the Adams Street extension.

Please see Response to Comment 57-11. The comment is noted and forwarded to the decision makers for their consideration and no further response is required.

**57-13** The comment states that the project site was originally within a floodplain until the City constructed the Napa River levee. The commenter questions whether the Project would result in the City violating the terms of the Measure A agreement by allowing homes to be built on land that was previously within a floodplain. The comment also asks if Measure A changed the buildability of the Project site.

Measure A, as described on page 3.9-6 of the Draft EIR, was passed in 1998 by Napa County and provided the basis for a number of flood improvement projects. The Project site has been designated and zoned for future residential development dating as far back as the City's 1975 General Plan, as stated on page 2-12 of the Draft EIR. The Project is not funded in any part with Measure A funds. The City's Flood Control Project, which did receive Measure A funds, was designed to provide flood protection for both developed areas within the City as well as areas already planned for future development, including the Project site. For further detail, please see Master Response 3 for more information on Measure A.

**57-14** The commenter states an opinion that homes should not be built in areas that have a "low ... possibility" of flooding. The comment also raises a concern regarding the City's responsibilities and liabilities in the event of major flood event and states the Project should not be approved.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. Please see Master Response 3 that addresses the City's liability in the event of a major flood event.

Comment Letter 58

Subject: [External] Hunter Project

Planning commission & city of St. Helena:

I have lived in Vinyard Valley for over 10 years and was so relieved that the 33 million dollar taxpayer money the funded the flood project was finished. No more erosion of soil under the wall,no flooding over the wall and no more high priced flood insurance for Vineyard Valley. 58-1

The 81 new homes will cause more erosion because the only place it will go is into Vinyard Valley. 58-2

Also, the flood of new waste in our sewer system on Paseo Grande. 58-3

We are also cutting are water use and the new homes will be using 18,000 gallons a day!!! Low flow toilets is less than minimal help. 58-4

Add the stress of our understaffed police and fire departments, so that Vinyard Valley and the new homes can get help before death and disaster strike!!! 58-5

So much more can be said, but isn't this enough to stop this land grab to make one person wealthy?! PLEASE, STOP HUNTER PROJECT FOR THE LIFE OF OUR COMMUNITY!! Thank You, Carla Holm 58-6

# Response to Letter 58
## Carla Holm
## November 3, 2021

**58-1** The commenter shares personal history and her relief that the City completed the levee along the Napa River.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**58-2** The comment expresses a general concern that the Project will cause significant erosion.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. However, erosion impacts were analyzed in Section 3.9 of the Draft EIR; and impacts were determined to be less than significant because the Project would be required to comply with existing state and city permitting requirements and conditions of approval that regulate erosion.

**58-3** The comment expresses a general concern regarding the City's sewer system capacity.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Section 3.13 of the Draft EIR discusses sewer system capacity in the City. Additionally, pursuant to Municipal Code Section 3.32.020, the City collects development impact fees on new development to pay for public improvements related to sewer projects. The Project applicant would be required to pay these fees, which would help fund future improvement projects. Please see Master Response 4 that addresses sewer concerns.

**58-4** The comment expresses a general concern regarding the Project's water usage.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. However, Master Response 2 addresses water supply concerns.

**58-5** The comment expresses a general concern that the Project would create a negative impact on police and fire protection services.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. However, the Draft EIR evaluates the ability of the City's police and fire departments to accommodate the increase in demand for service in Section 3.12, Public Services and Recreation. Development of the site was assumed in the City's 1993 General Plan as well as the recently adopted 2019 General Plan. As discussed

in the Draft EIR, the City's police and fire departments have adequate personnel to serve the Project and expansion of existing stations would not be required.

**58-6** The comment states opposition to the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

Comment Letter 59

**Subject:** [External] Objections to Hunter Project

November 22, 2021

Dear Ms. Derosa,

I am writing to express my serious concern related to the proposed 87-Unit Hunter project between Vineyard Valley and the levee which poses numerous significant problems. 59-1

Others have spoken and written on the impact traffic issues will have on our small city's limited roadways. Main Street is already congested and a bottleneck during a major portion of the day. How will it handle the additional cars and trucks from 87 new units? It makes me shudder to think about the congestion, to say nothing of the additional pollution, noise, and safety issues for pedestrians. 59-2 59-3

The same is true for substantial water issues. We are currently under a Phase 2 water shortage emergency program which limits non landscaping use to 65 gallons per resident daily. The Draft EIR dramatically underestimates water usage of the 87 new units. Further, the proposal is to use the Vineyard Valley sewer system which is already compromised and inadequate, would likely result in even more backups of rainwater and waste products than has already occurred from a city manhole located on Paseo during heavy rains. Vineyard Valley has more than enough responsibility providing water and sewer for its own residents. Adding 87 more units is untenable and dangerous. 59-4 59-5

However, my main concern is the lack of <u>any</u> emergency evacuation plan for our approximately 350 residents, a major omission for a retirement community such as ours. A couple of years ago I did a survey of our Park on safety issues, and discovered more than twenty percent of residents used assistive devices for mobility, e.g., walkers, electric carts, wheelchairs, crutches, canes. These people would need extra assistance in case of an emergency evacuation as well as two safe and dependable exits, one on each end of the Park. Will there be access to the levee as there is now that we can use to get to town? Are there evacuation plans for the proposed project that will not interfere with Vineyard Valley 59-6

resident's exodus? There is no way of knowing as this critical issue is not addressed in the EIR.

59-6 Cont.

Finally, I am horrified at the idea of six years to complete this project! Six years of construction noise, diesel trucks, dust, pollution, traffic congestion, etc., in the center of town will significantly reduce our quality of life and likely reduce property values.

59-7

Little financial gain to the city as the expenses for providing infrastructure and first responders will likely equal or exceed any income. Major issues with transportation, water and sewer. Omission of emergency evacuation considerations and plans.

59-8

I fail to see any positive value in the proposed project for our city and its quality of life. Therefore, I strongly urge the Planning Commission and Council, if it gets that far, to say NO and refuse to support any further consideration of the Hunter Project.

59-9

Sincerely,

Suzanne James

Resident of Vineyard Valley

# Response to Letter 59
## Suzanne James
## November 22, 2021

**59-1** The comment states opposition to the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**59-2** The comment expresses a general concern over the Project's impact to traffic congestion.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. Please also see Response to Comments 10-2 and 36-2 for additional information.

**59-3** The comment expresses general concerns over pollution, noise, and safety for pedestrians.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Therefore, a general overview of impacts addressed in the Draft EIR specific to air quality, noise, and pedestrian traffic safety is provided. The Draft EIR addresses direct and indirect impacts associated with construction and operation of the Project. Section 3.3, Air Quality, identifies sensitive receptors and notes close proximity to residences. The Bay Area Air Quality Management District (BAAQMD) establishes thresholds for the evaluation of potential impacts, which are established to be protective of human health. The EIR concluded that construction and operation of the Proposed Project would not result in emissions that exceed the BAAQMD emission thresholds for any criteria air pollutants, including reactive organic gases (ROG), nitrogen dioxide and nitric oxide ($NO_x$), particulate matter ($PM_{10}$, or $PM_{2.5}$). ROG emissions would be associated with motor vehicles, construction equipment, and architectural coatings (paint). The analysis also addresses if the Project would expose sensitive receptors to substantial pollutant concentrations. The BAAQMD has adopted project and cumulative thresholds for three risk-related air quality indicators to sensitive receptors: cancer risks, noncancer health effects, and increases in ambient air concentrations of $PM_{2.5}$. This includes exposure to $PM_{2.5}$ and other toxic air contaminants (TAC) which would occur during construction activities. The primary TAC is diesel particulate matter (DPM) which is emitted from emissions associated with construction equipment operations and heavy-duty trucks during construction activities, and the associated health impacts to sensitive receptors. Based on the modeling conducted for the Project construction activities would not exceed the BAAQMD thresholds resulting in exposure of sensitive receptors in the vicinity of the Project site to substantial TAC concentrations (see DEIR Tables 3.3-8 and 3.3-9, p. 3.3-33).

Please see Response to Comment 38-1 for more information on noise impacts.

Pedestrian safety along with transportation impacts are analyzed in Section 3.14 of the Draft EIR. This section analyzes Project impacts related to consistency with plans or policies addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities. As noted on page 3.14-40, the Project includes the extension of Adams Street and Starr Avenue to provide vehicle, bicycle and pedestrian access to the site, consistent with the 1993 General Plan Policy 5.8.1 and Policy CR1.1 from the City's 2019 General Plan. Sidewalks would be provided along both sides of the street allowing safe pedestrian access to the site from adjacent areas. Sidewalks are also available connecting the Project site to downtown St. Helena, including neighborhood services along Main Street, retail and grocery stores, and the City's Public Library. The Proposed Project would provide adequate sidewalks and would not conflict with any plans or policies supporting either the development of these facilities or the use of these facilities; therefore, impacts are less than significant.

**59-4** The comment expresses concern over the Project's impact to the City's water supply and their belief that the Draft EIR underestimates the Project's water demand.

Please see Master Response 2 that addresses the City's ability to supply water and the requirements of the Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code. As stated on page 3.13-24 of the Draft EIR, a Water Neutral Report was prepared for the Project that assumes a higher and more conservative persons per household (PPH) rate as compared to the City's PPH to determine population to calculate water demand.

**59-5** The comment states the Project would tie into the City's existing stormwater infrastructure and sewer lines that also serve Vineyard Valley Mobile Home Park and opines that adequate capacity is not available in the existing stormwater and sewer infrastructure to serve the Project.

The ability of the City's existing stormwater and wastewater infrastructure to serve the Project is addressed in the Draft EIR in Section 3.13, Utilities and Service Systems. As indicated in this section, the City's detention basin was designed to accommodate stormwater runoff assuming 70% of the Project site would be developed with impervious surfaces (i.e., roads, sidewalks, homes), which is more than the amount of impervious surface area to be developed under the Project.

Pursuant to Municipal Code Section 3.32.020, the City collects development impact fees on new development to pay for public improvements related to stormwater drainage projects. The Proposed Project applicant would pay these fees, which would help offset any increased demands on the City's stormwater drainage system. Therefore, the Proposed Project would not require or result in the relocation or construction of new or expanded stormwater drainage facilities and the impact would be less than significant.

Wastewater flows from the western portion of the Project site are proposed to drain into an existing public manhole at the corner of Starr Avenue and Hunt Avenue via new 8-inch sewer pipes. The area east of Starr Avenue, lower in elevation, is proposed to drain east through the Project site via new 8-inch sewer pipes within a public easement and into an existing public manhole in the Vineyard Valley Mobile Home Park. All new sewer mains and lines are sized to accommodate Project flows, per City standards. Please see also Master Response 4 that provides more details regarding the Project's wastewater infrastructure and the ability of the City to convey and treat the Project's wastewater.

**59-6** The comment raises a concern related to emergency evacuation for Vineyard Valley residents.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Emergency evacuation was analyzed Section 3.14 of the Draft EIR and Project impacts were concluded to be less than significant. Please also see Master Response 1, that provides more details related to emergency evacuation for both Vineyard Valley residents and the Proposed Project

**59-7** The commenter is concerned about the construction timeline and devaluation of properties.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. The commenter's concern related to property devaluation is not required to be evaluated in an EIR.

**59-8** The comment raises general concerns related to the cost of the Project for the City and re-iterates issues raised in Comments 59-2 through 59-7.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not introduce new issues related the accuracy or adequacy of the Draft EIR; therefore, no response is required. Please see Responses to Comments 59-2 through 59-7.

**59-9** The commenter is opposed to the Project and urges the City to reject the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required.

**Subject:** [External] Opposing Hunter Subdivision Project

To Saint Helena Planning Dept
Attn M De Rosa
Reference: The Hunter Project, Saint Helena CA

Hello Maya

The Hunter Project does not pass the common sense smell test, regardless of what Hunter's fancy consultants and lawyers tell you. It is a massive, dense project, inappropriate for the small city of Saint Helena. 60-1

It will use a lot of water, more than we have, regardless of what the developer claims. Just look at how many units there are. Whatever amount of water Hunter claims they will use, anyone with eyes and a brain can see it will use more water than that. 60-2

It will generate an unacceptable amount of traffic, and an unacceptable number of cars parking all over the surrounding streets. All of those extra cars will generate pollution, noise, and congestion. What was formerly a quiet, healthy, peaceful open space will be crammed with a ridiculous number of cars and structures. 60-3

Water that used to soak into the soil will be blocked by roofs, sidewalks, and streets. 60-4

Despite having built a personal levee around his personal property at taxpayer expense, the entire development is on a flood plain. The recent rains raised the water level from nothing to 16 feet in a few hours, even considering that the ground was so dry that it soaked up much of the water before it could even get to the river. 16 feet is only 2 feet below the flood stage of 18 feet. The recent storm was not nearly as severe as many historical storms. And past history is no longer representative of what is happening with climate change, worsening droughts, and more extreme weather. 60-5

There is not enough consistent water supply to serve Saint Helena as it is now, even without adding this massive development which will use more water than the developer claims it will. 60-6

There is no way to guarantee that future, extreme weather events will be contained by Hunter's personal levee that taxpayers paid for. Saint Helena, not Hunter, will be liable for the damage. Hunter and his money will be long gone. 60-7

The size of the project, its water use, its traffic, its noise and its flood risk simply do not pass the smell test. It stinks, and everybody knows it. 60-8

The project should not be built.

We urge the committee to reject the Hunter Project. 60-9

Frank and Tracy Jonelis
708 Hunt Ave, Saint Helena

# Response to Letter 60
## Frank and Tracy Jonelis
## November 1, 2021

**60-1** The comment states opposition to the Project due to its proposed size and density.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required.

**60-2** The comment raises concerns regarding the Project's increase in water demand and believes that the Draft EIR underestimates the Project's water usage.

Please see Master Response 2 that addresses the City's ability to supply water and the requirements of the Water Neutral Policy and Chapter 13.12, Water Use and Efficiency of the Municipal Code.

**60-3** The comment raises general concerns related to the Project's generation of traffic, stating that Project traffic will generate pollution, noise, and congestion.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. Please also see Response to Comment 59-3 for information on pollution and noise impacts.

**60-4** The comment states a general concern regarding the Project's increase in impervious surfaces.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. However, as stated in the Draft EIR on pages 3.9-44 and 3.9-45, the additional stormwater runoff created by the Proposed Project would be directed to the City-owned off-site detention basin, adjacent to the Project site, which has been designed to store the increase in storm water runoff from the Project site during a 100-year storm event. The detention basin was designed assuming that the Project site would be developed with 70% impervious surfaces; however, the Project would develop less of the site (58%) with impervious surfaces. Therefore, the stormwater runoff from the proposed Project would be adequately served by the off-site detention basin.

**60-5** The comment states that the Project is proposed on a flood plain and could be subject to historical storms, which could be even more severe due to climate change.

Flooding and flood hazards as a result of storms are addressed in the Draft EIR starting on page 3.9-5 of Section 3.9, Hydrology and Water Quality. As shown in Figure 3.9-2, the Project site is not within a Special Flood Hazard Areas but is mapped as being in an area with reduced flood risk due to a levee (FEMA 2012). By being within an area of reduced risk due to levee, the Project site is considered

mapped within the 500-year flood zone (FEMA 2012). Based on the levee design, the Project site would be subject to a flood exceeding a 200-year recurrence interval, equivalent to less than a 0.5% annual chance. FEMA has established the Project site is not subject to any floodplain development restrictions such as the requirement to purchase flood insurance (FEMA 2012). The likelihood of a serious flood affecting the Project site (as well as those areas also protected by the levee/flood wall) is very low. In addition, the levee provides greater than the often standard 100-year flood with a 200-year flood design to account for other factors such as climate change. Please see Master Response 3.

**60-6** The comment opines that the City does not have consistent water supply to serve its residents and that the Project would use more water than what is assessed in the Draft EIR.

Please see Response to Comment 60-2 and Master Response 2 that addresses the City's ability to supply water and the requirements of the Water Neutral Policy.

**60-7** The comment opines that there is no way to guarantee future extreme weather events would be contained by the Napa River levee and that the City would be liable for any damage.

Please see Response to Comment 60-5 and Master Response 3 that addresses City liability in a flood event.

**60-8** The comment raises general concerns related to the Project's impact on water supply, traffic, noise, and flood risk.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Master Responses 2 and 3 regarding water supply and levee concerns and Response to Comment 38-1.

**60-9** The commenter states their opposition to the Project and urges the City to reject the Project.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

Comment Letter 61

October 27, 2021

To members of the St. Helena City Council
and members of the St. Helena Planning Commission,

I have lived on Meadowcreek Circle in St. Helena since 2003.

Many of my concerns regarding the proposed Hunter project echo those previously voiced, as listed on page ES-3 of the Draft Environmental Impact Report for the Hunter Subdivision Project (DEIR): "Concerns raised from public agencies and the public include impacts to the property from potential flooding, traffic and circulation impacts, increased water demand, and impacts to cultural resources." I have chosen to focus my comments on specific threats to the health and safety of current and future St. Helena residents, should the Hunter project be built. 61-1

**Environmental/Air Quality Issues**

According to page 3.0-3 of the DEIR, "The Proposed Project application does not include a formal phasing plan. Therefore, for the purposes of this EIR buildout of the Project would occur based on market conditions and the timeliness of obtaining building permits. Therefore, it is assumed that the Project could take anywhere from 6 years or longer for full buildout, based on market and growth management factors."

Page 3.3-23 of the DEIR: "For the analysis, it was generally assumed that heavy construction equipment would be operating for approximately 8 hours per day, 5 days per week (22 days per month) during Proposed Project construction." As a local resident, I will verify there are currently existing conditions of substantial dust and noise from agricultural and grass control activities affecting residences in the vicinity of the proposed Hunter project, and the proposed 6 years of construction will certainly exacerbate those existing air quality issues. 61-2

Page 3.3-26 of the DEIR: "Notably, in the *California Building Industry Association v. Bay Area Air Quality Management District* case decided in 2015, the California Supreme Court held that CEQA does not generally require lead agencies to consider how existing environmental conditions might impact a project's occupants, except where the project would significantly ***exacerbate*** an existing environmental condition.

On page 3.3-26 the DEIR verifies that the probable worsening of existing air quality issues in the vicinity of the proposed Hunter project would rise to the level of a significant impact under California Environmental Quality Act (CEQA) Guidelines: "Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people." 61-3

I question which entity, the City of St.Helena or the Hunter project developers, will be legally and financially responsible for any loss of health, life or property by adjacent property residents resulting from environmental and air quality degradation caused by a protracted 6 year Hunter construction project? 61-4

**Water Quality and Availability**

According to the St. Helena City government, we are in a serious water emergency. Expensive upgrades will be necessary to provide adequate water service to existing customers of the St. Helena City water enterprise moving forward. In addition, past City of St. Helena leadership has made binding water supply decisions which have worsened our current water shortage. During the summer of 2021, many City water customers incurred unaffordable fines for excessive water use as a consequence of St. Helena water rationing regulations. I'm sure any future residents of the Hunter Subdivision would not enjoy sharing in this experience! 61-5

There are also ongoing issues with the quality of St. Helena City water and malfunctions at the City sewage treatment plant, as documented by City correspondence and local news media. Here is a recent example: below is a photo of water from the kitchen faucet of my St. Helena residence this week, from 10/25/21 to 10/26/21. I was assured by staff at St. Helena Public Works on the morning of 10/25/21 that this water was safe to drink, but to my knowledge, no water testing had been undertaken by the City, in spite of admission by City staff that a water main had been ruptured and infiltrated with pollutants. I was told that the Vice Mayor and the City Manager were aware of the situation. The City's difficulties in ensuring a quality water supply must be overwhelming, judging by the lack of timely communication on this issue. Finally, on the afternoon of 10/25/21, there was a single press release from the City mentioning a ruptured water main, but no mention of the visibly poor water quality, or any apparent attempt to determine if the water was fit for consumption. In addition, I can attest that my students at Robert Louis Stevenson Middle School were drinking this questionable water with no warning or word of caution from St. Helena City leadership to the school district. 61-6

In reference to the St. Helena 2010 Water Supply Plan, the DEIR (page 3.13-10) clearly states "...water supplies under both the Likely Buildout Scenario and the Full Buildout Scenario would not be sufficient to meet demands during all [water supply] scenarios."

Given these circumstances, how can the City or the developer warrant to any future Hunter Project residents that there will be a sufficient supply of good quality water to supply their residences? What if the water supply and quality continues to be inadequate? The current lack of an adequate supply of quality water in the City of St. Helena indicates that the addition of any further housing units must wait until the water delivery infrastructure is upgraded. Which entity, the City or the Hunter project developers, will be legally and financially responsible for any future injury to health, life or property resulting from the worsening of City of St. Helena water supply/quality issues, exacerbated by addition of 80+ households in the proposed Hunter project?

61-7

61-8

There are mitigating actions listed in the DEIR, such as page ES-3 "Minimize City water use by continuing the use of an existing on-site water well for irrigation of Proposed Project landscaped areas" and page 3.13-28 "The Proposed Project would be designed not to exceed 0.4 acre-feet/year/dwelling unit of water based on the installation of increasingly efficient and lower- water-using fixtures and appliances and irrigation systems." However well intentioned, these mitigating actions don't come close to solving the difficult issues facing the City of St.Helena's water enterprise.

61-9

**Danger from Earthquake/Flooding**

The DEIR states "The following policies from the City of St. Helena 2019 General Plan, Public Health and Safety element are relevant to geology, soils, and seismicity issues in the Project site. Policy PS3.1: ***Minimize risk of injury, loss of life and property damage from seismically induced and other known geologic hazards*** (page 3.6-18)."

Page 3.6-22 of the DEIR points out a substantial problem: "It is not acceptable to place compacted, engineered fill (designed to support future development) on the Hunter Parcel without first over excavating and recompacting the existing weak surface layer, due to the anticipated settlement of the weak soil layer as a result of the loads imposed by the new fill, as well as future building loads. Settlement of the weak soil layer, if left in place beneath the recently placed compacted fill, could lead to damage to new residential structures, streets, utilities, and concrete flatwork supported over the weak soil layer."

Due to the potential for liquefaction and/or settlement of weak soils, the Proposed Project could potentially expose residences to significant impacts from a major earthquake. The DEIR clearly states this is considered a significant impact.

61-10

Another safety issue is levee surrounding the Hunter property. It is well known that local news media has reported past correspondence between the City of St. Helena and the Army Corps of Engineers questioning whether the levee was constructed according to accepted engineering and safety standards. As one citizen brought up during public comments at the City Council meeting of 9/14/21, no one -- City of St. Helena staff or the Hunter developer--will answer simple questions in a public meeting regarding which entity, the City or the developer, will take responsibility for possible future damage to health, life or property if the levee protecting the Hunter property should be damaged. Was

61-11

the levee built to current engineering and safety standards? No one seems to want to answer that question affirmatively, with supporting documentation. 61-11 Cont.

Fortunately, page 3.9-12 of the DEIR provides us with a response on this issue: "Where the levee may be overtopped or in a 200+ year flood event, Proposed Project residents would have ample warning to evacuate prior to flooding. Based on a comparison of the base flood elevation to proposed lot pad elevations, flooding of Proposed Project lots would range between 0 and 5 feet in depth, with the deepest flooding occurring on the northern part of the Project site. ***This level of flooding would leave upper floors of residences available for refuge. Because of this, the risks from a 200+ year flood and/or levee failure are limited to property damage rather than risk of life. As previously indicated, this would be an impact of the pre-existing environment on the Proposed Project rather than the Proposed Project's impact on the environment."*** 61-12

Where is the mitigation or measures to protect public safety in this strategy? I remind the reader how readily disease vectors are spread via flood waters, and how toxic mold can grow for years in a structure damaged by a flood. In section 3.9-12, the Hunter project developers are clearly stating "The danger from the levee is just a pre-existing condition of this property, we won't take any responsibility for the outcome, we're going to move forward with this project no matter who is endangered, and the City of St. Helena will be left to deal with the legal and financial consequences." How about not building the proposed project in such an unsafe location? I wouldn't buy any residence under the unsafe circumstances proposed for the Hunter project, but that's just my personal perspective. I'm simply not interested in being trapped in my home's second story while unsanitary flood waters circulate through the lower story. 61-13

I'm wondering which entity, the City or the Hunter project developers, will be legally and financially responsible for any future loss of health, life or property resulting from a levee break or earthquake damage at the location of the proposed Hunter project? 61-14

**Traffic and Lack of Emergency Access/Egress**

Page 3.14-4 of the DEIR states "Would the proposed project result in inadequate emergency access? This is a less than-significant impact." I do not agree. Based on my 18+ year residence in the area immediately adjacent to the proposed Hunter project, I would like to elaborate on the negative traffic impacts of further residential development in the area. 61-15

Page 3.14-5 of the DEIR states "Under Cumulative conditions, would the proposed project conflict or be inconsistent with CEQA Guidelines section 15064.3(b)? This is considered a significant impact. No mitigation measures available." My understanding is that CEQA section 15064.3(b) pertains to potential negative traffic impacts. On page 3.15-5 the authors of the DEIR thus acknowledge the project will exacerbate traffic problems in the immediate vicinity and there are no mitigating actions possible. 61-16

According to the DEIR page 2-23, "Development of the Project site would require the extension of Adams Street and Starr Avenue onto the Project site to provide two points of ingress and egress…." 61-17

The developed areas adjacent to the proposed Hunter project -- Hunt Avenue/Hunt's Grove/Meadowcreek Circle/Starr Avenue -- have had a crowded street parking situation that has increased over the last decade. In addition to aggravating the impacted neighborhood parking situation, further increasing the density of the adjacent neighborhood housing will directly endanger 61-18

current residents, well as any future residents of the proposed Hunter project, if a sudden emergency evacuation is necessary, given the few points of exit (Pope Street bridge, Main Street) from the area. Responsible addition of 80+ households to this area must require development of *several* additional entry and exit points; the two cited in the DEIR are not sufficient to safely evacuate the planned Hunter development. In addition, due to prior land use agreements made by the City of St. Helena, it is highly questionable whether there will ever be a bridge built crossing the river at the intersection of Adams Street and Silverado Trail. 61-18 Cont. 61-19

The DEIR cites the historic frequency of local natural disasters in the form of floods "...1973, 1978, 1982, 1983, 1986, 1995, 1997, 1998 and 2005 (page 3.9-5)" and wildfires "August 2020 there were a number of wildfires including the LNU Lightning Complex Fire and the Glass Fire that burned large areas of Napa County including a small portion of the Project site (page ES-4)." This week, CHP and St. Helena Police Department reported "Early Monday morning (October 25), a section of Silverado Trail was damaged in a storm-related washout, resulting in a closure at Madrone Knoll Way to Meadowood Lane near St. Helena. Efforts are underway to reopen this section of Silverado Trail as soon as possible. The County expects repair work will begin as early as Friday and anticipates that ***Silverado Trail will be reopened within the next three weeks***." The fragile and limited points of egress on the east side of St. Helena have had a history of creating crisis situations as a result of our frequent natural disasters. Why is increased housing density being considered in an area of St. Helena with so few points of safe entry/exit? Why are the construction of multiple new points of entry/exit not integral to the Hunter Subdivision proposal? Why are the recommendations of the California State Department of Transportation on the development of safe evacuation routes (Evacuation Route Guidance, Design Information Bulletin 93, dated 12/23/20) not being followed in the plans for the Hunter project? 61-20 61-21

In the aftermath of the 2020 Glass Fire, the St. Helena Police Department and Napa County Sheriff launched a media campaign promoting the ZoneHaven evacuation management platform. Why is the City considering endangering the safety of residents by crowding 80+ more households into an evacuation zone with an existing high density housing complex and very few evacuation routes? This seems contradictory to any sort of safe and responsible evacuation plan. Which entity, the City or the Hunter project developers, will be legally and financially responsible for any future loss of health, life or property resulting from a faulty evacuation from the area surrounding the proposed Hunter Project? 61-22 61-23

**Right to Fair Housing**

Over the last three decades, the vast majority of St. Helena's high density housing units, as well as the majority of St. Helena's low income housing, has been constructed east of Main Street. These cumulative actions are well documented in the past minutes of St. Helena City Council and St. Helena Planning Commission meetings. As a result of actions by past St. Helena City leadership over many years, civil rights violations have emerged over the systematic practice of concentrating high residential density and low income housing in the area east of Main Street in an unbalanced manner. This sustained conduct on the part of past City of St. Helena leadership appears to qualify as discrimination in the conditions of housing under the jurisdiction of the United States Office of Fair Housing and Equal Opportunity. This discrimination has been inflicted on the entire class of St. Helena residents living east of Main Street. 61-24

When and where will a comparative number of high density or low income housing units be built west of Main Street, in order to mitigate actions that together constitute discrimination in the conditions of housing by past City of St. Helena leadership against the class of residents living east of Main Street? When will a project similar in scope and size to the proposed Hunter project be built west of Main Street?

61-25

These and other protracted local problems will be exacerbated if the proposed Hunter Subdivision project becomes a reality. While the DEIR repeatedly states (pages 2-33, 3.0-1, 3.10-13, 3.10-15, 3.10-17, 3.13-9, 4-5) that the California Housing Crisis Act of 2019 (SB 330) prohibits public agencies such as the City of St. Helena from imposing a moratorium or similar restriction on housing development, the SB 330 legislation provides for an exception which specifically protects citizens and municipalities against development that poses an imminent threat to public health and safety. The Hunter project poses numerous specific threats to the health and safety of current and future St. Helena residents, should the project be built, by compromising:

- environmental/air quality,
- water quality and availability,
- safety from earthquake/flooding
- emergency access/egress,
- the right to fair housing.

61-26

It seems to me that the answer regarding whether or not to move forward with the Hunter Subdivision Project as proposed can be found on page ES-17 of the DEIR: "Of the alternatives evaluated above, Alternative 2, the Park Preserve alternative [eg. maintaining the land as a nature preserve] is the environmentally superior alternative." Taken as a whole, this solution also sounds like the highest and best use of the parcel known as the Hunter Property, in order to responsibly ensure sustained health and safety for current and future residents of St. Helena.

61-27

Best regards,

Sherri Kelly
1192 Meadowcreek Circle

# Response to Letter 61
## Sherri Kelly
## October 27, 2021

**61-1** The comment is an introduction to the concerns presented in the comment letter.

The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**61-2** The commenter states their concerns related to Project construction exacerbating existing noise and air quality conditions within the area including generation of fugitive dust.

As discussed in the Draft EIR in Section 3.3, Air Quality, in developing thresholds of significance for air pollutants, the Bay Area Air Quality Management District (BAAQMD) considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be considered cumulatively considerable, resulting in a significant adverse air quality impact to the region's existing air quality conditions. Construction and operation of the Project would not result in an exceedance of the BAAQMD significance thresholds as presented in Tables 3.3-8 and 3.3-9. Furthermore, the Project would implement the BAAQMD's Best Management Practices (BMPs) for fugitive dust control during construction.

Please also see Response to Comment 38-1 regarding noise impacts.

**61-3** The commenter opines that the Draft EIR verifies that the Project would result in the probable worsening of existing air quality issues resulting in significant impacts.

Please see Response to Comment 61-2. The Draft EIR concluded that the Project would not result in exacerbating existing air quality conditions and would not result in the exceedance of the BAAQMD thresholds of significance for both construction and operations. Furthermore, heavy-duty equipment on the Project site during construction would emit odors. However, construction activity would be short-term and would cease to occur after construction is completed. Regarding operations, the Project would develop residential uses which is not a typical land use associated with the generation of a source of odors.

**61-4** The comment asks whether the City or the Project applicant would be legally and financially responsible for the loss of health, life, or property resulting from the degradation of air quality and the environment under the 6-year Project construction period.

Legal and financial concerns regarding a project are not environmental impacts under CEQA and are not evaluated in an EIR. The comment does not identify

specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**61-5** The comment suggests that the City is in a water emergency and upgrades would be necessary to ensure water service is provided to existing residents. The comment also states that the City has contributed to the worsening of the water shortage and many residents incurred fines for excessive water use as a result of City water rationing regulations.

Please see Master Response 2 for information on adequate water supplies.

**61-6** The comment describes their personal experiences that suggest ongoing issues with the quality of water provided by the City, and malfunctions at the City sewage treatment plant and goes on to describe their experience with possible water contamination.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**61-7** The comment asks how the City or Project applicant can approve the Project due to the City's water concerns.

Please see Master Response 2 for information on water availability in the City.

**61-8** The comment asks whether the City or Project applicant would be held legally and financially responsible for future injury to health, life, or property resulting from the exacerbation of the City's water supply and water quality issues from the Project.

The comment is noted and forwarded to the decision makers for their consideration. Legal liability for a potential future event is not within the scope of CEQA.

**61-9** The comment opines that the Project does not adequately address the City's water issues.

Please see Master Response 2 for further information on water supply and availability to serve the Project.

**61-10** The comment opines that, due to potential liquefaction/settlement issues of weak soils, the Project could expose residences to significant impacts.

The impact analysis of potential liquefaction hazards at the site is addressed in the Draft EIR beginning on page 3.6-21. The analysis concludes that this hazard is potentially significant. However, Mitigation Measure GEO-1 ensures that a design-level geotechnical report be completed prior to issuance of a grading or building permit. Adherence to this mitigation measure and City Building requirements would

reduce the potential impact to less than significant by incorporating design measures that can reduce potential impacts from liquefaction/settlement to less-than-significant levels.

**61-11** The comment asks whether the Napa River levee was constructed according to accepted engineering and safety standards, and whether the City or Project applicant would be responsible for future damage to life, health or property if the levee were to fail.

Legal liability for a potential future event is not within the scope of CEQA. Please see Master Response 3 for more information on the levee.

**61-12** The comment asks for a mitigation measure to address the potential impact of the levee overtopping or flooding from a 200-year flood event.

As discussed on page 3.0-1 of the Draft EIR, the purpose of the CEQA analysis is to identify the potential impacts of a project on the environment and not the effects of the environment on the project. However, as noted on page 3.9-12 of the Draft EIR, the potential for failure of the levee has less than a 0.5% chance of occurring in any given year and there would be no substantive risk to human health. Nonetheless, CEQA does not require mitigation for a potential impact of the environment on the Project. Please see Master Response 3 for more information specific to the levee and the Project's Conditions of Approval.

**61-13** The comment opines that the Project has legal and financial consequences to the City, and possible public safety consequences. The comment suggests that the Project should not be built in the proposed location because it would be unsafe for future residents.

See Master Response 3 for further information on City liability and Response to Comment 61-4 regarding legal and financial concerns. The comment is noted and forwarded to the decision makers for their consideration.

**61-14** The comment asks whether the City or the Project applicant would be legally and financially responsible for any future loss of health, life, or property resulting from a levee break or earthquake damage to the Project.

Determinations of legal liability for a potential future event is outside the scope of CEQA. Please see Master Response 3 for information regarding the levee. Additionally, please see Response to Comment 61-10 regarding how any potential earthquake hazards would be mitigated.

**61-15** The comment opines that the Proposed Project would result in inadequate emergency access.

Please see Master Response 1 that addresses emergency access concerns.

**61-16** The comment notes the conclusion in the Draft EIR that the Project would be in conflict with CEQA Guidelines Section 15064.3(b).

Traffic is evaluated in Section 3.14 of the Draft EIR, which analyzes the Project's increase in vehicle miles traveled (VMT), consistent with CEQA Guidelines Section 15064.3(b). The analysis concludes that the Project would have a significant and unavoidable impact due to an increase in VMT. Since the comment does not elaborate, or provide any substantial evidence to support the claim that the Draft EIR is inadequate, no further response is required.

**61-17** The comment re-states the text on page 2-23 of the Draft EIR regarding the extension of Adams Street and Starr Avenue onto the Project site to provide two points of ingress and egress.

The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**61-18** The comment states an opinion that parking is congested in the neighborhood and that overall traffic congestion will hinder emergency evacuation in the area.

The adequacy of parking supply is not an environmental impact under CEQA; therefore, the commenter's concern is noted for the decision makers and no further response is required. However, at the time building permits are requested, as required by the Municipal Code, the City will confirm the Project complies with Section 17.124.030.A.1 of the City's Zoning Code that addresses residential parking requirements. Please see Master Response 1 for information regarding emergency vehicle access.

**61-19** The comment opines that the addition of more than 80 new households must require several additional entry and exit points, in addition to the two cited in the Draft EIR. The comment also questions whether there will be a bridge built crossing the river at the intersection of Adams Street and Silverado Trail.

The Project provides two points of access along with emergency evacuation access, consistent with City requirements for this type of development. The commenter's opinion that additional points of access area required is noted and forwarded to the decision makers for their consideration. Additionally, please see Master Response 1 regarding emergency evacuation. The Proposed Project does not include the construction of a new bridge and does not involve any further extension of Adams Street, east of Starr Avenue. Any extension of Adams Street connecting to Silverado Trail would require further study and approval by the City and is not required for this Project.

**61-20** The comment notes that the Draft EIR acknowledges the historic frequency of floods and wildfires in the Project vicinity and states the commenter's opinion that the limited points of egress on the east side of the City have a history of creating crisis situations.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required. However, please see Master Response 1 for additional information regarding emergency evacuation.

**61-21** The comment asks why increased housing density is being considered in an area of the City with few points of safe entry and exit and why the recommendations of the California Department of Transportation regarding development of safe evacuation routes have not been followed.

Please see Master Response 1 for information regarding emergency evacuation.

**61-22** The comment references a past media campaign promoting the ZoneHaven evacuation management platform and asks why the City is considering endangering the safety of residents by introducing new households to an area with few evacuation routes.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required. However, please see Master Response 1 for additional information regarding emergency evacuation.

**61-23** The comment asks whether the City or the Project applicant would be legally and financially responsible for any future loss of health, life, or property resulting from evacuation failures around the Proposed Project.

Legal liability for a potential future event is outside the scope of CEQA. Please see Master Response 1 regarding emergency evacuation and Master Response 3 regarding City liability and Response to Comment 61-4.

**61-24** The comment states an opinion that most high-density and low-income housing in the City has been constructed east of Main Street and that these actions qualify as discrimination under the jurisdiction of the U.S. Office of Fair Housing and Equal Opportunity.

The comment does not address the adequacy of the Draft EIR, but instead expresses the commentor's opinion about the Project. The comment does not identify any specific areas where the EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**61-25** The comment asks when a comparative number of high-density or low-income housing units, or a project similar in size and scope to the Proposed Project would be built west of Main Street in order to mitigate for past "discrimination."

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**61-26** The comment states an opinion that the Project would pose an imminent threat to public health and safety and therefore qualifies as an exception to the California Housing Crisis Act of 2019 (SB 330), which prohibits the City from restricting housing development.

The comment does not address the adequacy of the Draft EIR, but instead expresses the commentor's opinion about the Project. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**61-27** The comment supports Alternative 2, the Park Preserve alternative, as the best use of the Project site.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required.

**To:** Mark Prestwich <MPrestwich@cityofsthelena.org>, Geoff Ellsworth <GEllsworth@cityofsthelena.org>, Paul Dohring <PDohring@cityofsthelena.org>, Anna Chouteau <AChouteau@cityofsthelena.org>, Lester Hardy <LHardy@cityofsthelena.org>, Eric Hall <ehall@cityofsthelena.org>
**Subject: [External] citizen request**

Dear Mr. Prestwich, Mr. Ellsworth and City Council members,

I have been the owner and resident of 1192 Meadowcreek Circle since 2003. I have been employed since 1991 as a teacher at St. Helena Unified School District. As both a long time resident and local educator, I believe the complex issues surrounding the proposed Hunter Subdivision project warrant adequate time and attention, in order to gain complete understanding of the project plan and all foreseeable consequences that this project will bring to the residents of St. Helena. 62-1

I'm a single parent who is employed full time. The Hunter DEIR is 638 pages long and the appendices total an additional 1940 pages. I am not an expert on the topics of property development, hydrology and soils, effective emergency evacuation strategies or flood control engineering. During the last 40 days, I have spent hours reading and studying the DEIR, and I'm nowhere close to being able to describe myself as an adequately informed citizen on the Hunter Subdivision proposal. 62-2

If I'm having trouble gaining full access the important information in the DEIR during the limited 45-day statutory timeline, I can only imagine that there are many other St. Helena residents who are unable to access or begin to understand the important information in the DEIR due to the document language, complexity and lack of sufficient time.

At last night's Planning Commision meeting, Commissioner Daniel Hale stated that only senior City staff had the authority to extend the statutory 45-day DEIR review deadline. He was not specific in identifying who those City staff were, so I'm writing to all of you. I am requesting the 45-day statutory DEIR review period be extended, so that all local residents have their rightful access and the opportunity to completely understand the contents of the DEIR document. 62-3

Sincerely,
Sherri Kelly

**63-1** The comment states general opposition to the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required.

**63-2** The comment expresses general concern regarding the Project's impact on traffic, the City's sewer system, and flood protection.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate. The Project's impact on transportation and circulation is addressed in Section 3.14, Transportation and Circulation. Master Response 3 addresses concerns related to flooding and flood protection and Master Response 4 addresses wastewater.

**63-3** The comment states opposition to the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required.

INTENTIONALLY LEFT BLANK

Comment Letter 64

City of St. Helena

I am writing to comment on the DERI for the Hunter project. There are so many reasons to object to this project. There is no water neutrality, loss of conservation easements, the proposed affordable housing does not conform to the Municipal Code, traffic over a railroad track which has a F rating from Caltrans and cannot be mitigated without opening Starr Avenue and building a new bridge over the Napa River and on and on. 64-1

However, an important reason is overlooked in this report and one that is an albatross for the city and stirred heated discussion since its beginning: The St. Helena Levee on the Napa River. There is positive to the levee project, but also many mistakes not the least of which is the missing monies never accounted for and continuing worries of no current comprehensive flood-risk management.

The width of the St. Helena levee was built wider than it was intended or needed to be, a size that took the levee wide of the Vineyard Valley property it was made to protect, resulting in a large 16.9-acre agriculture floodplain undeveloped and empty. On Sept. 8, 2010, a developer saw an opportunity and purchased this floodplain acreage. Then submitted plans to convert agricultural land into high density housing including 87 new residential units, this despite an explicit provision in Measure A that "none of these projects (levees) are intended or designed to encourage population growth." 64-2

The limitation on building expensive homes and apartments on this floodplain are many, not the least of which is how will the homeowners be able to purchase insurance for homes built in a flood plain? Will the city be responsible for damages if the levee fails? 64-3

St. Helena now has a chance to bring this to an end and avoid construction of 87 new homes behind the levee. "Floodplain managers, river scientists, and prudent leaders worldwide counsel that levee protection is never absolute, and that even the tallest and strongest wall comes with an inherent residual risk, a small but real possibility that it may fail or be overwhelmed during future floods....St. Helena should understand that levee protection brings a range of consequences, including the possibility of multiplying, not diminishing, the long-term risk of damage and potentially even loss of life in their community." 64-4

**I sincerely assume good intent when I ask the Planning Commission and then the City Council to thoroughly understand and preform due diligence into these issues. Best regards, Susan Kenward. St. Helena.** 64-5

INTENTIONALLY LEFT BLANK

# Response to Letter 64
## Susan Kenward

**64-1** The commenter states their opposition to the Project. In particular, the commenter raises concerns related to water neutrality, conservation easements, traffic and the Project's compliance with the City's Municipal Code.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. However, please refer to Master Response 2 regarding water neutrality, Response to Comment 45-2 regarding affordable housing and the City's Municipal Code, and Responses to Comments 32-6, 57-9 and 61-10 regarding traffic on Railroad Avenue and building a new bridge over the Napa River. Please see Response to Comment 36-3 regarding the easement.

**64-2** The comment expresses concern related to the Napa River levee. In particular, the comment claims that the levee project was financially mismanaged and that there are ongoing concerns related to flood-risk management. The comment claims the levee was built wider than intended or needed and that the Project conflicts with a provision in the City's Measure A agreement.

The comment does not identify any specific areas where the Draft EIR is inadequate; therefore, no further response is required. Please see Master Response 3 for more information regarding the levee and Measure A.

**64-3** The comment expresses concern related to future homeowner's ability to purchase flood insurance and also questions who would be liable for damages associated potential levee failure.

The Project site is outside of a FEMA special flood hazard area; therefore, purchase of flood insurance would not be required. However, because there remains residual risk of flooding from catastrophically large floods (such as a 500-year flood) or levee failures, property owners would have the option to purchase flood insurance. Regarding the liability for damage in the event of a catastrophic flood event, please see Master Response 3.

**64-4** The comment provides an unreferenced quote that states levee failure is a possibility and urges the City to assess long term risks associated with levee protection.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. However, please refer to Master Response 3 for more information specific to the levee and potential flood risks.

**64-5** The commenter requests the City's Planning Commission and City Council perform due diligence when reviewing the Project.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required.

Comment Letter 65

**From:** Grace Kistner <gdkistner@comcast.net>
**Sent:** Tuesday, November 23, 2021 3:02 PM
**To:** Maya DeRosa <MDeRosa@cityofsthelena.org>
**Subject:** [External] Proposed Hunter Project EIR Comments

Hi Maya,

My comments regarding the Proposed Hunter Development begin with Napa Counties Measure A Ordinance that was passed with over two thirds of Napa County Voters in March 1998. 65-1

I am attaching a copy of the Measure A Ordinance in its entirety. However the part of this Ordinance that is pertinent to the proposed Hunter Development is in:
Section 2 Findings, Paragraph G which states:

"None of the projects in the Plan are intended or designed to encourage population growth in Napa County. All of the projects are for flood protection, preserving ground water integrity, reducing sediment in the Napa River system, and for maintaining the reliability of the water supply for existing Napa County population of the date of this Ordinance." 65-2

The proposed Hunter has 51 Single Family Homes, 11 ADUs and 25 Multi-Family units which when sold or rented would increase the population significantly in St. Helena a City of about 6000 residents. 65-3

Flood protection to the existing residents would be greatly decreased and possibly put existing St. Helena residents in jeopardy due to the increase in concrete and asphalt required to build roads and driveways that would be necessary for the proposed project. This increase in hard surfaces in case of heavy rains would cause water to run off to the lower areas south of the project. In addition these hard surfaces would produce more sediment flowing to the Napa River. 65-4

Additionally the use of the well water for landscaping would not be helpful in preserving ground water integrity. Also the use of City water for this project would not maintain the reliability of the water supply for existing residents. 65-5

Measure A in itself should be grounds for denying the Proposed Hunter Project. 65-6

Grace D. Kistner
25 San Juan Court
St. Helena, Ca

# Response to Letter 65
## Grace Kistner
## November 23, 2021

**65-1** The comment states a concern related to the Project's compliance with Measure A.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. However, please refer to Master Response 3 and Response to Comments 35-6 and 57-3 regarding Measure A.

**65-2** The comment provides an excerpt from Measure A stating that projects funded under this Measure are not intended to encourage population growth.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. However, please refer to Master Response 3 and Response to Comments 35-6 and 57-3 regarding Measure A.

**65-3** The comment states there would "significantly" increase the population of St. Helena.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. The Draft EIR projects that the Project would add 213 residents to the existing population (6,049 as of 2020), an increase of 3.5% that is within the population growth estimates in the adopted 2040 General Plan.

**65-4** The comment claims that flood protection to existing residents would decrease due to the Project because of an increase in impervious surfaces. The comment also states that an increase in impervious surfaces would also produce more sediment flowing into the Napa River.

Please see Response to Comment 35-4. Regarding increased sediments flowing into the Napa River, the Draft EIR addresses this concern in Chapter 3.9, Hydrology and Water Quality. Specifically, on page 3.9-45 the Draft EIR concludes the impact water quality would be less than significant, because compliance with existing permitting requirements and conditions of approval (i.e., MS4 Permit and the City's Stormwater and Runoff Pollution Control Ordinance) are sufficient to avoid water quality degradation (including erosion and siltation).

**65-5** The comment raises a concern related to the Project's proposed use of well water and its impact on groundwater supply.

Please refer to Response to Comment 57-5 and Master Response 2 regarding the use of well water and the reliability of water supply.

**65-6** The comment states that Measure A should be grounds for denying the Project.

Please refer to Master Response 3 regarding Measure A.

An attachment to this letter can be found in Attachment B.

Comment Letter 66

**From:** Grace Kistner <gdkistner@comcast.net>
**Sent:** Monday, November 29, 2021 7:18 AM
**To:** Maya DeRosa <MDeRosa@cityofsthelena.org>
**Subject:** [External] Hunter EIR

The Proposed Hunter Project is definitely a residential development project and therefore falls the St. Helena zoning code 17.146. Residential Development Project Inclusionary which states that "A least twenty (20%) of all new dwelling units in a residential development project shall be affordable units, which shall be constructed and completed no later than the related market rate units." 66-1

Section I Basic Requirements for Owner-Occupied and Rental Affordable Units

Section I states: Affordable units shall be comparable in number of bedrooms, exterior appearance and overall quality of construction to market rate units
in the same residential project. Subject to approval of the planning commission, square footage of affordable units and interior features
in affordable units need not be the same or equivalent to those in market rate units in the same residential project so long as they are of
good quality and are consistent with contemporary standards for new housing.
Affordable units shall be dispersed throughout the
project, or subject to the approval of the planning commission may be clustered within the residential project when thus furthers
affordable housing opportunities." 66-2

In looking at the Project Description In The City Of St. Helena Notice Of Availability, Hunter Sub Division Project it appears that 16.9-acre parcel is proposed to contain fifty one (51) Single Family Market Homes and Eleven (11) ADU's.
Chapter 17.146 of the ST. Helena Zoning would require twenty (20) percent of the homes to be affordable in the 16.9 acre. This project should be denied as it is now proposed. 66-3

# Response to Letter 66
## Grace Kistner
## November 29, 2021

**66-1** The comment states an opinion that the Project is not compliant with Chapter 17.146 of the City's Municipal Code, which requires a percentage of new dwelling units to be affordable units.

The comment does not address the adequacy of the Draft EIR and is referencing requirements of the City's Inclusionary Housing Ordinance. The comment does not identify any specific areas where the EIR analysis is inadequate; therefore, no response is required. Please see Response to Comment 2-3 that addresses the Project's affordable housing requirement.

**66-2** The comment provides an excerpt of Chapter 17.146 of the City's Municipal Code which describes requirements for owner-occupied and rental affordable units under the City's Inclusionary Housing Ordinance.

The comment does not address the adequacy of the Draft EIR and is referencing requirements of the City's Inclusionary Housing Ordinance. The comment does not identify any specific areas where the EIR analysis is inadequate; therefore, no further response is required. See Response to Comment 66-1.

**66-3** The comment summarizes the Project's proposed residence types and expresses that the Project should be denied because, in the commentor's opinion, it is not compliant with Chapter 17.146 of the City's Municipal Code.

The comment does not address the adequacy of the Draft EIR, but instead expresses the commentor's opinion about the Project. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no further response is required. Please see Response to Comment 2-3.

Subject: [External] Hunter project

To whom it may concern, I do NOT want the Hunter project to happen, mostly because all (51) homes will be 2-story. Not everyone wants stairs in their homes. This project is a very awful thing if it does get approved. Please have the developer include single story homes also or else deny their application. Pamela. 67-1

**Subject:** [External] Draft EIR # 2108032014 (The Hunter Project)

Maya DeRosa,
Planning & Building Director
City of St. Helena Planning Department
1572 Railroad Avenue, St. Helena, California 94574

Dear Ms DeRosa,

In regard to the Draft EIR # 2108032014 (The Hunter Project), Transportation and Circulation, I'm strongly opposed to the development of this project. In my opinion the proposed project is completely inadvisable until our community-wide traffic and emergency access issues are addressed. 68-1

I've lived in St. Helena for 32 years and have experienced the greatly increased volume of traffic on Pope Street, Starr and Hunt and the frequent difficulty accessing the Silverado Trail via the Pope Street bridge. The addition of the Hunter projects' 100+ households with their associated vehicles makes no sense without an outlet from Highway 29 to the Silverado Trail other than the Pope Street bridge. We already experience serious daily traffic congestion. During emergencies on the Silverado Trail or Highway 29 and in the event of an evacuation we have few existing routes out of the area. Until suitable roads and city infrastructure are in place, the addition of more housing units in this proposed isolated neighborhood is irresponsible. 68-2 68-3

# Response to Letter 68
## Laurel Krsek
## November 2, 2021

**68-1** The comment states opposition to the Project and requests community-wide issues related to traffic and emergency access should be addressed

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The Project's impact on transportation and circulation is addressed in Section 3.14, Transportation and Circulation. The analysis includes consideration of motorized vehicle traffic impacts on roadway capacity, vehicle-miles traveled (VMT), and potential impacts to transit, bicycle, and pedestrians. Please also see Master Response 1, that provides more details specific to the maintenance road for emergency evacuation for both Vineyard Valley residents and Project residents.

**68-2** The comment states a concern that the Project will negatively impact traffic conditions.

Potential Project traffic impacts are analyzed in detail within Section 3.14 Transportation of the Draft EIR and within Appendix K, Traffic Impact Study. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no additional response is required.

**68-3** The comment states the commentor's concern related to emergency evacuation and states the Project should not be approved.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. Please see Master Response 1 that addresses emergency access concerns.

**Sent:** Saturday, October 30, 2021 5:50 AM
**To:** Maya DeRosa <MDeRosa@cityofsthelena.org>
**Subject:** [External] Hunter project

I would like to share my serious concerns regarding this project. 69-1

My family settled in St. Helena 7 generations ago. I've lived in St. Helena most of my 68 yrs. I've founded several businesses, always looking out for the best interest of our small community.

This project is drastically going to impact traffic on Pope, Starr, Hunt & Adams streets. I understand the owner has a well but our water situation will still be impacted. 69-2

Our water table has already been depleted irrigating vineyards. But we are an agricultural county and growing grapes is a priority. 69-3

The Glass Fire damaged our city's water supply. We're still in a serious draught. How can our city's resources properly manage all these new homes and homeowners? 69-4

We need affordable housing. But there must be a better solution than filling an open space in town with over 51 new homes. 69-5

Starr Ave is littered with cars before/after work and on weekends right now. The residents in the apartment complex at the end of Hunt have never had enough parking. They are forced to park and walk several blocks just to get to their apartment. Starr Ave residents have cars lined up in front of their own homes, leaving no room for guests. 69-6

I oppose this project due the size of it, the impact on water resources, city sewer & traffic. 69-7

Thank you.

## October 30, 2021

**69-1** The commenter states their history as residents of the City.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**69-2** The comment raises general concerns related to the Project's impact on traffic and the City's water supply.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 2 related to water supply. The Project's impact on transportation and circulation is addressed in Section 3.14, Transportation and Circulation. Please see Responses to Comments 57-8, 57-9, and 57-10 regarding traffic concerns.

**69-3** The comment states agriculture should be a priority for the area.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**69-4** The comment raises a general concern related to the Project's impact on the City's water supply.

Please see Master Response 2.

**69-5** The comment acknowledges the need for affordable housing but indicates another project could meet this need.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**69-6** The comment raises a concern related to the Project's impact on local parking.

The adequacy of parking supply is not an environmental impact under CEQA; therefore, the commenter's concern is noted for the decision makers and no further response is required. However, at the time building permits are requested, as required by the

Municipal Code, the City will confirm the Project complies with Section 17.124.030.A.1 of the City's Zoning Code that addresses residential parking requirements.

**69-7** The comment states opposition to the Project due to its impact on water, the City's sewer system, and traffic.

Please see Response to Comment 69-2 and Master Responses 1 for water supply and 4 for concerns regarding wastewater. Traffic impacts are evauated in Section 3.14 of the Draft EIR.

Comment Letter 70

Marina Lavagnino
Jenna Lavagnino
15 Del Rio Ct.
Saint Helena, Ca 94574

November 29, 2021

Ms. Maya DeRosa, Planning & Building Director
City of Saint Helena
1572 Railroad Avenue
Saint Helena, CA 94574

Re: **Hunter Project Draft Environmental Impact Report**

First, we want to thank you for extending the comment period. We only learned of this project midway through October, even though we moved to a home less than 100 feet from the proposed development in July. Neither my sister and I, nor the previous owners, received a notice regarding the DEIR. It took some time to get up-to-speed. We appreciated the opportunity to participate in the first public comment discussion of the DEIR, and look forward to the second.

70-1

About us: we live on Del Rio Ct. Our grandparents moved to Vineyard Valley in 1975 and went through two floods. Our mother moved here in 1993 and stayed through one flood. One of us moved here in 2017, and the other moved 'home' to Saint Helena this summer. We walk or ride a bicycle along the berm almost every day. One of us works from home, where our office looks directly out onto the beautiful land that is affected by this project. We talk to the people who walk, run and ride through this area of St. Helena, watch the wildlife, observe the colors of the sky, fog and vineyards, hear the birds, crickets and frogs.

We realize that we do not have the time or resources to adequately make sense of the details found in this report. We see that in most instances the writers of the report come to the conclusion that the issues raised can be resolved and will ultimately not have a substantial impact on our town. In a perfect world, that might be true, but our world is far from perfect.

In this letter we address three of the 15 areas of consideration in the DEIR: 10) Land Use, 12) Public Service and Recreation, and 13) Utilities and Service Systems (in reverse order.)

**Utilities and Service Systems**

Water. St. Helena does not currently have enough water to meet the needs of the current residents. It is one thing to let grass go brown in the summer, but another to outlaw watering trees and ask residents to severely curtail water usage. We either have a big problem and no solution, or the warnings of water shortages are over-hyped. Drought years will happen. Until

70-2

we have a more reliable way to meet the needs of the current citizens of St. Helena, we should stop inviting people to move here. We have read through the details of the 2010 plan, and the 2019 plan. The projected water deficit, in every scenario, is troubling. You seem to be balancing the water problem by anticipating that the current extreme water conservation will continue, while threatening people who live here now that things could be much worse before they get better.

70-2 Cont.

Wastewater and stormwater drainage are also serious concerns. Living immediately adjacent and 4 - 20 feet closer to sea-level than the anticipated homes is a real concern. We suggest that St. Helena take a close look at previous wastewater problems in this location and find a way to avoid future problems.

70-3

**Public Service and Recreation**

There is so much to review within this section. 2.45 persons per household for the purpose of calculating park and recreation facility demands is very different from the 8 persons per 4 bedroom home estimate used in the Utilities section. 12 elementary students among 87 residential units seems low. We would be interested in seeing what the numbers are at Hunt Street.

70-4

We will focus on recreation here. In section 3.12-16 it is stated that the City would have a ratio of 4.48 acres per 1,000 residents, which falls below the goal of 5 acres per 1,000 residents. So we would be short almost 5 acres of this goal, and about **40 acres short of the nationally recommended standard mentioned**. Don't we in St. Helena desire and deserve the higher standard?

70-5

**What this section woefully ignores is the recreation usage that will be taken away by this development.** Yes, there are parks in St. Helena. Table 3.12-2 lists 11 parks, 8 of these are mini parks. None of these parks provide a connection to the grandeur of St. Helena's position in the Napa Valley. There is a reason why so many St. Helenan's flock to the maintenance path, and it is not to look at the gravel beneath our feet. Walking along the berm provides a view of Mt. Saint Helena, both sides of the valley, beautiful vineyards, unique architecture with water towers and barns, a meadow, a habitat restoration area and a river, all of which are home to numerous wildlife, and a tremendous view of the sky. From glorious sunrise to inspiring sunset people come to this area to experience nature. It is convenient to the center of town and the library. It is free and currently available to all. It is a natural resource that provides space that we need, that isn't available in any of our 11 parks. This resource should be better understood if we are trying to document St. Helena's recreational facilities. It will be drastically diminished if homes are built up to the edge of the maintenance road.

70-6

**Land Use**

We need to have our utility needs met, and we need adequate access to outdoor recreation. We also need affordable housing. The people who work in St. Helena and the surrounding Napa Valley need safe places to live that do not require a 1 hour plus commute each way. It would be wonderful to build such housing in St. Helena, perhaps some of it on a portion of this parcel.

70-7

But what is shown on the drawings is so far from what seems acceptable or even legal that others will surely point out the numerous faults. There are two sections of affordable housing near us in St. Helena: the apartments next to Napa Valley College, and those on Hunt Street. Both of these are beautiful developments that feature something the Hunter Project seems to be lacking - common space. Where is the playground, the soccer field, the community garden, the dog park, the lawn? We know what works and what is meaningful for our community. When we propose affordable housing, let's do it like we value the people who will live in it.

70-7 Cont.

**In Conclusion**

We have a Planning Department for a reason - to make sure that future development meets the needs and goals of St. Helena. A lot of time has gone into preparing this document. It is inspiring to see how many thoughtful policies have been developed over the years to help guide us to a happy future. Now we have an opportunity to think about what will serve us - and what will not.

70-8

Thank you for your consideration-

INTENTIONALLY LEFT BLANK

# Response to Letter 70
## Marina and Jenna Lavagnino
## November 29, 2021

**70-1** The commenter thanks the City for extending the Draft EIR comment period and states the commenters did not receive prior noticing.

Please see Response to Comment 15-4 regarding noticing. The comment does not identify any specific areas where the Draft EIR or analysis is inadequate, therefore, no response is required.

**70-2** The comment raises concerns regarding the City's water supply and states that the City should not allow for new residential development.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 2 that addresses water supply and the City's Water Neutrality Policy.

**70-3** The comment raises concern related to the Project's impact on wastewater and stormwater drainage.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 4 that addresses wastewater concerns and Response to Comment 35-4 which addresses general stormwater drainage concerns.

**70-4** The comment notes that the 2.45 persons per household used to calculate park and recreation facility demands is different from the eight persons per 4-bedroom home estimate used to calculate demand for utilities. Additionally, the comment states an opinion that the Project's estimate of 12 elementary school students seems to be low. The commenter is interested to know the number of elementary students at Hunt Street residences.

See Response to Comment 7-3, regarding household size calculations.

Student generation rates were derived from the St. Helena Unified School District (SHUSD) Facility Master Plan, which outlines expected growth in demand for school facilities associated with projected development and plans how to fund and respond to such growth. Each school district develops their own student generation rates. Residences at Hunt Street are not a part of this Project; thus, no response is needed.

**70-5** The comment states an opinion that the City's parkland ratio would fall short of the City's goal of 5 acres of parkland per 1,000 residents and the nationally recommended standard of 10.5 acres of parkland per 1,000 residents. The comment states that City residents desire and deserve to have the nationally recommended parkland ratio standard.

As stated on page 3.12-16 of the Draft EIR, based on the City's 2018 population of 6,196 residents and park acreage of 27.43, the City's parkland to resident ratio is 4.43 acres per 1,000 residents. This parkland to resident ratio is lower than the City's goal and lower than the nationally recommended standard, even without development of the Proposed Project. Assuming the addition of 213 new residents to the City, the City would have a ratio of 4.28 acres of parkland per 1,000 residents. Park and recreational impact fees would be imposed on the Project and these impact fees would be used to cover the cost of parkland acquisition and park improvements. The Project applicant would pay these impact fees as stipulated in the City's Municipal Code Chapter 3.32, consistent with the Quimby Act. These park fees would be used by the City to purchase land to construct new parks or upgrade existing recreation facilities. The comment is noted and forwarded to the decision makers for their consideration.

**70-6** The comment states an opinion that the Public Services and Recreation section of the Draft EIR does not acknowledge the recreational land that will be removed by the Proposed Project. The commenter suggests that the levee maintenance road could be considered a recreational facility.

As stated on page 3.12-5 of the Draft EIR, the levee maintenance road is not a City recreational trail but is used informally as a trail by local residents. Additionally, the maintenance road is not a part of the Proposed Project. There is an existing City trail located on the northside of the levee maintenance road that would not be affected by the Project. A small portion of the maintenance road would be paved to accommodate construction of the Adams Street extension, but sidewalks would be provided along the extension of Adams Street to provide a safe connection to the remainder of the maintenance road and the trail, which would remain unaltered by the Proposed Project. Please see Chapter 3, Changes to the Draft EIR for a figure that shows the adjancent trails.

**70-7** The comment states an opinion that the Project would not add any recreational or common space areas, and asserts that nearby existing affordable housing developments provide these areas.

The commenter is correct that the Project does not include any on-site parks or -recreational facilities. However, as stated in Response to Comment 70-5, the Project applicant would pay park fees which would be used by the City to purchase land to construct new parks or upgrade existing recreation facilities. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is

required. However, the comment is noted and forwarded to the decision makers for their consideration.

**70-8** The commenter reflects on the purpose of the City's Planning Department and states that the Project gives the community an opportunity to evaluate what will best serve the community.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

INTENTIONALLY LEFT BLANK

Comment Letter 71

From: Lou Lavigne & Nancy Rothman
Fulton Lane
St. Helena

Subject:Hunter Project EIR

Dear Planning Commission:

We built our home on Fulton Lane (on the former Napa Valley Oriental Nursery site) after investigating the prior history of rejection of development on the Hunter site and the resultant preservation of the levee. We also explored the flood risk in this immediate area and concluded that the levee and existing drainage ditches/swales on Fulton Lane provided a reasonable level of protection. This new Hunter project proposal (which is literally in our backyard) is a significant concern to us for a number of reasons enumerated below and we strongly recommend its permanent rejection. 71-1

-Flood risk-it is difficult to see how building inside the levee on the floor of the basin is a safe proposition…who is going to assume the liability..the City or FEMA? Then there is the question of flood risk to the surrounding area starting in particular with Vineyard Valley ….? 71-2
We are also concerned that if the levee is compromised the two major drainage ditches from Fulton Lane will be overwhelmed and flood water will back up toward Fulton Lane as well. This already occurs in heavy rains to some extent near the outside base of the levee due to the congested connection of the Fulton drainage ditches and poor maintenance of the ditches which apparently is a City responsibility. 71-3

-Water Supply & Sewage -how any proposal to add 20 acre feet of water use (or 6.5 million gallons…more graphic) to St. Helena's already constrained water supply could be justified based on the ludicrous idea of retrofitting 333 offsite homes or paying ~$597,000 in lieu fees just doesn't compute without an identified plan.. Where is the water going to come from? St. Helena already has constraints on obtaining more water supply? Then there is the proposed use of abandoned wells being activated for the landscaping..where are these wells and is that practical without jeopardizing the other wells of vineyards and residents in this area. 71-4 71-5
Then there is the other side of the new water usage….Sewage..how the City's sewage system and plant could be made to handle even an additional 6.5 million gallons of waste water is a major challenge considering current City finances and sewage needs. 71-6

-Traffic-St Helena recently had a good taste of incremental traffic on Pope Street and surrounding streets with the rain caused closure of Silverado Trail; not a pleasant experience.
The proposed project adds traffic issues on at least two fronts
If as the developer proposes Starr Ave. were extended to an extended Adams Street the resultant short-cut speedway from Pope Street to Main street via Starr and Adams will further the traffic jam at Railroad and ultimately Main Street. Any proposal to add stop lights on this route would risk increasing speeds in a residential area with drivers attempting to make the light/s. Then there is the added traffic resulting from the residents and their visitors and vendors of the proposed development which will also feed into the extensions of Adams and Starr….plus the incremental intersections added by the proposed project would further add traffic hazards and congestion potential. 71-7
The intersections of Pope and Starr, the extended Starr and Hunt, Starr and the new street in the proposed development and the intersection of the extended Adams and Starr plus a new proposed street in the development linking with Adams at that same proposed intersection are all going to add congestion and pollution in a residential and agricultural neighborhood. 71-8

-Parking-while the project allows for parking it is hard to see based on other areas of the City where development has occurred that the proposed project doesn't add additional cars parking on-street further adding to congestion and adding more hazards for traffic, pedestrians and bicyclists. 71-9

-Hiking Trail—everyday we see many people hiking on the City Trail alongside and the one on top of the levee literally all the way to the Napa River…a beautiful walk in surrounded by vineyards and much nature as it is also a natural habitat in places. To systematically destroy the rural charm of St. Helena including this hiking trail plus replacing vineyards with houses and streets is short sighted in our view. 71-10

-Affordable Housing-we recognize and support the need for additional affordable housing, however, to build it in a flood risk area and to add a major residential development with all the issues raised here and by others seems like an inefficient way to get there. The City should fully explore other more development efficient alternatives. 71-11

-Financial strength of the developer—while this isn't a topic for the EIR per se it becomes one that needs to be carefully evaluated and monitored due the disruptive nature of the proposed project to the current site and neighboring areas and the estimated long six year duration of the project. Were this ill advised project to be attempted without the City having financial assurance from the developer (perhaps in the form of a bond) that it would be completed would add an additional risk as an interruption in construction, drainage etc. could result in incremental flood and other risks…plus an eyesore of a partially completed project. 71-12

In conclusion we have been unable to find the benefit to St. Helena and its residents of this proposed development. It all seems like a major step toward impairing the character of St. Helena which makes it a wonderful place to live and turning it into another congested suburb with strained municipal resources. We are totally against the proposed Hunter project. 71-13

Thank you, Lou Lavigne and Nancy Rothman
11/29/21

# Response to Letter 71
## Lou Lavigne and Nancy Rothman
## November 29, 2021

**71-1** The comment provides personal history of the commenters, stating they built their home on Fulton Lane after considering the history of the Project site. The commenter recommends the Project not be approved.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**71-2** The comment raises a concern related to the Project's location due to its proximity to the levee and asks who would assume liability in the event of a flood.

Please see Master Response 3 regarding the levee and liability in the event of a flood. Determinations of legal liabiloity for a potential future event is not within the scope of CEQA.

**71-3** The commenters expresses their concern that the Napa River levee could be compromised. The commenter is specifically concerned about two drainage ditches along Fulton Lane, stating that they could be overwhelmed and flood water could back up to Fulton Lane. The commenters assert that these drainage ditches are currently overwhelmed during heavy rain events due to congested connection and poor maintenance.

Please see Master Response 3 regarding the levee. As stated on page 3.9-12 of the Draft EIR, the modern design and construction of the levee (along with the City's ongoing inspection and maintenance of the levee) substantially reduces its potential to fail in a 200-year flood or in the event of an earthquake. The Proposed Project would not result in any changes to the drainage ditches along Fulton Lane or exacerbate existing flood risk, as explained in Section 3.9, Hydrology and Water Quality. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**71-4** The comment expresses a concern with the Project's impact on the City's water supply and states that retrofitting of plumbing fixtures and/or payment of in lieu fees is not adequate (per the City's Water Neutral Policy).

Please see Master Response 2 regarding the City's water supply and Water Neutral Policy.

**71-5** The comment opines that the City has limitations on obtaining more water supply and mentions the Project's proposed use of groundwater for landscaping. The comment questions the location of the proposed well and whether use of the well would jeopardize other wells in the area.

Please see Master Response 2 regarding the City's water supply and Response to Comment 57-5 regarding use of the existing well for landscaping.

**71-6** The comment raises concern related to the City's sewer system, specifically the commenter's opinion that the City does not have capacity to treat additional sewage generated by the Project.

Please see Response to Comment 38-1 and Master Response 4 regarding City wastewater conveyance and system capacity.

**71-7** The comment opines that the extension of Adams Street to the Project site may increase cut-through traffic along Starr Avenue and Adams Street and asserts that stop lights along this route would not be feasible.

Section 3.14, Transportation and Circulation of the Draft EIR analyzes traffic congestion and vehicular queuing along Starr Avenue and Adams Street, and concludes that impacts would be less than significant. This includes future year analysis scenarios with and without the traffic of the proposed project. Further, the Draft EIR does not recommend stop lights along any stretch of Starr Avenue or Adams Street.

**71-8** The comment states an opinion that the Proposed Project would result in traffic congestion and pollution within the neighborhood.

Please see Response to Comment 71-7. The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**71-9** The comment opines that the Project would create additional parking capacity issues.

The adequacy of parking supply is not an environmental impact under CEQA; therefore, the commenter's concern is noted for the decision makers and no further response is required. However, at the time building permits are requested, as required by the Municipal Code, the City will confirm the Project complies with Section 17.124.030.A.1 of the City's Zoning Code that addresses residential parking requirements.

**71-10** The comment states an opinion that the Project would replace the view of vineyards from the adjacent trail with houses and streets, which would destroy the rural charm of the City.

The commenter is correct that the Proposed Project would remove a majority of the existing vineyard and open space that characterize the site. However, views of agricultural features in the City are not unique to the Project site such that the Proposed Project would substantially impact publicly available views. As stated on page 3.1-26 of the Draft EIR, the Project applicant is required to comply with the City's Design Review Ordinance (Chapter 17.164 of the City's Zoning Ordinance) and undergo design review to ensure the proposed development is visually consistent and compatible with the applicable General Plan and with adjacent areas as well as the existing environment. The comment is noted and forwarded to the decision makers for their consideration.

**71-11** The comment suggests that the City should explore other alternatives for affordable housing.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**71-12** The comment questions the financial stability of the applicant to complete the Project and is concerned what would happen if only a portion of the Project was constructed.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. The finances and economic viability of a project are not within the scope of CEQA and not subject to analysis in an EIR. The commenter's concern is noted and forwarded to the decision makers for their consideration.

**71-13** The comment states opposition to the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

INTENTIONALLY LEFT BLANK

Comment Letter 72

**November 4th, 2021 Response to Hunter DEIR**

My name is Sandra Lowry. I have lived on Starr Avenue since 1997. My husband and I moved to St. Helena from the Peninsula to get away from crowded neighborhoods, constant traffic, packed freeways and noise from SFO and two freeways. So we came to St. Helena; a decision we have never regretted. Our past experience taught us how big development can transform neighborhoods and towns, but not in a good way.

St. Helena is once again threatened by the possible approval of a flawed plan: I am speaking, of course, about the Proposed Hunter Development.

There is a callousness in the DEIR that I have never before seen: i.e., in case of flooding, residents can go to the second story of their homes. Really? Let's talk about the street I live on: Starr Ave. I believe I can speak plainly about the subject.

72-1

Please see Section 3:14.2 Roadway System: "Starr Avenue is a two-lane, undivided/mixed use street oriented north-south within the study area....."parking is available along most sections of the road." I disagree. Actually, Starr Avenue is parked up every afternoon, through the night and on weekends. Many parked vehicles (trucks, work trucks, cars) come from Hunts Grove (they need more parking onsite) and other areas, sometimes being parked for weeks unless neighbors call police. Good luck finding a parking place in front of your home on Starr. Your future residents better plan on parking at home. There is nowhere else.

72-2

And Starr Avenue has an important speeding problem; the crosswalk on the south end of Starr is a joke. There is a safety issue here. Drivers seldom stop for pedestrians and often drive around people in the middle of that crosswalk. They come speeding up Starr, headed for Pope Street and pedestrians have had narrow escapes to avoid being hit by vehicles. Last week I was pulling into my driveway in the middle of the day. Another driver was tail gating me and decided to speed up and pass instead of waiting for me to complete the turn. This is no country road, folks! I was driving at the speed limit – 25 mph. To continue:

72-3

Another quote and an important one from the DEIR: "Thresholds of Significance: Consistent with Appendix of the CEQA Guidelines, a significant impact would occur

72-4

if development of the proposed project would RESULT IN INADEQUATE EMERGENCY ACCESS."

3:14-4 "Mitigations Measures NONE REQUIRED". I disagree. Starr Avenue, one of the more popular routes in town, is already overcrowded with parked cars and traffic, and in an emergency such as fire or flood, many residents of the proposed development will decide to take Starr Avenue as their escape route. Meadow creek residents, Hunt's Grove residents, and Harvest Court residents would naturally choose Starr as their best escape route as well. Pure chaos.

72-4 Cont.

No matter which route the proposed Hunter development residents choose , they will be backed up on Hunt Ave., Starr Ave., Pope St., Adams, and Main as everyone on the East and West sides of town will be headed for the two- lane road exits out of town via the Silverado Trail and Highway 29, providing these exits are available.

72-5

According to the DEIR, exits from the proposed development, in case of emergency are Starr, Adams and a third exit that is unclear to me. Where is the location exactly? Please clarify.

72-6

If it is the levee, isn't that also the second exit for the 250 elderly people from Vineyard Valley? A problematic idea indeed. All emergency evacuation routes considered would be a driving nightmare and questionable. Picture the backup. Please clarify.

72-7

The DEIR admits there will be an increase in traffic on streets connected with the proposed project. And their Table 3:14-1 shows projections:

"Weekday Proposed Project Trips Generation"

"Proposed project estimates 798 trips daily and on Saturdays the project expects to generate 815 daily trips and 80 peak hour trips." Figure in a 24 hour period 800+ more vehicles on your streets. How do you plan to mitigate increased traffic through neighborhoods full of children and the elderly? Will there be speed bumps? (Actually, we need them now!) Traffic lights? More lighted crosswalks? (All current crosswalks should be lighted and flashing when in use). Closer

72-8

monitoring of speed limits? Is Starr Avenue intended to become a bypass? Please clarify.

72-8 Cont.

Please do not overlook these facts: The building of this project will be extremely stressful and harmful to the peace, health and quality of life for the entire East side of town, but especially to residents of Starr Avenue, Meadowcreek Circle, Harvest Court, Vineyard Valley, and Hunt's Grove. Are we being asked to endure trucks, cement mixers, etc., and breathe 6+ years of dust, debris and put up with noise from the pounding of building equipment and hammers? These would be impossible living conditions for me. Please clarify.

72-9

If this development is approved, we are selling the soul of our town and misunderstanding why St. Helena is a destination, unlike anywhere else in the country.

The document uses the term "less than significant" many times throughout. I have something to say about that: We the People who oppose this plan are not "less than significant". Our friends and neighbors are not "less than significant" - I am not "less than significant."

72-10

Thank you for your kind consideration and the opportunity to express some of my concerns. Sincerely, Sandra Lowry, 1175 Starr Avenue

# Response to Letter 72
## Sandra Lowry
## November 4, 2021

**72-1** The comment explains the commenter's personal history and general opposition to the Project.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**72-2** The comment states an opinion that Starr Avenue is "parked up every afternoon, through the night an on weekends" and suggests that future residents of the Proposed Project would not be able to find parking along Starr Avenue.

The adequacy of parking supply is not an environmental impact under CEQA; therefore, the commenter's concern is noted for the decision makers and no further response is required. However, at the time building permits are requested, as required by the Municipal Code, the City will confirm the Project complies with Section 17.124.030.A.1 of the City's Zoning Code that addresses residential parking requirements. .

**72-3** The comment states an opinion that Starr Avenue has several safety issues including speeding, aggressive drivers, and a lack of pedestrian amenities.

As stated in Section 3.14 of the Draft EIR, Starr Avenue was analyzed in regard to vehicular collisions and overall safety along the roadway. The conclusion of the Draft EIR were that the Proposed Project would not increase hazards due to a geometric design feature or incompatible use that would contribute to an increase in collisions or create visual obstructions that would impede vehicles, bicyclists, and pedestrians from having safe access to and from the Project site. An EIR is not required to evaluate aggressive drivers.

**72-4** The commenter disagrees with the Draft EIR conclusion that the Proposed Project would not result in inadequate emergency access and states that Starr Avenue is already very congested.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. For additional information regarding emergency access, please refer to Master Response 1.

**72-5** The comment states that there is a lack of roadway connections to Highway 29 and Silverado Trail, and roadways would be backed up during an emergency.

The commenter's opinion regarding the lack of roadway connections to Highway 29 is noted for the decision makers. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. For additional information regarding emergency access, please refer to Master Response 1.

**72-6** The commenter asks for the location of the third emergency exit stated in the Draft EIR.

As described on page 2-24 in Chapter 2, Project Description, "[e]mergency vehicle access would be provided via the extension of Adams Street, Starr Avenue, and an emergency vehicle access (EVA) to the existing gravel maintenance road that borders the north/northwest boundary of the Project site." For additional information regarding emergency access, please refer to Master Response 1.

**72-7** The comment expresses the commenter's opinion regarding congestion of the levee access (maintenance) road for purposes of emergency evacuation.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. For additional information regarding emergency access, please refer to Master Response 1.

**72-8** The comment addresses the Proposed Project's trip generation and its effect on roadway congestion and asks for additional mitigation measures.

Section 3.14, Transportation and Circulation of the Draft EIR analyzes all transportation impacts as mandated by CEQA. All mitigation measures and potential mitigation measure that would be needed, are discussed in detail within Section 3.14. Further, Appendix K, Transportation Impact Study, identifies several recommended roadway improvements. However, as explained on page 3.14-1 in Section 3.14, Transportation and Circulation, the CEQA Guidelines were updated (December 2018) to remove evaluation of the delay that vehicles experience at intersections and on roadway segments, which is often measured using a level of service (LOS) metric. Therefore, the operational aspects of the Proposed Project that contribute to delay and congestion on local roadways is no longer considered an environmental impact under CEQA. Therefore, the recommended roadway improvements are not identified as mitigation measures. The recommended roadway improvements are for informational purposes as to how the project could address LOS deficiencies.

**72-9** The commenter expresses concern about with Project traffic and potential fugitive dust emissions associated with construction activities.

The Project would not result in exacerbating existing air quality conditions and would not result in the exceedance of the Bay Area Air Quality Management District (BAAQMD) thresholds of significance for both construction and operations. Furthermore, the BAAQMD's CEQA Guidelines contain feasible control measures to reduce fugitive dust emissions from construction activity. The measures in the CEQA Guidelines are divided into three categories: (1) basic control measures, (2)

enhanced control measures, and (3) optional control measures. The BAAQMD recommends that all construction incorporate basic control measures, regardless of the size of the site. Therefore, the Project would implement necessary precautions to reduce fugitive dust emissions such as implementing the BAAQMD's Best Management Practices (BMPs) for fugitive dust control during construction. Please see Response to Comment 72-8 regarding traffic.

**72-10** The comment states opposition to the Project and the impact conclusions in the Draft EIR.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not specify where the Draft EIR is inadequate; therefore, no further response is required.

INTENTIONALLY LEFT BLANK

Comment Letter 73

PUBLIC COMMNENT – HUNTER PROJECT DEIR – LEVEE FAILURE/FLOODING
FROM: Isobel Luria – 1173 Starr Avenue
DATE: November 2, 2021

The Hunter Project's DEIR in its section on Hydrology, Water and Drainage completely ignores the potentially adverse effects of Climate Change. It displays a callous and cavalier attitude when discussing the possibility of a catastrophic flood and the serious consequences that would be faced by future residents of the proposed subdivision. 73-1

The Hunter Project has been controversial from its inception and has met with much opposition. While the current city administration cannot be held responsible for the questionable decisions of its predecessors; it will be held responsible from now on. 73-2

Briefly, Dennis Hunter purchased the "raw" land for the project in 1997. In 1998, Measure A was passed. Mr. Hunter filed to start development planning in 2005. In 2008, he agreed to a lot line adjustment to facilitate the City's Flood Protection Project. In 2009, the City began work to construct a levee. "... the standard design level of protection (afforded by the levee) is for the 100-year flood event; however, the 200 year design basis was implemented to provide an additional factor of safety and to account for potential settlement..."( DEIR 3.9-8) Meanwhile in 2010, the Applicant filed for a Temporary Subdivision Map, which was accepted in March of 2011. The levee was completed in the same year. In 2012, FEMA revised its flood map, categorizing the area as a Zone X – an area protected by a levy with a moderate to low chance of flooding and an optional Flood Insurance program. It should be noted that this levee and its adjacent floodwall also protects much of East St. Helena, including Vineyard Valley Mobil Home Park, the Hunt's Grove Apartments and the Meadowcreek subdivision, all of which have sizable populations. 73-3

It is interesting that this DEIR makes no mention of any "due diligence" on its part of conducting an examination of the levee to ascertain its current condition. I can only assume the Project is leaving that up to the City of St. Helena, the entity responsible for maintaining it. Furthermore, no mention is made of any attempt by the applicant to contact FEMA to ascertain whether, again in view of Climate Change, residents will be able to obtain flood insurance and low interest flood mitigation loans, since this will be needed for new housing built in very close proximity to a **pre- existing** levee. Usually, FEMA supports areas where levees were built as a flood mitigation ie. the housing was already in place and subject to flooding! It should be noted that I could find no discussion about this on the FEMA website. 73-4

Now, as a result of Climate Change, the country is experiencing unpredictable and unprecedented weather events with increasing frequency. (We just had one – the "bomb' cyclone and accompanying atmospheric river.) FEMA is faced with an increasing burden of claims. It is not inconceivable that St. Helena could experience a catastrophic flood in the not too distant future and the levee could fail. The DEIR states that in the event of a catastrophic flood or earthquake, residents would have ample warning to evacuate. Furthermore, "flooding on the Proposed Project lots would range between 0-5 feet in depth, with the deepest flooding occurring on the northern part of the Project site. This level of flooding would leave upper floors of residences available for refuge....the risks from a 200 year 73-5 73-6 73-7 73-8

1

flood and/or levee failure are limited to property damage rather than risk of life." (DEIR 11-2) On the other hand, FEMA states that while levees reduce the risk of flooding, they don't eliminate it. They..."**deteriorate overtime and must be maintained. When levees fail, or are overtopped, the results can be catastrophic. In fact, the flood damage can be greater than if the levee had not been built." (FEMA website "Living with Levees")** I emphasize that as result of its "Zone X" classification, where flood insurance is **optional**, much of the property might not be covered.

The aftermath of this sort of catastrophic flood is awful. I disagree with the DEIR conclusion that residents would have ample time to evacuate. One can imagine that a levee failure would produce a "tidal-like" wave of debris filled water gushing through the subdivision. Unlike a regular flood where water levels rise more slowly, people would be lucky if they **reached** the second floor. Houses would be severely damaged and residents, if not injured or worse, badly traumatized. In any case, they would need to relocate, file insurance claims with FEMA, if they actually had purchased the optional insurance, possibly secure low interest FEMA loans to finance their flood repair, and, of course, find contractors, not to mention deal with their day-to-day existence – kids, school, work, and so forth. Additionally, there would be the continuing stress of wondering if claims or loans will even be granted because FEMA does its homework: they investigate every claim. In the case of this Applicant's Project, FEMA might refuse to pay for the flood damage and repair because the houses were built close to a pre-existing levee. They might argue, if they look at the time sequence, that levees should not be erected to protect future subdivisions and that locating new structures near existing levees creates a preventable and needless risk.

Should FEMA withhold its aid, the residents would probably sue the developer and the City, it being the entity who granted permission for the subdivision to be built. These lawsuits could be prohibitively expensive. This scenario would be disastrous for St. Helena. But why should the city even allow itself this level of exposure when a valid reason exits for denying the project: a reason that even the state of California must support. In reality, the city lacks the infrastructure on the East side of St. Helena to safely and expeditiously evacuate even existing residents in a catastrophic emergency. In the case of a severe flood and levee failure, roads in the Hunter Project would probably be impassable, Starr might be affected, and use of the Pope Street bridge to access the Silverado trail, questionable at best.

If the city turns down the applicant on these grounds, and there are additional reasons that are almost as compelling, the applicant will most likely sue. But this exposure is far less than the multiple suits that would derive from not only a badly damaged subdivision, but also one in which lives could have been lost: the city could be found to have been derelict in its obligation to protect its residents.

Finally, it should be noted that I am not an attorney, simply a concerned resident. I am basing my opinion on common sense and logic. It is my belief that the city should not give this applicant the green light.

73-8 Cont.

## Response to Letter 73
### Isobel Luria
### November 2, 2021

**73-1** The comment states an opinion that the Hydrology, Water Quality, and Drainage section of the Draft EIR ignores the potentially adverse effects of climate change and dismisses the consequences of a catastrophic flood.

Please see Response to Comment 31-1.

**73-2** The comment states the commenter's personal observation that the Proposed Project has been controversial and that the current City administration will be held responsible for their decisions.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration.

**73-3** The comment explains the commenter's understanding of the history of acquisition of the Project site and construction of the levee.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 3 that provides information specific to the levee.

**73-4** The comment states that the levee and adjacent floodwall protects much of the eastern side of the City.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, the comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 3 that provides information specific to the levee.

**73-5** The comment states an opinion that the Draft EIR does not include a due diligence examination of the current condition of the levee.

The Project does not have an impact on the levee's effectiveness or on flood hazards for surrounding communities, either directly or indirectly. California Supreme Court's decision in *California Building Industry Association v. Bay Area Air Quality Management District (2015) 62 Cal.4th 369* held that "agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents" but they must analyze hazards the project

might risk exacerbating. Accordingly, comments regarding the levee, that will not be directly or indirectly impacted the Project, are outside the scope of CEQA review for this Project.

**73-6** The comment asserts that the Draft EIR does not mention any contact to FEMA to ascertain whether residents will be able to obtain flood insurance and low interest flood mitigation loans.

As stated on page 3.9-8 of the Draft EIR, because the Project site is outside of a FEMA Special Flood Hazard Area (SFHA), no flood insurance would be required. However, because there remains residual risk of flooding from catastrophically large floods (such as a 500-year flood) or levee failures, residents in flood-prone areas, even if outside of a regulatory flood zone, have the option to purchase optional flood insurance. Additionally, please see Master Response 3 for more information about flood insurance.

**73-7** The comment states an opinion that the country is experiencing more frequent extreme weather events resulting in a burden of claims to FEMA.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. However, please see Master Response 3 for information about the role of FEMA.

**73-8** The comment references a statement from FEMA which states that levees deteriorate over time and if failure or overtopping occurs, flood damage can be greater than if the levee had not been built. The comment goes on to suggest that since flood insurance is optional, the Project would not be fully insured against flood damage.

Please see Response to Comment 73-5 and also Master Response 3 regarding the levee and the need for flood insurance.

**73-9** The comment disagrees with the Draft EIR conclusion that Project residents would have ample time to evacuate in the event of a flood. The comment also states that FEMA may refuse to pay for flood damage and repair because the Project was built close to an existing levee.

Please see Response to Comment 73-5. However, the Draft EIR states on page 3.9-12 that in the unlikely situation the levee is overtopped, Project residents would have ample warning to evacuate prior to flooding. The same existing measures implemented to respond to flood emergencies within the region would continue to be used and would serve to provide residents with the means to avoid personal harm in the event of a catastrophic flood. This includes flood watches, advisories, and warnings from the National Weather Service, reporting by local news outlets, announcements and communications via Integrated Public Alert and Warning System, text alerts, and other means of communication that would be increasingly

used in the event of a severe flood threat. Please see Master Response 3 for more information regarding flood protection and potential for levee failure.

**73-10** The comment states an opinion that if FEMA withholds aid in the event of a flood event, Project residents would likely sue the Project applicant and the City.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. Please see Master Response 3 for more information regarding flood protection and the potential for levee failure.

**73-11** The comment opines that the east side of the City lacks the infrastructure to evacuate residents in the event of an emergency.

Please refer to Master Response 1 regarding emergency evacuation plans.

**73-12** The comment states an opinion that a lawsuit from the Project applicant in the event the City rejects the Project would cause less bad publicity than if the City were to be sued by residents.

The comment is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**73-13** The comment states the commenter's opinion that the City should not approve the Proposed Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

INTENTIONALLY LEFT BLANK

Comment Letter 74

HUNTER PROJECT – COMMENTS ON DEIR (11/3/21)
Isobel Luria – 1173 Starr Avenue

With the effects of "climate change" becoming more and more severe, the Hunter Project couldn't have come up at a worse time. The fires of 2017 and 2020 have made people all too aware that our lovely city, as well much of the Napa Valley, can suddenly turn into an inferno. Furthermore, the residents of Saint Helena are struggling with the effects of one of the most severe droughts on record. Additionally, while things are really dry now, at some point in the future, we will experience some really wet winters with even more severe storms and the Napa River will flood. If in the past, the "100 year" flood was the marker to which all floods were compared, we should accept the fact that a "200 year" flood is not unimaginable and prepare for such an event. It is in the light of this new reality that the Hunter Project DEIR should be scrutinized by our community. 74-1

The DEIR relies on vague, untested figures that when examined often seem ludicrous. While it is useful to quantify data, the methods employed must be able to withstand examination. It is difficult to comprehend why St. Helena is in such a hurry to approve this project. I do not have the technical expertise to comment on all the possible health and safety issues that could potentially arise because of this project, but this DEIR underestimates the Project's many negative impacts and offers few ways to mitigate them. I would simply urge the city to do its own due diligence and question the conclusions reached in this DEIR. 74-2

TRAFFIC AND CIRCULATION

The DEIR allows that there will be increased traffic caused by the additional cars the new residents of the HP will use. After a lengthy discussion of the local roadways, a description of the proposed extension of Starr Avenue and Adams Street, a rather low estimate of the number of cars that new residents will bring into our city, and a forecast of where the worst areas of congestion might be, the Report admits that, yes, there will be increased traffic as a result of this subdivision and that there is really no way to mitigate the effects this will have. 74-3

The DEIR arrives at an estimate of the number of individuals, who will live in the subdivision, and the number of cars they will use. It is always difficult to accurately predict the size of a new population and it is in the interest of developers to underestimate this to some extent. The DEIR fails to take into consideration of what happens to families as time goes by: they can increase in size: baby by baby. When children reach a certain age, especially in a valley such as ours, they want and need cars and parking. Those of us who live in the Meadowcreek subdivision are well aware of this phenomenon: parking in our neighborhood, especially overnight and early in the morning, can be so dense that there is barely room to put out garbage bins on collection day. This congestion is partly the result of inadequate parking at the Hunt Grove apartments located at the east end of Hunt Street. In planning for new subdivision, additional land must be set aside to satisfy future parking needs, especially in the area that contains the Affordable Housing units. 74-4 74-5

1

SAFETY

The proposed subdivision will necessitate a four-way intersection where Starr Avenue and Hunt Street meet. This is already a very dangerous intersection as cars going south on Hunt often fail to come to a full STOP before turning right on Starr. There are already a fair number of children in this neighborhood and residents have experienced some "close calls." The addition of more cars and more people exacerbate the potential for accidents. I disagree with the DEIR when they fail to even try to suggest a "mitigation." Clearly, one comes to my mind: don't permit the Applicant to build the subdivision in this location. 74-6

EMERGENCY EVACUATION

In the event of an emergency evacuation, it is clear from the location of the proposed subdivision that most vehicles will access Starr Avenue to reach Pope Street and thereby head either north or south as the situation dictates via either the Silverado Trail (hereafter called the Trail) or 29. Granted there is the possibility of following a circuitous route by driving west on Adams but that would not be the route of choice. In addition, the narrow Pope Street bridge is a very poor structure to handle evacuations. In the last two fires, the northern exits from the valley were blocked by the fire and everyone had to exit to the south. Last week, as a result, of the recent heavy rains a portion of the Silverado Trail had to be shut down. 74-7

I question why the City of St. Helena would consider granting approval of a new subdivision in the area described in the DEIR until the infrastructure has been improved and a reliable evacuation route created. The safety of the residents is at stake and even the State of California cannot question that. 74-8

WATER

In its analysis of Hydrology and Water Quality, (see DEIR 3.9-40 – 3.9-43) I believe that the DEIR reaches faulty conclusions about the HP's impact on ground water in the area by relying on vague or untested figures. In addition, it bases conclusions on weather history without taking into consideration the probability that, because of Climate Change, we will experience weather of record-breaking severity. The report makes statements like the following (DEIR section 3.9-10) "The Subbasin was found to exhibit stable groundwater levels, even despite a very dry 2020 water year…The long-term (1988-2020) annual change in storage for the subbasin is a decrease of 8,0945 AF following the very dry conditions of 2020 but still with water ranges generally experienced over the long term. " 74-9

The DEIR goes on to discuss (see Table 3.13-9) that the proposed landscaping for the subdivision, its outdoor water needs, will be "water neutral" because of a currently inoperable well on the property. This well has been tested and shown produce 350 GPM. The DEIR states that this output is adequate to supply the subdivision, which is projected to require 17.16 acre feet per year. Again, this figure is a questionable as the DEIR states that 185 trees are going to be planted and that there will be drought tolerant plantings between the trees. Young trees and plants need ample water to establish themselves. Furthermore, no allowance is made for the landscaping homeowners will plant in their private gardens. 74-10

2

The DEIR assumes that the annual draw down of water by the subdivision will not have much impact on the subbasin because future rainfall will recharge it. Unfortunately for the Hunter Project, St. Helena is experiencing the effects of a "mega drought" and has instituted Stage II water use restrictions." Furthermore, much of the area in the proposed subdivision will be covered by hardscape and buildings thus eliminating a big percentage of land currently available for direct recharging of ground water. While it is true that in very wet years ample run off from the hardscape will find its way into the storm drainage system, this is not the case in dry years. I disagree with the DEIR's conclusion that the construction of this development will not have a negative impact on ground water supplies. I doubt, given the reality of Climate Change, that its need for well water will not exceed the annual 0.9% it projects. (DEIR section 3.9.48)

74-11

The report, in its discussion on water (DEIR section 3.13-24.-.3.13-33), also underestimates the quantity of indoor water that future residents of the subdivision will purchase from the City of St. Helena: 17,752 gallons per day or 19.88 acre-feet per year. The figures on which the DEIR bases its conclusions are found in Table 3.13.10. While I understand that some "guesstimates" must be used for discussion purposes, these figures seem low and some sort of tests should be run to determine how to accurately measure water usage by individuals. For example, the DEIR states that the residents of the new subdivision will flush toilets 3 times per person per day. **Really?** Another understated usage concerns the future kitchen faucets. It is projected that each resident will briefly use this faucet 1 time daily. It would seem these people will neither drink nor prepare meals. But the biggest fallacy in logic is yet to come. To support its contention that the Hunter Project will achieve a Water Neutral status (a requirement of all new construction called for by the St. Helena 2019 General Plan EIR), the developers will be required to retrofit a certain percentage of existing homes and businesses with water saving devices. I assume that the water saved by this retrofitting is supposed to compensate for a portion of the future consumption of in-house water by the subdivision. Many homes and businesses in St. Helena have already had this sort of retrofit. Secondly, and more importantly, water usage in town has already been drastically reduced owing to stringent conservation regulations in place and backed up by penalties. Considering the conservation already taking place, it is difficult to imagine that retrofitting several hundred houses will result in much additional water being saved. Alternately, the developer offers to pay a fee to the city in lieu of the retrofit. In actuality, the HP will not be water-neutral, and the city lacks a stable enough water supply to allow this project to be built.

74-12

74-13

INTENTIONALLY LEFT BLANK

## Response to Letter 74
### Isobel Luria

**74-1** The comment states an opinion that due to climate change and extreme weather events, including a flood event, development of the Proposed Project is not recommended.

The comment does not address the adequacy of the Draft EIR, but instead expresses the commentor's opinion about the Project. The comment does not identify any specific areas where the EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. However, please see also Master Response 3 regarding the protection provided by the Napa River levee in the event of a flood.

**74-2** The comment states an opinion that the Draft EIR relies on untested data and underestimates the Project's potential impacts without providing adequate mitigation.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. However, the analysis in the Draft EIR relies on technical studies prepared for the Project as well as other substantial evidence required to determine any potential Project impacts. The comment is noted and forwarded to the decision makers for their consideration.

**74-3** The commenter is concerned about traffic congestion increasing as a result of the Proposed Project.

The Project's impact on transportation and circulation is addressed in Section 3.14, Transportation and Circulation. The analysis includes consideration of motorized vehicle traffic impacts on roadway capacity, vehicle-miles traveled (VMT), and potential impacts to transit, bicycle, and pedestrians. The comment does not identify any specific areas where the Draft EIR or analysis is inadequate; therefore, no further response is required. Please see also Response to Comment 36-2.

**74-4** The comment states an opinion the Project's trip generation is inaccurate.

Trip generation estimates for the Project were provided in Section 3.14 of the Draft EIR. Estimates were calculated based upon trip rates provided in the Institute of Transportation Engineers' (ITE) Trip Generation, 10th Edition. In September 2021 the 11th Edition of the ITE manual was released. It does not change the Project's trip rates derived from the 10th Edition. Average trip generation rates represent weighted averages from studies conducted throughout the United States and Canada since 1980 that surveyed the identified use. Single-Family and multi-family land uses are based on surveys and weighted averages. Rates are not based on a specified

number of bedrooms or vehicles per household. The rates provided in the Draft EIR are based on accepted industry standards for this type of project.

**74-5** The comment expresses the commenter's concern about lack of parking availability in the neighborhood.

The adequacy of parking supply is not an environmental impact under CEQA; therefore, the commenter's concern is noted for the decision makers and no further response is required. However, at the time building permits are requested, as required by the Municipal Code, the City will confirm the Project complies with Section 17.124.030.A.1 of the City's Zoning Code that addresses residential parking requirements.

**74-6** The comment expresses the commenter's concern regarding the effect the Proposed Project would have on pedestrian safety and vehicular collisions at the intersection of Starr Avenue and Hunt Avenue.

As stated in Section 3.14 of the Draft EIR, Starr Avenue and Hunt Avenue were analyzed in regard to vehicular collisions and overall safety along both roadways. The conclusion of the Draft EIR was that the Proposed Project would not increase hazards due to a geometric design feature or incompatible use that would contribute to an increase in collisions or create visual obstructions that would impede vehicles, bicyclists, and pedestrians from having safe access to and from the Project site. Additionally, vehicular collisions within the City were also analyzed within Section 3.14 of the Draft EIR and Project impacts were concluded to be less than significant. Therefore, no mitigation measures would be required.

**74-7** The comment states the commenter's opposition to the Project and the effect on emergency access routes and evacuation in case of emergencies.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. Section 3.14 of the Draft EIR analyzed emergency vehicle access in detail. For additional information regarding emergency vehicle access and evacuation, please see Master Response 1.

**74-8** The commenter q asks why the City would approve the Project prior to improving the existing infrastructure and a reliable evacuation route is created.

Please see Master Response 1 regarding emergency evacuation.

**74-9** The comment opines that the Hydrology and Water Quality section of the EIR is based on vague and untested information and does not consider extreme weather conditions caused by climate change. The commenter quotes a statement from page 3.9-10 of the EIR regarding groundwater levels.

Please see Response to Comments 14-9 through 14-17 and Master Response 2, regarding water supply.

**74-10** The comment states an opinion outdoor water needs are not accurately portrayed in Table 3.13-9 of the Draft EIR because new trees and plants require a significant amount of water to get established, and homeowners will also require water for landscape irrigation.

Please see Responses to Comments14-9 through 14-17 and Master Response 2.

**74-11** The comment states that the Draft EIR's conclusion on page 3.9-48 is inaccurate because climate change will likely cause the need for groundwater to exceed the projected figure of 0.9%.

Please see Responses to Comments 14-9 through 14-17 and Master Response 2.

**74-12** The comment states an opinion that the discussion on pages 3.13-24 through 3.13-33 of the Draft EIR underestimates the quantity of indoor water that the Project will require and "tests" should be run to determine how to accurately measure water usage by Project residents.

Please see Responses to Comments14-9 through 14-17 and Master Response 2.

**74-13** The comment states an opinion that retrofitting houses will not save enough water for the Project to be considered water neutral.

Please see Responses to Comments14-9 through 14-17 and Master Response 2.

**Sent:** Monday, November 8, 2021 1:00 PM
**To:** Maya DeRosa <MDeRosa@cityofsthelena.org>
**Subject:** [External] Levee Maintenance

Hi Maya,

Still working away on the Hunter DEIR. Could I please get copies of the Levee Maintenance records. I haven't found them in any of the appendices. Thanks so much. 75-1

If the Planning Department doesn't have them, perhaps you could tell me whom I should contact.

Thanks so much.

# Response to Letter 75
## Isobel Luria
## November 8, 2021

**75-1** The commenter requests copies of the City's levee maintenance records.

The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. The City posts levee maintenance records available to the public on the City's website here: https://www.cityofsthelena.org/publicworks/page/flood-control-and-river-restoration-project

Please refer to Master Response 3 for additional information specific to the levee.

INTENTIONALLY LEFT BLANK

Comment Letter 76

HUNTER PROJECT – REVISED COMMENTS AND QUESTIONS ON DEIR (11/30/21)
Isobel Luria – 1173 Starr Avenue

With the effects of "climate change" becoming more and more severe, this is an inopportune time to consider approving the Hunter Project. The fires of 2017 and 2020 have made people all too aware that our lovely city, as well much of the Napa Valley, can suddenly turn into an inferno. Furthermore, the residents of Saint Helena are struggling with the effects of one of the most severe droughts on record. Additionally, while things are really dry now, in the future, we will experience some really wet winters with even more severe storms and the Napa River will flood. If in the past, the "100 year" flood was the marker to which all floods were compared, we should accept the fact that a "200 year" flood is not unimaginable and prepare for such an event. It is in the light of this new reality that the Hunter Project DEIR should be scrutinized by our community. 76-1

The DEIR relies on vague, untested figures that when examined often seem ludicrous. While it is useful to quantify data, the methods employed must be able to withstand examination. This is a very disappointing report that cavalierly dismisses impacts as insignificant when a mitigation is needed. 76-2

TRAFFIC AND CIRCULATION: PARKING

After describing local roadways including the proposed extension of Starr Avenue and Adams Street, discussing how to measure traffic impacts ( DEIR 3.14-39) using Vehicle Miles Travelled (VMT), and identifying areas of future congestion, the DEIR concludes that, while the vehicles used by future residents of the Hunter Project will increase traffic, there is really no way to mitigate this situation. Even though the Project has good access to shopping, even though there will be bike routes and sidewalks, people living in a place like St. Helena tend to drive. 76-3

The DEIR estimates that 213 individuals will live in the subdivision. This number is based on the figure of 2.45 people per unit, which is the basis the City relies on for medium/high density zoning. Some people will own several cars. It is always difficult to accurately predict the size of a new population and it is in the interest of developers to underestimate this to some extent. The DEIR fails to take into consideration what happens to families as time goes by: they tend to increase in size, baby by baby. When children reach a certain age, especially in a valley such as ours, they want and need cars and parking. **While the number of parking spaces and garages described in the DEIR may be sufficient at first, it will not accommodate future needs.** Those of us who live in the neighboring Meadowcreek subdivision are well aware of this phenomenon. Parking in our neighborhood, especially overnight and early in the morning, can be so dense that there is barely room to put out garbage bins on collection day. This congestion is partly the result of inadequate parking at the Hunt Grove apartments located at the east end of Hunt Street. 76-4

-1-

Isobel Luria cont'd

Question 1. What can the Applicant do to insure that the new subdivision doesn't exacerbate in the future the parking problem we already have in our neighborhood? 76-5

TRAFFIC AND CIRCULATION: SAFETY

The proposed subdivision will necessitate a four-way intersection where Starr Avenue and Hunt Street meet. (DEIR 3.14-47). Currently, this is a somewhat hazardous intersection for residents of the neighborhood, particularly children, and a fair number of people have experienced "close calls." Additionally, the DEIR notes that an extended Starr to an extended Adams could be used by drivers as an alternate route bypassing Main Street. This will not only increase traffic at this location but also the potential for accidents. 76-6 76-7

Question 2. What could be done to mitigate this impact?

EMERGENCY EVACUATION

The DEIR doesn't address the fact that there is not an efficient means for evacuating the residents of St. Helena in an emergency even though adding more population impacts this situation. It is clear from the location of the proposed subdivision that most vehicles will travel south on Starr Avenue to reach Pope Street and then head north or south as the situation dictates via either the Silverado Trail or Route 29. Granted there is the possibility of following a circuitous route by driving west on Adams but that would not be the route of choice. The narrow Pope Street bridge is a very poor structure to handle evacuations. In the last two fires, the northern exits from the valley were blocked by fires and everyone had to exit to the south. Last week, as a result of the recent heavy rains, a portion of the Silverado Trail had to be shut down. I question why the City of St. Helena would consider granting approval to a new subdivision in the area described in the DEIR until infrastructure has been updated to allow for a more efficient evacuation. 76-8

Question 3. What can be done to improve the Emergency Evacuation Routes out of St. Helena?

WILDLAND FIRE HAZARDS

An example of the callous attitude found in this DEIR occurs in its brief discussion and dismissal of Wildland Fire Hazards. (DEIR 3.8-5) While speaking about the September 2020 Glass Fire the statement is made that "The hills visible from the Project site experienced fire damage." It makes no mention of the fact that part of the area where the subdivision will be constructed, also burned in that fire. The fact that the Project site is in a Non Very High fire Hazard Safety Zone did not seem to protect it! 76-9

-2-

Isobel Luria cont'd

Question 4. What mitigations are planned to protect the Project area from the dangers of Wildfires? 76-9 Cont.

HYDROLOGY AND WATER QUALITY

In its analysis of Hydrology and Water Quality, (see DEIR 3.9-40 – 3.9-43) the DEIR reaches faulty conclusions about the Hunter Project's impact on ground water in the area. In addition, it bases conclusions on weather history without taking into consideration the probability that, because of Climate Change, we will experience weather of record-breaking severity. The report makes statements like the following (DEIR section 3.9-10) "The Subbasin was found to exhibit stable groundwater levels, even despite a very dry 2020 water year...The long-term (1988-2020) annual change in storage for the subbasin is a decrease of 8,0945 AF following the very dry conditions of 2020 but still with water ranges generally experienced over the long term. " 76-10

The DEIR goes on to discuss (see Table 3.13-9) that the proposed landscaping for the subdivision, its **outdoor water needs**, will be "water neutral" because of a currently inoperable well on the property. The well was tested for one 24 hour period and produced 350 GPM. The DEIR states that this output is adequate to supply the landscaping water requirements for the subdivision, which is projected to use 17.16 acre feet per year, without noticeably affecting levels in the Napa River because it will draw water from deep in the aquifer. I take exception to this statement as the Applicant expects to plant 185 trees with drought tolerant plantings between the them. Young trees and plants need ample water to establish themselves. Furthermore, **no allowance is made for the outdoor water needs of the 51 privately owned lots.** The applicant assumes that future rainfall will recharge the subbasin as it has in the past when the area served as a vineyard. Unfortunately, St. Helena is experiencing the effects of a "megadrought" of unknown duration. In addition, much of the proposed subdivision will be covered by buildings and "hardscape" thus eliminating a large percentage of land currently available for direct recharging of ground water. I question the DEIR's conclusion that the irrigation of this development will not have a negative impact on the local subbasin. 76-11

To assume, based on one 24 hour well test, that a subdivision the size of the Hunter Project will be "water neutral" as far as its landscape needs are concerned is questionable. To go even further and state that the project's irrigation will have no impact on the Subbasin or nearby Napa River without further testing is unconscionable. 76-12 76-13

Question 5. From what source will the landscaping on the privately owned lots be irrigated and how much additional water will that require? 76-14

Question 6. What additional testing should be required of the Applicant to determine more accurately the actual impact on the ground water subbasin that the well on the Project will draw from. 76-15

The report, in its discussion on water (DEIR section 3.13-24.-.3.13-33), also underestimates the quantity of **indoor water** future residents of the subdivision will purchase from the City of St. Helena: 17,752 gallons per day or 19.88 acre-feet per year. The figures on which the DEIR 76-16

-3-

Isobel Luria cont'd

bases its conclusions are found in Table 3.13.10. ( **Again I point out that these figures do not include any water allowance for private yards.** )While I understand that some "guesstimates" must be used for discussion purposes, these figures seem low and some sort of tests should be run to determine how to accurately measure water usage by individuals. For example, the DEIR states that the residents of the new subdivision will flush toilets 3 times per person per day. Another understated usage concerns the future kitchen faucets. It is projected that each resident will briefly use this faucet 1 time daily. It would seem these people will neither drink nor prepare meals. But the biggest fallacy in logic is yet to come. To support its contention that the Hunter Project will achieve a Water Neutral status (a requirement of all new construction called for by the St. Helena 2019 General Plan EIR), the developers will be required to retrofit a certain percentage of existing homes and businesses with water saving devices. I assume that the water saved by this retrofitting is supposed to compensate for a portion of the future consumption of in-house water by the subdivision. Many homes and businesses in St. Helena have already had this sort of retrofit. Secondly, and more importantly, water usage in town has already been drastically reduced owing to stringent conservation regulations in place and backed up by penalties. Considering the conservation already taking place, it is difficult to imagine that retrofitting several hundred houses will result in much additional water being saved. Alternately, the developer offers to pay a fee to the city in lieu of the retrofit. How will paying a fee render the subdivision "water neutral?"

76-16 Cont.

76-17

Question 7. What is a better method to determine how much indoor water will actually be consumed by future residents?

76-18

Question 8. Once a reasonable projection is made, how will that level of usage impact the city and its residents, who are already under Stage II water restrictions?

76-19

-4-

## Response to Letter 76
### Isobel Luria

**76-1** The comment states an opinion the Project should not be approved due to the existing drought and potential for increased flooding as a result of climate change.

The comment does not raise does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 3 for information regarding climate change and the status of the Napa River levee.

**76-2** The comment states an opinion that the Draft EIR relies on vague and untested data that dismisses Project impacts and the need for mitigation.

The comment does not raise does not identify specific areas where the Draft EIR is inadequate; therefore, no further response is required. The comment is noted and forwarded to the decision makers for their consideration.

**76-3** The comment states an opinion the Project's trip generation estimates are inaccurate and underestimated because families increase in size the number of cars can increase.

Please see Response to Comment 74-4.

**76-4** The comment states an opinion that parking in the neighborhood is over capacity.

The adequacy of parking supply is not an environmental impact under CEQA; therefore, the commenter's concern is noted for the decision makers and no further response is required. However, at the time building permits are requested, as required by the Municipal Code, the City will confirm the Project complies with Section 17.124.030.A.1 of the City's Zoning Code that addresses residential parking requirements. .

**76-5** The comment asks what the Proposed Project would do to lessen parking capacity concerns.

Please see Response to Comment 76-4.

**76-6** The comment expresses the commenter's concern about the safety of the Starr Avenue and Hunt Avenue intersection.

Please see Response to Comment 59-3.

**76-7** The comment states an opinion that an extension of Starr Avenue to Adams Street could increase traffic and the potential for accidents and asks what can be done to mitigate this impact.

Please see Response to Comment 59-3.

**76-8** The comment states an opinion that the Draft EIR does not consider that the City does not have efficient means for emergency evacuation, which would be further impacted by the Project and asks what can be done to improve emergency evacuation.

Section 3.14 of the Draft EIR analyzed emergency vehicle access in detail. For additional information regarding emergency vehicle access and evacuation, please see Master Response 1.

**76-9** The comment states an opinion that the Draft EIR fails to note that a part of the Project site was burned in the September 2020 Glass Fire. The commenter asks what mitigation measures are planned to protect the Project area from wildfires.

The Draft EIR notes on page 3.8-5 that the hills visible from the Project site experienced fire damage. The Project site did not experience any fire damage from the 2020 Glass Fire. The discussion under Impact 3.8-4 on page 3.8- 21 describes how best management practices, BAAQMD regulations, and properly irrigated landscapes would reduce fire risk.

**76-10** The comment states an opinion that the Hydrology and Water Quality analysis reaches faulty conclusions about the Project's impact on groundwater because it does not consider the effects of climate change.

Please see Response to Comments 35-4 through 35-6.

**76-11** The comment states an opinion that outdoor water needs are not accurately portrayed in Table 3.13-9 of the Draft EIR because new trees and plants require significant amounts of water to get established and landscape irrigation for the new homes is not included.

Please see Responses to Comments14-9 through 14-17 and Master Response 2.

**76-12** The comment states an opinion that because the City is experiencing a severe drought and the Project would increase impervious surface area, there may be a negative impact on the local groundwater subbasin.

Please see Master Response 2 and Responses to Comments 35-4 through 35-6.

**76-13** The comment suggests that the Draft EIR should not assume the Project would be water neutral based on one 24-hour well test. The comment also states an opinion

that it is not reasonable to conclude that Project's irrigation would have no impact on the groundwater subbasin or Napa River without further testing.

Please see Responses to Comments 14-9 through 14-17, 57-5 and Master Response 2.

**76-14** The commenter asks how much additional water would be required to irrigate privately owned lots and where the water will come from.

Please see Response to Comments 14-9 through 14-17 and Master Response 2.

**76-15** The commenter asks what additional testing should be required of the Project applicant to determine a more accurate impact on the groundwater subbasin.

Please see Responses to Comments 35-4 through 35-6, 57-5 and Master Response 2.

**76-16** The comment states an opinion the discussion on pages 3.13-24 through 3.13-33 of the Draft EIR underestimates the quantity of indoor water that future residents of the Project will use, including landscape irrigation. The comment goes on to state that tests should be done to determine how to accurately measure water usage by individuals.

Please see Responses to Comments 14-9 through 14-17 and Master Response 2.

**76-17** The comment states an opinion that retrofitting houses will not save enough water for the Project to be considered water neutral. The commenter asks how the in-lieu fee would satisfy the water neutral condition.

Please see Responses to Comments 14-9 through 14-17 and Master Response 2.

**76-18** The commenter asks if there is a better method to determine the indoor water usage of future residents.

Please see Responses to Comments 14-9 through 14-17 and Master Response 2.

**76-19** The commenter asks how the Project's water demand would impact the City and its residents.

Please see Responses to Comments 14-9 through 14-17 and Master Response 2.

INTENTIONALLY LEFT BLANK

Comment Letter 77

To: Maya DeRosa, St Helena City Planner November 7, 2021

Re: Hunter Project -- Citizen Comments

Dear Ms. DeRosa,

We have been St Helena residents for nearly 50 years now and have watched things happen that could never be predicted back those oh so many years ago. This proposed Hunter housing project is just one of those potential events that if approved will someday be looked back upon as "How could they have ever let something like that be built where it is?" 77-1

The Vineyard Valley Mobile Home Park is obviously sited in a location where homes or mobile homes should never have been allowed. The occurrence of two 100 Year Floods in that park within nine years of one another attest to the allowance of a project that would flood and cause such unfathomable harm and devastation.

Looking back to those early 1970s, fear of flooding was a valid concern. That low lying property adjacent to the Napa River and Sulphur Creek had been know to be under water many times in recorded history. Only because of the evolving engineering talent of that time and the presumed wisdom of those who can make such decisions, was the VVMHP allowed to be built. Yes, it was built in a flood plain, but Federal Flood Insurance was available to residents should something go wrong and the park go under in a flood. That one band-aid alone was deemed to be acceptable should a flood occur.

It was only because of the modern-day engineering talent of that time that a Flood Wall (I.e. heavy duty wooden fence) was designed and approved as a deterrent to the possibility of flooding to the park. The northern (actually western) edge of the park was required to have a dirt berm (levee) of about 24 inches above grade, and placed into that dirt levee were 4x6 wooden posts upon which the approximately 4x12 lateral boards were placed to become this "Flood Wall" that was supposed to keep a wall (actually a lake) of water from inundating the mobile homes on the inside of the park. Looking back, it seems preposterous that such a scheme could be created let alone approved for such a foreboding potential flood. But approved it was. 77-2

In 1986, at the time of the first 100 Year Flood at that location, I was on scene with other volunteers assisting the California Division of Forestry (precursor to Cal Fire) crew members as we filled sandbags and dropped them over the Flood Wall to rest on the opposite side of the so-called levee, two feet below the water level. It became obvious very soon that there was a very serious problem that had never been included into the original engineering plan for this levee and Flood Wall. This oversight was the failure to understand that gophers, moles and voles would permeate this dirt levee, and as the pressure from the flood waters on the other side began to penetrate their subterranean runs, those channels would burst through to our side of the levee and get larger and larger as they rapidly eroded. We even tried to sandbag "our side" of that Wall/levee, but that did not work. Soon the mobile home park streets were filling with water and our efforts shifted to evacuating the hundreds of older residents of VVMHP. The Water Wall had failed, and the park was submerged.

Once the flood waters had subsided and the flooded mobile homes were being removed and replaced with new ones, a solution to any possible future flooding had to be designed. Engineers immediately removed the berm/levee concept from the newly designed flood barrier. The new Flood Wall was to be a cinder block wall with cinder block support posts. The wall was to be higher than

before, and subject to FEMA and National Flood Insurance requirements. Once those requirements were determined as adequate for any future possibility of a similar or even larger flood, the owner of the VVMHP insisted upon paying for the height to be even one cinder block higher than engineers required as an added safety measure. And so, it was to be. Another cinder block was added to the height.

It seemed to be a win-win situation for most everyone. There were not only updated engineering regulations being adhered to, but the project was so convincing that many of the insurance companies who had paid millions of dollars to care for their VVMHP customers were even willing to continue insuring them as well as accepting new applicants.

And now we come to 1995 when yet another 100 Year Flood arose and put the newly designed and engineered Flood Wall to the test – a "test" that failed.

With flood waters having destroyed both of the prior "engineering marvels" designed to protect Vineyard Valley, a more grandiose project had to be created. Hence the multi-million-dollar flood control project currently in place with a levee to supposedly protect the VVMHP and adjacent homes.

77-2 Cont.

History reveals the eternal battle between technology and nature, especially where levees are concerned. While the 2005 drama of Hurricane Katrina in New Orleans and the collapse of earthen and concrete levees that were engineered to protect that area are still fresh in our minds, each year more and more levees of lesser fame have failed with catastrophic results as well.

77-3

Simply speaking, we (St Helena) cannot be lulled into complacency to think that our levee between the eastern end of Adams Street and the Napa River can be relied upon to protect property behind it. As such, it is folly to rely upon this levee to protect the proposed Hunter Project in the future. While there are many obvious reasons why levees fail, one of those causes is unwanted vegetation being allowed to grow upon or alongside a levee. Our St Helena levee is a good example of just such a problem with the large area of Coyote Brush that has been allowed to take root there.

77-4

Just as we were not able to rely upon the two prior flood control measures mentioned earlier, it is only logical and reasonable that we cannot rest assured that this new engineering creation of a levee will preclude yet another failure and subsequent damage to something like the Hunter Project.

While there is no justification for ignoring the inevitability of levee failure, there is only one of two solutions to this proposal. The first is to deny this project based upon the potential for failure, and the second would be to approve the project subject to the applicant assuming full responsibility and liability in the event of a levee breach or any other such inundation of that project area.

77-5

Sincerely,

Norm Manzer
103 Camino Vista
St Helena, CA 94574

# Response to Letter 77
## Norm Manzer
## November 7, 2021

**77-1** The commenter provides their history as City residents and states opposition to the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required.

**77-2** The comment provides their history of previous flood events in the City, particularly at the Vineyard Valley Mobile Home Park. The comment also describes their understanding of several previous engineering projects to control and manage flooding in the Project area.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 3 that addresses flooding concerns.

**77-3** The comment provides a general statement about flood events and levee failure and provides Hurricane Katrina as an example.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. Please see Master Response 3 that addresses flooding concerns.

**77-4** The comment states an opinion that the Napa River levee should not be relied on to protect Project residents and references previous flood events discussed in Comment 77-2.

Please see Response to Comment 73-5. Please also see Master Response 3 addresses issues associated with flooding and the levee.

**77-5** The comment state opposition to the Project and requests the City not approve the Project based on the potential for levee failure and requests that the Project applicant be liable for potential levee failure should the Project be approved.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required. Please see Response to Comment 73-5 and Master Response 3 that addresses concerns specific to the levee.

Subject: [External] Hunter Subdivision Project

Hi Maya

I am writing to let you know that my husband and I are very much against the proposed Hunter subdivision going forward. 78-1

We plan on joining the meeting on Nov 2nd to learn more as we're certain there have been impact studies completed. 78-2

This high density housing will go towards accelerating the depletion of our already overtaxed resources, especially our water. 78-3

Thank you,

Beth and David Marks
945 Brown St
St Helena CA 94574

INTENTIONALLY LEFT BLANK

# Response to Letter 78
## Beth and David Marks
## October 30, 2021

**78-1** The comment states opposition to the Project.

The commenter's opinion is noted and forwarded to the decision makers for their consideration. The comment does not address the accuracy or adequacy of the Draft EIR; therefore, no further response is required.

**78-2** The comment states that it is the commenters' plan to attend future Project hearings.

The comment does not identify any specific areas where the EIR or analysis is inadequate. Therefore, no response is required; the comment is noted and forwarded to the decision-makers for their consideration.

**78-3** The comment states an opinion that "high density housing" (the commenter's term) will further impact limited resources, including water.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration. To clarify, the Project is proposing residential development consistent with the "medium density" designation of the St Helena General Plan. Please see also Master Response 2 regarding water supply.

Subject: Hunter Project Draft EIR is Inadequate and Incomplete

11/28/21

I support more housing, more diversity in St. Helena, and property owner rights. But I strongly feel the proposal for 87 units DEIR is significantly lacking in information and proposes inaccurate information. 79-1

The question is, why does no one in town support this project? Or alternatively, why isn't the project so compelling, that it generates support? 79-2

**Notably**:

1. **SAFETY & Circulation**: The circulation via Starr Ave, Adams, to the Silverado Trail must be addressed. It is critical the Adams eastern entrance to St Helena is now planned and budgeted. Even without the Hunter project, the Adams St extension needs to connect to the Silverado Trail. We are at a tipping point: build the bridge. Pope and Pratt are not seismically sound bridges, nor can these historic bridges serve adequately for the next 100 years. Adams between Railroad and the eastern terminus was always intended to be a major artery street connecting to Silverado trail (as shown by the width of Adams near Railroad & Library Lane). It is time to bite the bullet and figure out how to get a MODERN, seismically safe, truck compliant bridge between Deer Park and Zinfandel Lane, crossing the Napa River. By adding "conservatively" 213 residents to St. Helena, using as example 160 cars (1.84 car/unit @ 14' per car) translates to a line of cars about ½ mile long. It is imperative this new neighborhood and all residents have a means of evacuation during a fire, seismic or other hazardous event. 79-3

   The Starr Ave extension (~60') appears to be narrower than the Adams St extension (~65') – these are important residential streets to accommodate larger than average traffic, and sound mitigation measures, visual enhancement measures (ie larger verges, bulb-out parking/cross walks, median strips), bike lanes, should be implemented. 79-4

   Underground wires to prevent fire hazards should be implemented; this is the bordering the urban wildland interface, and all fire mitigation measures should be detailed and modeled for the community. 79-5

   Per the St Helena General plan quoted in this report "Policy 4.7.3: The new eastern entry via the Adams extension" needs to be factored into the long-term planning for the Adams/Silverado Trail connection. 79-6

The DEIR does not address additional financial impacts to the residents of St. Helena by completing the Adams St extension to Silverado Trail.

The DEIR does not account for the cost of a traffic light at Adams and Silverado Trail.

79-6 Cont.

The City of St. Helena is already routing TRUCK traffic down residential streets: Pope to Edwards to Hunt for the 6-week closure of Hunt/Hwy 29. ADAMS Street is the logical and right location for **TRUCK and thoroughfare traffic**. Edwards is no wider than Adams at Adams/Hwy29, but nonetheless, the City of St. Helena is routing traffic on a narrow tree-lined street (with portions of low wires and low branches, and the sweet "oak tree" in the street block). It is past time to take responsibility for safe, planned, attractive thoroughfare traffic.

79-7

The extension of Adams St for this project does not adequately show how 18-wheeler trucks will navigate the "kink" in the road which is the western starting point of this project. This will be the main eastern entrance to St. Helena – it needs to be "beautified" with tree-lined verges and ideally a tree-lined median, bike lanes, and extra buffer between the street and the residences for separation of people and traffic. Now is the time to rectify and plan for this, not make due with 100-year old streets and retrofit them.

79-8

We need 2 WAYS OUT of this valley. To not act on this is irresponsible and a lawsuit waiting to happen when lives could be jeopardized in an emergency.

79-9

2. **The water mitigation measures are completely inadequate.** Providing the cost of 333 bathroom faucets, toilets, sink faucets, & shower heads to the city WILL NOT mitigate the water impact from this project. IF this was the case, the citizens of St. Helena would gladly have paid this ONE-TIME cost to mitigate our water woes by now.

79-10

In fact, does this mean that I can pay $7K/residence and not have water rationing anymore because I've paid an in-lieu fee to the city? This is absurd. **The project needs to pay the true cost of added water consumption, instead of a fake fee to pretend it generates more water. <u>The project must pay for new infrastructure to generate more water for this development.</u>**

79-11

Hunter Subdivision Water Neutrality Calculations, Appendix J, state the home and multi-units will use 17,752 gallons per day / 508 persons = 34.9 Gallons per person per day. 34.9 gallons PER PERSON DAY is completely inadequate to project for the water usage. Do they never wash the dog, wash the car, have a guest, fill a kiddie pool?

79-12

There is a disconnect in the DEIR stating in table 5-1 the need for **15,509,215** gallons per year (Gallons per year is a figure most citizens will understand vs acre feet/year) and the

79-13

17,752 gal/day or **6,479,480** gal/year in the Appendix J. This is a shortfall of 9M+ gallons/year.

79-13 Cont.

The Appendix J is a broad brush, inadequate analysis of the water impact. It is simply a calculation of the cost of water fixtures for an in-lieu fee, and proposing that the citizens of St Helena do MORE to save water so the developer can build out his property. **Many citizens of St Helena have been saving water since the 1970's drought! There is no more water to save in the households.**

79-14

The Appendix J does not account for the ADU usage; it only accounts for 51 homes @ 8 persons/ 4 bed home and 25 multi-unit homes at 4 persons/2 bedroom unit.

79-15

"The per capita water use for St. Helena in 2015 is approximately 220 gallons/day" per DEIR. Right now, the per capita is <65 gallons per person day.

79-16

There are few if any lawns in St Helena (certainly no green lawns now). Schools and parks have different water rules than residents, so water saving here is not going to benefit residents in my opinion. Lawns are completely inappropriate for the landscape design in this project as stated in the DEIR.

79-17

There is no data to support there still exists any non-conserving water fixtures in St Helena.

79-18

The City of St. Helena residents already pay very very high water rates. **This project DEIR does not address potential future additional costs to residents for water rate increases due to poor planning for new water resources, especially those on a fixed income.**

79-19

This project proposes an outdated schematic for single family homes and low-income apartments, when it should be proposing high-energy efficient housing, probably multi-story, with an elevator, to serve both elderly and persons with disabilities, with a native community garden/park with extremely low water needs, and compact private outdoor space, which will further reduce water needs.

79-20

3. **St. Helena does not need more segregated low-income housing.** The developer has a blank slate, and instead is using an outdated ideology for housing. Grouping multi-family units in one location perpetuates the history of segregated housing which is now recognized as having a huge impact on equity, perception of real estate value, and is not a forward-thinking design of inclusivity, integration of housing types.

   The site of the Hunter multi-housing units puts it adjacent to the existing multi-housing units on Monte Vista. The subtext is clear. Put the low-income housing next to the existing apartments—bunch the multi-units low/lower-income housing together because no one wants to look at them or treat them like equal citizens. **This is a stigma**

79-21

**for this neighborhood and the City east of the railroad which bears by far, the burden of multi-family housing.** This is not a design of inclusivity. The DEIR does not address the impact on neighborhood perceptions by building easily identifiable "low income housing." The low-income housing should look the same as all the other housing in the project, and make efforts to integrate with the adjoining existing housing. This has been successfully done in many communities, where the low-income housing looks just like all the other housing in the neighborhood. 79-21 Cont. 79-22

The low-income housing needs to include homes for purchase, not only rentals. This will be regulated housing and will not appreciate the same as market-rate, but it will allow owners the opportunity for pride of ownership, tax benefits, and further diversify St. Helena. 79-23

The DEIR does not account for the added cost of administering the low-income housing; a trust fund needs to be established. 79-24

The schematic housing plan has rigid housing types: Single family homes, likely 2-level, some with ADUs, and duplex or apartment attached multi-unit 2-bedroom low-income homes. If there were more attached homes, both conservation of land and energy is achieved. 3 stories need to be considered. Elevator access needs to be considered for a project of this size. 79-25

The ADU schematics are lacking in the site plan. Where are they going? To truly make the ADU affordable, there should be site condos constructed by the developer to increase the range of housing price, with supporting site-condo HOA docs provided at the outset. 79-26

There is no recognition of housing for persons with mobility impairments. Our land is too valuable to put all the ADA housing on the street level, and multi-level housing with elevator(s) need to be created. 79-27

The HOA information is lacking in the DEIR, and when there is a flood, or serious project impairment, what bond is placed by the developer? If the HOA does not have financial reserves/stability, how does this affect the low-income housing and the development? 79-28

There is no information in the DEIR explaining how the homes will be available for VA loans, FHA loans, or help to first time home-buyers. 79-29

The DEIR does not address how it will serve very low, low, moderate, and market rate homes specifically, and how many bedrooms/units will each have. There needs to be equity in distribution here, and the "low-income" housing can not only be 2-bedroom residences. 79-30

**Additionally:**

- There are no public parks affiliated with this project, and there should be both parks and improvement to the river trail. There is no analysis in the DEIR of park's needs. 79-31
- At the public meeting, a resident commented there are important artifacts of native people at this site. I can attest that I have personally seen native artifacts at this site when I walked this area for hours at a time as a child. There is no recognition or addressing of this in the DEIR. This is offensive and a huge oversight. 79-32
- The DEIR is labeled reduced and/or optimized, which degrades the quality of the file. The full file should be available for review. Case in point, Figure 2.1, Regional Location, should be able to zoom in 200%+ to clearly identify adjoining parcels. Zooming in shows a fuzzy image. Figure 2-2 & 2-3 project site photographs are faded, and poor resolution, do not adequately show interface with adjacent properties. 79-33
- On figure 2-4, Single family homeowners names are identified. However, the individuals who live at Hunt's Grove, are not identified on the map. There are human beings who live at Hunt's Grove and Monte Vista, and just because they are not property owners, their presence should not be overlooked. At a minimum, the number of units showing bed/bath count in the multi units should be displayed, to indicate the direct impact to Hunts Grove and other adjacent parcels. The Vineyard Valley owners are also not identified. Size and adjoining agricultural parcels should be identified to the north of the project. # Bedrooms and # of residences should be identified on the site maps. 79-34
- The concept to extend Starr Ave to Fulton should be noted here as years from now, this is a direct possibility, and part of safety/evacuation planning. 79-35
- The Adams Street at a minimum should have bioswales to receive water to replenish the ground water, vs dumping rain water to the sewer infrastructure. 79-36
- Page 2-11: Mt. St. Helena is a significant view. It is notable and similar to views of Mt. Tamalpais, Mt Diablo. Vineyards are a significant view in the City limits. If need be the CITY needs to designate views of Mt St Helena as significant. 79-37
- Even if "The Project site is now designated Zone X, which FEMA identifies as an area with a moderate to low risk of flooding due to a levee failure and is considered protected from a 100-year flood event," the project needs to address the impact during a 100 year flood event. Also, what foundations will be used on top of the added fill at this project site and will prospective home buyers be notified their homes are built on fill? What is the height of the foundations and first floors to absorb a 100 year flood? Surely these homes are built to last 100 years. **Will these owners be required to buy flood insurance? How will this impact the financing available to purchase these homes?** 79-38 79-39 79-40
- The 2019 General Plan designates this area a medium green, "agriculture." I'm not seeing on the 2019 General plan where this project site is designated medium density residential. The DEIR should show the General Plan designation, and it should be linked in the report for ease of location, not buried in an appendix that one has to sift through to find. 2019 General plan showing agriculture at this site: 79-41

- The DEIR states the HOA would oversee street lights and public landscaping. This is confusing and inadequate. There is minimal public landscaping, and there should be a park, verges with trees, a walking path to the Napa River. Why would the HOA service the streetlights on a city street? Is it a private street, and if so the HOA needs to pay for full street maintenance, the common sewer line and underground utilities. 79-42
- There is no % for the arts this project. A project of this size needs to contribute to the arts, culture and history of our community. Funds for a permanent City arts project must be considered. 79-43

I expect our city and each council member, each commission member to express their opinion on this project. 79-44

I am disappointed in the level of communications from the City to outreach to citizens for comments, and to make it easy for citizens to comment on this project. 79-45

Thank you for your serious consideration.

Tracy McBride, 510-517-6202, tracymcbride22@gmail.com

## Response to Letter 79
### Tracy McBride
### November 28, 2021

**79-1** The commenter states their support for more housing in the City but opines that the Draft EIR includes inaccurate information.

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**79-2** The commenter asks, "... why does no one in town support this project?"

The comment does not identify any specific areas where the Draft EIR analysis is inadequate; therefore, no response is required. The comment is noted and forwarded to the decision makers for their consideration.

**79-3** The commenter calls for the extension of Adams Street to connect to the Silverado Trail and for the extension to be suitable for trucks. The comment also states an opinion that emergency evacuation would be affected by the Proposed Project.
